Access the BNF your way

The British National Formulary (BNF) and BNF for Children are updated monthly online via MedicinesComplete, ensuring healthcare professionals always have the latest prescribing advice.

You can be alerted to all the latest updates by signing up to the BNF eNewsletter at www.bnf.org/newsletter.

**ONLINE**

BNF on MedicinesComplete
Access BNF and BNF for Children on MedicinesComplete and receive the very latest drug information through monthly online updates.

BNF on FormularyComplete
Create, edit and manage your own local formulary content built upon the trusted prescribing advice of the BNF and BNF for Children.

BNF on Evidence Search
Search the BNF and BNF for Children alongside other authoritative clinical and non-clinical evidence and best practice at http://evidence.nhs.uk from NICE.

**MOBILE**

BNF app – Stay up to date anywhere with the BNF app available for iOS, Android and Blackberry.
BNF eBook – Available as an ePDF via a range of suppliers. See www.pharmpress.com/bnf.
BNF on MedicinesComplete – Now mobile responsive.

**PRINT**

BNF subscription – if you prefer to access BNF in print, take advantage of our subscription option. We will send you the new BNF as soon as the book is published. One or two year packages (including or excluding BNFC) are available. Discounted pricing is also available on bulk sales.
How to purchase

Purchase direct from Pharmaceutical Press by visiting www.pharmpress.com/bnf

For enquiries about the BNF or BNFC in print, contact direct@macmillan.co.uk
Tel: +44 (0) 1256 302 699

For enquiries concerning MedicinesComplete, BNF on FormularyComplete, or bulk orders of the print edition, contact pharmpress@rpharms.com

Preface

The BNF is a joint publication of the British Medical Association and the Royal Pharmaceutical Society. It is published under the authority of a Joint Formulary Committee which comprises representatives of the two professional bodies, the UK Health Departments, the Medicines and Healthcare products Regulatory Agency, and a national guideline producer. The Dental Advisory Group oversees the preparation of advice on the drug management of dental and oral conditions; the Group includes representatives of the British Dental Association and a representative from the UK Health Departments. The Nurse Prescribers’ Advisory Group advises on the content relevant to nurses and includes representatives from different parts of the nursing community and from the UK Health Departments.

The BNF aims to provide prescribers, pharmacists, and other healthcare professionals with sound up-to-date information about the use of medicines.

The BNF includes key information on the selection, prescribing, dispensing and administration of medicines. Medicines generally prescribed in the UK are covered and those considered less suitable for prescribing are clearly identified. Little or no information is included on medicines promoted for purchase by the public.

Information on drugs is drawn from the manufacturers’ product literature, medical and pharmaceutical literature, UK health departments, regulatory authorities, and professional bodies. Advice is constructed from clinical literature and reflects, as far as possible, an evaluation of the evidence from diverse sources. The BNF also takes account of authoritative national guidelines and emerging safety concerns. In addition, the editorial team receives advice on all therapeutic areas from expert clinicians; this ensures that the BNF’s recommendations are relevant to practice.

The BNF is designed as a digest for rapid reference and it may not always include all the information necessary for prescribing and dispensing. Also, less detail is given on areas such as obstetrics, malignant disease, and anaesthesia since it is expected that those undertaking treatment will have specialist knowledge and access to specialist literature. BNF for Children should be consulted for detailed information on the use of medicines in children. The BNF should be interpreted in the light of professional knowledge and supplemented as necessary by specialised publications and by reference to the product literature. Information is also available from medicines information services, see Medicines Information Services.

It is important to use the most recent BNF information for making clinical decisions. The print edition of the BNF is updated in March and September each year. Monthly updates are provided online via Medicines Complete and the NHS Evidence portal. The more important changes are listed under Changes; changes listed online are cumulative (from one print edition to the next), and can be printed off each month to show the main changes since the last print edition as an aide memoire for those using print copies.

The BNF Publications website (www.bnf.org) includes additional information of relevance to healthcare professionals. Other digital formats of the BNF—including versions for mobile devices and integration into local formularies—are also available.

Acknowledgements

The Joint Formulary Committee is grateful to individuals and organisations that have provided advice and information to the BNF.

The principal contributors for this update were:

Expert advice on the management of oral and dental conditions was kindly provided by M. Addy, P. Coulthard, A. Crighton, M.A.O. Lewis, J.G. Meechan, N.D. Robb, C. Scully, R.A. Seymour, R. Welbury, and J.M. Zakrzewska. S. Kaur provided valuable advice on dental prescribing policy.

Members of the British Association of Dermatologists’ Therapy & Guidelines Subcommittee, D.A. Buckley, M. Cork, E. Duarte Williams, M. Griffiths, T. Leslie, E. Mallon, P. McHenry, P. Hunzehally, I. Nasr, C. Saunders, V. Swale, S. Ungureanu, S. Wakelin, A. Brain (Secretariat), and M.F. Mohd Mustapa (Secretariat) have provided valuable advice.

Members of the Advisory Committee on Malaria Prevention, R.H. Behrens, D. Bell, P.L. Chiodini, V. Field, F. Genasi, L. Goodyer, A. Green, J. Jones, G. Kassianos, D.G. Lalloo, D. Patel, H. Patel, M. Powell, D.V. Shingadia, N.O. Subair, C.J.M. Whitty, M. Blaze (Secretariat), and V. Smith (Secretariat) have provided valuable advice.

The UK Ophthalmic Pharmacy Group have also provided valuable advice.

The MHRA have provided valuable assistance.

Correspondents in the pharmaceutical industry have provided information on new products and commented on products in the BNF.

Numerous doctors, pharmacists, nurses, and others have sent comments and suggestions.

BNF interactions are provided by C.L. Preston, S.L. Jones, H.K. Sandhu, and S. Sutton.

The BNF has valuable access to the Martindale data banks by courtesy of A. Brayfield and staff.

J. Macdonald and staff provided valuable technical assistance.

K.K. Cheema, M.E. Elnaeem, H.G. Hesketh, M. Khalid, and E. Laughton provided considerable assistance during the production of this update of the BNF.

How BNF publications are constructed

The BNF is unique in bringing together authoritative, independent guidance on best practice with clinically validated drug information, enabling healthcare professionals to select safe and effective medicines for individual patients.

Information in the BNF has been validated against emerging evidence, best-practice guidelines, and advice from a network of clinical experts.

Hundreds of changes are made between print editions, and are published monthly in some digital formats. The most clinically significant updates are listed under Changes p. xv.

Joint Formulary Committee
The Joint Formulary Committee (JFC) is responsible for the content of the BNF. The JFC includes doctors appointed by the BMJ Group, pharmacists appointed by the Royal Pharmaceutical Society, nursing and lay representatives; there are also representatives from the Medicines and Healthcare products Regulatory Agency (MHRA), the UK Health Departments, and a national guideline producer.

The JFC decides on matters of policy and reviews amendments to the BNF in the light of new evidence and expert advice.

Dental Advisory Group
The Dental Advisory Group oversees the preparation of advice on the drug management of dental and oral conditions; the group includes representatives from the British Dental Association and a representative from the UK Health Departments.

Nurse Prescribers’ Advisory Group
The Nurse Prescribers’ Advisory Group oversees the list of drugs approved for inclusion in the Nurse Prescribers’ Formulary; the group includes representatives from a range of nursing disciplines and stakeholder organisations.

Editorial Team
BNF clinical writers have all worked as pharmacists and have a sound understanding of how drugs are used in clinical practice. Each clinical writer is responsible for editing, maintaining, and updating BNF content. During the publication cycle the clinical writers review information in the BNF against a variety of sources.

Amendments to the text are drafted when the clinical writers are satisfied that any new information is reliable and relevant. The draft amendments are passed to expert advisers for comment and then presented to the Joint Formulary Committee for consideration. Additionally, sections are regularly chosen for thorough review. These planned reviews aim to verify all the information in the selected sections and to draft any amendments to reflect the current best practice.

Clinical writers prepare the text for publication and undertake a number of checks on the knowledge at various stages of the production.

Expert advisers
The BNF uses about 60 expert clinical advisers (including doctors, pharmacists, nurses, and dentists) throughout the UK to help with clinical content. The role of these expert advisers is to review existing text and to comment on amendments drafted by the clinical writers. These clinical experts help to ensure that the BNF remains reliable by:

- commenting on the relevance of the text in the context of best clinical practice in the UK;
- checking draft amendments for appropriate interpretation of any new evidence;
- providing expert opinion in areas of controversy or when reliable evidence is lacking;
- advising on areas where the BNF diverges from summaries of product characteristics;
- providing independent advice on drug interactions, prescribing in hepatic impairment, renal impairment, pregnancy, breast-feeding, children, the elderly, palliative care, and the emergency treatment of poisoning.

In addition to consulting with regular advisers, the BNF calls on other clinical specialists for specific developments when particular expertise is required.

The BNF works closely with a number of expert bodies that produce clinical guidelines. Drafts or pre-publication copies of guidelines are routinely received for comment and for assimilation into the BNF.

Sources of BNF information
The BNF uses a variety of sources for its information; the main ones are shown below.

Summaries of product characteristics
The BNF receives summaries of product characteristics (SPCs) of all new products as well as revised SPCs for existing products. The SPCs are the principal source of product information and are carefully processed, despite the ever-increasing volume of information being issued by the pharmaceutical industry. Such processing involves:

- verifying the approved names of all relevant ingredients including ‘non-active’ ingredients (the BNF is committed to using approved names and descriptions as laid down by the Human Medicines Regulations 2012);
- comparing the indications, cautions, contra-indications, and side-effects with similar existing drugs. Where these are different from the expected pattern, justification is sought for their inclusion or exclusion;
- seek independent data on the use of drugs in pregnancy and breast-feeding;
- incorporating the information into the BNF using established criteria for the presentation and inclusion of the data;
- checking interpretation of the information by a second clinical writer before submitting to a content manager; changes relating to doses receive an extra check;
- identifying potential clinical problems or omissions and seeking further information from manufacturers or from expert advisers;
- careful validation of any areas of divergence of the BNF from the SPC before discussion by the Committee (in the light of supporting evidence);
- constructing, with the help of expert advisers, a comment on the role of the drug in the context of similar drugs.

Much of this processing is applicable to the following sources as well.

Expert advisers
The role of expert clinical advisers in providing the appropriate clinical context for all BNF information is discussed above.

Literature
Clinical writers monitor core medical and pharmaceutical journals. Research papers and reviews relating to drug therapy are carefully processed. When a difference between the advice in the BNF and the paper is noted, the new information is assessed for reliability and relevance to UK clinical practice. If necessary, new text is drafted and discussed with expert advisers and the Joint Formulary Committee. The BNF enjoys a close working relationship with a number of national information providers.

Systematic reviews
The BNF has access to various databases of systematic reviews (including the Cochrane Library and various web-
based resources). These are used for answering specific queries, for reviewing existing text, and for constructing new text. Clinical writers receive training in critical appraisal, literature evaluation, and search strategies. Reviews published in Clinical Evidence are used to validate BNF advice.

Consensus guidelines
The advice in the BNF is checked against consensus guidelines produced by expert bodies. A number of bodies make drafts or pre-publication copies of the guidelines available to the BNF; it is therefore possible to ensure that a consistent message is disseminated. The BNF routinely processes guidelines from the National Institute for Health and Care Excellence (NICE), the Scottish Medicines Consortium (SMC), and the Scottish Intercollegiate Guidelines Network (SIGN).

Reference sources
Textbooks and reference sources are used to provide background information for the review of existing text or for the construction of new text. The BNF team works closely with the editorial team that produces Martindale: The Complete Drug Reference. The BNF has access to Martindale information resources and each team keeps the other informed of significant developments and shifts in the trends of drug usage.

Statutory information
The BNF routinely processes relevant information from various Government bodies including Statutory Instruments and regulations affecting the Prescriptions only Medicines Order. Official compendia such as the British Pharmacopoeia and its addenda are processed routinely to ensure that the BNF complies with the relevant sections of the Human Medicines Regulations 2012.

The BNF maintains close links with the Home Office (in relation to controlled drug regulations) and the Medicines and Healthcare products Regulatory Agency (including the British Pharmacopoeia Commission). Safety warnings issued by the Commission on Human Medicines (CHM) and guidelines on drug are issued by the UK health departments are processed as a matter of routine.

Relevant professional statements issued by the Royal Pharmaceutical Society are included in the BNF as are guidelines from bodies such as the Royal College of General Practitioners.

The BNF reflects information from the Drug Tariff, the Scottish Drug Tariff, and the Northern Ireland Drug Tariff.

Medicines and devices
NHS Prescription Services (from the NHS Business Services Authority) provides non-clinical, categorical information (including prices) on the medicines and devices included in the BNF.

Comments from readers
Readers of the BNF are invited to send in comments. Numerous letters and emails are received by the BNF team. Such feedback helps to ensure that the BNF provides practical and clinically relevant information. Many changes in the presentation and scope of the BNF have resulted from comments sent in by users.

Comments from industry
Close scrutiny of BNF by the manufacturers provides an additional check and allows them an opportunity to raise issues about BNF’s presentation of the role of various drugs; this is yet another check on the balance of BNF’s advice. All comments are looked at with care and, where necessary, additional information and expert advice are sought.

Market research
Market research is conducted at regular intervals to gather feedback on specific areas of development, such as drug interactions or changes to the way information is presented in digital formats.

Overview
The BNF is an independent professional publication that is kept up-to-date and addresses the day-to-day prescribing information needs of healthcare professionals. Use of this resource throughout the health service helps to ensure that medicines are used safely, effectively, and appropriately.
How to use the BNF

This edition of the BNF marks a fundamental change to the structure of the content. The changes have been made to bring consistency and clarity to BNF content, and to the way that the content is arranged within print and digital products, increasing the ease with which information can be found.

For this print edition, the most notable changes include:

— Drug monographs – where possible, all information that relates to a single drug is now contained within its drug monograph, moving information previously contained in the prescribing notes. Drug monographs have also changed structurally: additional sections have been added, ensuring greater regularity around where information is located within the publication.

— Drug-class monographs – where substantial amounts of information is common to all drugs within a drug class (e.g. macrolides, p. 469), a drug-class monograph has been created to contain the common information.

— Medicines – categorical information about marketed medicines, such as price and pack size, continues to be sourced directly from the Dictionary of Medicines and Devices provided by the NHS Business Services Authority. However, clinical information curated by the BNF team has been clearly separated from the categorical pricing and pack size information and is included in the relevant section of the drug monograph.

— Section numbering – the BNF section numbering has been removed. This section numbering tied the content to a rigid structure and enforced the retention of defunct classifications, such as mercurial diuretics, and hindered the relocation of drugs where therapeutic use had altered. It also caused constraints between the BNF and BNF for Children, where drugs had different therapeutic uses in children.

— Appendix 4 – the content has been moved to individual drug monographs. The introductory notes have been replaced with a new guidance section, Guidance on intravenous infusions, p. 14.

Introduction

In order to achieve the safe, effective, and appropriate use of medicines, healthcare professionals must be able to use the BNF effectively, and keep up to date with significant changes in the BNF that are relevant to their clinical practice. This How to Use the BNF is key in introducing the new structure of the BNF to all healthcare professionals involved with prescribing, monitoring, supplying, and administering medicines, as well as supporting the learning of students training to join these professions.

Structure of the BNF

This new BNF broadly follows the high-level structure of previous editions:

Front matter, comprising information on how to use the BNF, the significant content changes in each edition, and guidance on various prescribing matters (e.g. prescription writing, the use of intravenous drugs, particular considerations for special patient populations);

Chapters, containing drug monographs describing the uses, doses, safety issues and other considerations involved in the use of drugs; class monographs; and treatment summaries, covering guidance on the selection of drugs. Monographs and treatment summaries are divided into chapters based on specific aspects of medical care, such as Chapter 5, Infections, or Chapter 16, Emergency treatment of poisoning; or drug use related to a particular system of the body, such as Chapter 2, Cardiovascular.

Within each chapter, content is organised alphabetically by therapeutic use (e.g. Respiratory disease, obstructive), with the treatment summaries first (e.g. asthma), followed by the monographs of the drugs used to manage the conditions discussed in the treatment summary. Within each therapeutic use, the drugs are organised alphabetically by classification (e.g. Antimuscarinics, Beta-agonist bronchodilators) and then alphabetically within each classification (e.g. Acetazolamide, Glycopyrronium bromide, Ipratropium bromide).

Appendices, covering interactions, borderline substances, cautionary and advisory labels, and woundcare.

Back matter, covering the lists of medicines approved by the NHS for Dental and Nurse Practitioner prescribing, proprietary and specials manufacturer’s contact details, and the index. Yellow cards are also included, to facilitate the reporting of adverse events, as well as quick reference guides for life support and key drug doses in medical emergencies, for ease of access.

Navigating the BNF

The contents page provides the high-level layout of information within the BNF; and in addition, each chapter begins with a small contents section, describing the therapeutic uses covered within that chapter. Once in a chapter, location is guided by the side of the page showing the chapter number (the thumbnail), alongside the chapter title. The top of the page includes the therapeutic use (the running head) alongside the page number.

On one page, visual cues aid navigation: treatment summary information is in black type, with therapeutic use titles similarly styled in black, whereas the use of colour indicates drug-related information, including drug classification titles, class monographs, and drug monographs.

Although navigation is possible by browsing, primarily access to the information is via the index, which covers the titles of drug class monographs, drug monographs, and treatment summaries; as well as the names of branded medicines and other topics of relevance, such as abbreviations, guidance sections, tables, and images.

Content types

Treatment summaries

Treatment summaries are of three main types;

— an overview of delivering a drug to a particular body system (e.g. Skin conditions, management, p. 998),
— a comparison between a group or groups of drugs (e.g. Beta-adrenoceptor blocking drugs, p. 139),
— an overview of the drug management or prophylaxis of common conditions intended to facilitate rapid appraisal of options (e.g. Hypertension, p. 121, or Malaria, prophylaxis, p. 528).

In order to select safe and effective medicines for individual patients, information in the treatment summaries must be used in conjunction with other prescribing details about the drugs and knowledge of the patient’s medical and drug history.

Monographs

Overview

In previous editions, a systemically administered drug with indications for use in different body systems was split across the chapters relating to those body systems body systems. So, for example, codeine phosphate was found in chapter 1, for its antiinflammatory effects and chapter 4 for its analgesic effects. However, the monograph in chapter 1 contained only the dose and some selected safety precautions.

In this new BNF all of the information for the systemic use of a drug is contained within one monograph, so codeine phosphate is now included in chapter 4. This
carries the advantage of providing all of the information in one place, so the user does not need to flick back and forth across several pages to find all of the relevant information for that drug. Cross references are included in chapter 1, where the management of diarrhoea is discussed, to the drug monograph to assist navigation.

Where drugs have systemic and local uses, for example, chloramphenicol, and the considerations around drug use are markedly different according to the route of administration, the monograph is split, as with previous editions, into the relevant chapters.

This means that the majority of drugs will still be placed in the same chapters and sections as previous editions, and although there may be some variation in order, all of the relevant information will be easier to locate.

One of the most significant changes to the monograph structure is the increased granularity, with a move from around 9 sections to over 20 sections; sections are only included when relevant information has been identified. The following information describes these sections and their uses in more detail.

**Nomenclature**

Monograph titles follow the convention of recommended international non-proprietary names (rINNs), or, in the absence of a rINN, British Approved Names. Relevant synonyms are included below the title. In some instances a brief description of the drug action is included. Over future editions these drug action statements will be rolled out for all drugs.

In some monographs, immediately below the nomenclature or drug action, there are a number of cross references or flags used to signpost the user to any additional information they need to consider about a drug.

This is most common for drugs formulated in combinations, where users will be signposted to the monographs for the individual ingredients (e.g. Ispaghula husk with senna, p. 54) or for drugs that are related to a class monograph (see Class monographs, below).

**Indication and dose**

User feedback has highlighted that one of the main uses of the BNF is identifying indications and doses of drugs. Therefore in this edition, indication and dose information has been promoted to the top of the monograph and highlighted by a coloured panel to aid quick reference.

The indication and dose section is more highly structured than in previous editions, giving greater clarity around which doses should be used for which indications and by which route. In addition, if the dose varies with a specific preparation or formulation that dosing information has been moved out of the preparations section and in to the indication and dose panel, under a heading of the preparation name.

Doses are either expressed in terms of a definite frequency (e.g. 1 g 4 times daily) or in the total daily dose format (e.g. 6 g daily in 3 divided doses); the total daily dose should be divided into individual doses (in the second example, the patient should receive 2 g 3 times daily).

Doses for specific patient groups (e.g. the elderly) may be included if they are different to the standard dose. Doses for children can be identified by the relevant age range and may vary according to their age or body-weight.

In previous editions of the BNF, age ranges and weight ranges overlapped. For clarity and to aid selection of the correct dose, wherever possible the age and weight ranges now do not overlap. When interpreting age ranges it is important to understand that a patient is considered to be 64 up until the point of their 65th birthday, meaning that an age range of adult 18 to 64 is applicable to a patient from the day of their 18th birthday until the day before their 65th birthday. All age ranges should be interpreted in this way. Similarly, when interpreting weight ranges, it should be understood that a weight range of 35 to 59kg is applicable to a patient as soon as they tip the scales at 35kg right up until, but not including, the point that the scales tip to 60kg. All weight ranges should be interpreted in this way.

In all circumstances, it is important to consider the patient in question and their physical condition, and select the dose most appropriate for the individual.

**Other information relevant to Indication and dose**

The dose panel also contains, where known, an indication of pharmacokinetic considerations that may affect the choice of dose, and dose equivalence information, which may aid the selection of dose when switching between drugs or preparations.

The BNF includes unlicensed use of medicines when the clinical need cannot be met by licensed medicines; such use should be supported by appropriate evidence and experience. When the BNF recommends an unlicensed medicine or the ‘off-label’ use of a licensed medicine, this is shown below the indication and dose panel in the unlicensed use section.

**Minimising harm and drug safety**

The drug chosen to treat a particular condition should minimise the patient’s susceptibility to adverse effects and, where co-morbidities exist, have minimal detrimental effects on the patient’s other diseases. To achieve this, the Contra-indications, Cautions and Side-effects of the relevant drug should be reviewed.

The information under Cautions can be used to assess the risks of using a drug in a patient who has co-morbidities that are also included in the Cautions for that drug—if a safer alternative cannot be found, the drug may be prescribed while monitoring the patient for adverse-effects or deterioration in the co-morbidity. Contra-indications are far more restrictive than Cautions and mean that the drug should be avoided in a patient with a condition that is contra-indicated.

The impact that potential side-effects may have on a patient’s quality of life should also be assessed. For instance, in a patient who has difficulty sleeping, it may be preferable to avoid a drug that frequently causes insomnia. Clinically relevant Side-effects for drugs are included in the monographs or class monographs. Side-effects are listed in order of frequency, where known, and arranged alphabetically.

The frequency of side-effects follows the regulatory standard:

- Very common — occurs more frequently than 1 in 10 administrations of a drug
- Common — occurs between 1 in 10 and 1 in 100 administrations of a drug
- Uncommon — between 1 in 100 and 1 in 1,000 administrations of a drug
- Rare — between 1 in 1,000 and 1 in 10,000 administrations of a drug
- Very rare — occurs less than 1 in 10,000 administrations of a drug
- Frequency not known

An exhaustive list of side-effects is not included, particularly for drugs that are used by specialists (e.g. cytotoxic drugs and drugs used in anaesthesia). The BNF also omits effects that are likely to have little clinical consequence (e.g. transient increase in liver enzymes). Recognising that hypersensitivity reactions can occur with virtually all medicines, this effect is generally not listed, unless the drug carries an increased risk of such reactions, when the information is included under Allergy and cross sensitivity.

The Important safety advice section in the BNF, delineated by a coloured outline box, highlights important safety concerns, often those raised by regulatory authorities or guideline producers. Safety warnings issued by the Commission on Human Medicines (CHM) or Medicines and
Healthcare products Regulatory Agency (MHRA) are found here. Drug selection should aim to minimise drug interactions. If it is necessary to prescribe a potentially serious combination of drugs, patients should be monitored appropriately. The mechanisms underlying drug interactions are explained in Appendix 1 p. 1137, followed by details of drug interactions.

Use of drugs in specific patient populations
Drug selection should aim to minimise the potential for drug accumulation, adverse drug reactions, and exacerbation of pre-existing hepatic or renal disease. If it is necessary to prescribe drugs whose effect is altered by hepatic or renal disease, appropriate drug dose adjustments should be made, and patients should be monitored adequately. The general principles for prescribing are outlined under Prescribing in Hepatic Impairment p. 17, and Prescribing in Renal Impairment p. 17. Information about drugs that should be avoided or used with caution in hepatic disease or renal impairment can be found in drug monographs under Hepatic Impairment and Renal impairment (e.g. fluconazole p. 518).

Similarly, drug selection should aim to minimise harm to the fetus, nursing infant, and mother. The infant should be monitored for potential side-effects of drugs used by the mother during pregnancy or breast-feeding. The general principles for prescribing are outlined under Prescribing in Pregnancy p. 19 and Prescribing in Breast-feeding p. 19. The Treatment Summaries provide guidance on the drug treatment of common conditions that can occur during pregnancy and breast-feeding (e.g. asthma p. 210).

Information about the use of specific drugs during pregnancy and breast-feeding can be found in their drug monographs under Pregnancy, and Breast-feeding (e.g. fluconazole p. 518).

In this edition a new section, Conception and contraception, containing information around considerations for females of childbearing potential or men who might father a child (e.g. isotretinoin p. 1045) has been included.

Administration and monitoring
When selecting the most appropriate drug, it may be necessary to screen the patient for certain genetic markers or metabolic states. This information is included within a section called Pre-treatment screening (e.g. abacavir, p. 561). This section covers one-off tests required to assess the suitability of a patient for a particular drug.

Once the drug has been selected, it needs to be given in the most appropriate manner. A new Directions for administration section contains the information about intravenous administration previously located in Appendix 4. This provides practical information on the preparation of intravenous drug infusions, including compatibility of drugs with standard intravenous infusion fluids, method of dilution or reconstitution, and administration rates. In addition, general advice relevant to other routes of administration is provided within this section (e.g. fentanyl, p. 362).

After selecting and administering the most appropriate drug by the most appropriate route, patients should be monitored to ensure they are achieving the expected benefits from drug treatment without any unwanted side-effects. The Monitoring section specifies any special monitoring requirements, including information on monitoring the plasma concentration of drugs with a narrow therapeutic index (e.g. theophylline, p. 238). Monitoring may, in certain cases, be affected by the impact of a drug on laboratory tests (e.g. hydroxocobalamin, p. 837), and this information is included in Effects on laboratory tests.

In some cases, when a drug is withdrawn, further monitoring or precautions may be advised (e.g. clonidine, p. 137): these are covered under Treatment cessation.

Choice and supply
The prescriber and the patient should agree on the health outcomes that the patient desires and on the strategy for achieving them (see Taking Medicines to Best Effect, p. 1). Taking the time to explain to the patient (and carers) the rationale and the potential adverse effects of treatment may improve adherence. For some medicines there is a special need for counselling (e.g. appropriate posture during administration of doxycycline, p. 496); this is shown in Patient and carer advice.

Other information contained in the latter half of the monograph also helps prescribers and those dispensing medicines choose medicinal forms (by indicating information such as flavour or when branded products may not be interchangeeable e.g. Diltiazem, p. 149), assess the suitability of a drug for prescribing, understand the NHS funding status for a drug (e.g. sildenafil, p. 656, or assess when a patient may be able to purchase a drug without prescription (e.g. loperamide hydrochloride, p. 56).

Medicinal forms
In the BNF, preparations follow immediately after the monograph for the drug that is their main ingredient. In previous editions, when a particular preparation had safety information, dose advice or other clinical information specific to the product, it was contained within the preparations record. This information has now been moved to the relevant section in the main body of the monograph under a heading of the name of the specific medicinal form (e.g. peppermint oil), p. 40.

In the new BNF, the medicinal forms (formerly preparations) record provides information on the type of formulation (e.g. tablet), the amount of active drug in a solid dosage form, and the concentration of active drug in a liquid dosage form. The legal status is shown for prescription-only medicines and controlled drugs, as well as pharmacy medicines and medicines on the general sales list. Practitioners are reminded, by a statement at the top of the monograph that not all products containing a specific drug ingredient may be similarly licensed. To be clear on the precise licensing status of specific medicinal forms, practitioners should check the product literature for the particular product being prescribed or dispensed.

Patients should be prescribed a preparation that complements their daily routine, and that provides the right dose of drug for the right indication and route of administration. When dispensing liquid preparations, a sugar-free preparation should always be used in preference to one containing sugar. Patients receiving medicines containing cariogenic sugars should be advised of the importance of good oral hygiene, and so this information is now covered at the level of the dose form (e.g. peppermint oil). It is not possible to keep abreast of all of the generic products available on the UK market, and so this information serves as a reminder to the healthcare professional that, if the presence of a particular excipient is of concern, they should check the product literature for the particular product being prescribed or dispensed.

Cautionary and advisory labels that pharmacists are recommended to add when dispensing are included in the medicinal forms (formerly Preparations) record. Details of these labels can be found in Appendix 3, p. 1291. As these labels have now been applied at the level of the dose form, a full list of medicinal products with their relevant labels would be extensive. This list has therefore been removed, but the information is retained within the monograph.
In the case of compound preparations, the prescribing information for all constituents should be taken into account.

**Prices in the BNF**

Basic NHS net prices are given in the BNF to provide an indication of relative cost. Where there is a choice of suitable preparations for a particular disease or condition the relative cost may be used in making a selection. Cost-effective prescribing must, however, take into account other factors (such as dose frequency and duration of treatment) that affect the total cost. The use of more expensive drugs is justified if it will result in better treatment of the patient, or a reduction of the length of an illness, or the time spent in hospital.

Prices are regularly updated using the Drug Tariff and proprietary price information published by the NHS dictionary of medicines and devices (dm+d, www.dmd.nhs.uk). The weekly updated dm+d data (including prices) can be accessed using the dm+d browser of the NHS Business Services Authority (www.ppa.org.uk/systems/pddbrowseerv2.3new/browser.jsp). Prices have been calculated from the net cost used in pricing NHS prescriptions in June 2015 and generally reflect whole dispensing packs. Prices for extemporaneously prepared preparations are not provided in the BNF as prices vary between different manufacturers.

In Appendix 5 prices stated are per dressing or bandage. BNF prices are not suitable for quoting to patients seeking private prescriptions or contemplating over-the-counter purchases because they do not take into account VAT, professional fees, and other overheads.

A fuller explanation of costs to the NHS may be obtained from the Drug Tariff. Separate drug tariffs are applicable to England and Wales (www.ppa.org.uk/ppta/edt_introt.htm), Scotland (www.isdscotland.org/HealthTopics/Prescribing-and-Medicines/Scottish-Drug-Tariff/), and Northern Ireland (www.dhsspsni.gov.uk/pas-tariff); prices in the different tariffs may vary.

**Drug-class monographs**

In previous editions of the BNF, information relating to a class of drug sharing the same properties (e.g. tetracyclines, p. 496), was contained within the prescribing notes. In this new edition, drug-class monographs have been created to contain the common information; this ensures such information is easier to find, and has a more regularised structure.

For consistency and ease of use, the class monograph follows the same structure as a drug monograph. Class monographs are indicated by the presence of a flag (e.g. Beta blockers, systemic, p. 140). If a drug monograph has a corresponding class monograph, that needs to be considered in tandem, in order to understand the full information about a drug, the monograph is also indicated by a flag (e.g. metoprolol, p. 144). Where the drug monographs run on from a class monograph no further cross referencing is given. However, occasionally, due to differences in therapeutic use, the drug monograph may not directly follow the class monograph. In this situation the need to consider a class monograph is still indicated by a flag, but a cross reference is also provided to help navigate the user to the class monograph (e.g. sotalol, p. 93).

**Other content**

**Nutrition**

Appendix 2, p. 1260 includes tables of ACBS-approved enteral feeds and nutritional supplements based on their energy and protein content. There are separate tables for specialised formulae for specific clinical conditions. Classified sections on foods for special diets and nutritional supplements for metabolic diseases are also included.

**Wound dressings**

A table on wound dressings in Appendix 4 (previously Appendix 5), p. 1294 allows an appropriate dressing to be selected based on the appearance and condition of the wound. Further information about the dressing can be found by following the cross-reference to the relevant classified section in the Appendix.

**Advanced wound contact dressings** have been classified in order of increasing absorbency.

**Other useful information**

**Finding significant changes in the BNF**

- **Changes**, p. xv, provides a list of significant changes, dose changes, classification changes, new names, and new preparations that have been incorporated into the BNF, as well as a list of preparations that have been discontinued and removed from the BNF. Changes listed online are cumulative (from one print edition to the next), and can be printed off each month to show the main changes since the last print edition as an aide memoire for those using print copies. So many changes are made for each update of the BNF, that not all of them can be accommodated in the Changes section. We encourage healthcare professionals to review regularly the prescribing information on drugs that they encounter frequently.

- **Changes to the Dental Practitioners’ Formulary**, p. 27, are located at the end of the Dental List.

- **E-newsletter**, the BNF & BNFC e-newsletter service is available free of charge. It alerts healthcare professionals to details of significant changes in the clinical content of these publications and to the way that this information is delivered. Newsletters also review clinical case studies, provide tips on using these publications effectively, and highlight forthcoming changes to the publications. To sign up for e-newsletters go to www.bnfn.org.

- An e-learning programme developed in collaboration with the Centre for Pharmacy Postgraduate Education (CPPPE), enables pharmacists to identify and assess how significant changes in the BNF affect their clinical practice. The module can be found at www.cpppe.ac.uk.

**Using other sources for medicines information**

The BNF is designed as a digest for rapid reference. Less detail is given on areas such as obstetrics, malignant disease, and anaesthesia since it is expected that those undertaking treatment will have specialist knowledge and access to specialist literature. BNF for Children should be consulted for detailed information on the use of medicines in children. The BNF should be interpreted in the light of professional knowledge and supplemented as necessary by specialised publications and by reference to the product literature. Information is also available from medicines information services.
Changes

Monthly updates are provided online via MedicinesComplete and the NHS Evidence portal. The changes listed below are cumulative (from one print edition to the next).

**Significant changes**
Significant changes made since release of data for the print edition of BNF 69 (March–September 2015):
- Aceclofenac p. 916: updated cardiovascular advice—new contra-indications in certain established cardiovascular diseases [MHRA advice].
- Apixaban p. 108 for the treatment and secondary prevention of deep vein thrombosis and/or pulmonary embolism [NICE guidance].
- Axitinib p. 802 for treating advanced renal cell carcinoma after failure of prior systemic treatment [NICE guidance].
- Codeine phosphate p. 360 for cough and cold: restricted use in children [MHRA advice].
- Dabigatran etexilate p. 117 for the treatment and secondary prevention of deep vein thrombosis and/or pulmonary embolism [NICE guidance].
- Diclofenac potassium p. 920, 12.5 mg tablets no longer available over the counter [MHRA advice].
- Dimethyl fumarate p. 727: risk of lymphopenia and potential risk of progressive multifocal leukoencephalopathy [MHRA advice].
- Empagliflozin p. 610 in combination therapy for treating type 2 diabetes [NICE guidance].
- Hydroxyzine hydrochloride p. 248: risk of QT interval prolongation and Torsade de Pointes [MHRA advice].
- Indinavir p. 906, adalimumab p. 901 and golimumab p. 904 for treating moderately to severely active ulcerative colitis after the failure of conventional therapy [NICE guidance].
- Obinutuzumab p. 739 in combination with chlorambucil for untreated chronic lymphocytic leukaemia [NICE guidance].
- Ofatumumab p. 740 in combination with chlorambucil or bendamustine for untreated chronic lymphocytic leukaemia [NICE guidance].
- Omalizumab p. 235 for previously treated chronic spontaneous urticaria [NICE guidance].
- Pomalidomide p. 797 for relapsed and refractory multiple myeloma previously treated with lenalidomide p. 796 and bortezomib p. 801 [NICE guidance].
- Rivaroxaban p. 109 for preventing adverse outcomes after acute management of acute coronary syndrome [NICE guidance].
- Rifaximin p. 495 for preventing episodes of overt hepatic encephalopathy [NICE guidance].
- Simeprevir p. 548 in combination with peginterferon alfa p. 542 and ribavirin p. 545 for treating genotypes 1 and 4 chronic hepatitis C [NICE guidance].
- Sofosbuvir p. 546 for treating chronic hepatitis C [NICE guidance].
- Ustekinumab p. 899 for treating active psoriatic arthritis [NICE guidance].

**Dose changes**
Changes in dose statements made since release of data for the print edition of BNF 69 (March–September 2015):
- Eprosartan p. 133
- Lisdexamfetamine mesilate p. 271 [dose in renal impairment]
- Tetrastarch p. 854 [Volulyte®]
- Tetrastarch p. 854 [Voluven®]
- Tamadol hydrochloride p. 373 [oral dose for acute and chronic pain]

**Classification changes**
Classification changes made since release of data for the print edition of BNF 69 (March–September 2015):

**New names**
Name changes introduced since release of data for the print edition of BNF 69 (March–September 2015):

**Deleted preparations**
Preparations discontinued since release of data for the print edition of BNF 69 (March–September 2015):
- Anafranil SR®
- BindRen®
- Brexidol®
- Calcium-Sandoz®
- Calmrdic HC®
- Didronel®
- Eporatio®
- Fularix®
- Froben®
- Ortho-Gynest®
- Penbritin® syrup
- Pneumovax® II
- Rienso®
- Rupafin®
- Vantax®
- Vistabel®

**New preparations**
New preparations included since release of data for the print edition of BNF 69 (March–September 2015):
- Bydureon® pre-filled pen [exenatide p. 599]
- DuoResp Spirironax® [budesonide with formoterol p. 229]
- Envarsus® [tacrolimus p. 720]
- Fostair NEXTThaler® [beclometasone with formoterol p. 221]
- Jaydless® [levonorgestrel p. 692]
- Ketoconazole HRA® [ketoconazole p. 587]
- Lonquex® [lipecifilgrastim p. 842]
- Salofalk® 1 g suppositories [mesalamine p. 34]
Guidance on prescribing

General guidance
Medicines should be prescribed only when they are necessary, and in all cases the benefit of administering the medicine should be considered in relation to the risk involved. This is particularly important during pregnancy, when the risk to both mother and fetus must be considered. It is important to discuss treatment options carefully with the patient to ensure that the patient is content to take the medicine as prescribed. In particular, the patient should be helped to distinguish the adverse effects of prescribed drugs from the effects of the medical disorder. When the beneficial effects of the medicine are likely to be delayed, the patient should be advised of this.

Taking medicines to best effect
Difficulties in adherence to drug treatment occur regardless of age. Factors contributing to poor compliance with prescribed medicines include:

- prescription not collected or not dispensed;
- purpose of medicine not clear;
- perceived lack of efficacy;
- real or perceived adverse effects;
- patients’ perception of the risk and severity of side-effects may differ from that of the prescriber;
- instructions for administration not clear;
- physical difficulty in taking medicines (e.g. swallowing the medicine, handling small tablets, or opening medicine containers);
- unattractive formulation (e.g. unpleasant taste);
- complicated regimen.

The prescriber and the patient should agree on the health outcomes that the patient desires and on the strategy for achieving them (‘concordance’). The prescriber should be sensitive to religious, cultural, and personal beliefs that can affect a patient’s acceptance of medicines. Taking the time to explain to the patient (and relatives) the rationale and the potential adverse effects of treatment may improve adherence. Reinforcement and elaboration of the physician’s instructions by the pharmacist and other members of the healthcare team also helps. Advising the patient of the possibility of alternative treatments may encourage the patient to seek advice rather than merely abandon unacceptable treatment.

Simplifying the drug regimen may help; the need for frequent administration may reduce adherence, although there appears to be little difference in adherence between once-daily and twice-daily administration. Combination products reduce the number of drugs taken but at the expense of the ability to titrate individual doses.

Biosimilar medicines
A biosimilar medicine is a new biological product that is similar to a medicine that has already been authorised to be marketed (the biological reference medicine) in the European Union. The active substance of a biosimilar medicine is similar, but not identical, to the biological reference medicine. Biological products are different from standard chemical products in terms of their complexity and although theoretically there should be no important differences between the biosimilar and the biological reference medicine in terms of safety or efficacy, when prescribing biological products, it is good practice to use the brand name. This will ensure that substitution of a biosimilar medicine does not occur when the medicine is dispensed. Biosimilar medicines have black triangle status at the time of initial marketing. It is important to report suspected adverse reactions to biosimilar medicines using the Yellow Card Scheme. For biosimilar medicines, adverse reaction reports should clearly state the brand name and the batch number of the suspected medicine.

Complementary and alternative medicine
An increasing amount of information on complementary and alternative medicine is becoming available. The scope of the BNF is restricted to the discussion of conventional medicines but reference is made to complementary treatments if they affect conventional therapy (e.g. interactions with St John’s wort). Further information on herbal medicines is available at www.mhra.gov.uk.

Abbreviation of titles
In general, titles of drugs and preparations should be written in full. Unofficial abbreviations should not be used as they may be misinterpreted.

Non-proprietary titles
Where non-proprietary (‘generic’) titles are given, they should be used in prescribing. This will enable any suitable product to be dispensed, thereby saving delay to the patient and sometimes expense to the health service. The only exception is where there is a demonstrable difference in clinical effect between each manufacturer’s version of the formulation, making it important that the patient should always receive the same brand; in such cases, the brand name or the manufacturer should be stated. Non-proprietary titles should not be invented for the purposes of prescribing generically since this can lead to confusion, particularly in the case of compound and modified-release preparations.

Titles used as headings for monographs may be used freely in the United Kingdom but in other countries may be subject to restriction. Many of the non-proprietary titles used in this book are titles of monographs in the European Pharmacopoeia, British Pharmacopoeia, or British Pharmaceutical Codex 1973. In such cases the preparations must comply with the standard (if any) in the appropriate publication, as required by the Human Medicines Regulations 2012.

Proprietary titles
Names followed by the symbol® are or have been used as proprietary names in the United Kingdom. These names may in general be applied only to products supplied by the owners of the trade marks.

Marketing authorisation and BNF advice
In general the doses, indications, cautions, contra-indications, and side-effects in the BNF reflect those in the manufacturers’ data sheets or Summaries of Product Characteristics (SPCs) which, in turn, reflect those in the corresponding marketing authorisations (formerly known as Product Licences). The BNF does not generally include proprietary medicines that are not supported by a valid Summary of Product Characteristics or when the marketing authorisation holder has not been able to supply essential information. When a preparation is available from more than one manufacturer, the BNF reflects advice that is the most clinically relevant regardless of any variation in the marketing authorisations. Unlicensed products can be obtained from ‘special-order’ manufacturers or specialist importing companies.

Where an unlicensed drug is included in the BNF, this is indicated in square brackets after the entry. When the BNF
Guidance on prescribing

2 Guidance on prescribing

suggested a use (or route) that is outside the licensed indication of a product ('off-label' use), this too is indicated. Unlicensed use of medicines becomes necessary if the clinical need cannot be met by licensed medicines; such use should be supported by appropriate evidence and experience.

The doses stated in the BNF are intended for general guidance and represent, unless otherwise stated, the usual range of doses that are generally regarded as being suitable for adults.

Prescribing unlicensed medicines

Prescribing medicines outside the recommendations of their marketing authorisation alters (and probably increases) the prescriber’s professional responsibility and potential liability. The prescriber should be able to justify and feel competent in using such medicines, and also inform the patient or the patient’s carer that the prescribed medicine is unlicensed.

Oral syringes

An oral syringe is supplied when oral liquid medicines are prescribed in doses other than multiples of 5 mL. The oral syringe is marked in 0.5 mL divisions from 1 to 5 mL to measure doses of less than 5 mL (other sizes of oral syringe may also be available). It is provided with an adaptor and an instruction leaflet. The 5–5 mL spoon is used for doses of 5 mL (or multiples thereof).

Important To avoid inadvertent intravenous administration of oral liquid medicines, only an appropriate oral or enteral syringe should be used to measure an oral liquid medicine (if a medicine spoon or graduated measure cannot be used); these syringes should not be compatible with intravenous or other parenteral devices. Oral or enteral syringes should be clearly labelled ‘Oral’ or ‘Enteral’ in a large font size; it is the healthcare practitioner’s responsibility to label the syringe with this information if the manufacturer has not done so.

Excipients

Branded oral liquid preparations that do not contain fructose, glucose, or sucrose are described as ‘sugar-free’ in the BNF. Preparations containing hydrogenated glucose syrup, mannitol, maltitol, sorbitol, or xylitol are also marked ‘sugar-free’ since there is evidence that they do not cause dental caries. Patients receiving medicines containing cariogenic sugars should be advised of appropriate dental hygiene measures to prevent caries. Sugar-free preparations should be used whenever possible.

Where information on the presence of aspartame, gluten, sulfites, tartrazine, arachis (peanut) oil or sesame oil is available, this is indicated in the BNF against the relevant preparation.

Information is provided on selected excipients in skin preparations, in vaccines, and on selected preparations and excipients in eye drops and injections.

The presence of benzyl alcohol and polyoxyl castor oil (polyethoxylated castor oil) in injections is indicated in the BNF. Benzyl alcohol has been associated with a fatal toxic syndrome in preterm neonates, and therefore, parenteral preparations containing the preservative should not be used in neonates. Polyoxyl castor oils, used as vehicles in intravenous injections, have been associated with severe anaphylactoid reactions.

The presence of propylene glycol in oral or parenteral medicines is indicated in the BNF; it can cause adverse effects if its elimination is impaired, e.g. in renal failure, in neonates and young children, and in slow metabolisers of the substance. It may interact with disulfiram p. 428 and metronidazole p. 475.

The lactose content in most medicines is too small to cause problems in most lactose-intolerant patients. However in severe lactose intolerance, the lactose content should be determined before prescribing. The amount of lactose varies according to manufacturer, product, formulation, and strength.

Important In the absence of information on excipients in the BNF and in the product literature (available at www.medicines.org.uk/emc), contact the manufacturer (see Index of Proprietary Manufacturers) if it is essential to check details.

Extemporaneous preparation

A product should be dispensed extemporaneously only when no product with a marketing authorisation is available.

The BP direction that a preparation must be freshly prepared indicates that it must be made not more than 24 hours before it is issued for use. The direction that a preparation should be recently prepared indicates that deterioration is likely if the preparation is stored for longer than about 4 weeks at 15–25°C.

The term water used without qualification means either potable water freshly drawn direct from the public supply and suitable for drinking or freshly boiled and cooled purified water. The latter should be used if the public supply is from a local storage tank or if the potable water is unsuitable for a particular preparation (Water for injections).

Drugs and driving

Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

A new offence of driving, attempting to drive, or being in charge of a vehicle, with certain specified controlled drugs in excess of specified limits, came into force on 2nd March 2015. This offence is an addition to the existing rules on drug impaired driving and fitness to drive, and applies to two groups of drugs—commonly abused drugs, including cannabis, cocaine, and ketamine p. 1110, and drugs used mainly for medical reasons, such as opioids and benzodiazepines. Amfetamines are also expected to be added to the legislation later in 2015. Anyone found to have any of the drugs (including related drugs, for example, apomorphine hydrochloride p. 332) above specified limits in their blood will be guilty of an offence, whether their driving was impaired or not. This also includes prescribed drugs which metabolise to those included in the offence, for example, selegiline hydrochloride p. 340. However, the legislation provides a statutory “medical defence” for patients taking drugs for medical reasons in accordance with instructions, if their driving was not impaired—it continues to be an offence to drive if actually impaired.

Patients should therefore be advised to continue taking their medicines as prescribed, and when driving, to carry suitable evidence that the drug was prescribed, or sold, to treat a medical or dental problem, and that it was taken according to the instructions given by the prescriber, or information provided with the medicine (e.g. a repeat prescription form or the medicine’s patient information leaflet). Further information is available from the Department for Transport at www.gov.uk/government/collections/drug-driving.

Patents

In the BNF, certain drugs have been included notwithstanding the existence of actual or potential patent rights. In so far as such substances are protected by Letters
Patent, their inclusion in this Formulary neither conveys, nor implies, licence to manufacture.

**Health and safety**

When handling chemical or biological materials particular attention should be given to the possibility of allergy, fire, explosion, radiation, or poisoning. Substances such as corticosteroids, some antimicrobials, phenothiazines, and many cytotoxics, are irritant or very potent and should be handled with caution. Contact with the skin and inhalation of dust should be avoided.

**Safety in the home**

Patients must be warned to keep all medicines out of the reach of children. All solid dose and all oral and external liquid preparations must be dispensed in a reclosable child-resistant container unless:

- the medicine is in an original pack or patient pack such as to make this inadvisable;
- the patient will have difficulty in opening a child-resistant container;
- a specific request is made that the product shall not be dispensed in a child-resistant container;
- no suitable child-resistant container exists for a particular liquid preparation.

All patients should be advised to dispose of unwanted medicines by returning them to a supplier for destruction.

**Labelling of prescribed medicines**

There is a legal requirement for the following to appear on the label of any prescribed medicine:

- name of the patient;
- name and address of the person dispensing the medicine;
- date of dispensing;
- name of the medicine;
- directions for use of the medicine;
- precautions relating to the use of the medicine.

The Royal Pharmaceutical Society recommends that the following also appears on the label:

- the words 'Keep out of the sight and reach of children';
- where applicable, the words 'Use this medicine only on your skin'.

A pharmacist can exercise professional skill and judgement to amend or include more appropriate wording for the name of the medicine, the directions for use, or the precautions relating to the use of the medicine.

**Non-proprietary names of compound preparations**

Non-proprietary names of compound preparations which appear in the BNF are those that have been compiled by the British Pharmacopoeia Commission or another recognised body; whenever possible they reflect the names of the active ingredients.

Prescribers should avoid creating their own compound names for the purposes of generic prescribing; such names do not have an approved definition and can be misinterpreted.

Special care should be taken to avoid errors when prescribing compound preparations; in particular the hyphen in the prefix ‘co-’ should be retained.

Special care should also be taken to avoid creating generic names for modified-release preparations where the use of these names could lead to confusion between formulations with different lengths of action.

**EEA and Swiss prescriptions**

Pharmacists can dispense prescriptions issued by doctors and dentists from the European Economic Area (EEA) or Switzerland (except prescriptions for controlled drugs in Schedules 1, 2, or 3, or for drugs without a UK marketing authorisation). Prescriptions should be written in ink or otherwise so as to be indelible, should be dated, should state the name of the patient, should state the address of the prescriber, should contain particulars indicating whether the prescriber is a doctor or dentist, and should be signed by the prescriber.

**Security and validity of prescriptions**

The Councils of the British Medical Association and the Royal Pharmaceutical Society have issued a joint statement on the security and validity of prescriptions. In particular, prescription forms should:

- not be left unattended at reception desks;
- not be left in a car where they may be visible; and
- when not in use, be kept in a locked drawer within the surgery and at home.

Where there is any doubt about the authenticity of a prescription, the pharmacist should contact the prescriber.

If this is done by telephone, the number should be obtained from the directory rather than relying on the information on the prescription form, which may be false.

**Patient group direction (PGD)**

In most cases, the most appropriate clinical care will be provided on an individual basis by a prescriber to a specific individual patient. However, a Patient Group Direction for supply and administration of medicines by other healthcare professionals can be used where it would benefit patient care without compromising safety.

A Patient Group Direction is a written direction relating to the supply and administration (or administration only) of a licensed prescription-only medicine (including some Controlled Drugs in specific circumstances) by certain classes of healthcare professionals; the Direction is signed by a doctor (or dentist) and by a pharmacist. Further information on Patient Group Directions is available in Health Service Circular HSC 2000/026 (England), HDL (2001) 7 (Scotland), and WHC (2000) 116 (Wales); see also the Human Medicines Regulations 2012.

**NICE and Scottish Medicines Consortium**

Advice issued by the National Institute for Health and Care Excellence (NICE) is included in the BNF when relevant. The BNF also includes advice issued by the Scottish Medicines Consortium (SMC) when a medicine is restricted or not recommended for use within NHS Scotland. If advice within a NICE Single Technology Appraisal differs from SMC advice, the Scottish Executive expects NHS Boards within NHS Scotland to comply with the SMC advice. Details of the advice together with updates can be obtained from www.nice.org.uk and from www.scottishmedicines.org.uk.
Prescription writing

Shared care
In its guidelines on responsibility for prescribing (circular EL (51) 127) between hospitals and general practitioners, the Department of Health has advised that legal responsibility for prescribing lies with the doctor who signs the prescription.

Prescriptions should be written legibly in ink or otherwise so as to be indelible (it is permissible to issue carbon copies of NHS prescriptions as long as they are signed in ink), should be dated, should state the name and address of the patient, the address of the prescriber, an indication of the type of prescriber, and should be signed in ink by the prescriber (computer-generated facsimile signatures do not meet the legal requirement). The age and the date of birth of the patient should preferably be stated, and it is a legal requirement in the case of prescription-only medicines to state the age for children under 12 years. These recommendations are acceptable for prescription-only medicines. Prescriptions for controlled drugs have additional legal requirements.

Wherever appropriate the prescriber should state the current weight of the child to enable the dose prescribed to be checked. Consideration should also be given to including the dose per unit mass e.g. mg/kg or the dose per m$^2$ body-surface area e.g. mg/m$^2$ where this would reduce error.

The following should be noted:

- The strength or quantity to be contained in capsules, lozenges, tablets etc. should be stated by the prescriber. In particular, strength of liquid preparations should be clearly stated (e.g. 125 mg/5 mL).
- The unnecessary use of decimal points should be avoided, e.g. 3 mg, not 3.0 mg.
- Quantities of 1 gram or more should be written as 1 g etc.
- Quantities less than 1 gram should be written in milligrams, e.g. 500 mg, not 0.5 g.
- Quantities less than 1 mg should be written in micrograms, e.g. 100 micrograms, not 0.1 mg.
- When decimals are unavoidable a zero should be written in front of the decimal point where there is no other figure, e.g. 0.5 mL, not .5 mL.
- Use of the decimal point is acceptable to express a range, e.g. 0.5 to 1 g.
- Micrograms and ‘nanograms’ should not be abbreviated. Similarly ‘units’ should not be abbreviated.
- The term ‘millilitre’ (ml or mL) is used in medicine and pharmacy, and cubic centimetre, c.c., or cm$^3$ should not be used. (The use of capital ‘L’ in mL is a printing convention throughout the BNF; both ‘ml’ and ‘mL’ are recognised SI abbreviations).
- Dose and dose frequency should be stated; in the case of preparations to be taken ‘as required’ a minimum dose interval should be specified.
- Care should be taken to ensure children receive the correct dose of the active drug. Therefore, the dose should normally be stated in terms of the mass of the active drug (e.g. ‘125 mg 3 times daily’); terms such as ‘5 mL’ or ‘1 tablet’ should be avoided except for compound preparations.
- When doses other than multiples of 5 mL are prescribed for oral liquid preparations the dose-volume will be provided by means of an oral syringe, (except for preparations intended to be measured with a pipette). Suitable quantities: Elixirs, Linctuses, and Paediatric Mixtures (5-mL dose), 50, 100, or 150 mL.
- Adult Mixtures (10-mL dose), 200 or 300 mL

Ear Drops, Eye drops, and Nasal Drops, 10 mL (or the manufacturer’s pack)
Eye Lotions, Gargles, and Mouthwashes, 200 mL
- The names of drugs and preparations should be written clearly and not abbreviated, using approved titles only; avoid creating generic titles for modified-release preparations.
- The quantity to be supplied may be stated by indicating the number of days of treatment required in the box provided on NHS forms. In most cases the exact amount will be supplied. This does not apply to items directed to be used as required—if the dose and frequency are not given then the quantity to be supplied needs to be stated.
- When several items are ordered on one form the box can be marked with the number of days of treatment provided the quantity is added for any item for which the amount cannot be calculated.
- Although directions should preferably be in English without abbreviation, it is recognised that some Latin abbreviations are used, for details, see Inside Back Cover.

Sample prescription

Prescribing by dentists Until new prescribing arrangements are in place for NHS prescriptions, dentists should use form FP10D (GPI4 in Scotland, WP10D in Wales) to prescribe only those items listed in the Dental Practitioners’ Formulary. The Human Medicines Regulations 2012 does not set any limitations upon the number and variety of substances which the dentist may administer to patients in the surgery or may order by private prescription—provided the relevant legal requirements are observed the dentist may use or order whatever is required for the clinical
situation. There is no statutory requirement for the dentist to communicate with a patient’s medical practitioner when prescribing for dental use. There are, however, occasions when this would be in the patient’s interest and such communication is to be encouraged.

**Computer-issued prescriptions**

For computer-issued prescriptions the following advice, based on the recommendations of the Joint GP Information Technology Committee, should also be noted:

1. The computer must print out the date, the patient’s surname, one forename, other initials, and address, and may also print out the patient’s title and date of birth. The age of children under 12 years and of adults over 60 years must be printed in the box available; the age of children under 5 years should be printed in years and months. A facility may also exist to print out the age of patients between 12 and 60 years.

2. The doctor’s name must be printed at the bottom of the prescription form; this will be the name of the doctor responsible for the prescription (who will normally sign it). The doctor’s surgery address, reference number, and Primary Care Trust (PCT, Health Board in Scotland, Local Health Board in Wales) are also necessary. In addition, the surgery telephone number should be printed.

3. When prescriptions are to be signed by general practitioner registrars, assistants, locums, or deputising doctors, the name of the doctor printed at the bottom of the form must still be that of the responsible principal.

4. Names of medicines must come from a dictionary held in the computer memory, to provide a check on the spelling and to ensure that the name is written in full. The computer can be programmed to recognise both the non-proprietary and the proprietary name of a particular drug and to print out the preferred choice, but must not print out both names. For medicines not in the dictionary, separate checks are required—the user must be warned that no check was possible and the entire prescription must be entered in the lexicon.

5. The dictionary may contain information on the usual doses, formulations, and pack sizes to produce standard predetermined prescriptions for common preparations, and to provide a check on the validity of an individual prescription on entry.

6. The prescription must be printed in English without abbreviation; information may be entered or stored in abbreviated form. The dose must be in numbers, the frequency in words, and the quantity in numbers in brackets, thus: 40 mg four times daily (112). It must also be possible to prescribe by indicating the length of treatment required.

7. The BNF recommendations should be followed as listed above.

8. Checks may be incorporated to ensure that all the information required for dispensing a particular drug has been filled in. For instructions such as ‘as directed’ and ‘when required’, the maximum daily dose should normally be specified.

9. Numbers and codes used in the system for organising and retrieving data must never appear on the form.

10. Supplementary warnings or advice should be written in full, should not interfere with the clarity of the prescription itself, and should be in line with any warnings or advice in the BNF; numerical codes should not be used.

11. A mechanism (such as printing a series of nonspecific characters) should be incorporated to cancel out unused space, or wording such as ‘no more items on this prescription’ may be added after the last item.

Otherwise the doctor should delete the space manually.

12. To avoid forgery the computer may print on the form the number of items to be dispensed (somewhere separate from the box for the pharmacist). The number of items per form need be limited only by the ability of the printer to produce clear and well-demarcated instructions with sufficient space for each item and a spacer line before each fresh item.

13. Handwritten alterations should only be made in exceptional circumstances—it is preferable to print out a new prescription. Any alterations must be made in the doctor’s own handwriting and countersigned; computer records should be updated to fully reflect any alteration. Prescriptions for drugs used for contraceptive purposes (but which are not promoted as contraceptives) may need to be marked in handwriting with the symbol ‘D’, (or endorsed in another way to indicate that the item is prescribed for contraceptive purposes).

14. Prescriptions for controlled drugs can be printed from the computer, but the prescriber’s signature must be handwritten (See Controlled Drugs and Drug Dependence; the prescriber may use a date stamp).

15. The strip of paper on the side of the FP10SS (GP10SS in Scotland, WP10SS in Wales) may be used for various purposes but care should be taken to avoid including confidential information. It may be advisable for the patient’s name to appear at the top, but this should be preceded by ‘confidential’.

16. In rural dispensing practices prescription requests (or details of medicines dispensed) will normally be entered in one surgery. The prescriptions (or dispensed medicines) may then need to be delivered to another surgery or location; if possible the computer should hold up to 10 alternatives.

17. Prescription forms that are reprinted or issued as a duplicate should be labelled clearly as such.
Emergency supply of medicines

Emergency supply requested by member of the public

Pharmacists are sometimes called upon by members of the public to make an emergency supply of medicines. The Human Medicines Regulations 2012 allows exemptions from the Prescription Only requirements for emergency supply to be made by a person lawfully conducting a retail pharmacy business provided:

a) that the pharmacist has interviewed the person requesting the prescription-only medicine and is satisfied:
   i) that there is immediate need for the prescription-only medicine and that it is impracticable in the circumstances to obtain a prescription without undue delay;
   ii) that treatment with the prescription-only medicine has on a previous occasion been prescribed for the person requesting it;
   iii) as to the dose that it would be appropriate for the person to take;
b) that no greater quantity shall be supplied than will provide 5 days’ treatment of phenobarbital p. 409, phenobarbital sodium, or Controlled Drugs in Schedules 4 or 5 doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation (or 30 days’ treatment for other prescription-only medicines, except when the prescription-only medicine is:
   i) insulin, an ointment or cream, or a preparation for the relief of asthma in an aerosol dispenser when the smallest pack can be supplied;
   ii) an oral contraceptive when a full cycle may be supplied;
   iii) an antibiotic in liquid form for oral administration when the smallest quantity that will provide a full course of treatment can be supplied;
c) that an entry shall be made by the pharmacist in the prescription book stating:
   i) the date of supply;
   ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
   iii) the name and address of the patient;
   iv) the nature of the emergency;
d) that the container or package must be labelled to show:
   i) the date of supply;
   ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
   iii) the name of the patient;
   iv) the name and address of the pharmacy;
   v) the words ‘Emergency supply’;
   vi) the words ‘Keep out of the reach of children’ (or similar warning);
e) that the prescription-only medicine is not a substance specifically excluded from the emergency supply provision, and does not contain a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital p. 409 or phenobarbital sodium for the treatment of epilepsy: for details see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition); (Doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation).

Emergency supply requested by prescriber

Emergency supply of a prescription-only medicine may also be made at the request of a doctor, a dentist, a supplementary prescriber, a community practitioner nurse prescriber, a nurse, pharmacist, or optometrist independent prescriber, or a doctor or dentist from the European Economic Area or Switzerland, provided:

a) that the pharmacist is satisfied that the prescriber by reason of some emergency is unable to furnish a prescription immediately;
b) that the prescriber has undertaken to furnish a prescription within 72 hours;
c) that the medicine is supplied in accordance with the directions of the prescriber requesting it;
d) that the medicine is not a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital p. 409 or phenobarbital sodium for the treatment of epilepsy: for details see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition); (Doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation).
e) that an entry shall be made in the prescription book stating:
   i) the date of supply;
   ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
   iii) the name and address of the practitioner requesting the emergency supply;
   iv) the name and address of the patient;
   v) the date on the prescription;
   vi) when the prescription is received the entry should be amended to include the date on which it is received.

Royal Pharmaceutical Society’s guidelines

1. The pharmacist should consider the medical consequences of not supplying a medicine in an emergency.
2. If the pharmacist is unable to make an emergency supply of a medicine the pharmacist should advise the patient how to obtain essential medical care.

For conditions that apply to supplies made at the request of a patient see Medicines, Ethics and Practice, London Pharmaceutical Press, (always consult latest edition).
Controlled drugs and drug dependence

The Misuse of Drugs Act, 1971 prohibits certain activities in relation to ‘Controlled Drugs’, in particular their manufacture, supply, and possession. The penalties applicable to offences involving the different drugs are graded broadly according to the harmfulness attributable to a drug when it is misused and for this purpose the drugs are defined in the following three classes:

**Class C** includes: certain drugs related to the amphetamines such as benzphetamine and chlorphentermine, buprenorphine p. 434, diethylpropion, mazindol, meptobarbital p. 265 pemeoline, pipradrol, most benzodiazipines, tramadol hydrochloride p. 373, zaleplon p. 422, zolpidem tartrate p. 423, zopiclone p. 423, and zopiclone p. 423 which are subject to minimal control. Part II includes androgenic and anabolic steroids, clenbuterol, chionic gonadotrophin (HCG), non-human chionic gonadotrophin, somatotropin, somatrem, and somatropin p. 642. Controlled drug prescription requirements do not apply and Schedule 4 Controlled Drugs are not subject to safe custody requirements.

**Schedule 5** includes those preparations which, because of their strength, are exempt from virtually all Controlled Drug requirements other than retention of invoices for two years.

**Prescriptions**

Preparations in Schedules 1, 2, 3, 4 of the Misuse of Drugs Regulations 2001 (and subsequent amendments) are identified throughout the BNF and BNF for children using the following symbols:

| CD1 | for preparations in Schedule 1 |
| CD2 | for preparations in Schedule 2 |
| CD3 | for preparations in Schedule 3 |
| CD4-1 | for preparations in Schedule 4 (Part I) |
| CD4-2 | for preparations in Schedule 4 (Part II) |

The principal legal requirements relating to medical prescriptions are listed below.

**Prescription requirements**

Prescriptions for Controlled Drugs that are subject to prescription requirements, (all preparations in Schedules 2 and 3, except temazepam p. 420), must be indelible, (a machine-written prescription is acceptable; the prescriber’s signature must be handwritten), and must be signed by the prescriber, be dated, and specify the prescriber’s address. The prescription must always state:

- the name and address of the patient;
- in the case of a preparation, the form, (the dosage form e.g. tablets must be included on a Controlled Drugs prescription irrespective of whether it is implicit in the proprietary name e.g. MST Continus or whether only one form is available), and where appropriate the strength of the preparation (when more than one strength of a preparation exists the strength required must be specified);
- for liquids, the total volume in millilitres (in both words and figures) of the preparation to be supplied; for dosage units, the number (in both words and figures) of dosage units to be supplied; in any other case, the total quantity (in both words and figures) of the Controlled Drug to be supplied;
- the dose (the instruction ‘one as directed’ constitutes a dose but ‘as directed’ does not);
- the words ‘for dental treatment only’ if issued by a dentist.

A pharmacist is not allowed to dispense a Controlled Drug unless all the information required by law is given on the prescription. In the case of a prescription for a Controlled Drug in Schedule 2 or 3, a pharmacist can amend the prescription if it specifies the total quantity only in words or
Controlled drugs and drug dependence

Instalments and ‘repeats’

A prescription may order a Controlled Drug to be dispensed by instalments; the amount of instalments and the intervals to be observed must be specified. A total of 14 days’ treatment by instalment of any drug listed in Schedule 2 of the Misuse of Drugs Regulations, buprenorphine p. 434, and diazepam p. 267 may be prescribed in England. In England, forms FP10(MDA) (blue) and FP10H(MDA) (blue) should be used. In Scotland, forms GP10 (peach), HBP (blue), or HBPA (pink) should be used. In Wales a total of 14 days’ treatment by instalment of any drug listed in Schedules 2–5 of the Misuse of Drugs Regulations may be prescribed. In Wales, form WP10(MDA) or form WP10HP(AD) should be used. Instalment prescriptions must be dispensed in accordance with the directions in the prescription. However, the Home Office has approved specific wording which may be included in an instalment prescription to cover certain situations; for example, if a pharmacy is closed on the day when an instalment is due. For details, see Prescribing of diamorphine (heroin), dipipanone, or cocaine for addicts, see Prescribing of diamorphine (heroin), dipipanone, and cocaine for addicts. Despite marked reduction in the prescribing of amphetamines, there is concern that abuse of illicit amfetamine and related compounds is widespread. Benzodiazepines are commonly misused. However, the misuse of barbiturates is now uncommon, in line with declining medicinal use and consequent availability. Cannabis (Indian hemp) has no approved medicinal use and consequent availability. Lysergide (bysergic acid diethylamide, LSD) is a much more potent hallucinogen; its use can lead to severe psychotic states which can be life-threatening. There are concerns over increases in the availability and misuse of other drugs with variously combined hallucinogenic, anaesthetic, or sedative properties. These include ketamine p. 1110 and gamma-hydroxybutyrate (sodium oxybate, GHB).

Supervised consumption

Individuals prescribed opioid substitution therapy can take their daily dose under the supervision of a doctor, nurse, or pharmacist during the dose stabilisation phase (usually the first 3 months of treatment), after a relapse or period of...
instability, or if there is a significant increase in the dose of methadone. Supervised consumption should continue (in accordance with local protocols) until the prescriber is confident that the patient is compliant with their treatment.

**Prescribing drugs likely to cause dependence or misuse**

The prescriber has three main responsibilities:

- **To avoid creating dependence by introducing drugs to patients without sufficient reason.** In this context, the proper use of the morphine-like drugs is well understood. The dangers of other Controlled Drugs are less clear because recognition of dependence is not easy and its effects, and those of withdrawal, are less obvious.
- **To see that the patient does not gradually increase the dose of a drug, given for good medical reasons, to the point where dependence becomes more likely.** This tendency is seen especially with hypnotics and anxiolytics. The prescriber should keep a close eye on the amount prescribed to prevent patients from accumulating stocks. A minimal amount should be prescribed in the first instance, or when seeing a new patient for the first time.
- **To avoid being used as an unwitting source of supply for addicts and being vigilant to methods for obtaining medicines.** Methods include visiting more than one doctor, fabricating stories, and forging prescriptions.

Patients under temporary care should be given only small supplies of drugs unless they present an unequivocal letter from their own doctor. Doctors should also remember that their own patients may be attempting to collect prescriptions from other prescribers, especially in hospitals. It is sensible to reduce dosages steadily or to issue weekly or even daily prescriptions for small amounts if it is apparent that dependence is occurring. The stealing and misuse of prescription forms could be minimised by the following precautions:

- do not leave unattended or if called away from the consulting room or reception desks; do not leave in a car where they may be visible; when not in use, keep in a locked drawer within the surgery and at home;
- draw a diagonal line across the blank part of the form under the prescription;
- write the quantity in words and figures when prescribing drugs prone to abuse; this is obligatory for controlled drugs;
- alterations are best avoided but if any are made they should be clear and unambiguous; add initials against altered items;
- if prescriptions are left for collection they should be left in a safe place in a sealed envelope.

**Travelling abroad**

Prescribed drugs listed in Schedule 4 Part II (CD Anab) and Schedule 5 of the Misuse of Drugs Regulations 2001 are not subject to export or import licensing. However, patients intending to travel abroad for more than 3 months carrying any amount of drugs listed in Schedules 2, 3, or 4 Part I (CD Benz) will require a personal export/import licence. Further details can be obtained at www.gov.uk/controlled-drugs-licences-fees-and-returns or from the Home Office by contacting licensing.enquiry.aadu@homeoffice.gsi.gov.uk

In cases of emergency, telephone (020) 7035 6330

Applications must be supported by a covering letter from the prescriber and should give details of:

- the patient’s name and address;
- the quantities of drugs to be carried;
- the strength and form in which the drugs will be dispensed;
- the country or countries of destination;
- the dates of travel to and from the United Kingdom.

Applications for licences should be sent to the Home Office, Drugs Licensing & Compliance Unit, Fry Building, 2 Marsham Street, SW1P 4DF. Alternatively, completed application forms can be emailed to dlcucommsofficer@homeoffice.gsi.gov.uk with a copy of the covering letter from the prescriber as a pdf. A minimum of two weeks should be allowed for processing the application.

Patients travelling for less than 3 months do not require a personal export/import licence for carrying Controlled Drugs, but are advised to carry a letter from the prescribing doctor. Those travelling for more than 3 months are advised to make arrangements to have their medication prescribed by a practitioner in the country they are visiting.

Doctors who want to take Controlled Drugs abroad while accompanying patients may similarly be issued with licences. Licences are not normally issued to doctors who want to take Controlled Drugs abroad solely in case a family emergency should arise.

Personal export/import licences do not have any legal status outside the UK and are issued only to comply with the Misuse of Drugs Act and to facilitate passage through UK Customs and Excise control. For clearance in the country to be visited it is necessary to approach that country’s consular in the UK.

**Notification of patients receiving structured drug treatment for substance dependence**

In **England**, doctors should report cases where they are providing structured drug treatment for substance dependence to their local National Drug Treatment Monitoring System (NDTMS) Team. General information about NDTMS can be found at www.nta.nhs.uk/ndtms.aspx.

Enquiries about NDTMS, and how to submit data, should initially be directed to:

Malcom Roxburgh, NTA Information Manager
Tel: (020) 7972 1964
malcolm.roxburgh@nta-nhs.org.uk

In **Scotland**, doctors should report cases to the Substance Misuse Programme (SMP).

Tel: (0131) 275 6348

In **Northern Ireland**, the Misuse of Drugs (Notification of Supply to Addicts) (Northern Ireland) Regulations 1973 require doctors to send particulars of persons whom they consider to be addicted to certain controlled drugs to the Chief Medical Officer of the Department of Health and Social Services. The Northern Ireland contacts are:

Medical contact:
Dr Ian McMaster,
C3 Castle Buildings
Belfast BT4 3FQ
Tel: (028) 9052 2421
Fax: (028) 9052 0718
ian.mcmaster@dhsspsni.gov.uk

Administrative contact:
Public Health Information & Research Branch
Annex 2
Castle Building
Belfast BT4 3SQ
Tel: (028) 9052 2520

Public Health Information & Research Branch also maintains the Northern Ireland Drug Misuse Database (NIDMD) which collects detailed information on those presenting for treatment, on drugs misused and injecting behaviour; participation is not a statutory requirement.

In **Wales**, doctors should report cases where they are providing structured drug treatment for substance dependence.
dependence on the Welsh National Database for Substance Misuse; enquiries should be directed to: substance.misuse-queries@wales.nhs.uk.

Prescribing of diamorphine (heroin), dipipanone, and cocaine for addicts

The Misuse of Drugs (Supply to Addicts) Regulations 1997 require that only medical practitioners who hold a special licence issued by the Home Secretary may prescribe, administer, or supply diamorphine hydrochloride p. 361, dipipanone (Diconal®), or cocaine in the treatment of drug addiction; other practitioners must refer any addict who requires these drugs to a treatment centre. Whenever possible the addict will be introduced by a member of staff from the treatment centre to a pharmacist whose agreement has been obtained and whose pharmacy is conveniently sited for the patient. Prescriptions for weekly supplies will be sent to the pharmacy by post and will be dispensed on a daily basis as indicated by the doctor. If any alterations of the arrangements are requested by the addict, the portion of the prescription affected must be represcribed and not merely altered.

General practitioners and other doctors do not require a special licence for prescribing diamorphine hydrochloride p. 361, dipipanone, and cocaine for patients (including addicts) for relieving pain from organic disease or injury.
Adverse reactions to drugs

Any drug may produce unwanted or unexpected adverse reactions. Rapid detection and recording of adverse drug reactions is of vital importance so that unrecognised hazards are identified promptly and appropriate regulatory action is taken to ensure that medicines are used safely. Healthcare professionals and coroners are urged to report suspected adverse drug reactions directly to the Medicines and Healthcare products Regulatory Agency (MHRA) through the Yellow Card Scheme using the electronic form at www.mhra.gov.uk/yellowcard. Alternatively, prepaid Yellow Cards for reporting are available from the address below and are also bound in the inside back cover of the BNF.

Send Yellow Cards to:
FREEPOST YELLOW CARD
(No other address details required).
Tel: 0800 731 6789

Suspected adverse drug reactions to any therapeutic agent should be reported, including drugs (self-medication as well as those prescribed), blood products, vaccines, radiographic contrast media, complementary and herbal products. For biosimilar medicines and vaccines, adverse reaction reports should clearly state the brand name and the batch number of the suspected medicine or vaccine.

Suspected adverse drug reactions should be reported through the Yellow Card Scheme at www.mhra.gov.uk/yellowcard. Yellow Cards can be used for reporting suspected adverse drug reactions to medicines, vaccines, herbal or complementary products, whether self-medicated or prescribed. This includes suspected adverse drug reactions associated with misuse, overdose, medication errors or from use of unlicensed and off-label medicines. Yellow Cards can also be used to report medical device incidents, defective medicines, and suspected fake medicines.

Spontaneous reporting is particularly valuable for recognising possible new hazards rapidly. An adverse reaction should be reported even if it is not certain that the drug has caused it, or if the reaction is well recognised, or if other drugs have been given at the same time. Reports of overdoses (deliberate or accidental) can complicate the assessment of adverse drug reactions, but provide important information on the potential toxicity of drugs.

A freephone service is available to all parts of the UK for advice and information on suspected adverse drug reactions; contact the National Yellow Card Information Service at the MHRA on 0800 731 6789. Outside office hours a telephone-answering machine will take messages. The following Yellow Card Centres can be contacted for further information:

Yellow Card Centre West Midlands
City Hospital
Dudley Road
Birmingham B18 7QH
Tel: (0121) 507 5672

Yellow Card Centre Scotland
CARDS, Royal Infirmary of Edinburgh
51 Little France Crescent
Old Dalkeith Road
Edinburgh EH16 4SA
Tel: (0131) 242 2919
YCCScotland@luht.scot.nhs.uk

The MHRA’s database facilitates the monitoring of adverse drug reactions. More detailed information on reporting and a list of products currently under additional monitoring can be found on the MHRA website: www.mhra.gov.uk.

MHRA Drug Safety Update

Drug Safety Update is a monthly newsletter from the MHRA and the Commission on Human Medicines (CHM); it is available at www.mhra.gov.uk/drugsafetyupdate.

Self-reporting

Patients and their carers can also report suspected adverse drug reactions to the MHRA. Reports can be submitted directly to the MHRA through the Yellow Card Scheme using the electronic form at www.mhra.gov.uk/yellowcard, by telephone on 0808 100 3352, or by downloading the Yellow Card form from www.mhra.gov.uk. Alternatively, patient Yellow Cards are available from pharmacies and GP surgeries. Information for patients about the Yellow Card Scheme is available in other languages at www.mhra.gov.uk/yellowcard.

Prescription-event monitoring

In addition to the MHRA’s Yellow Card Scheme, an independent scheme monitors the safety of new medicines using a different approach. The Drug Safety Research Unit identifies patients who have been prescribed selected new medicines and collects data on clinical events in these patients. The data are submitted on a voluntary basis by general practitioners on green forms. More information about the scheme and the Unit’s educational material is available from www.dsru.org.

Newer drugs and vaccines

Only limited information is available from clinical trials on the safety of new medicines. Further understanding about the safety of medicines depends on the availability of information from routine clinical practice. The black triangle symbol identifies newly licensed medicines that require additional monitoring by the European Medicines Agency. Such medicines include new active substances, biosimilar medicines, and medicines that the European Medicines Agency consider require additional monitoring. The black triangle symbol also appears in the Patient Information Leaflets for relevant medicines, with a brief explanation of what it means. Products usually retain a black triangle for 5 years, but this can be extended if required.

Spontaneous reporting is particularly valuable for recognising possible new hazards rapidly. For medicines showing the black triangle symbol, the MHRA asks that all suspected reactions (including those considered not to be serious) are reported through the Yellow Card Scheme. An adverse reaction should be reported even if it is not certain that the drug has caused it, or if the reaction is well...
recognised, or if other drugs have been given at the same time.

Established drugs and vaccines
Healthcare professionals and coroners are asked to report all suspected reactions to established drugs (including over-the-counter, herbal, and unlicensed medicines and medicines used off-label) and vaccines that are serious, medically significant, or result in harm. Serious reactions include those that are fatal, life-threatening, disabling, incapacitating, or which result in or prolong hospitalisation, or a congenital abnormality; they should be reported even if the effect is well recognised. Examples include anaphylaxis, blood disorders, endocrine disturbances, effects on fertility, haemorrhage from any site, renal impairment, jaundice, ophthalmic disorders, severe CNS effects, severe skin reactions, reactions in pregnant women, and any drug interactions. Reports of serious adverse reactions are required to enable comparison with other drugs of a similar class. Reports of overdoses (deliberate or accidental) can compromise the assessment of adverse drug reactions, but provide important information on the potential toxicity of drugs.

For established drugs there is no need to report well-known, relatively minor side-effects, such as dry mouth with tricyclic antidepressants or constipation with opioids.

Medication errors
Adverse drug reactions where harm occurs as a result of a medication error are reportable as a Yellow Card or through the local risk management systems into the National Reporting and Learning System (NRLS). If reported to the NRLS, these will be shared with the MHRA. If the NRLS is not available and harm occurs, report using a Yellow Card.

Adverse reactions to medical devices
Suspected adverse reactions to medical devices including dental or surgical materials, intra-uterine devices, and contact lens fluids should be reported. Information on reporting these can be found at: www.mhra.gov.uk.

Side-effects in the BNF
The BNF includes clinically relevant side-effects for most drugs; an exhaustive list is not included for drugs that are used by specialists (e.g. cytotoxic drugs and drugs used in anaesthesia). Where causality has not been established, side-effects in the manufacturers’ literature may be omitted from the BNF.

Recognising that hypersensitivity reactions can occur with virtually all medicines, this effect is not generally listed, unless the drug carries an increased risk of such reactions. The BNF also omits effects that are likely to have little clinical consequence (e.g. transient increase in liver enzymes).

Side-effects are generally listed in order of frequency and arranged broadly by body systems. Occasionally a rare side-effect might be listed first if it is considered to be particularly important because of its seriousness. In the product literature the frequency of side-effects is generally described as follows:

<table>
<thead>
<tr>
<th>Description of the frequency of side-effects</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Very common</td>
<td>greater than 1 in 10</td>
</tr>
<tr>
<td>Common</td>
<td>1 in 100 to 1 in 10</td>
</tr>
<tr>
<td>Uncommon (formerly ‘less commonly’ in BNF publications)</td>
<td>1 in 1000 to 1 in 100</td>
</tr>
<tr>
<td>Rare</td>
<td>1 in 10 000 to 1 in 10 000</td>
</tr>
<tr>
<td>Very rare</td>
<td>less than 1 in 10 000</td>
</tr>
</tbody>
</table>

Special problems
Delayed drug effects Some reactions (e.g. cancers, chloroquine retinopathy, and retroperitoneal fibrosis) may become manifest months or years after exposure. Any suspicion of such an association should be reported directly to the MHRA through the Yellow Card Scheme.

The elderly Particular vigilance is required to identify adverse reactions in the elderly.

Congenital abnormalities When an infant is born with a congenital abnormality or there is a malformed aborted fetus doctors are asked to consider whether this might be an adverse reaction to a drug and to report all drugs (including self-medications) taken during pregnancy.

Children Particular vigilance is required to identify and report adverse reactions in children, including those resulting from the unlicensed use of medicines; all suspected reactions should be reported directly to the MHRA through the Yellow Card Scheme (see also Adverse Drug Reactions in Children).

Prevention of adverse reactions
Adverse reactions may be prevented as follows:

• never use any drug unless there is a good indication. If the patient is pregnant do not use a drug unless the need for it is imperative;
• allergy and idiosyncrasy are important causes of adverse drug reactions. Ask if the patient had previous reactions to the drug or formulation;
• ask if the patient is already taking other drugs including self-medications, drug supplements, complementary and alternative therapies; interactions may occur;
• age and hepatic or renal disease may alter the metabolism or excretion of drugs, so that much smaller doses may be needed. Genetic factors may also be responsible for variations in metabolism, and therefore for the adverse effect of the drug; notably of isoniazid p. 506 and the tricyclic antidepressants;
• prescribe as few drugs as possible and give very clear instructions to the elderly or any patient likely to misunderstand complicated instructions;
• whenever possible use a familiar drug; with a new drug, be particularly alert for adverse reactions or unexpected events;
• consider if excipients (e.g. colouring agents) may be contributing to the adverse reaction. If the reaction is minor, a trial of an alternative formulation of the same drug may be considered before abandoning the drug;
• warn the patient if serious adverse reactions are liable to occur.

Oral side-effects of drugs
Drug-induced disorders of the mouth may be due to a local action on the mouth or to a systemic effect manifested by oral changes. In the latter case urgent referral to the patient’s medical practitioner may be necessary.
Adverse reactions to drugs 13

Oral mucosa Medicaments left in contact with or applied directly to the oral mucosa can lead to inflammation or ulceration; the possibility of allergy should also be borne in mind. Aspirin p. 104 tablets allowed to dissolve in the sulcus for the treatment of toothache can lead to a white patch followed by ulceration. Flavouring agents, particularly essential oils, may sensitise the skin, but mucosal swelling is not usually prominent. The oral mucosa is particularly vulnerable to ulceration in patients treated with cytotoxic drugs, e.g. methotrexate p. 762. Other drugs capable of causing oral ulceration include ACE inhibitors, gold, nicorandil p. 185, NSAIDs, pancreatein p. 81, penicillamine p. 896, proguanil hydrochloride p. 539, and protease inhibitors. Erythema multiforme or Stevens-Johnson syndrome may follow the use of a wide range of drugs including antibacterials, antiretrovirals, sulfonamide derivatives, and anticonvulsants; the oral mucosa may be extensively ulcerated, with characteristic target lesions on the skin. Oral lesions of toxic epidermal necrolysis have been reported with a similar range of drugs. Lichenoid eruptions are associated with ACE inhibitors, NSAIDs methylprednisolone p. 138, chloroquine p. 536, oral antidiabetics, thiazide diuretics, and gold. Candidiasis can complicate treatment with antibacterials and immunosuppressants and is an occasional side-effect of corticosteroid inhalers.

Teeth and jaw Brown staining of the teeth frequently follows the use of chlorhexidine p. 989 mouthwash, spray or gel, but can readily be removed by polishing. Iron salts in liquid form can stain the enamel black. Superficial staining has been reported rarely with co-amoxiclav p. 484 suspension. Intrinsic staining of the teeth is most commonly caused by tetracyclines. They will affect the teeth if given at any time from about the fourth month in utero until the age of twelve years; they are contra-indicated during pregnancy, in breast-feeding women, and in children under 12 years. All tetracyclines can cause permanent, unsightly staining in children, the colour varying from yellow to grey. Excessive ingestion of fluoride leads to dental fluorosis with mottling of the enamel and areas of hypoplasia or pitting; fluoride supplements occasionally cause mild mottling (white patches) if the dose is too large for the child’s age (taking into account the fluoride content of the local drinking water and of toothpaste). The risk of osteonecrosis of the jaw is substantially greater for patients receiving intravenous bisphosphonates in the treatment of cancer than for patients receiving oral bisphosphonates for osteoporosis or Paget’s disease. All patients receiving bisphosphonates should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment, or as soon as possible after starting treatment. Patients with cancer receiving cevacinumab p. 736 or sunitinib p. 817 may also be at risk of osteonecrosis of the jaw. Periodontium Gingival overgrowth (gingival hyperplasia) is a side-effect of phenytoin p. 398 and sometimes of ciclosporin p. 717 or of nifedipine p. 154 (and some other calcium-channel blockers). Thrombocytopenia may be drug related and may cause bleeding at the gingival margins, which may be spontaneous or may follow mild trauma (such as toothbrushing).

Salivary glands The most common effect that drugs have on the salivary glands is to reduce flow (xerostomia). Patients with a persistently dry mouth may have poor oral hygiene; they are at an increased risk of dental caries and oral infections (particularly candidiasis). Many drugs have been implicated in xerostomia, particularly antimuscarinics (anticholinergics), antidepressants (including tricyclic antidepressants, and selective serotonin re-uptake inhibitors), alpha-blockers, antihistamines, antipsychotics, bicalutamid p. 914, bupropion hydrochloride p. 433, clonidine hydrochloride p. 137, 5HT agonists, opioids, and tizanidine p. 913. Excessive use of diuretics can also result in xerostomia. Some drugs (e.g. clozapine p. 313, neostigmine p. 912) can increase saliva production but this is rarely a problem unless the patient has associated difficulty in swallowing. Pain in the salivary glands has been reported with some antihypertensives (e.g. clonidine hydrochloride p. 137, methyldopa p. 138) and with vinca alkaloids. Swelling of the salivary glands can occur with iodides, antithyroid drugs, phenothiazines, and sulfonamides.

Taste There can be decreased taste acuity or alteration in taste sensation. Many drugs are implicated, including amiodarone hydrochloride p. 88, calcitonin, ACE inhibitors, carbimazole p. 664, clarithromycin p. 470, gold, griseofulvin p. 1012, lithium salts, metformin hydrochloride p. 594, metronidazole p. 475, penicillamine p. 896, phenindione p. 120, propafenone hydrochloride p. 92, protease inhibitors, terbinafine p. 214, and zopiclone p. 423.

Defective medicines During the manufacture or distribution of a medicine an error or accident may occur whereby the finished product does not conform to its specification. While such a defect may impair the therapeutic effect of the product and could adversely affect the health of a patient, it should not be confused with an Adverse Drug Reaction where the product conforms to its specification.

The Defective Medicines Report Centre assists with the investigation of problems arising from licensed medicinal products thought to be defective and co-ordinates any necessary protective action. Reports on suspect defective medicinal products should include the brand or the non-proprietary name, the name of the manufacturer or supplier, the strength and dosage form of the product, the product licence number, the batch number or numbers of the product, the nature of the defect, and an account of any action already taken in consequence. The Centre can be contacted at:

Guidance on intravenous infusions

Intravenous additives policies
A local policy on the addition of drugs to intravenous fluids should be drawn up by a multi-disciplinary team in each strategic health authority (or equivalent) and issued as a document to the members of staff concerned. Centralised additive services are provided in a number of hospital pharmacy departments and should be used in preference to making additions on wards.

The information that follows should be read in conjunction with local policy documents.

Guidelines
- Drugs should only be added to infusion containers when constant plasma concentrations are needed or when the administration of a more concentrated solution would be harmful.
- In general, only one drug should be added to any infusion container and the components should be compatible. Ready-prepared solutions should be used whenever possible. Drugs should not normally be added to blood products, mannitol, or sodium bicarbonate.
- Only specially formulated additives should be used with fat emulsions or amino-acid solutions.
- Solutions should be thoroughly mixed by shaking and checked for absence of particulate matter before use.
- Strict asepsis should be maintained throughout and in general the giving set should not be used for more than 24 hours (for drug admixtures).
- The infusion container should be labelled with the patient’s name, the name and quantity of additives, and the date and time of addition (and the new expiry date or time). Such additional labelling should not interfere with information on the manufacturer’s label that is still valid. When possible, containers should be retained for a period after use in case they are needed for investigation.
- It is good practice to examine intravenous infusions from time to time while they are running. If cloudiness, crystallisation, change of colour, or any other sign of interaction or contamination is observed the infusion should be discontinued.

Problems
Microbial contamination The accidental entry and subsequent growth of micro-organisms converts the infusion fluid pathway into a potential vehicle for infection with micro-organisms, particularly species of Candida, Enterobacter, and Klebsiella. Ready-prepared infusions containing the additional drugs, or infusions prepared by an additive service (when available) should therefore be used in preference to making extemporaneous additions to infusion containers on wards etc. However, when this is necessary strict aseptic procedure should be followed.

Incompatibility Physical and chemical incompatibilities may occur with loss of potency, increase in toxicity, or other adverse effect. The solutions may become opalescent or precipitation may occur, but in many instances there is no visual indication of incompatibility. Interaction may take place at any point in the infusion fluid pathway, and the potential for incompatibility is increased when more than one substance is added to the infusion fluid.

Common incompatibilities Precipitation reactions are numerous and varied and may occur as a result of pH, concentration changes, ‘salting-out’ effects, complexation or other chemical changes. Precipitation or other particle formation must be avoided since, apart from lack of control of dosage on administration, it may initiate or exacerbate adverse effects. This is particularly important in the case of drugs which have been implicated in either thrombophlebitis (e.g. diazepam) or in skin sloughing or necrosis caused by extravasation (e.g. sodium bicarbonate and certain cytotoxic drugs). It is also especially important to effect solution of colloidal drugs and to prevent their subsequent precipitation in order to avoid a pyrogenic reaction (e.g. amphotericin).

It is considered undesirable to mix beta-lactam antibiotics, such as semi-synthetic penicillins and cephalosporins, with proteinaceous materials on the grounds that immunogenic and allergenic conjugates could be formed.

A number of preparations undergo significant loss of potency when added singly or in combination to large volume infusions. Examples include ampicillin in infusions that contain glucose or lactates. The breakdown products of dacarbazine have been implicated in adverse effects.

Blood Because of the large number of incompatibilities, drugs should not normally be added to blood and blood products for infusion purposes. Examples of incompatibility with blood include hypertonic mannitol solutions (irreversible crenation of red cells), dextran (routelux formation and interference with cross-matching), glucose (clumping of red cells), and oxytocic (inactivation).

If the giving set is not changed after the administration of blood, but used for other infusion fluids, a fibrin clot may form which, apart from blocking the set, increases the likelihood of microbial growth.

Intravenous fat emulsions These may break down with coalescence of fat globules and separation of phases when additions such as antibacterials or electrolytes are made, thus increasing the possibility of embolism. Only specially formulated products such as Vitlipid N® may be added to appropriate intravenous fat emulsions.

Other infusions Infusions that frequently give rise to incompatibility include amino acids, mannitol, and sodium bicarbonate.

Bactericides Bactericides such as chlorocresol 0.1% or phenylmercuric nitrate 0.001% are present in some injection solutions. The total volume of such solutions added to a container for infusion on one occasion should not exceed 15 ml.

Method
Ready-prepared infusions should be used whenever available. Potassium chloride is usually available in concentrations of 20, 27, and 40 mmol/litre in sodium chloride intravenous infusion (0.9%), glucose intravenous infusion (5%) or sodium chloride and glucose intravenous infusion. Lidocaine hydrochloride is usually available in concentrations of 0.1 or 0.2% in glucose intravenous infusion (5%).

When addition is required to be made extemporaneously, any product reconstitution instructions such as those relating to concentration, vehicle, mixing, and handling precautions should be strictly followed using an aseptic technique throughout. Once the product has been reconstituted, addition to the infusion fluid should be made immediately in order to minimise microbial contamination and, with certain products, to prevent degradation or other formulation change which may occur; e.g. reconstituted ampicillin injection degrades rapidly on standing, and also may form polymers which could cause sensitivity reactions. It is also important in certain instances that an infusion fluid of specific pH be used (e.g. furosemide injection requires dilution in infusions of pH greater than 5.5). When drug additions are made it is important to mix thoroughly; additions should not be made to an infusion container that has been connected to a giving set, as mixing
is hampered. If the solutions are not thoroughly mixed a concentrated layer of the additive may form owing to differences in density. Potassium chloride is particularly prone to this ‘layering’ effect when added without adequate mixing to infusions packed in non-rigid infusion containers; if such a mixture is administered it may have a serious effect on the heart.

A time limit between addition and completion of administration must be imposed for certain admixtures to guarantee satisfactory drug potency and compatibility. For admixtures in which degradation occurs without the formation of toxic substances, an acceptable limit is the time taken for 10% decomposition of the drug. When toxic substances are produced stricter limits may be imposed. Because of the risk of microbial contamination a maximum time limit of 24 hours may be appropriate for additions made elsewhere than in hospital pharmacies offering central additive service.

Certain injections must be protected from light during continuous infusion to minimise oxidation, e.g. dacarbazine and sodium nitroprusside.

Dilution with a small volume of an appropriate vehicle and administration using a motorised infusion pump is advocated for preparations such as unfractionated heparin where strict control over administration is required. In this case the appropriate dose may be dissolved in a convenient volume (e.g. 24–48 mL) of sodium chloride intravenous infusion (0.9%).

**Information provided in the BNF**

The *BNF* gives information about preparations given by three methods:

- continuous infusion;
- intermittent infusion;
- addition via the drip tubing.

Drugs for continuous infusion must be diluted in a large volume infusion. Penicillins and cephalosporins are not usually given by continuous infusion because of stability problems and because adequate plasma and tissue concentrations are best obtained by intermittent infusion. Where it is necessary to administer them by continuous infusion, detailed literature should be consulted.

Drugs that are both compatible and clinically suitable may be given by intermittent infusion in a relatively small volume of infusion over a short period of time, e.g. 100 mL in 30 minutes. The method is used if the product is incompatible or unstable over the period necessary for continuous infusion; the limited stability of ampicillin or amoxicillin in large volume glucose or lactate infusions may be overcome in this way.

Intermittent infusion is also used if adequate plasma and tissue concentrations are not produced by continuous infusion as in the case of drugs such as dacarbazine, gentamicin, and ticarcillin. An in-line burette may be used for intermittent infusion techniques in order to achieve strict control over the time and rate of administration, especially for infants and children and in intensive care units. Intermittent infusion may also make use of the ‘piggy-back’ technique provided that no additions are made to the primary infusion. In this method the drug is added to a small secondary container connected to a Y-type injection site on the primary infusion giving set; the secondary solution is usually infused within 30 minutes.

**Addition via the drip tubing** is indicated for a number of cytotoxic drugs in order to minimise extravasation. The preparation is added aseptically via the rubber septum of the injection site of a fast-running infusion. In general, drug preparations intended for a bolus effect should be given directly into a separate vein where possible. Failing this, administration may be made via the drip tubing provided that the preparation is compatible with the infusion fluid when given in this manner.

**Drugs given by intravenous infusion** The *BNF* includes information on addition of drugs to *Glucose intravenous infusion* 5 and 10%, and *Sodium chloride intravenous infusion* 0.9%. Compatibility with glucose 5% and with sodium chloride 0.9% indicates compatibility with *Sodium chloride and glucose intravenous infusion*. Infusion of a large volume of hypotonic solution should be avoided therefore care should be taken if water for injections is used. The information relates to the proprietary preparations indicated; for other preparations suitability should be checked with the manufacturer.

Information provided in the BNF The *BNF* gives information about preparations given by three methods:

**Drugs given by intravenous infusion** The *BNF* includes information on addition of drugs to *Glucose intravenous infusion* 5 and 10%, and *Sodium chloride intravenous infusion* 0.9%. Compatibility with glucose 5% and with sodium chloride 0.9% indicates compatibility with *Sodium chloride and glucose intravenous infusion*. Infusion of a large volume of hypotonic solution should be avoided therefore care should be taken if water for injections is used. The information relates to the proprietary preparations indicated; for other preparations suitability should be checked with the manufacturer.
Prescribing for children

For detailed advice on medicines used for children, consult BNF for Children.

Children, and particularly neonates, differ from adults in their response to drugs. Special care is needed in the neonatal period (first 28 days of life) and doses should always be calculated with care. At this age, the risk of toxicity is increased by reduced drug clearance and differing target organ sensitivity.

Whenever possible, intramuscular injections should be avoided in children because they are painful.

Where possible, medicines for children should be prescribed within the terms of the marketing authorisation (product licence). However, many children may require medicines outside the limits of the licence, the Human Medicines Regulations 2012 does not prohibit the use of unlicensed medicines. It is recognised that the informed use of unlicensed medicines or of licensed medicines for unlicensed applications ('off-label' use) is often necessary in paediatric practice.

Adverse drug reactions in children

Suspected adverse drug reactions in children and young adults under 18 years should be reported through the Yellow Card Scheme. Yellow cards can be used for reporting suspected adverse drug reactions to medicines, vaccines, herbal or complementary products, whether self-medicating or prescribed. This includes suspected adverse drug reactions associated with misuse, overdose, medication errors or from use of unlicensed and off-label medicines. Yellow Cards can also be used to report medical device incidents, defective medicines, and suspected fake medicines.

Report all suspected adverse drug reactions that are:

- serious, medically significant or result in harm.
- associated with newer drugs and vaccines; the most up to date list of black triangle medicines is available at: www.mhra.gov.uk/blacktriangle.

If in doubt whether to report a suspected adverse drug reaction, please complete a Yellow Card.

The identification and reporting of adverse reactions to drugs in children and neonates is particularly important because:

- the action of the drug and its pharmacokinetics in children (especially in the very young) may be different from that in adults;
- drugs may not have been extensively tested in children;
- many drugs are not specifically licensed for use in children and are used either 'off-label' or as unlicensed products;
- drugs may affect the way a child grows and develops or may cause delayed adverse reactions which do not occur in adults;
- suitable formulations may not be available to allow precise dosing in children or they may contain excipients that should be used with caution in children;
- the nature and course of illnesses and adverse drug reactions may differ between adults and children.

Even if reported through the British Paediatric Surveillance Unit’s Orange Card Scheme, any identified suspected adverse drug reactions should also be submitted to the Yellow Card Scheme.

Adverse drug reactions where harm occurs as a result of a medication error are reportable as a Yellow Card or through the local risk management systems into the National Reporting and Learning System (NRLS). If reported to the NRLS, these will be shared with the MHRA. If the NRLS is not available and harm occurs, report using a Yellow Card.

Prescription writing

Prescriptions should be written according to the guidelines in Prescription Writing. Inclusion of age is a legal requirement in the case of prescription-only medicines for children under 12 years of age, but it is preferable to state the age for all prescriptions for children.

It is particularly important to state the strengths of capsules or tablets. Although liquid preparations are particularly suitable for children, they may contain sugar which encourages dental decay. Sugar-free medicines are preferred for long-term treatment.

Many children are able to swallow tablets or capsules and may prefer a solid dose form; involving the child and parents in choosing the formulation is helpful.

When a prescription for a liquid oral preparation is written and the dose ordered is smaller than 5 mL, an oral syringe will be supplied. Parents should be advised not to add any medicines to the infant’s feed, since the drug may interact with the milk or other liquid in it; moreover the ingested dosage may be reduced if the child does not drink all the contents.

Parents must be warned to keep all medicines out of reach of children.

Rare paediatric conditions

Information on substances such as biotin and sodium benzoate used in rare metabolic conditions is included in BNF for Children; further information can be obtained from:

Dosage in children

Children’s doses in the BNF are stated in the individual drug entries or a cross-reference is provided to BNF for Children.

Doses are generally based on body-weight (in kilograms) or specific age ranges, e.g. first month (neonate), 1–5 years, 6–11 years, 12–17 years.

Dose calculation

Many children’s doses are standardised by weight (and therefore require multiplying by the body-weight in kilograms to determine the child’s dose); occasionally, the doses have been standardised by body surface area (in m²).

These methods should be used rather than attempting to calculate a child’s dose on the basis of doses used in adults. For most drugs the adult maximum dose should not be exceeded. For example if the dose is stated as 8 mg/kg (max. 300 mg), a child weighing 10 kg should receive 80 mg but a child weighing 40 kg should receive 300 mg (rather than 320 mg).

Young children may require a higher dose per kilogram than adults because of their higher metabolic rates. Other problems need to be considered. For example, calculation by body-weight in the overweight child may result in much higher doses being administered than necessary; in such cases, dose should be calculated from an ideal weight, related to height and age.

Body surface area (BSA) estimates are sometimes preferable to body-weight for calculation of paediatric doses.
since many physiological phenomena correlate better with body surface area. Body surface area can be estimated from weight. For more information, refer to BNF for Children. Where the dose for children is not stated, prescribers should consult BNF for Children or seek advice from a medicines information centre.

Dose frequency
Antibacterials are generally given at regular intervals throughout the day. Some flexibility should be allowed in children to avoid waking them during the night. For example, the night-time dose may be given at the child’s bedtime. Where new or potentially toxic drugs are used, the manufacturers’ recommended doses should be carefully followed.

Prescribing in hepatic impairment

Liver disease may alter the response to drugs in several ways as indicated below, and drug prescribing should be kept to a minimum in all patients with severe liver disease. The main problems occur in patients with jaundice, ascites, or evidence of encephalopathy.

Impaired drug metabolism
Metabolism by the liver is the main route of elimination for many drugs, but hepatic reserve is large and liver disease has to be severe before important changes in drug metabolism occur. Routine liver-function tests are a poor guide to the capacity of the liver to metabolise drugs, and in the individual patient it is not possible to predict the extent to which the metabolism of a particular drug may be impaired.

A few drugs, e.g. rifampicin p. 508 and fusidic acid p. 463, are excreted in the bile unchanged and can accumulate in patients with intrahepatic or extrahepatic obstructive jaundice.

Hypoproteinaemia
The hypoalbuminaemia in severe liver disease is associated with reduced protein binding and increased toxicity of some highly protein-bound drugs such as phenytoin p. 398 and prednisolone p. 585.

Reduced clotting
Reduced hepatic synthesis of blood-clotting factors, indicated by a prolonged prothrombin time, increases the sensitivity to oral anticoagulants such as warfarin sodium p. 121 and phenindione p. 120.

Hepatic encephalopathy
In severe liver disease many drugs can further impair cerebral function and may precipitate hepatic encephalopathy. These include all sedative drugs, opioid analgesics, those diuretics that produce hypokalaemia, and drugs that cause constipation.

Fluid overload
Oedema and ascites in chronic liver disease can be exacerbated by drugs that give rise to fluid retention e.g. NSAIDs and corticosteroids.

Hepatotoxic drugs
Hepatotoxicity is either dose-related or unpredictable (idiosyncratic). Drugs that cause dose-related toxicity may do so at lower doses in the presence of hepatic impairment than in individuals with normal liver function, and some drugs that produce reactions of the idiosyncratic kind do so more frequently in patients with liver disease. These drugs should be avoided or used very carefully in patients with liver disease. Where care is needed when prescribing in hepatic impairment, this is indicated under the relevant drug in the BNF.

Prescribing in renal impairment

The use of drugs in patients with reduced renal function can give rise to problems for several reasons:

- reduced renal excretion of a drug or its metabolites may cause toxicity;
- sensitivity to some drugs is increased even if elimination is unimpaired;
- many side-effects are tolerated poorly by patients with renal impairment;
- some drugs are not effective when renal function is reduced.

Many of these problems can be avoided by reducing the dose or by using alternative drugs.

Principles of dose adjustment in renal impairment

The level of renal function below which the dose of a drug must be reduced depends on the proportion of the drug eliminated by renal excretion and its toxicity. For many drugs with only minor or no dose-related side-effects very precise modification of the dose regimen is unnecessary and a simple scheme for dose reduction is sufficient.

For more toxic drugs with a small safety margin or patients at extremes of weight, dose regimens based on creatinine clearance should be used. When both efficacy and toxicity are closely related to plasma-drug concentration, recommended regimens should be regarded only as a guide to initial treatment; subsequent doses must be adjusted.
Prescribing in renal impairment

The total daily maintenance dose of a drug can be reduced either by reducing the size of the individual doses or by increasing the interval between doses. For some drugs, although the size of the maintenance dose is reduced it is important to give a loading dose if an immediate effect is required. This is because it takes about five times the half-life of the drug to achieve steady-state plasma concentrations. Because the plasma half-life of drugs excreted by the kidney is prolonged in renal impairment it can take many doses for the reduced dosage to achieve a therapeutic plasma concentration. The loading dose should usually be the same size as the initial dose for a patient with normal renal function.

Nephrotoxic drugs should, if possible, be avoided in patients with renal disease because the consequences of nephrotoxicity are likely to be more serious when renal reserve is already reduced. Dose recommendations are based on the severity of renal impairment.

Renal function is measured either in terms of estimated glomerular filtration rate (eGFR) calculated from a formula derived from the Modification of Diet in Renal Disease study (‘MDRD formula’ that uses serum creatinine, age, sex, and race (for Afro-Caribbean patients)) or it can be expressed as creatinine clearance (best derived from a 24-hour urine collection but often calculated from the Cockcroft and Gault formula (CG)).

**Cockcroft and Gault Formula**

\[
\text{Estimated Creatinine Clearance} = \frac{(140 - \text{Age}) \times \text{Weight} \times \text{Constant}}{\text{Serum creatinine}} \text{ in } \text{mL/minute}
\]

Age in years  
Weight in kilograms; use ideal body-weight  
Serum creatinine in micromol/litre  
Constant = 1.23 for men; 1.04 for women

The serum-creatinine concentration is sometimes used instead as a measure of renal function but it is only a rough guide to drug dosing.

**Important** Renal function in adults is increasingly being reported on the basis of estimated glomerular filtration rate (eGFR) normalised to a body surface area of 1.73 m² and derived from the Modification of Diet in Renal Disease (MDRD) formula. However, published information on the effects of renal impairment on drug elimination is usually stated in terms of creatinine clearance as a surrogate for glomerular filtration rate (GFR).

The information on dosage adjustment in the BNF is expressed in terms of eGFR, rather than creatinine clearance, for most drugs (exceptions include toxic drugs and patients at extremes of weight). Although the two measures of renal function are not interchangeable, in practice, for most drugs and for most patients (over 18 years) of average build and height, eGFR (MDRD ‘formula’) can be used to determine dosage adjustments in place of creatinine clearance. An individual’s absolute glomerular filtration rate can be calculated from the eGFR as follows:

\[
\text{GFR Absolute} = \text{eGFR} \times (\text{individual’s body surface area}/1.73)
\]

**Toxic drugs** For potentially toxic drugs with a small safety margin, creatinine clearance (calculated from the Cockcroft and Gault formula) should be used to adjust drug dosages in addition to plasma-drug concentration and clinical response.

**Patients at extremes of weight** In patients at both extremes of weight (BMI of less than 18.5 kg/m² or greater than 30 kg/m²) the absolute glomerular filtration rate or creatinine clearance (calculated from the Cockcroft and Gault formula) should be used to adjust drug dosages.

In the BNF, values for eGFR, creatinine clearance (for toxic drugs), or another measure of renal function are included where possible. However, where such values are not available, the BNF reflects the terms used in the published information.

### Chronic kidney disease in adults: UK guidelines for identification, management and referral (March 2006) define renal function as follows:

<table>
<thead>
<tr>
<th>Degree of impairment</th>
<th>eGFR mL/minute/1.73 m²</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal - Stage 1</td>
<td>More than 90 (with other evidence of kidney damage)</td>
</tr>
<tr>
<td>Mild - Stage 2</td>
<td>60–89 (with other evidence of kidney damage)</td>
</tr>
<tr>
<td>Moderate - Stage 3</td>
<td>30–59</td>
</tr>
<tr>
<td>Severe - Stage 4</td>
<td>15–29</td>
</tr>
<tr>
<td>Established renal failure - Stage 5</td>
<td>Less than 15</td>
</tr>
</tbody>
</table>

1. NICE clinical guideline 73 (September 2008)—Chronic kidney disease: Stage 3a eGFR 45–59, Stage 3b eGFR 30–44

**Dialysis**

For prescribing in patients on continuous ambulatory peritoneal dialysis (CAPD) or haemodialysis, consult specialist literature.

Drug prescribing should be kept to the minimum in all patients with severe renal disease. If even mild renal impairment is considered likely on clinical grounds, renal function should be checked before prescribing any drug which requires dose modification. Where care is needed when prescribing in renal impairment, this is indicated under the relevant drug in the BNF.
Prescribing in pregnancy

Drugs can have harmful effects on the embryo or fetus at any time during pregnancy. It is important to bear this in mind when prescribing for a woman of childbearing age or for men trying to father a child.

During the first trimester drugs can produce congenital malformations (teratogenesis), and the period of greatest risk is from the third to the eleventh week of pregnancy. During the second and third trimesters drugs can affect the growth or functional development of the fetus, or they can have toxic effects on fetal tissues.

Drugs given shortly before term or during labour can have adverse effects on labour or on the neonate after delivery. Not all the damaging effects of intra-uterine exposure to drugs are obvious at birth, some may only manifest later in life. Such late-onset effects include malignancy, e.g. adenocarcinoma of the vagina after puberty in females exposed to diethylstilbestrol in the womb, and adverse effects on intellectual, social, and functional development.

The amount of drug transferred in breast milk is rarely sufficient to produce a discernible effect on the infant. This applies particularly to drugs that are poorly absorbed and need to be given parenterally. However, there is a theoretical possibility that a small amount of drug present in breast milk can induce a hypersensitivity reaction. A clinical effect can occur in the infant if a pharmacologically significant quantity of the drug is present in milk. For some drugs (e.g. fluvastatin p. 180), the ratio between the concentration in milk and that in maternal plasma may be high enough to expose the infant to adverse effects. Some infants, such as those born prematurely or who have jaundice, are at a slightly higher risk of toxicity. Some drugs inhibit the infant’s sucking reflex (e.g. phenobarbital p. 409) while others can affect lactation (e.g. bromocriptine p. 333).

Important

Drugs should be prescribed in pregnancy only if the expected benefit to the mother is thought to be greater than the risk to the fetus, and all drugs should be avoided if possible during the first trimester. Drugs which have been extensively used in pregnancy and appear to be usually safe should be prescribed in preference to new or untried drugs; and the smallest effective dose should be used. Few drugs have been shown conclusively to be teratogenic in humans, but no drug is safe beyond all doubt in early pregnancy. Screening procedures are available when there is a known risk of certain defects.

Absence of information does not imply safety. It should be noted that the BNF and BNF for Children provide independent advice and may not always agree with the product literature.

Information on drugs and pregnancy is also available from the UK Teratology Information Service. www.uktis.org

Tel: 0844 892 0909 (09.00–17.00 Monday to Friday; urgent enquiries only outside these hours).

Prescribing in breast-feeding

Breast-feeding is beneficial; the immunological and nutritional value of breast milk to the infant is greater than that of formula feeds.

Although there is concern that drugs taken by the mother might affect the infant, there is very little information on this. In the absence of evidence of an effect, the potential for harm to the infant can be inferred from:

- the amount of drug or active metabolite of the drug delivered to the infant (dependent on the pharmacokinetic characteristics of the drug in the mother);
- the efficiency of absorption, distribution, and elimination of the drug by the infant (infant pharmacokinetics);
- the nature of the effect of the drug on the infant (pharmacodynamic properties of the drug in the infant).

The amount of drug transferred in breast milk is rarely sufficient to produce a discernible effect on the infant. This applies particularly to drugs that are poorly absorbed and need to be given parenterally. However, there is a theoretical possibility that a small amount of drug present in breast milk can induce a hypersensitivity reaction. A clinical effect can occur in the infant if a pharmacologically significant quantity of the drug is present in milk. For some drugs (e.g. fluvastatin p. 180), the ratio between the concentration in milk and that in maternal plasma may be high enough to expose the infant to adverse effects. Some infants, such as those born prematurely or who have jaundice, are at a slightly higher risk of toxicity. Some drugs inhibit the infant’s sucking reflex (e.g. phenobarbital p. 409) while others can affect lactation (e.g. bromocriptine p. 333).

Important

For many drugs insufficient evidence is available to provide guidance and it is advisable to administer only essential drugs to a mother during breast-feeding. Because of the inadequacy of information on drugs in breast-feeding, absence of information does not imply safety.
Prescribing in palliative care

Palliative care is an approach that improves the quality of life of patients and their families facing life-threatening illness, through the prevention and relief of suffering by means of early identification and impeccable assessment and treatment of pain and other problems, physical, psychosocial, and spiritual. Careful assessment of symptoms and needs of the patient should be undertaken by a multidisciplinary team. Specialist palliative care is available in most areas as day hospice care, home-care teams (often known as Macmillan teams), in-patient hospice care, and hospital teams. Many acute hospitals and teaching centres now have consultative, hospital-based teams. Hospice care of terminally ill patients has shown the importance of symptom control and psychosocial support of the patient and family. Families should be included in the care of the patient if they wish. Many patients wish to remain at home with their families. Although some families may at first be afraid of caring for the patient at home, support can be provided by community nursing services, social services, voluntary agencies and hospices together with the general practitioner. The family may be reassured by the knowledge that the patient will be admitted to a hospital or hospice if the family cannot cope.

Drug treatment The number of drugs should be as few as possible, for even the taking of medicine may be an effort. Oral medication is usually satisfactory unless there is severe nausea and vomiting, dysphagia, weakness, or coma, when parenteral medication may be necessary.

Pain Pain management in palliative care is focused on achieving control of pain by administering the right drug in the right dose at the right time. Analgesics can be divided into three broad classes: non-opioid (paracetamol p. 354, NSAID), opioid (e.g. codeine phosphate p. 360 ‘weak’, morphine p. 367 ‘strong’) and adjuvant (e.g. antidepressants, antiepileptics). Drugs from the different classes are used alone or in combination according to the type of pain and response to treatment. Analgesics are more effective in preventing pain than in the relief of established pain; it is important that they are given regularly. Paracetamol or a NSAID given regularly will often be sufficient to manage mild pain. If non-opioid analgesics alone are not sufficient, then an opioid analgesic alone or in combination with a non-opioid analgesic at an adequate dosage, may be helpful in the control of moderate pain. Codeine phosphate or tramadol hydrochloride p. 373 can be considered for moderate pain. If these preparations do not control the pain then morphine is the most useful opioid analgesic. Alternatives to morphine, including transdermal buprenorphine p. 434, transdermal fentanyl p. 362, hydromorphone hydrochloride p. 366, methadone hydrochloride p. 436, or oxycodone hydrochloride p. 369, should be initiated by those with experience in palliative care. Initiation of an opioid analgesic should not be delayed by concern over a theoretical likelihood of psychological dependence (addiction).

Bone metastases In addition to the above approach, radiotherapy, bisphosphonates, and radioactive isotopes of strontium ranelate p. 626 (Metastron® available from GE Healthcare) may be useful for pain due to bone metastases.

Neuropathic pain Patients with neuropathic pain may benefit from a trial of a tricyclic antidepressant. An antiepileptic may be added or substituted if pain persists; gabapentin p. 392 and pregabalin p. 400 are licensed for neuropathic pain. Ketamine p. 1110 is sometimes used under specialist supervision for neuropathic pain that responds poorly to opioid analgesics. Pain due to nerve compression may be reduced by a corticosteroid such as dexamethasone p. 947, which reduces oedema around the tumour, thus reducing compression. Nerve blocks or regional anaesthesia techniques (including the use of epidural and intrathecal catheters) can be considered when pain is localised to a specific area.

Pain management with opioids

Oral route Treatment with morphine p. 367 is given by mouth as immediate-release or modified-release preparations. During the titration phase the initial dose is based on the previous medication used, the severity of the pain, and other factors such as presence of renal impairment, increasing age, or frailty. The dose is given either as an immediate-release preparation 4-hourly or as a modified-release preparation 12-hourly, in addition to rescue doses.

If pain occurs between regular doses of morphine (‘breakthrough pain’), an additional dose (‘rescue dose’) of immediate-release morphine should be given. An additional dose should also be given 30 minutes before an activity that causes pain, such as wound dressing. The standard dose of a strong opioid for breakthrough pain is usually one-tenth to one-sixth of the regular 24-hour dose, repeated every 2–4 hours as required (up to hourly may be needed if pain is severe or in the last days of life). Review pain management if rescue analgesic is required frequently (twice daily or more). Each patient should be assessed on an individual basis. Formulations of fentanyl p. 362 that are administered nasally, buccally or sublingually are also licensed for breakthrough pain. When adjusting the dose of morphine, the number of rescue doses required and the response to them should be taken into account; increments of morphine should not exceed one-third to one-half of the total daily dose every 24 hours. Thereafter, the dose should be adjusted with careful assessment of the pain, and the use of adjuvant analgesics should also be considered. Upward titration of the dose of morphine stops when either the pain is relieved or unacceptable adverse effects occur, after which it is necessary to consider alternative measures. Morphine immediate-release 30mg 4-hourly (or modified-release 100mg 12-hourly) is usually adequate for most patients; some patients require morphine immediate-release up to 200mg 4-hourly (or modified-release 600mg 12-hourly), occasionally more is needed. Once their pain is controlled, patients started on 4-hourly immediate-release morphine can be transferred to the same total 24-hour dose of morphine given as the modified-release preparation for 12-hourly or 24-hourly administration. The first dose of the modified-release preparation is given with, or within 4 hours of, the last dose of the immediate-release preparation. For preparations suitable for 12-hourly or 24-hourly administration see modified-release preparations under morphine p. 367. Increments should be made to the dose, not to the frequency of administration. The patient must be monitored closely for efficacy and side-effects, particularly constipation, and nausea and vomiting. A suitable laxative should be prescribed routinely.
Oxycodone hydrochloride p. 369 can be used in patients who require an opioid but cannot tolerate morphine. If the patient is already receiving an opioid, oxycodone hydrochloride should be started at a dose equivalent to the current analgesic (see below). Oxycodone hydrochloride immediate-release preparations can be given for breakthrough pain.

### Equivalent doses of opioid analgesics

This table is only an approximate guide (doses may not correspond with those given in clinical practice); patients should be carefully monitored after any change in medication and dose titration may be required.

<table>
<thead>
<tr>
<th>Analgesic</th>
<th>Route</th>

<tr>
<td>Tramadol</td>
<td>PO</td>
<td>100 mg</td>
</tr>
</tbody>
</table>

PO = by mouth; IM = intramuscular; IV = intravenous; SC = subcutaneous

### Parenteral route

The equivalent parenteral dose of morphine p. 367 (subcutaneous, intramuscular, or intravenous) is about half of the oral dose. If the patient becomes unable to swallow, generally morphine is administered as a continuous subcutaneous infusion (for details, see Continuous Subcutaneous Infusions below). Diamorphine hydrochloride p. 361 is sometimes preferred, because being more soluble, it can be given in a smaller volume. The equivalent subcutaneous dose of dihydromorphone hydrochloride is about one-third of the oral dose of morphine.

If the patient can resume taking medicines by mouth, then oral morphine may be substituted for subcutaneous infusion of morphine or diamorphine hydrochloride, see table above of approximate equivalent doses of morphine and dihydromorphone hydrochloride. The infusion is discontinued when the first oral dose of morphine is given.

### Rectal route

Morphine p. 367 is also available for rectal administration as suppositories; alternatively oxycodone hydrochloride suppositories p. 369 can be obtained on special order.

### Transdermal route

Transdermal preparations of fentanyl p. 362 and buprenorphine p. 434 are available, they are not suitable for acute pain or in patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. Prescribers should ensure that they are familiar with the correct use of transdermal preparations, see under buprenorphine p. 434 and fentanyl p. 362 (inappropriate use has caused fatalities). Immediate-release morphine can be given for breakthrough pain.

The following 24-hour oral doses of morphine are considered to be approximately equivalent to the buprenorphine and fentanyl patches shown, however when switching due to possible opioid-induced hyperalgesia, reduce the calculated equivalent dose of the new opioid by one-quarter to one-half.

### Buprenorphine patches are approximately equivalent to the following 24-hour doses of oral morphine

<table>

Fentanyl equivalents in this table are for patients on well-tolerated opioid therapy for long periods; for patients who are opioid naive or who have been stable on oral morphine or other immediate release opioid for only several weeks, see Transdermal Route above. Conversion ratios vary and these figures are a guide only. Morphine equivalents for transdermal opioid preparations have been approximated to allow comparison with available preparations of oral morphine.

### Prescribing in palliative care

**Symptom control**

Several recommendations in this section involve unlicensed indications or routes.

**Anorexia** Anorexia may be helped by prednisolone p. 979 or dexamethasone p. 947.

**Bowel colic and excessive respiratory secretions** Bowel colic and excessive respiratory secretions may be reduced by a subcutaneous injection of hyoscine butylbromide p. 344, hyoscine butylbromide p. 73, or glycopyrronium bromide p. 1100. These antimuscarinics are generally given every 4 hours when required, but hourly use is occasionally necessary, particularly in excessive respiratory secretions. If symptoms persist, they can be given regularly via a continuous infusion device. Care is required to avoid the discomfort of dry mouth.

**Capillary bleeding** Capillary bleeding can be treated with tranexamic acid p. 95 by mouth; treatment is usually discontinued one week after the bleeding has stopped, or, if necessary, it can be continued at a reduced dose. Alternatively, gauze soaked in tranexamic acid 100 mg/mL p. 95 or adrenaline/epinephrine solution 1 mg/mL (1 in 1000) p. 196 can be applied to the affected area. Vitamin K may be useful for the treatment and prevention of bleeding associated with prolonged clotting in liver.
disease. In severe chronic cholestasis, absorption of vitamin K may be impaired; either parenteral or water-soluble oral vitamin K (see phytomenadione p. 889) should be considered.

**Constipation**

Constipation is a common cause of distress and is almost invariable after administration of an opioid analgesic. It should be prevented if possible by the regular administration of laxatives; a faecal softener with a peristaltic stimulant (e.g. co-danthramer p. 52) or lactulose p. 47 solution with a senna p. 53 preparation should be used. Methylaltrexone bromide p. 47 is licensed for the treatment of opioid-induced constipation.

**Convulsions**

Patients with cerebral tumours or uraemia may be susceptible to convulsions. Prophylactic treatment with phenytoin p. 398 or carbamazepine p. 387 should be considered. When oral medication is no longer possible, diazepam p. 267 given rectally, or phenobarbital p. 409 by injection is continued as prophylaxis. For the use of midazolam p. 414 by subcutaneous infusion using a continuous infusion device see below.

**Dry mouth**

Dry mouth may be relieved by good mouth care and measures such as chewing sugar-free gum, sucking ice or pineapple chunks, or the use of artificial saliva, dry mouth associated with candidiasis can be treated by oral preparations of nystatin p. 997 or miconazole p. 997; alternatively, fluconazole p. 518 can be given by mouth. Dry mouth may be caused by certain medications including opioids, antimuscarinic drugs (e.g. hyoscine), antidepressants and some antiemetics; if possible, an alternative preparation should be considered.

**Dysphagia**

A corticosteroid such as dexamethasone p. 947 may help, temporarily, if there is an obstruction due to tumour. See also Dry mouth, above.

**Dyspnoea**

Breathlessness at rest may be relieved by regular oral morphine p. 367 in carefully titrated doses. Diazepam p. 267 may be helpful for dyspnoea associated with anxiety. A corticosteroid, such as dexamethasone p. 947, may also be helpful if there is bronchospasm or partial obstruction.

**Fungating tumours**

Fungating tumours can be treated by regular dressing and antibacterial drugs; systemic treatment with metronidazole p. 475 is often required to reduce malodour but topical metronidazole is also used.

**Gastro-intestinal pain**

The pain of bowel colic may be reduced by loperamide hydrochloride p. 56. Hyoscine butylbromide may also be helpful, given sublingually as *Kwells®* tablets. Subcutaneous injections of hyoscine butylbromide p. 73, hyoscine hydrobromide p. 344, and glycopyrronium bromide p. 1100 can also be used to treat bowel colic. Gastric distension pain due to pressure on the stomach may be helped by a preparation incorporating an antacid with an antiflatulent and a prokinetic such as domperidone p. 346 before meals.

**Hiccups**

Hiccups due to gastric distension may be helped by a preparation incorporating an antacid with an antiflatulent. If this fails, metoclopramide hydrochloride p. 347 by mouth or by subcutaneous or intramuscular injection can be added; if this also fails, baclofen p. 914, or nifedipine p. 154, or chlorpromazine hydrochloride p. 304 can be tried.

**Insomnia**

Patients with advanced cancer may not sleep because of discomfort, cramps, night sweats, joint stiffness, or fear. There should be appropriate treatment of these problems before hypnotics are used. Benzodiazepines, such as temazepam p. 420, may be useful.

**Intractable cough**

Intractable cough may be relieved by moist inhalations or by regular administration of oral morphine p. 367. Methadone hydrochloride p. 436 linctus should be avoided because it has a long duration of action and tends to accumulate.

**Muscle spasm**

The pain of muscle spasm can be helped by a muscle relaxant such as diazepam p. 267 or baclofen p. 914.

**Nausea and vomiting**

Nausea and vomiting are common in patients with advanced cancer. Ideally, the cause should be determined before treatment with an antiemetic is started. A prokinetic antiemetic may be a preferred choice for first-line therapy.

Nausea and vomiting may occur with opioid therapy particularly in the initial stages but can be prevented by giving an antiemetic such as haloperidol p. 306 or metoclopramide hydrochloride p. 347. An antiemetic is usually necessary only for the first 4 or 5 days and therefore combined preparations containing an opioid with an antiemetic are not recommended because they lead to unnecessary antiemetic therapy (and associated side-effects when used long-term).

Metoclopramide hydrochloride has a prokinetic action and is used by mouth for nausea and vomiting associated with gastritis, gastric stasis, and functional bowel obstruction. Drugs with antimuscarinic effects antagonise prokinetic drugs and, if possible, should not be used concurrently. Haloperidol is used by mouth for most metabolic causes of vomiting (e.g. hypercalcaemia, renal failure).

Cyclizine p. 343 is given by mouth. It is used for nausea and vomiting due to mechanical bowel obstruction, raised intracranial pressure, and motion sickness. Levomepromazine p. 345 is used as an antiemetic; it is given by mouth or by subcutaneous injection at bedtime. For the dose by subcutaneous infusion see below. Dexamethasone p. 947 by mouth can be used as an adjunct.

Antiemetic therapy should be reviewed every 24 hours; it may be necessary to substitute the antiemetic or to add another one.

For the administration of antiemetics by subcutaneous infusion using a continuous infusion device, see below. For the treatment of nausea and vomiting associated with cancer chemotherapy see Cytotoxic drugs p. 744.

**Pruritus**

Pruritus, even when associated with obstructive jaundice, often responds to simple measures such as application of emollients. In the case of obstructive jaundice, further measures include administration of colestyramine p. 173).

**Raised intracranial pressure**

Headache due to raised intracranial pressure often responds to a high dose of a corticosteroid, such as dexamethasone p. 947 and should be given before 6 p.m. to reduce the risk of insomnia.

**Restlessness and confusion**

Restlessness and confusion may require treatment with an antipsychotic, e.g. haloperidol p. 306 or levomepromazine p. 345, by mouth or by subcutaneous injection, both repeated every 2 hours if required. The dose and frequency is adjusted according to the level of patient distress and the response. A regular maintenance dose should also be considered, given twice daily either by mouth or by subcutaneous injection; alternatively use a continuous infusion device.

Levomepromazine is licensed to treat pain in palliative care—this use is reserved for distressed patients with severe pain unresponsive to other measures (seek specialist advice).
Continuous subcutaneous infusions

Although drugs can usually be administered by mouth to control the symptoms of advanced cancer, the parenteral route may sometimes be necessary. Repeated administration of intramuscular injections can be difficult in a cachectic patient. This has led to the use of portable continuous infusion devices, such as syringe drivers, to give a continuous subcutaneous infusion, which can provide good control of symptoms with little discomfort or inconvenience to the patient.

Indications for the parenteral route are:
- the patient is unable to take medicines by mouth owing to nausea and vomiting, dysphagia, severe weakness, or coma
- there is malignant bowel obstruction in patients for whom further surgery is inappropriate (avoiding the need for an intravenous infusion or for insertion of a nasogastric tube)
- occasionally when the patient does not wish to take regular medication by mouth.

Syringe driver rate settings Staff using syringe drivers should be adequately trained and different rate settings should be clearly identified and differentiated; incorrect use of syringe drivers is a common cause of medication errors.

Bowel colic and excessive respiratory secretions Hyoscine hydrobromide p. 344 effectively reduces respiratory secretions and bowel colic and is sedative (but occasionally causes paradoxical agitation). Hyoscine butylbromide p. 72 is used for bowel colic and for excessive respiratory secretions, and is less sedative than hyoscine hydrobromide. Glycopyrronium bromide p. 1100 may also be used to treat bowel colic or excessive respiratory secretions.

Confusion and restlessness Haloperidol p. 306 has little sedative effect. Levomepromazine p. 345 has a sedative effect. Midazolam p. 414 is a sedative and an antiepileptic that may be used in addition to an antipsychotic drug in a very restless patient. Midazolam is also used for myoclonus.

Convolusions If a patient has previously been receiving an antiepileptic drug or has a primary or secondary cerebral tumour or is at risk of convulsion (e.g. owing to uraemia) antiepileptic medication should not be stopped. Midazolam is the benzodiazepine antiepileptic of choice for continuous subcutaneous infusion.

Nausea and vomiting Haloperidol p. 306 and levomepromazine p. 345 can both be given as a subcutaneous infusion but sedation can limit the dose of levomepromazine. Cyclizine is particularly likely to precipitate if mixed with diamorphine or other drugs (see under Mixing and Compatibility, below).

Mixing and compatibility The general principle that injections should be given into separate sites (and should not be mixed) does not apply to the use of syringe drivers in palliative care. Provided that there is evidence of compatibility, selected injections can be mixed in syringe drivers. Not all types of medication can be used in a subcutaneous infusion. In particular, chlorpromazine hydrochloride p. 304, prochlorperazine p. 309, and diazepam p. 267 are contra-indicated as they cause skin reactions at the injection site; to a lesser extent cyclizine p. 343 and levomepromazine p. 345 also sometimes cause local irritation.

In theory injections dissolved in water for injections are more likely to be associated with pain (possibly owing to their hypotonicity). The use of physiological saline (sodium chloride 0.9% p. 953) however increases the likelihood of precipitation when more than one drug is used; moreover subcutaneous infusion rates are slow (0.1–0.3 mL/hour) that pain is not usually a problem when water is used as a diluent.

Diamorphine can be given by subcutaneous infusion in a strength of up to 250 mg/mL; up to a strength of 40 mg/mL either water for injections or physiological saline (sodium chloride 0.9%) is a suitable diluent—above that strength only water for injections is used (to avoid precipitation). The following can be mixed with diamorphine:
- Cyclizine, may precipitate at concentrations above 10 mg/mL or in the presence of sodium chloride 0.9% or as the concentration of diamorphine relative to cyclizine increases; mixtures of diamorphine and cyclizine are also likely to precipitate after 24 hours.
- Dexamethasone, special care is needed to avoid precipitation of dexamethasone when preparing it.
- Haloperidol, mixtures of haloperidol and diamorphine are likely to precipitate after 24 hours if haloperidol concentration is above 2 mg/mL.
- Hyoscine butylbromide
- Hyoscine hydrobromide
- Levomepromazine
- Metoclopramide, under some conditions infusions containing metoclopramide become discoloured; such solutions should be discarded.
- Midazolam Subcutaneous infusion solution should be monitored regularly both to check for precipitation (and discoloration) and to ensure that the infusion is running at the correct rate.

Problems encountered with syringe drivers The following are problems that may be encountered with syringe drivers and the action that should be taken:
- if the subcutaneous infusion runs too quickly check the rate setting and the calculation;
- if the subcutaneous infusion runs too slowly check the start button, the battery, the syringe driver, the cannula, and make sure that the injection site is not inflamed;
- if there is an injection site reaction make sure that the site does not need to be changed—firmness or swelling at the site of injection is not in itself an indication for change, but pain or obvious inflammation is.
Equivalent doses of morphine sulfate and diamorphine hydrochloride given over 24 hours

These equivalences are *approximate only* and should be adjusted according to response

If breakthrough pain occurs give a subcutaneous (preferable) or intramuscular injection equivalent to one-tenth to one-sixth of the total 24-hour subcutaneous infusion dose. It is kinder to give an intermittent bolus injection subcutaneously—absorption is smoother so that the risk of adverse effects at peak absorption is avoided (an even better method is to use a subcutaneous butterfly needle). To minimise the risk of infection no individual subcutaneous infusion solution should be used for longer than 24 hours.
Prescribing for the elderly

Old people, especially the very old, require special care and consideration from prescribers. Medicines for Older People, a component document of the National Service Framework for Older People (Department of Health. National Service Framework for Older People. London: Department of Health, March 2001), describes how to maximise the benefits of medicines and how to avoid excessive, inappropriate, or inadequate consumption of medicines by older people.

Appropriate prescribing

Elderly patients often receive multiple drugs for their multiple diseases. This greatly increases the risk of drug interactions as well as adverse reactions, and may affect compliance. The balance of benefit and harm of some medicines may be altered in the elderly. Therefore, elderly patients’ medicines should be reviewed regularly and medicines which are not of benefit should be stopped. Non-pharmacological measures may be more appropriate for symptoms such as headache, sleeplessness, and light-headedness when associated with social stress as in widowhood, loneliness, and family dispersal.

In some cases prophylactic drugs are inappropriate if they are likely to complicate existing treatment or introduce unnecessary side-effects, especially in elderly patients with poor prognosis or with poor overall health. However, elderly patients should not be denied medicines which may help them, such as anticoagulants or antiplatelet drugs for atrial fibrillation, antihypertensives, statins, and drugs for osteoporosis.

Form of medicine

Frail elderly patients may have difficulty swallowing tablets; if left in the mouth, ulceration may develop. They should always be encouraged to take their tablets or capsules with enough fluid, and whilst in an upright position to avoid the possibility of oesophageal ulceration. It can be helpful to discuss with the patient the possibility of taking the drug as a liquid if available.

Manifestations of ageing

In the very old, manifestations of normal ageing may be mistaken for disease and lead to inappropriate prescribing. In addition, age-related muscle weakness and difficulty in maintaining balance should not be confused with neurological disease. Disorders such as light-headedness not associated with postural or postprandial hypotension are unlikely to be helped by drugs.

Sensitivity

The nervous system of elderly patients is more sensitive to many commonly used drugs, such as opioid analgesics, benzodiazepines, antipsychotics, and antiparkinsonian drugs, all of which must be used with caution. Similarly, other organs may also be more susceptible to the effects of drugs such as anti-hypertensives and NSAIDs.

Pharmacokinetics

Pharmacokinetic changes can markedly increase the tissue concentration of a drug in the elderly, especially in debilitated patients. The most important effect of age is reduced renal clearance. Many aged patients thus excrete drugs slowly, and are highly susceptible to nephrotoxic drugs. Acute illness can lead to rapid reduction in renal clearance, especially if accompanied by dehydration. Hence, a patient stabilised on a drug with a narrow margin between the therapeutic and the toxic dose (e.g. digoxin p. 94) can rapidly develop adverse effects in the aftermath of a myocardial infarction or a respiratory-tract infection. The hepatic metabolism of lipid soluble drugs is reduced in elderly patients because there is a reduction in liver volume. This is important for drugs with a narrow therapeutic window.

Adverse reactions

Adverse reactions often present in the elderly in a vague and non-specific fashion. Confusion is often the presenting symptom (caused by almost any of the commonly used drugs). Other common manifestations are constipation (with antimuscarinics and many tranquillisers) and postural hypotension and falls (with diuretics and many psychotropics).

Hypnotics

Many hypnotics with long half-lives have serious hangover effects, including drowsiness, unsteady gait, slurred speech, and confusion. Hypnotics with short half-lives should be used but they too can present problems. Short courses of hypnotics are occasionally useful for helping a patient through an acute illness or some other crisis but every effort must be made to avoid dependence. Benzodiazepines impair balance, which can result in falls.

Diuretics

Diuretics are overprescribed in old age and should not be used on a long-term basis to treat simple gravitational oedema which will usually respond to increased movement, raising the legs, and support stockings. A few days of diuretic treatment may speed the clearing of the oedema but it should rarely need continued drug therapy.

NSAIDs

Bleeding associated with aspirin and other NSAIDs is more common in the elderly who are more likely to have a fatal or serious outcome. NSAIDs are also a special hazard in patients with cardiac disease or renal impairment which may again place older patients at particular risk. Owing to the increased susceptibility of the elderly to the side-effects of NSAIDs the following recommendations are made:

- for osteoarthritis, soft-tissue lesions, and back pain, first try measures such as weight reduction (if obese), warmth, exercise, and use of a walking stick;
- for osteoarthritis, soft-tissue lesions, back pain, and pain in rheumatoid arthritis, paracetamol p. 354 should be used first and can often provide adequate pain relief;
- alternatively, a low-dose NSAID (e.g. ibuprofen p. 927 up to 1.2 g daily) may be given;
- for pain relief when either drug is inadequate, paracetamol in a full dose plus a low-dose NSAID may be given;
- if necessary, the NSAID dose can be increased or an opioid analgesic given with paracetamol p. 354;
- do not give two NSAIDs at the same time.

Prophylaxis of NSAID-induced peptic ulcers may be required if continued NSAID treatment is necessary see NSAID-associated ulcers under Peptic ulceration p. 61.

Other drugs

Other drugs which commonly cause adverse reactions are antiparkinsonian drugs, antihypertensives, psychotropics, and digoxin p. 94. The usual maintenance dose of digoxin p. 94 in very old patients is 125 micrograms daily (62.5 micrograms in those with renal disease); lower doses are often inadequate but toxicity is common in those given 250 micrograms daily. Drug-induced blood disorders are much more common in the elderly. Therefore drugs with a tendency to cause bone marrow depression (e.g. co-trimoxazole p. 461, mianserin...
hydrochloride p. 290) should be avoided unless there is no acceptable alternative. The elderly generally require a lower maintenance dose of warfarin sodium p. 121 than younger adults; once again, the outcome of bleeding tends to be more serious.

**Guidelines**

Always consider whether a drug is indicated at all.

**Limit range** It is a sensible policy to prescribe from a limited range of drugs and to be thoroughly familiar with their effects in the elderly.

**Reduce dose** Dosage should generally be substantially lower than for younger patients and it is common to start with about 50% of the adult dose. Some drugs (e.g. long-acting antidiabetic drugs such as glibenclamide p. 611) should be avoided altogether.

**Review regularly** Review repeat prescriptions regularly. In many patients it may be possible to stop some drugs, provided that clinical progress is monitored. It may be necessary to reduce the dose of some drugs as renal function declines.

**Simplify regimens** Elderly patients benefit from simple treatment regimens. Only drugs with a clear indication should be prescribed and whenever possible given once or twice daily. In particular, regimens which call for a confusing array of dosage intervals should be avoided.

**Explain clearly** Write full instructions on every prescription (including repeat prescriptions) so that containers can be properly labelled with full directions. Avoid imprecisions like 'as directed'. Child-resistant containers may be unsuitable.

**Repeats and disposal** Instruct patients what to do when drugs run out, and also how to dispose of any that are no longer necessary. Try to prescribe matching quantities. If these guidelines are followed most elderly people will cope adequately with their own medicines. If not then it is essential to enrol the help of a third party, usually a relative or a friend.

---

**Drugs and sport**

UK Anti-Doping, the national body responsible for the UK’s anti-doping policy, advises that athletes are personally responsible should a prohibited substance be detected in their body. An advice card listing examples of permitted and prohibited substances is available from:

UK Anti-doping
Oceanic House
1a Cockspur Street
London SW1Y 5BG
Tel: (020) 7766 7350
information@ukad.org.uk
www.ukad.org.uk

**General Medical Council’s advice** Doctors who prescribe or collude in the provision of drugs or treatment with the intention of improperly enhancing an individual’s performance in sport contravene the GMC’s guidance, and such actions would usually raise a question of a doctor’s continued registration. This does not preclude the provision of any care or treatment where the doctor’s intention is to protect or improve the patient’s health.
Prescribing in dental practice

Advice on the drug management of dental and oral conditions has been integrated into the main text. For ease of access, guidance on such conditions is usually identified by means of a relevant heading (e.g. Dental and Orofacial Pain) in the appropriate sections of the BNF.

The following is a list of topics of particular relevance to dentists.

**General guidance**

- Prescribing by dentists, see Prescription writing p. 4
- Oral side-effects of drugs, see Adverse reactions to drugs p. 11
- Medical emergencies in dental practice (below)
- Medical problems in dental practice p. 30

**Drug management of dental and oral conditions**

- Dental and orofacial pain, see Analgesics p. 352
- Neuropathic pain p. 382
- Non-opioid analgesics and compound analgesic preparations, see Analgesics p. 352
- Opioid analgesics, see Analgesics p. 352
- Non-steroidal anti-inflammatory drugs p. 915

**Oral infections**

- Bacterial infections, see Antibacterials, principles of therapy p. 438
- Phenoxymethylpenicillin p. 481
- Broad-spectrum penicillins (amoxicillin p. 482 and ampicillin p. 483)
- Cephalosporins (cefalexin p. 456 and cefadroxil p. 458)
- Tetracyclines p. 496
- Macrolides (clarithromycin p. 470, erythromycin p. 471 and azithromycin p. 955)
- Clindamycin p. 467
- Metronidazole p. 475
- Fusidic acid p. 956

**Fungal infections**

- Local treatment, Oropharynx infections, fungal p. 996
- Systemic treatment, Antifungals, systemic use p. 512
- Viral infections
- Herpetic gingivostomatitis, local treatment, see Oropharynx infections, viral p. 997
- Herpetic gingivostomatitis, systemic treatment, see Oropharynx infections, viral p. 997

**Anaesthetics, anxiolytics and hypnotics**

- Anaesthesia, sedation, and resuscitation in dental practice p. 1094
- Hypnotics, see Hypnotics and anxiolytics p. 416
- Sedation for dental procedures, see Hypnotics and anxiolytics p. 416
- Local anaesthesia p. 1111

**Oral ulceration and inflammation p. 992**

- Mouthwashes, gargles and dentifrices, see Mouthwashes and other preparations for oropharyngeal use p. 989
- Dry mouth, see Treatment of dry mouth p. 987
- Aromatic inhalations, see Aromatic inhalations, cough preparations and systemic nasal decongestants p. 258
- Nasal decongestants, see Aromatic inhalations, cough preparations and systemic nasal decongestants p. 258

**Dental Practitioners’ Formulary p. 1520**

**Changes to Dental Practitioners’ Formulary, see Dental Practitioners’ Formulary p. 1520**

**Medical emergencies in dental practice**

This section provides guidelines on the management of the more common medical emergencies which may arise in dental practice. Dentists and their staff should be familiar with standard resuscitation procedures, but in all circumstances it is advisable to summon medical assistance as soon as possible. See also algorithm of the procedure for Cardiopulmonary resuscitation p. 195.

**The drugs referred to in this section include:**

- Adrenaline/epinephrine Injection, adrenaline 1 in 1000, (adrenaline 1 mg/mL as acid tartrate), 1 mL amp p. 196
- Aspirin Dispersible Tablets 300 mg p. 104
- Glucagon Injection, glucagon (as hydrochloride), 1-unit vial (with solvent) p. 618
- Glucagon (as hydrochloride), 1-unit vial p. 618
- Oxygen
- Salbutamol Aerosol Inhalation, salbutamol 100 micrograms/metered inhalation p. 222

**Adrenal insufficiency**

Adrenal insufficiency may follow prolonged therapy with corticosteroids and can persist for years after stopping. A patient with adrenal insufficiency may become hypotensive under the stress of a dental visit (important: see also Adrenal suppression for details of corticosteroids (systemic) p. 579 cover before dental surgical procedures under general anaesthesia).

**Management**

- Lay the patient flat
- Give oxygen
- Transfer patient urgently to hospital

**Anaphylaxis**

A severe allergic reaction may follow oral or parenteral administration of a drug. Anaphylactic reactions in dentistry may follow the administration of a drug or contact with substances such as latex in surgical gloves. In general, the more rapid the onset of the reaction the more profound it tends to be. Symptoms may develop within minutes and rapid treatment is essential.

Anaphylactic reactions may also be associated with additives and excipients in foods and medicines. Refined arachis (peanut) oil, which may be present in some medicinal products, is unlikely to cause an allergic reaction—nevertheless it is wise to check the full formula of preparations which may contain allergens (including those for topical application, particularly if they are intended for use in the mouth or for application to the nasal mucosa).

**Symptoms and signs**

- Paraesthesia, flushing, and swelling of face
- Generalised itching, especially of hands and feet
- Bronchospasm and laryngospasm (with wheezing and difficulty in breathing)
- Rapid weak pulse together with fall in blood pressure and pallor; finally cardiac arrest

**Management**

First-line treatment includes securing the airway, restoration of blood pressure (laying the patient flat and raising the feet, or in the recovery position if unconscious or nauseous and at risk of vomiting), and administration of adrenaline/epinephrine injection p. 196. This is given intramuscularly in a dose of 500 micrograms (0.5 mL adrenaline injection 1 in 1000); a dose of 300 micrograms (0.3 mL adrenaline injection 1 in 1000) may be appropriate for immediate self-administration. The dose is repeated if...
necessarily at 5-minute intervals according to blood pressure, pulse, and respiratory function. Oxygen administration is also of primary importance. Arrangements should be made to transfer the patient to hospital urgently.

**Asthma**

Patients with asthma may have an attack while at the dental surgery. Most attacks will respond to 2 puffs of the patient’s short-acting beta, agonist inhaler such as salbutamol 100 micrograms/puff p. 222; further puffs are required if the patient does not respond rapidly. If the patient is unable to use the inhaler effectively, further puffs should be given through a large-volume spacer device (or, if not available, through a plastic or paper cup with a hole in the bottom for the inhaler mouthpiece). If the response remains unsatisfactory, or if further deterioration occurs, then the patient should be transferred urgently to hospital. Whilst awaiting transfer, oxygen should be given with salbutamol 5 mg or terbutaline sulfate 10 mg p. 225 by nebuliser; if a nebuliser is unavailable, then 2–10 puffs of salbutamol 100 micrograms/metered inhalation should be given (preferably by a large-volume spacer), and repeated every 10–20 minutes if necessary. If asthma is part of a more generalised anaphylactic reaction, an intramuscular injection of adrenaline/epinephrine p. 196 (as detailed under Anaphylaxis) should be given.

Patients with severe chronic asthma or whose asthma has deteriorated previously during a dental procedure may require an increase in their prophylactic medication before a dental procedure. This should be discussed with the patient’s medical practitioner and may include increasing the dose of inhaled or oral corticosteroid.

**Cardiac emergencies**

If there is a history of angina the patient will probably carry glyceryl trinitrate spray or tablets p. 190 (or isosorbide dinitrate tablets p. 191) and should be allowed to use them. Hospital admission is not necessary if symptoms are mild and resolve rapidly with the patient’s own medication. See also Coronary Artery Disease p. 29.

Arrhythmias may lead to a sudden reduction in cardiac output with loss of consciousness. Medical assistance should be summoned. For advice on pacemaker interference, see also Pacemakers p. 30.

The pain of myocardial infarction is similar to that of angina but generally more severe and more prolonged.

**Symptoms and signs of myocardial infarction**

- Progressive onset of severe, crushing pain across front of chest; pain may radiate towards the shoulder and down arm, or into neck and jaw
- Skin becomes pale and clammy
- Nausea and vomiting are common
- Pulse may be weak and blood pressure may fall
- Breathlessness

**Initial management of myocardial infarction**

Call immediately for medical assistance and an ambulance, as appropriate. Allow the patient to rest in the position that feels most comfortable; in the presence of breathlessness this is likely to be sitting position, whereas the syncopal patient should be laid flat; often an intermediate position (dictated by the patient) will be most appropriate. Oxygen may be administered.

Sublingual glyceryl trinitrate p. 190 may relieve pain. Intramuscular injection of drugs should be avoided because absorption may be too slow (particularly when cardiac output is reduced) and pain relief is inadequate. Intramuscular injection also increases the risk of local bleeding into the muscle if the patient is given a thrombolytic drug. Reassure the patient as much as possible to relieve further anxiety. If available, aspirin p. 104 in a single dose of 300 mg should be given. A note (to say that aspirin has been given) should be sent with the patient to the hospital. For further details on the initial management of myocardial infarction, see Management of ST-Segment Elevation Myocardial Infarction p. 186.

If the patient collapses and loses consciousness attempt standard resuscitation measures. See also algorithm of the procedure for Cardiopulmonary resuscitation p. 195.

**Epileptic seizures**

Patients with epilepsy must continue with their normal dosage of anticonvulsant drugs when attending for dental treatment. It is not uncommon for epileptic patients not to volunteer the information that they are epileptic but there should be little difficulty in recognising a tonic-clonic (grand mal) seizure.

**Symptoms and signs**

- There may be a brief warning (but variable)
- Sudden loss of consciousness, the patient becomes rigid, falls, may give a cry, and becomes cyanotic (tonic phase)
- After 30 seconds, there are jerking movements of the limbs; the tongue may be bitten (clonic phase)
- There may be frothing from mouth and urinary incontinence
- The seizure typically lasts a few minutes; the patient may then become flaccid but remain unconscious. After a variable time the patient regains consciousness but may remain confused for a while

**Management**

During a convulsion try to ensure that the patient is not at risk from injury but make no attempt to put anything in the mouth or between the teeth (in mistaken belief that this will protect the tongue). Give oxygen to support respiration if necessary. Do not attempt to restrain convulsive movements.

After convulsive movements have subsided place the patient in the coma (recovery) position and check the airway.

After the convulsion the patient may be confused (postictal confusion) and may need reassurance and sympathy. The patient should not be sent home until fully recovered. Seek medical attention or transfer the patient to hospital if it was the first episode of epilepsy, or if the convulsion was atypical, prolonged (or repeated), or if injury occurred. Medication should only be given if convulsive seizures are prolonged (convulsive movements lasting 5 minutes or longer) or repeated rapidly.

Midazolam oromucosal solution p. 414 can be given by the buccal route in adults as a single dose of 10 mg [unlicensed]. For further details on the management of status epilepticus, including details of paediatric doses of midazolam, see Drugs used in status epilepticus (Epilepsy p. 383). Focal seizures similarly need very little active management (in an automatism only a minimum amount of restraint should be applied to prevent injury). Again, the patient should be observed until post-ictal confusion has completely resolved.

**Hypoglycaemia**

Insulin-treated diabetic patients attending for dental treatment under local anaesthesia should inject insulin and eat meals as normal. If food is omitted the blood glucose will fall to an abnormally low level (hypoglycaemia). Patients can often recognise the symptoms themselves and this state responds to sugar in water or a few lumps of sugar. Children may not have such prominent changes but may appear unduly lethargic.

**Symptoms and signs**

- Shaking and trembling
- Sweating
If the patient has systemic disease or is taking other medication, the matter may need to be discussed with the patient’s general practitioner or hospital consultant.

**Allergy**
Patients should be asked about any history of allergy; those with a history of atopic allergy (asthma, eczema, hay fever, etc.) are at special risk. Those with a history of a severe allergy or of anaphylactic reactions are at high risk—it is essential to confirm that they are not allergic to any medication, or to any dental materials or equipment (including latex gloves). See also Anaphylaxis p. 242.

**Arrhythmias**
Patients, especially those who suffer from heart failure or who have sustained a myocardial infarction, may have irregular cardiac rhythm. Atrial fibrillation is a common arrhythmia even in patients with normal hearts and is of little concern except that dentists should be aware that such patients may be receiving anticoagulant therapy. The patient’s medical practitioner should be asked whether any special precautions are necessary. Premedication (e.g. with temazepam p. 420) may be useful in some instances for very anxious patients.

See also Cardiac emergencies and Dental Anaesthesia (Local anaesthesia p. 1111).

**Cardiac prostheses**
For an account of the risk of infective endocarditis in patients with prosthetic heart valves, see Infective Endocarditis p. 29. For advice on patients receiving anticoagulants, see Thromboembolic disease p. 30.

**Coronary artery disease**
Patients are vulnerable for at least 4 weeks following a myocardial infarction or following any sudden increase in the symptoms of angina. It would be advisable to check with the patient’s medical practitioner before commencing treatment. See also Cardiac Emergencies p. 28. Treatment with low-dose aspirin (75 mg daily), clopidogrel p. 106, or dipyridamole p. 107 should not be stopped routinely nor should the dose be altered before dental procedures.

A Working Party of the British Society for Antimicrobial Chemotherapy has not recommended antibiotic prophylaxis for patients following coronary artery bypass surgery.

**Cyanotic heart disease**
Patients with cyanotic heart disease are at risk in the dental chair, particularly if they have pulmonary hypertension. In such patients a syncopal reaction increases the shunt away from the lungs, causing more hypoxia which worsens the syncopal reaction—a vicious circle that may prove fatal. The advice of the cardiologist should be sought on any patient with congenital cyanotic heart disease. Treatment in hospital is more appropriate for some patients with this condition.

**Hypertension**
Patients with hypertension are likely to be receiving antihypertensive drugs. Their blood pressure may fall dangerously low under general anaesthesia, see also under Dental Anaesthesia (Local anaesthesia p. 1111).

**Immunosuppression and indwelling intraperitoneal catheters**
Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who are immunosuppressed (including transplant patients) and patients with indwelling intraperitoneal catheters do not require antibiotic prophylaxis for dental treatment provided there is no other indication for prophylaxis.
Prescribing in dental practice

The Working Party has commented that there is little evidence that dental treatment is followed by infection in immunosuppressed and immunodeficient patients nor is there evidence that dental treatment is followed by infection in patients with indwelling intraperitoneal catheters.

**Infective endocarditis**
While almost any dental procedure can cause bacteraemia, there is no clear association with the development of infective endocarditis. Routine daily activities such as tooth brushing also produce a bacteraemia and may present a greater risk of infective endocarditis than a single dental procedure.

Antibacterial prophylaxis and chlorhexidine p. 989 mouthwash are not recommended for the prevention of endocarditis in patients undergoing dental procedures. Such prophylaxis may expose patients to the adverse effects of antimicrobials when the evidence of benefit has not been proven.

**Reduction of oral bacteraemia** Patients at risk of endocarditis include those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis, should be advised to maintain the highest possible standards of oral hygiene in order to reduce the:
- need for dental extractions or other surgery;
- chances of severe bacteraemia if dental surgery is needed;
- possibility of ‘spontaneous’ bacteraemia.

**Postoperative care** Patients at risk of endocarditis include those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis, should be warned to report to the doctor or dentist any unexplained illness that develops after dental treatment.

Any infection in patients at risk of endocarditis should be investigated promptly and treated appropriately to reduce the risk of endocarditis.

**Patients on anticoagulant therapy**
For general advice on dental surgery in patients receiving oral anticoagulant therapy see Thromboembolic Disease (below).

**Joint prostheses**
Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients with prosthetic joint implants (including total hip replacements) do not require antibiotic prophylaxis for dental treatment. The Working Party considers that it is unacceptable to expose patients to the adverse effects of antibiotics when there is no evidence that such prophylaxis is of any benefit, but that those who develop any intercurrent infection require prompt treatment with antibiotics to which the infecting organisms are sensitive.

The Working Party has commented that joint infections have rarely been shown to follow dental procedures and are even more rarely caused by oral streptococci.

**Pacemakers**
Pacemakers prevent asystole or severe bradycardia. Some ultrasonic scalers, electronic apex locators, electroanalgesic devices, and electrocautery devices interfere with the normal function of pacemakers (including shielded pacemakers) and should not be used. The manufacturer’s literature should be consulted whenever possible. If severe bradycardia occurs in a patient fitted with a pacemaker, electrical equipment should be switched off and the patient placed supine with the legs elevated. If the patient loses consciousness and the pulse remains slow or is absent, cardiopulmonary resuscitation may be needed. Call immediately for medical assistance and an ambulance, as appropriate.

**Thromboembolic disease**
Patients receiving a heparin or an oral anticoagulant such as warfarin sodium p. 121, acenocoumarol p. 120 (nicoumalone), phenindione p. 120, apixaban p. 108, dabigatran etexilate p. 117 or rivaroxaban p. 109 may be liable to excessive bleeding after extraction of teeth or other dental surgery. Often dental surgery can be delayed until the anticoagulant therapy has been completed.

For a patient requiring long-term therapy with warfarin sodium, the patient’s medical practitioner should be consulted and the International Normalised Ratio (INR) should be assessed 72 hours before the dental procedure. This allows sufficient time for dose modification if necessary. In those with an unstable INR (including those who require weekly monitoring of their INR, or those who have had some INR measurements greater than 4.0 in the last 2 months), the INR should be assessed within 24 hours of the dental procedure. Patients requiring minor dental procedures (including extractions) who have an INR below 4.0 may continue warfarin sodium without dose adjustment.

There is no need to check the INR for a patient requiring a non-invasive dental procedure.

If it is necessary to remove several teeth, a single extraction should be done first; if this goes well further teeth may be extracted at subsequent visits (two or three at a time).

Measures should be taken to minimise bleeding during and after the procedure. This includes the use of sutures and a haemostatic such as oxidised cellulose, collagen sponge or resorbable gelatin sponge. Scaling and root planing should initially be restricted to a limited area to assess the potential for bleeding.

For a patient on long-term warfarin sodium, the advice of the clinician responsible for the patient’s anticoagulation should be sought if:
- the INR is unstable, or if the INR is greater than 4.0;
- the patient has thrombocytopenia, haemophilia, or other disorders of haemostasis, or suffers from liver impairment, alcoholism, or renal failure;
- the patient is receiving antiplatelet drugs, cytotoxic drugs or radiotherapy.

Intramuscular injections are contra-indicated in patients taking anticoagulants with an INR above the therapeutic range, and in those with any disorder of haemostasis. In patients taking anticoagulants who have a stable INR within the therapeutic range, intramuscular injections should be avoided if possible; if an intramuscular injection is necessary, the patient should be informed of the increased risk of localised bleeding and monitored carefully.

A local anaesthetic containing a vasoconstrictor should be given by infiltration, or by intraligamentary or mental nerve injection if possible. If regional nerve blocks cannot be avoided the local anaesthetic should be given cautiously using an aspirating syringe.
Drugs which have potentially serious interactions with anticoagulants include aspirin and other NSAIDs, carbamazepine p. 387, imidazole and triazole antifungals (including miconazole p. 1011), erythromycin p. 471, clarithromycin p. 470, and metronidazole p. 475; for details of these and other interactions with anticoagulants, see Appendix 1 (dabigatran etexilate, heparins, phenindione, rivaroxaban, and coumarins).

Although studies have failed to demonstrate an interaction, common experience in anticoagulant clinics is that the INR can be altered following a course of an oral broad-spectrum antibiotic, such as ampicillin p. 483 or amoxicillin p. 482. Information on the treatment of patients who take anticoagulants is available at www.npsa.nhs.uk/patientsafety/alerts-and-directives/alerts/anticoagulant.

Liver disease
Liver disease may alter the response to drugs and drug prescribing should be kept to a minimum in patients with severe liver disease. Problems are likely mainly in patients with jaundice, ascites, or evidence of encephalopathy. For guidance on prescribing for patients with hepatic impairment, see Prescribing in hepatic impairment p. 17. Where care is needed when prescribing in hepatic impairment, this is indicated under the relevant drug in the BNF.

Renal impairment
The use of drugs in patients with reduced renal function can give rise to many problems. Many of these problems can be avoided by reducing the dose or by using alternative drugs. Special care is required in renal transplantation and immunosuppressed patients; if necessary such patients should be referred to specialists. For guidance on prescribing in patients with renal impairment, see Prescribing in renal impairment p. 17. Where care is needed when prescribing in renal impairment, this is indicated under the relevant drug in the BNF.

Pregnancy
Drugs taken during pregnancy can be harmful to the fetus and should be prescribed only if the expected benefit to the mother is thought to be greater than the risk to the fetus; all drugs should be avoided if possible during the first trimester. For guidance on prescribing in pregnancy, see Prescribing in pregnancy p. 19. Where care is needed when prescribing in pregnancy, this is indicated under the relevant drug in the BNF.

Breast-feeding
Some drugs taken by the mother whilst breast-feeding can be transferred to the breast milk, and may affect the infant. For guidance on prescribing in breast-feeding, see Prescribing in breast-feeding p. 19. Where care is needed when prescribing in breast-feeding, this is indicated under the relevant drug in the BNF.
Chapter 1
Gastro-intestinal system

1 Chronic bowel disorders

Chronic bowel disorders

Once tumours are ruled out individual symptoms of chronic bowel disorders need specific treatment including dietary manipulation as well as drug treatment and the maintenance of a liberal fluid intake.

Clostridium difficile infection

Clostridium difficile infection is caused by colonisation of the colon with Clostridium difficile and production of toxin. It often follows antibiotic therapy and is usually of acute onset, but may become chronic. It is a particular hazard of ampicillin, amoxicillin, co-amoxiclav, second- and third-generation cephalosporins, clindamycin, and quinolones, but few antibiotics are free of this side-effect. Treatment options include metronidazole p. 475, vancomycin p. 485, and fidaxomicin p. 468.

Diverticular disease

Diverticular disease is treated with a high-fibre diet, bran supplements, and bulk-forming drugs. Antispasmodics may provide symptomatic relief when colic is a problem. Antibacterials are used only when the diverticula in the intestinal wall become infected. Antimotility drugs which slow intestinal motility, e.g. codeine phosphate p. 360, diphenoxylate, and loperamide hydrochloride p. 56 could possibly exacerbate the symptoms of diverticular disease and are contra-indicated.

Irritable bowel syndrome

Irritable bowel syndrome can present with pain, constipation, or diarrhea. In some patients there may be important psychological aggravating factors which respond to reassurance and possibly specific treatment e.g. with an antidepressant.

The fiber intake of patients with irritable bowel syndrome should be reviewed. If an increase in dietary fibre is required, soluble fibre (e.g. ispaghula husk p. 45, sterculia p. 46, or oats) is recommended; insoluble fibre (e.g. bran) may exacerbate symptoms and its use should be discouraged. A laxative can be used to treat constipation. An osmotic laxative, such as a macrogol, is preferred; lactulose p. 47 may cause bloating. Linaclootide p. 40 is licensed for the treatment of moderate to severe irritable bowel syndrome associated with constipation. Stimulant laxatives should be avoided or used only occasionally. Loperamide hydrochloride p. 56 may relieve diarrhoea and antispasmodic drugs may relieve pain. Opioids with a central action, such as codeine phosphate p. 360, are better avoided because of the risk of dependence.

A tricyclic antidepressant can be used for abdominal pain or discomfort [unlicensed indication] in patients who have not responded to laxatives, loperamide hydrochloride p. 56, or antispasmodics. A selective serotonin reuptake inhibitor may be considered in those who do not respond to a tricyclic antidepressant [unlicensed indication].

Malabsorption syndromes

Individual conditions need specific management and also general nutritional consideration. Coeliac disease (gluten enteropathy) usually needs a gluten-free diet and pancreatic insufficiency needs pancreatic supplements.

See further information on foods for special diets (ACBS), see Borderline substances p. 1260.

1.1 Inflammatory bowel disease

Inflammatory bowel disease

Chronic inflammatory bowel diseases include ulcerative colitis and Crohn’s disease. Effective management requires drug therapy, attention to nutrition, and in severe or chronic active disease, surgery.

Aminosalicylates (balsalazide sodium p. 34, mesalazine p. 34, olsalazine sodium p. 37, and sulfasalazine p. 37), corticosteroids (hydrocortisone p. 583, beclometasone dipropionate p. 38, budesonide p. 38, and prednisolone p. 585), and drugs that affect the immune response are used in the treatment of inflammatory bowel disease.

Treatment of acute ulcerative colitis and Crohn’s disease

Acute mild to moderate disease affecting the rectum (proctitis) or the recto-sigmoid is treated initially with local application of an aminosalicylate; alternatively, a local corticosteroid can be used but it is less effective. A combination of a local aminosalicylate and a local
corticosteroid can be used for proctitis that does not respond to a local aminosalicylate alone. Foam preparations and suppositories are especially useful when patients have difficulty retaining liquid enemas.

Diffuse inflammatory bowel disease or disease that does not respond to local therapy requires oral treatment. Mild disease affecting the proximal colon can be treated with an oral aminosalicylate alone; a combination of a local and an oral aminosalicylate can be used in proctitis or distal colitis. Refractory or moderate inflammatory bowel disease usually requires adjunctive use of an oral corticosteroid such as prednisolone for 4–8 weeks. Modified-release budesonide is licensed for Crohn’s disease affecting the ileum and the ascending colon; it causes fewer systemic side-effects than oral prednisolone but may be less effective. Beclometasone dipropionate by mouth is licensed as an adjunct to mesalazine for mild to moderate ulcerative colitis, but it is not known whether it is as effective as other corticosteroids.

Severe inflammatory bowel disease or disease that is not responding to an oral corticosteroid requires hospital admission and treatment with an intravenous corticosteroid (such as hydrocortisone p. 583 or methylprednisolone p. 584); other therapy may include intravenous fluid and electrolyte replacement, and possibly parenteral nutrition. Specialist supervision is required for patients who fail to respond adequately to these measures. Patients with severe ulcerative colitis that has not responded to intravenous corticosteroids, may benefit from a short course of intravenous ciclosporin p. 717 [unlicensed indication]. Patients with unresponsive or chronically active Crohn’s disease may benefit from azathioprine p. 716, mercaptopurine p. 762 [unlicensed indication], or once-weekly methotrexate p. 762 [unlicensed indication]; these drugs have a slower onset of action.

Infliximab p. 906 is licensed for the management of severe active Crohn’s disease and severe ulcerative colitis in patients whose condition has not responded adequately to treatment with a corticosteroid and a conventional drug that affects the immune response, or who are intolerant of them.

Adalimumab p. 901 is licensed for the treatment of severe active Crohn’s disease and severe ulcerative colitis in patients whose condition has not responded adequately to treatment with a corticosteroid and a conventional drug that affects the immune response, or who are intolerant of them. For inducing remission, adalimumab can be used in combination with a corticosteroid, but it may be given alone if a corticosteroid is inappropriate or is not tolerated. Adalimumab may also be used for Crohn’s disease in patients who have relapsed while taking infliximab or who cannot tolerate infliximab because of hypersensitivity reactions.

Golimumab p. 904 is licensed for the treatment of severe ulcerative colitis in patients whose condition has not responded adequately to conventional therapy, or who are intolerant of it.

Vedolizumab p. 39 is licensed for the treatment of moderate to severe active Crohn’s disease and ulcerative colitis in patients who have had an inadequate response with, lost response to, or are intolerant to either conventional therapy or a tumour necrosis factor alpha inhibitor.

Maintenance of remission of acute ulcerative colitis and Crohn’s disease

Smoking cessation reduces the risk of relapse in Crohn’s disease and should be encouraged. Aminosalicylates are efficacious in the maintenance of remission of ulcerative colitis, but there is no evidence of efficacy in the maintenance of remission of Crohn’s disease.

Corticosteroids are not suitable for maintenance treatment because of their side-effects. In resistant or frequently relapsing cases either azathioprine p. 716 or mercaptopurine p. 762 [unlicensed indication], given under close supervision may be helpful. Methotrexate p. 762 is tried in Crohn’s disease if azathioprine or mercaptopurine cannot be used [unlicensed indication]. Maintenance therapy with infliximab p. 906 should be considered for patients with Crohn’s disease or ulcerative colitis who respond to the initial induction course of infliximab; fixed-interval dosing is superior to intermittent dosing. Adalimumab p. 901 is licensed for maintenance therapy in Crohn’s disease and ulcerative colitis. Golimumab p. 904 is licensed for maintenance therapy in ulcerative colitis.

Fistulating Crohn’s disease

Treatment may not be necessary for simple, asymptomatic perianal fistulas. Metronidazole p. 475 or ciprofloxacin p. 490 can improve symptoms of fistulating Crohn’s disease but complete healing occurs rarely [unlicensed indication]. Metronidazole is usually given for 1 month but no longer than 3 months because of concerns about peripheral neuropathy. Ciprofloxacin by mouth is given twice daily. Other antibacterials should be given if specifically indicated (e.g. sepsis associated with fistulas and perianal disease) and for managing bacterial overgrowth in the small bowel. Fistulas may also require surgical exploration and local drainage.

Either azathioprine p. 716 or mercaptopurine p. 762 is used as a second-line treatment for fistulating Crohn’s disease and continued for maintenance [unlicensed indication]. Infliximab p. 906 is used for fistulating Crohn’s disease refractory to conventional treatments; fixed-interval dosing is superior to intermittent dosing. Maintenance therapy with infliximab should be considered for patients who respond to the initial induction course of infliximab. Adalimumab p. 901 can be used if there is intolerance to infliximab p. 906 [unlicensed indication].

Adjunctive treatment of inflammatory bowel disease

Due attention should be paid to diet; high-fibre or low-residue diets should be used as appropriate.

Antimitoty drugs such as codeine phosphate p. 360 and loperamide hydrochloride p. 56, and antispasmodic drugs may precipitate paralytic ileus and megacolon in active ulcerative colitis; treatment of the inflammation is more logical. An osmotic laxative, such as a macrogol, may be required in proctitis. Diarrhoea resulting from the loss of bile-salt absorption (e.g. in terminal ileal disease or bowel resection) may improve with colestyramine p. 173, which binds bile salts.

Drugs used in chronic bowel disorders

Aminosalicylates
Sulfasalazine p. 37 is a combination of 5-aminosalicylic acid (‘5-ASA’) and sulfapyridine; sulfapyridine acts only as a carrier to the colonic site of action but still causes side-effects. In the newer aminosalicylates, mesalazine p. 34 (5-aminosalicylic acid), balsalazide sodium p. 34 (a prodrug of 5-aminosalicylic acid) and olsalazine sodium p. 37 (a dimer of 5-aminosalicylic acid which cleaves in the lower bowel), the sulfonamide-related side-effects of sulfasalazine are avoided, but 5-aminosalicylic acid alone can still cause side-effects including blood disorders and lupus-like syndrome also seen with sulfasalazine.

Drugs affecting the immune response
Azathioprine p. 716, ciclosporin p. 717, mercaptopurine p. 762, and methotrexate p. 762 have a role in the treatment of inflammatory bowel disease.

Folic acid p. 836 should be given to reduce the possibility of methotrexate toxicity [unlicensed indication]. Folic acid is usually given once weekly on a different day to the methotrexate; alternative regimens may be used in some settings.
Cytokine modulators
Infliximab p. 906, adalimumab p. 901, and golimumab p. 904 are monoclonal antibodies which inhibit the pro-
flammatory cytokine, tumour necrosis factor alpha. They should be used under specialist supervision. Adequate
resuscitation facilities must be available when infliximab is used.

AMINOSALICYLATES

Aminosalicylates

SIDE-EFFECTS
• Rare Acute pancreatitis · agranulocytosis · alopecia · aplastic anaemia · arthralgia · blood disorders · eosinophilia · fibrosing alveolitis · hepatitis · interstitial nephritis · leucopenia · lung disorders · lupus erythematosus-like syndrome · methaemoglobinemia · myalgia · myocarditis · nephrotic syndrome · neutropenia · pericarditis · peripheral neuropathy · renal dysfunction · skin reactions · Stevens-Johnson syndrome · thrombocytopenia
• Frequency not known Abdominal pain · diarrhoea · exacerbation of symptoms of colitis · headache · hypersensitivity reactions · nausea · rash · urticaria · vomiting

SIDE-EFFECTS, FURTHER INFORMATION
Blood Disorders A blood count should be performed and the drug stopped immediately if there is suspicion of a
blood dyscrasia.
• ALLERGY AND CROSS-SENSITIVITY Contraindicated in salicylate hypersensitivity.
• RENAL IMPAIRMENT Renal function should be monitored more frequently in renal impairment.
• MONITORING REQUIREMENTS Renal function should be monitored before starting an oral aminosalicylate, at 3
months of treatment, and then annually during treatment.
• PATIENT AND CARER ADVICE Blood disorders Patients receiving aminosalicylates, and their
carers, should be advised to report any unexplained bleeding, bruising, purpura, sore throat, fever or malaise
that occurs during treatment.

Balsalazide sodium

INDICATIONS AND DOSE
Treatment of mild to moderate ulcerative colitis (acute attack)
BY MOUTH
• Adult: 2.25 g 3 times a day until remission occurs or for
up to maximum of 12 weeks
Maintenance of remission of ulcerative colitis
BY MOUTH
• Adult: 1.5 g twice daily (max. per dose 3 g), adjusted
good response; maximum 6 g per day

CAUTIONS History of asthma
SIDE-EFFECTS Cholelithiasis
PREGNANCY Manufacturer advises avoid.
BREAST FEEDING Diarrhoea may develop in the infant. Monitor breast-fed infants for diarrhoea.
HEPATIC IMPAIRMENT Avoid in severe impairment.
RENAL IMPAIRMENT Manufacturer advises avoid in moderate to severe impairment.

Mesalazine

INDICATIONS AND DOSE
PENTASA® TABLETS
Treatment of mild to moderate ulcerative colitis, acute attack
BY MOUTH
• Adult: Up to 4 g once daily, alternatively up to 4 g daily
in 2–3 divided doses
Maintenance of remission of ulcerative colitis
BY MOUTH
• Adult: 2 g once daily
MEZAVANT® XL
Treatment of mild to moderate ulcerative colitis, acute attack
BY MOUTH
• Adult: 2.4 g once daily
ASACOL® MR 800MG TABLETS
Treatment of mild to moderate ulcerative colitis, acute attack
BY MOUTH
• Adult: 2.4–4.8 g daily in divided doses
Maintenance of remission of ulcerative colitis
BY MOUTH
• Adult: Up to 2.4 g once daily, alternatively up to 4.8 g
daily in divided doses
Maintenance of remission of Crohn’s ileo-colitis
BY MOUTH
• Adult: Up to 2.4 g daily in divided doses
ASACOL® MR 400MG TABLETS
Treatment of mild to moderate ulcerative colitis, acute attack
BY MOUTH
• Child 12–17 years: 800 mg 3 times a day
• Adult: 2.4 g daily in divided doses
Maintenance of remission of ulcerative colitis and Crohn’s ileo-colitis
BY MOUTH
• Child 12–17 years: 400–800 mg 3 times a day
• Adult: 1.2–2.4 g daily in divided doses
OCTASA®
Treatment of mild to moderate ulcerative colitis, acute attack
BY MOUTH
• Adult: 2.4–4.8 g once daily, alternatively 2.4–4.8 g
daily in divided doses, dose over 2.4 g daily in divided
doses only
Maintenance of remission of ulcerative colitis and Crohn’s ileo-colitis
BY MOUTH
• Adult: 1.2–2.4 g once daily, alternatively daily in divided doses

MEDICINAL FORMS
There can be variation in the licensing of different medicines
containing the same drug.

Capsule
CAUTIONARY AND ADVISORY LABELS 21, 25
• Colazide (Almirall Ltd)
Balsalazide disodium 750 mg Colazide 750mg capsules 1
130 capsule pack £30.42 DT price = £30.42

Mesalazine
**SALOFALK® TABLETS**

Treatment of mild to moderate ulcerative colitis, acute attack

- **BY MOUTH**
  - Child 5-17 years (body-weight up to 39 kg): 10–20 mg/kg 3 times a day
  - Child 5-17 years (body-weight 40 kg and above): 0.5–1 g 3 times a day
  - Adult: 0.5–1 g 3 times a day

Maintenance of remission of ulcerative colitis

- **BY MOUTH**
  - Child 5-17 years (body-weight up to 39 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
  - Child 5-17 years (body-weight 40 kg and above): 500 mg 3 times a day
  - Adult: 500 mg 3 times a day

**IPOCOL®**

Treatment of mild to moderate ulcerative colitis, acute attack

- **BY MOUTH**
  - Adult: 2.4 g daily in divided doses

Maintenance of remission of ulcerative colitis

- **BY MOUTH**
  - Adult: 1.2–2.4 g daily in divided doses

**PENTASA GRANULES**

Treatment of mild to moderate ulcerative colitis, acute attack

- **BY MOUTH**
  - Child 5-17 years (body-weight up to 40 kg): 10–20 mg/kg 3 times a day
  - Child 5-17 years (body-weight 41 kg and above): 1–2 g twice daily, total daily dose may alternatively be given in 3–4 divided doses
  - Adult: Up to 4 g once daily, alternatively up to 4 g daily in 2–4 divided doses

Maintenance of remission of ulcerative colitis

- **BY MOUTH**
  - Child 5-17 years (body-weight up to 40 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
  - Child 5-17 years (body-weight 41 kg and above): 2 g once daily
  - Adult: 2 g once daily

**SALOFALK® GRANULES**

Treatment of mild to moderate ulcerative colitis, acute attack

- **BY MOUTH**
  - Child 5-17 years (body-weight up to 40 kg): 30–50 mg/kg once daily, dose preferably given in the morning, alternatively 10–20 mg/kg 3 times a day
  - Child 5-17 years (body-weight 41 kg and above): 1.5–3 g once daily, dose preferably given in the morning, alternatively 0.5–1 g 3 times a day
  - Adult: 1.5–3 g once daily, dose preferably taken in the morning, alternatively 0.5–1 g 3 times a day

Maintenance of remission of ulcerative colitis

- **BY MOUTH**
  - Child 5-17 years (body-weight up to 40 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
  - Child 5-17 years (body-weight 41 kg and above): 500 mg 3 times a day
  - Adult: 500 mg 3 times a day

**SALOFALK® RECTAL FOAM**

Treatment of mild ulcerative colitis affecting sigmoid colon and rectum

- **BY RECTUM**
  - Child 12-17 years: 2 g once daily, dose to be administered into the rectum at bedtime, alternatively 2 g daily in 2 divided doses
  - Adult: 2 g once daily, dose to be administered into the rectum at bedtime, alternatively 2 g daily in 2 divided doses

**ASACOL® FOAM ENEMA**

Treatment of acute attack of mild to moderate ulcerative colitis, affecting the rectosigmoid region

- **BY RECTUM**
  - Adult: 1 g daily for 4–6 weeks, to be administered into the rectum

**SALOFALK® SUPPOSITORIES**

Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectum, sigmoid colon and descending colon

- **BY RECTUM**
  - Adult: 0.5–1 g 2–3 times a day, adjusted according to response, dose to be given using 500 mg suppositories

**ASACOL® SUPPOSITORIES**

Treatment of acute attack of mild to moderate ulcerative colitis and maintenance of remission

- **BY RECTUM**
  - Adult: 0.75–1.5 g daily in divided doses, last dose to be administered at bedtime

**PENTASA® SUPPOSITORIES**

Treatment of acute attack, ulcerative proctitis

- **BY RECTUM**
  - Child 15-17 years: 1 g daily for 2–4 weeks
  - Adult: 1 g daily for 2–4 weeks

Maintenance, ulcerative proctitis

- **BY RECTUM**
  - Child 15-17 years: 1 g daily
  - Adult: 1 g daily

**PENTASA® RETENTION ENEMA**

Treatment of acute attack of mild to moderate ulcerative colitis or maintenance of remission

- **BY RECTUM**
  - Adult: 1 g once daily, dose to be administered at bedtime

**SALOFALK® ENEMA**

Treatment of acute attack of mild to moderate ulcerative colitis or maintenance of remission

- **BY RECTUM**
  - Adult: 2 g once daily, dose to be administered at bedtime

**CAUTIONS**

- Elderly
- Pulmonary disease
PRESCRIBING AND DISPENSING INFORMATION

DIRECTIONS FOR ADMINISTRATION

RENAL IMPAIRMENT

SIDE-EFFECTS

CAUTIONARY AND ADVISORY LABELS

Very rare

Rare

Negligible quantities cross placenta.

Avoid in severe impairment.

Dizziness

Negligible amounts of mesalazine detected in infants, but negligible quantities of mesalazine detected in breast milk. Monitor breast-fed infant for diarrhoea.

Dizziness

EXCIPIENTS: May contain Aspartame

Salofalk

Mesalazine 400 mg gastro-resistant tablets | 90 tablet P Dod £47.50 | 180 tablet P Dod £95.00 DT price = £117.62

Salofalk (Dr. Falk Pharma UK Ltd)

Mesalazine 33.9 mg per 1 ml Salofalk 2g/59ml enema | 7 enema P Dod £29.92

INTERACTIONS

The manufacturers of some mesalazine gastro-resistant and modified-release medicines (Asacol® MR tablets, Ipocol®, Salofalk® granules) suggest that preparations that lower stool pH (e.g. lactulose) may prevent the release of mesalazine.

SIDE-EFFECTS

Rare Dizziness

Very rare Oligospermia (reversible)

PREGNANCY

Negligible quantities cross placenta.

BREAST FEEDING

Diarrhoea reported in breast-fed infants, but negligible amounts of mesalazine detected in breast milk. Monitor breast-fed infant for diarrhoea.

HEPATIC IMPAIRMENT

Avoid in severe impairment.

RENAL IMPAIRMENT

Use with caution. Avoid if eGFR less than 20 ml/minute/1.73 m².

DIRECTIONS FOR ADMINISTRATION

PENTASA® TABLETS

Tablets may be halved, quartered, or dispersed in water, but should not be chewed.

PENTASA® GRANULES

Granules should be placed on tongue and washed down with water without chewing.

In children Contents of one sachet should be weighed and divided immediately before use; discard any remaining granules.

SALOFALK® GRANULES

Granules should be placed on tongue and washed down with water without chewing.

PRESCRIBING AND DISPENSING INFORMATION

Flavours of granule formulations of Salofalk® may include vanilla. There is no evidence to show that any one oral preparation of mesalazine is more effective than another; however, the delivery characteristics of oral mesalazine preparations may vary.

PATIENT AND CAREER ADVICE

If it is necessary to switch a patient to a different brand of mesalazine, the patient should be advised to report any changes in symptoms. Some products may require special administration advice; patients and carers should be informed.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

Mezavant XL (Shire Pharmaceuticals Ltd)

Mesalazine 1.2 gram Mezavant XL 1200mg tablets | 60 tablet P Dod £62.44 DT price = £62.44

Pentasa (Ferring Pharmaceuticals Ltd)

Mesalazine 500 mg Pentasa 500mg modified-release tablets | 100 tablet P Dod £30.74 DT price = £30.74

Mesalazine 1 gram Pentasa 1g modified-release tablets | 60 tablet P Dod £36.89 DT price = £36.89

Gastro-resistant tablet

CAUTIONARY AND ADVISORY LABELS 5, 25

Mesalazine (Non-proprietary)

Mesalazine 400 mg Mesalazine 400mg gastro-resistant tablets | 90 tablet P Dod £29.41 DT price = £29.41 | 120 tablet P Dod £39.21

Mesalazine 800 mg Mesalazine 800mg gastro-resistant tablets | 90 tablet P Dod £58.81

Asacol MR (Warner Chilcott UK Ltd)

Mesalazine 400 mg Asacol 400mg MR gastro-resistant tablets | 90 tablet P Dod £29.41 DT price = £29.41 | 120 tablet P Dod £39.21

Mesalazine 800 mg Asacol 800mg MR gastro-resistant tablets | 180 tablet P Dod £117.62 DT price = £117.62

Ipocol (Sanofi Ltd)

Mesalazine 400 mg Ipocol 400mg gastro-resistant tablets | 120 tablet P Dod £17.68

Octasa MR (Tillets Pharma Ltd)

Mesalazine 400 mg Octasa 400mg MR gastro-resistant tablets | 90 tablet P Dod £19.50 DT price = £29.41 | 120 tablet P Dod £26.00
**Olsalazine sodium**

**INDICATIONS AND DOSE**

Treatment of acute attack of mild ulcerative colitis

**BY MOUTH**

- Adult: 1 g daily in divided doses, doses to be taken after meals, then increased if necessary up to 3 g daily in divided doses (max. per dose 1 g), dose to be increased over 1 week.

**Maintenance of remission of mild ulcerative colitis**

**BY MOUTH**

- Adult: Maintenance 500 mg twice daily, dose to be taken after food.

**SIDE-EFFECTS**

- **Common or very common** Watery diarrhoea
- **Frequency not known** Blurred vision - palpitation - photosensitivity - pyrexia - tachycardia

**PREGNANCY**

Manufacturer advises avoid unless potential benefit outweighs risk.

**BREAST FEEDING**

Monitor breast-fed infants for diarrhoea.

**RENAL IMPAIRMENT**

Use with caution; manufacturer advises avoid in significant impairment.

**DIRECTIONS FOR ADMINISTRATION**

Capsules can be opened and contents sprinkled on food.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS** 21
  - Olsalazine sodium 500 mg Olsalazine 500mg tablets | 60 tablet [POD] £85.00 DT price = £85.00

**Capsule**

- **CAUTIONARY AND ADVISORY LABELS** 21
  - Olsalazine sodium 250 mg Olsalazine 250mg capsules | 112 capsule [POD] £75.00 DT price = £75.00

---

**Sulfasalazine**  
*(Sulphasalazine)*

**INDICATIONS AND DOSE**

Treatment of acute attack of mild to moderate and severe ulcerative colitis | Active Crohn’s disease

**BY MOUTH**

- Adult: 1–2 g 4 times a day until remission occurs, corticosteroids may also be given, if necessary
- Adult: 0.5–1 g twice daily, administered alone or in conjunction with oral therapy, morning and night after a bowel movement

**Maintenance of remission of mild to moderate and severe ulcerative colitis**

**BY MOUTH**

- Adult: 500 mg 4 times a day

**BY RECTUM**

- Adult: 0.5–1 g twice daily, administered alone or in conjunction with oral therapy, morning and night after a bowel movement

**Active rheumatoid arthritis (administered on expert advice)**

**BY MOUTH**

- Adult: Initially 500 mg daily, increased in steps of 500 mg every 1 week, increased to 2–3 g daily in divided doses, enteric coated tablets to be administered

---

**INFLAMMATORY BOWEL DISEASE**  
**37**

**CONTRA-INDICATIONS**

Child under 2 years of age

**CAUTIONS**

Acute porphyrias p. 864 | G6PD deficiency | history of allergy | history of asthma | maintain adequate fluid intake | risk of haematological toxicity | risk of hepatic toxicity | slow acetylator status

**INTERACTIONS**

- Appendix 1 (aminosalicylates).

**SIDE-EFFECTS**

- **Common or very common** Blood disorders - cough - dizziness - fever - Heinz body anaemia - insomnia - megaloblastic anaemia - proteinuria - pruritus - stomatitis - taste disturbances - tinnitus
- **Uncommon** Alopecia - convulsions - depression - dysphoria - vasculitis
- **Frequency not known** Anaphylaxis - aseptic meningitis - ataxia - crystalluria - disturbances of smell - epidermal necrolysis - exfoliative dermatitis - gastro-intestinal intolerance - hallucinations - hypersensitivity reactions - leucopenia (especially in patients with rheumatoid arthritis) - loss of appetite - neutropenia (especially in patients with rheumatoid arthritis) - oligospermia - parotitis - photosensitivity - rashes - serum sickness - some soft contact lenses may be stained - thrombocytopenia (especially in patients with rheumatoid arthritis) - yellow-orange discoloration of other body fluids - yellow-orange discoloration of skin - yellow-orange discoloration of urine

**SIDE-EFFECTS, FURTHER INFORMATION**

**Gastro-intestinal side effects**

Upper gastro-intestinal side-effects common over 4 g daily.

**Blood disorders**

Haematological abnormalities occur usually in the first 3 to 6 months of treatment and are reversible on cessation of treatment.

**PREGNANCY**

Theoretical risk of neonatal haemolysis in third trimester; adequate folate supplements should be given to mother.

**BREAST FEEDING**

Small amounts in milk (1 report of bloody diarrhoea); theoretical risk of neonatal haemolysis especially in G6PD-deficient infants.

**HEPATIC IMPAIRMENT**

Use with caution.

**RENAI IMPAIRMENT**

Risk of toxicity, including crystalluria, in moderate impairment—ensure high fluid intake. Avoid in severe impairment.

**MONITORING REQUIREMENTS**

- Blood disorders Close monitoring of full blood counts (including differential white cell count and platelet count) is necessary initially, and at monthly intervals during the first 3 months.
- Renal function Although the manufacturer recommends renal function tests in rheumatic diseases, evidence of practical value is unsatisfactory.
- Liver function Liver function tests should be performed at monthly intervals for first 3 months.

**PATIENT AND CARER ADVICE**

Contact lenses Some soft contact lenses may be stained.

EXCIPIENTS: May contain Alcohol

- **SULFASALAZINE (Non-proprietary)**
  - Sulfasalazine 50 mg per 1 ml Sulfasalazine 250mg/5ml oral suspension sugar free (sugar-free) | 500 ml [Post] £41.00 DT price = £14.00

**Suppository**

**CAUTIONARY AND ADVISORY LABELS 14**

- Salazopyrin (Pfizer Ltd)
  - Sulfasalazine 500 mg Salazopyrin 500mg suppositories | 10 suppository [Post] £3.30

**CORTICOSTEROIDS**

**Beclometasone dipropionate**  
*Beclometasone dipropionate*

The properties listed below are those particular to systemic use of the drug only. For properties common to the class, see Corticosteroids, systemic, p. 579.

**INDICATIONS AND DOSE**

**Adjunct to aminosalicylates in acute mild to moderate ulcerative colitis**

**BY MOUTH**

- Adult: 5 mg daily maximum duration of treatment of 4 weeks, dose to be taken in the morning

**SIDE-EFFECTS**

Constipation - drowsiness

**HEPATIC IMPAIRMENT**

Manufacturer advises avoid in severe impairment—no information available.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment

**Modified-release tablet**

**CAUTIONARY AND ADVISORY LABELS 25**

- Clipper (Chiesi Ltd)  
  - Beclometasone dipropionate 5 mg Clipper 5mg gastro-resistant modified-release tablets | 30 tablet [Post] £56.56

**Budesonide**

The properties listed below are those particular to the drug only. For properties common to the class, see corticosteroids (systemic), p. 579.

**INDICATIONS AND DOSE**

**ENTOCORT® CAPSULES**

Mild to moderate Crohn’s disease affecting the ileum or ascending colon | Chronic diarrhoea due to collagenous colitis

**BY MOUTH**

- Adult: 3 mg 3 times a day for up to 8 weeks, reduce dose for the last 2 weeks of treatment

Autoimmune hepatitis, induction of remission

**BY MOUTH**

- Adult: 3 mg 3 times a day

Autoimmune hepatitis, maintenance

**BY MOUTH**

- Adult: 3 mg twice daily

**ENTOCORT® GRANULES**

Mild to moderate Crohn’s disease affecting the ileum or ascending colon | Collagenous colitis

**BY MOUTH**

- Adult: 9 mg daily for up to 8 weeks, to be taken in the morning, dose to be reduced for the last 2 weeks of treatment

**ENTOCORT® RECTAL FOAM**

Ulcerative colitis affecting sigmoid colon and rectum

**BY RECTUM**

- Adult: 1 metered application once daily for up to 8 weeks

Dose equivalence and conversion

1 metered application is equivalent to budesonide 2 mg.

**ENTOCORT® ENEMA**

Ulcerative colitis involving rectal and recto-sigmoid disease

**BY RECTUM**

- Adult: 1 enema daily for 4 weeks, to be administered at bedtime

**CAUTIONS**

- With systemic use Autoimmune hepatitis

**HEPATIC IMPAIRMENT**

- With systemic use When used in autoimmune hepatitis liver function tests should be monitored every 2 weeks for 1 month, then at least every 3 months.

**DIRECTIONS FOR ADMINISTRATION**

- With oral use Granules should be placed on tongue and washed down with water without chewing.

**ENTOCORT® GRANULES**

Granules should be placed on tongue and washed down with water without chewing.

**PRESCRIBING AND DISPENSING INFORMATION**

Flavours of granule formulations may include lemon.

**ENTOCORT® CAPSULES**

Dispense in original container (contains dessicant).

**PATIENT AND CARER ADVICE**

- With oral use Patients or carers should be given advice on how to administer budesonide granules

**NATIONAL FUNDING/ACCESS DECISIONS**

**ENTOCORT® CAPSULES**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (April 2015) that Budesonide gastro-resistant capsules are accepted for restricted use within NHS Scotland for the treatment of autoimmune hepatitis in non-cirrhotic patients who are intolerant of conventional oral corticosteroids (prednisolone) with severe corticosteroid-related side effects (actual or anticipated) such as psychosis, poorly controlled diabetes or osteoporosis.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.
**Vedolizumab**

**DRUG ACTION** Vedolizumab is a monoclonal antibody that binds specifically to the alpha_4 integrin, which is preferentially expressed on gut homing T helper lymphocytes.

**INDICATIONS AND DOSE**

Moderate to severe active ulcerative colitis in patients who have had an inadequate response with, lost response to, or are intolerant to either conventional therapy or a tumour necrosis factor alpha inhibitor (under expert supervision)

**BY INTRAVENOUS INFUSION**

- Adult: Initially 300 mg, then 300 mg after 2 weeks, followed by 300 mg after 4 weeks, followed by 300 mg every 8 weeks, dose to be given over 30 minutes, if treatment is interrupted or response decreases, dosing frequency may be increased—consult product literature; review treatment if no response within 10 weeks of initial dose

Moderate to severe active Crohn’s disease in patients who have had an inadequate response with, lost response to, or are intolerant to either conventional therapy or a tumour necrosis factor alpha inhibitor (under expert supervision)

**BY INTRAVENOUS INFUSION**

- Adult: Initially 300 mg, then 300 mg after 2 weeks, followed by 300 mg after 4 weeks, followed by 300 mg every 8 weeks, dose to be given over 30 minutes, if no response is observed, an additional dose of 300 mg may be given 10 weeks after initial dose; if treatment is interrupted or response decreases, dosing frequency may be increased—consult product literature; review treatment if no response within 14 weeks of initial dose

**CONTRA-INDICATIONS** Severe active infection

**CAUTIONS** Controlled chronic severe infection, history of recurring severe infection, previous treatment with natalizumab (wait at least 12 weeks between natalizumab use and initiation of vedolizumab unless potential benefit outweighs risk); previous treatment with rituximab

**CAUTIONS, FURTHER INFORMATION**

**Risk of infection** Patients must be screened for tuberculosis before starting treatment; if latent tuberculosis is diagnosed, appropriate treatment must be initiated prior to vedolizumab treatment; if tuberculosis is diagnosed during treatment, discontinue vedolizumab until infection is resolved.

Patients should be brought up to date with current immunisation schedule before initiating treatment.

**INTERACTIONS** → Appendix 1 (vedolizumab).

**SIDE-EFFECTS**

- **Common or very common** Acne, arthralgia, back pain, constipation, cough, dyspepsia, eczema, erythema, flatulence, gastroenteritis, headache, hypertension, infections, malaise, muscle spasms, muscular weakness, nasal congestion, nausea, night sweats, oropharyngeal pain, paraesthesia, pharyngitis, pruritus, pyrexia, rash, upper respiratory tract infection

- **Uncommon** Folliculitis, oral candidiasis, vulvovaginal candidiasis

- **Frequency not known** Dizziness, infusion-related reactions, listeria meningitis, salmonella sepsis, tuberculosis

**SIDE-EFFECTS, FURTHER INFORMATION**

Infusion-related reactions

- Infusion-related and hypersensitivity reactions have been reported. Patients should be observed continuously during each infusion for signs and symptoms of acute hypersensitivity reactions; they should also be observed for 2 hours after the initial two infusions, and for 1 hour after subsequent infusions. Discontinue treatment if a severe infusion-related or other severe reaction occurs and initiate appropriate treatment (e.g. adrenaline and antihistamines); if a mild to moderate infusion-related reaction occurs, interrupt infusion or reduce infusion rate and initiate appropriate treatment (if reaction subsides the infusion may be continued)—consider pretreatment with an antihistamine, hydrocortisone, and/or paracetamol prior to subsequent infusions in patients who experience mild to moderate infusion-related reactions.

**CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 18 weeks after treatment.

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

**MONITORING REQUIREMENTS**

- Monitor closely for infection before, during and after treatment—potential increased risk of opportunistic infection.

- Monitor for new onset or worsening neurological signs and symptoms (withhold treatment if progressive multifocal leukoencephalopathy (PML) is suspected).

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Entyvio®), give intermittently in Sodium chloride 0.9%; allow vial to reach room temperature then reconstitute with 4.8 mL of water for injection (using a syringe with a 21–25 gauge needle); gently swirl vial for at least 15 seconds, do not shake vigorously or invert; allow to stand for up to 20 minutes (gently swirl vial if needed), leave for an additional 10 minutes if not dissolved; gently invert vial three times, withdraw 5 mL of reconstituted solution (using a syringe with a 21–25 gauge needle), and add to 250 mL of infusion fluid; gently mix and give over 30 minutes.

**PATIENT AND CARER ADVICE** Patients should be provided with a patient alert card.
## 40 Constipation and bowel cleansing

### 1.2 Irritable bowel syndrome

**Drugs used for Irritable bowel syndrome not listed below:**

- Alverine citrate, p. 74
- Mebeverine hydrochloride, p. 75

### ANTI spasmodics

**Peppermint oil**

**INDICATIONS AND DOSE**

**Colpermin®**

Relief of abdominal colic and distension, particularly in irritable bowel syndrome

**BY MOUTH**

- Child 15–17 years: 1–2 capsules 3 times a day for up to 3 months if necessary, capsule to be swallowed whole
- Adult: 1–2 capsules 3 times a day for up to 3 months if necessary, capsule to be swallowed whole with water

**Mintec®**

Relief of abdominal colic and distension, particularly in irritable bowel syndrome

**BY MOUTH**

- Adult: 1–2 capsules 3 times a day for up to 2–3 months if necessary, dose to be taken before meals, swallowed whole with water

### CAUTIONS

- Sensitivity to menthol

### SIDE-EFFECTS

- Rare  Allergic reactions - ataxia - bradycardia - headache - muscle tremor - rash
- Frequency not known  Heartburn - perianal irritation

### PREGNANCY

- Not known to be harmful.

### BREAST FEEDING

- Significant levels of menthol in breast milk unlikely.

### DIRECTIONS FOR ADMINISTRATION

Capsules should not be broken or chewed because peppermint oil may irritate mouth or oesophagus.

### MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: enema

- **Modified-release capsule**
  - Peppermint oil 200 microlitre  Colpermin gastro-resistant modified-release capsules | 20 capsule [**(G)**] £3.33 | 100 capsule [**(G)**] £12.18 DT price = £12.18
  - Gas tro-resistant capsule
    - PEPPERMINT OIL (Non-proprietary)
      - Peppermint oil 200 microlitre  Peppermint oil 0.2ml gastro-resistant capsules | 84 capsule [**(G)**] £7.04 DT price = £7.04
    - Brands may include Apercap, Mintec
  - Liquid
    - PEPPERMINT OIL (Non-proprietary)
      - Ethanol 90% 15 ml per 1 litre, Peppermint oil 5 ml per 1 litre, Purified water 9.5 ml per 1 litre  Peppermint oil BP 1973 | 100 ml [**(G)**] £5.95 | 100 ml £9.50

### CONTRA-INDICATIONS

- Gastro-intestinal obstruction - inflammatory bowel disease

### CAUTIONS

- Predisposition to fluid and electrolyte disturbances

### MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- **Colpermin 290 microgram**  Constella 290microgram capsules | 28 capsule [**(P)**] £3.75

## 2 Constipation and bowel cleansing

### 2.1 Bowel cleansing

**Drugs used for Bowel cleansing not listed below:**

- Bisacodyl, p. 52
- Docusate sodium, p. 52
- Macrogol 3350 with potassium chloride, sodium bicarbonate and sodium chloride, p. 48
- Magnesium sulfate, p. 858
- Phosphate, p. 861
- Sodium picosulfate, p. 54
**MAGNESIUM-CONTAINING DRUGS**

**Citric acid with magnesium carbonate**  
(Formulated as a bowel cleansing preparation)

### INDICATIONS AND DOSE

**Bowel evacuation for surgery, colonoscopy or radiological examination**  
**BY MOUTH**

- **Child 5-9 years:** One-third of a sachet to be given at 8 a.m. the day before the procedure and, one-third of a sachet to be given between 2 and 4 p.m. the day before the procedure.
- **Child 10-17 years:** 0.5–1 sachet, given at 8 a.m. the day before the procedure and 0.5–1 sachet, given between 2 and 4 p.m. the day before the procedure.
- **Adult:** 1 sachet, given 8 a.m. the day before the procedure and 1 sachet, given between 2 and 4 p.m. the day before the procedure, use half the dose in frail elderly patients.

### CONTRA-INDICATIONS

- Acute severe colitis - gastric retention - gastro-intestinal obstruction - gastro-intestinal perforation - toxic megacolon.

### CAUTIONS

- Children - colitis (avoid if acute severe colitis) - debilitated - elderly - hypovolaemia (should be corrected before administration of bowel cleansing preparations) - impaired gag reflex or possibility of regurgitation or aspiration - patients with fluid and electrolyte disturbances.

### CAUTIONS, FURTHER INFORMATION

- Adequate hydration should be maintained during treatment.

### INTERACTIONS

- Other oral drugs should not be taken one hour before or after administration of bowel cleansing preparations because absorption may be impaired. Consider withholding ACE inhibitors, angiotensin-II receptor antagonists, and NSAIDs on the day that bowel cleansing preparations are given and for up to 72 hours after the procedure. Also consider withholding diuretics on the day that bowel cleansing preparations are given.

### SIDE-EFFECTS

- **Common or very common** Abdominal distension - abdominal pain - nausea - vomiting
- **Uncommon** Dehydration - dizziness - electrolyte disturbances - headache

### SIDE-EFFECTS, FURTHER INFORMATION

- **Abdominal pain** Abdominal pain is usually transient and can be reduced by taking preparation more slowly.

### PREGNANCY

- Use with caution.

### BREAST FEEDING

- Use with caution.

### HEPATIC IMPAIRMENT

- Avoid in hepatic coma if risk of renal failure.

### RENAL IMPAIRMENT

- In adults: Avoid if eGFR less than 30 mL/minute/1.73 m² — risk of hypermagnesaemia.
- In children: Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m² — risk of hypermagnesaemia.

### MONITORING REQUIREMENTS

- Renal function should be measured before starting treatment in patients at risk of fluid and electrolyte disturbances.

### DIRECTIONS FOR ADMINISTRATION

- One sachet should be reconstituted with 200 mL of hot water; the solution should be allowed to cool for approx. 30 minutes before drinking.

### PRESCRIBING AND DISPENSING INFORMATION

- Reconstitution of one sachet containing 11.57 g magnesium carbonate and 17.79 g anhydrous citric acid produces a solution containing magnesium citrate with 118 mmol Mg²⁺. Flavours of oral powders may include lemon and lime.

### PATIENT AND CARER ADVICE

- Low residue or fluid only diet (e.g. water, fruit squash, clear soup, black tea or coffee) recommended before procedure (according to prescriber’s advice) and copious intake of clear fluids recommended until procedure. Patient or carers should be given advice on how to administer oral powder.

### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

#### Effervescent powder

- **CAUTIONARY AND ADVISORY LABELS** 13, 10
- **ELECTROLYTES:** Magnesium
- **Citramag** (Sanochemia Diagnostics UK Ltd)
  - Citric acid anhydrous 17.79 gram, Magnesium carbonate heavy 11.57 gram
  - Citramag effervescent powder sachets (sugar-free)  
  - 10 sachet [£] 18.92

### OSMOTIC LAXATIVES

**Macrogol 3350 with anhydrous sodium sulfate, ascorbic acid, potassium chloride, sodium ascorbate and sodium chloride**  
(Polyethylene glycols)

### INDICATIONS AND DOSE

**MOVIPREP®**

- **Bowel evacuation for surgery, colonoscopy or radiological examination**  
  **BY MOUTH**
  - **Adult:** 1 litre daily for 2 doses: first dose of reconstituted solution taken on the evening before procedure and the second dose on the morning of procedure, alternatively 2 litres daily for 1 dose; reconstituted solution to be taken on the evening before the procedure, treatment should be completed at least 1 hour before colonoscopy.

### CONTRA-INDICATIONS

### CAUTIONS

- Colitis (avoid if acute severe colitis) - debilitated patients - elderly - fluid and electrolyte disturbances - heart failure - hypovolaemia (should be corrected before administration of bowel cleansing preparations) - impaired gag reflex or possibility of regurgitation or aspiration.

### INTERACTIONS

- Consider withholding ACE inhibitors, angiotensin-II receptor antagonists, and NSAIDs on the day that bowel cleansing preparations are given and for up to 72 hours after the procedure. Also consider withholding diuretics on the day that bowel cleansing preparations are given.

### SIDE-EFFECTS

- **Common or very common** Abdominal distension - abdominal pain - nausea - vomiting
- **Uncommon** Dehydration - dizziness - electrolyte disturbances - headache
- **Frequency not known** Anal discomfort - fatigue - sleep disturbances

### SIDE-EFFECTS, FURTHER INFORMATION

- **Abdominal pain** Abdominal pain is usually transient and can be reduced by taking preparation more slowly.

Gastro-intestinal system

INTERACTIONS

CAUTIONS

CONTRA-INDICATIONS

(Formulated as a bowel cleansing preparation)

bicarbonate and sodium chloride

Macrogol 3350 with anhydrous sodium sulfate, potassium chloride, sodium bicarbonate and sodium chloride

(Macrogol 3350 with anhydrous sodium sulfate, potassium chloride, sodium bicarbonate and sodium chloride

(Formulated as a bowel cleansing preparation)

INDICATIONS AND DOSE

Bowel cleansing before radiological examination, colonoscopy, or surgery

INITIALLY BY MOUTH

Adult: Initially 2 litres daily for 2 doses: first dose of reconstituted solution taken on the evening before procedure and the second dose on the morning of procedure, alternatively (by mouth) initially 250 mL every 10–15 minutes, reconstituted solution to be administered, alternatively (by nasogastric tube) initially 20–30 mL/minute, starting on the day before procedure until 4 litres have been consumed

CONTRA-INDICATIONS

Acute severe colitis • gastric retention • gastro-intestinal obstruction • gastro-intestinal perforation • toxic megacolon

CAUTIONS

Colitis (avoid if acute severe colitis) • debilitated patients • elderly • fluid and electrolyte disturbances • heart failure • hypovolaemia (should be corrected before administration of bowel cleansing preparations) • impaired gag reflex or possibility of regurgitation or aspiration

INTERACTIONS

Consider withholding ACE inhibitors, angiotensin-II receptor antagonists, and NSAIDs on the day that bowel cleansing preparations are given and for up to 72 hours after the procedure. Also consider withholding diuretics on the day that bowel cleansing preparations are given.

SIDE-EFFECTS

Common or very common Abdominal distention • abdominal pain • nausea • vomiting

Uncommon Anal discomfort • dehydration • dizziness • electrolyte disturbances • fatigue • headache • sleep disturbances

SIDE-EFFECTS, FURTHER INFORMATION

Abdominal pain Abdominal pain is usually transient and can be reduced by taking preparation more slowly.

PREGNANCY

Manufacturers advise use only if essential—no information available.

BREAST FEEDING

Manufacturers advise use only if essential—no information available.

MONITORING REQUIREMENTS

Renal function should be measured before starting treatment in patients at risk of fluid and electrolyte disturbances.

DIRECTIONS FOR ADMINISTRATION

MOVIPREP®

One pair of sachets (A and B) should be reconstituted in 1 litre of water and taken over 1–2 hours.

1 litre of other clear fluid should also be taken during treatment.

PRESCRIBING AND DISPENSING INFORMATION

Flavours of oral powder formulations may include lemon or orange.

PATIENT AND CARER ADVICE

Patient information leaflet.

Solid food should not be taken during treatment until procedure completed.

Treatment can be stopped if bowel motions become watery and clear.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Adult: 1 sachet taken before 8 a.m, then 1 sachet after 6–8 hours

PHARMACOKINETICS

Acts within 3 hours of first dose.

PICOLAX® SACHETS

Bowel evacuation on day before radiological procedure, endoscopy, or surgery

BY MOUTH

Child 1 year: 0.25 sachet taken before 8 a.m, then 0.25 sachet after 6–8 hours

Child 2–3 years: 0.5 sachet taken before 8 a.m, then 0.5 sachet after 6–8 hours

Child 4–8 years: 1 sachet taken before 8 a.m, then 1.5 sachet after 6–8 hours

Child 9–17 years: 1 sachet taken before 8 a.m, then 1 sachet after 6–8 hours

Adult: 1 sachet taken before 8 a.m, then 1 sachet after 6–8 hours
2.2 Constipation

Constipation

Before prescribing laxatives it is important to be sure that the patient is constipated and that the constipation is not secondary to an underlying undiagnosed complaint. It is also important for those who complain of constipation to understand that bowel habit can vary considerably in frequency without doing harm. Some people tend to consider themselves constipated if they do not have a bowel movement each day. A useful definition of constipation is the passage of hard stools less frequently than the patient’s own normal pattern and this can be explained to the patient.

Misconceptions about bowel habits have led to excessive laxative use. Abuse may lead to hypokalaemia. Thus, laxatives should generally be avoided except where straining will exacerbate a condition (such as angina) or increase the risk of rectal bleeding as in haemorrhoids. Laxatives are also of value in drug-induced constipation, for the expulsion of parasites after anthelminthic treatment, and to clear the alimentary tract before surgery and radiological procedures. Prolonged treatment of constipation is sometimes necessary. Also see the prevention of opioid-induced constipation in palliative care.

The laxatives that follow have been divided into 5 main groups. This simple classification disguises the fact that some laxatives have a complex action.

Bulk-forming laxatives

Bulk-forming laxatives are of value if the diet is deficient in fibre. Bulk-forming laxatives are of particular value in those with small hard stools, but should not be required unless fibre cannot be increased in the diet. A balanced diet, including adequate fluid intake and fibre is of value in preventing constipation.

Bulk-forming laxatives can be used in the management of patients with colostomy, ileostomy, haemorrhoids, anal fissure, chronic diarrhoea associated with diverticular disease, irritable bowel syndrome, and as adjuncts in ulcerative colitis. Adequate fluid intake must be maintained to avoid intestinal obstruction. Unprocessed wheat bran, taken with food or fruit juice, is a most effective bulk-forming preparation. Finely ground bran, though more palatable, seems to have little advantage over coarse bran.

Methylcellulose also acts as a faecal softener. Methylcellulose p. 45, ispaghula husk p. 45, and sterculia p. 46 are useful in patients who cannot tolerate bran. Methylcellulose also acts as a faecal softener.

Stimulant laxatives

Stimulant laxatives include bisacodyl p. 52, sodium picosulfate p. 54, and members of the anthraquinone group, senna p. 53, co-danthramer p. 52 and co-danthrusate p. 51. The indications for co-danthramer and

Flavours of oral powder formulations may include lemon.

CAUTIONARY AND ADVISORY LABELS 10, 13

ELECTROLYTES: May contain Magnesium, potassium

CitraFleet® SACHETS
One sachet should be reconstituted with 150 mL (approx. half a glass) of cold water.

Picolax® SACHETS
One sachet should be reconstituted with 150 mL (approx. half a glass) of cold water.

Sodium picosulfate 10 mg
Citric acid anhydrous 12 gram, Magnesium oxide 3.5 gram, Sodium picosulfate 10 mg
CitraFleet oral powder 15.08g sachets (sugar-free) | 2 sachet £3.25

Picolax® Ferring Pharmaceuticals Ltd
CitraFleet oral powder 16.1g sachets (sugar-free) | 2 sachet £3.39

Pharmacokinetics

Acts within 3 hours of first dose.

Contra-indications

Acute severe colitis - ascites - congestive cardiac failure - gastric retention - gastro-intestinal obstruction - gastro-intestinal perforation - gastro-intestinal ulceration - toxic megacolon

Cautions

General cautions:
Cardiac disease (avoid in congestive cardiac failure) - children - colitis (avoid if acute severe colitis) - debilitated patients - elderly - fluid and electrolyte disturbances - hypovolaemia (should be corrected before administration) - impaired gag reflex or possibility of regurgitation or aspiration - recent gastro-intestinal surgery

Side-effects

Common or very common:
Abdominal distension - abdominal pain (usually transient—reduced by taking more slowly) - nausea - vomiting

Uncommon:
Dehydration - dizziness - electrolyte disturbances - headache

Frequency not known:
Anal discomfort - fatigue - rash - sleep disturbances

Pregnancy
Caution.

Breast feeding
Caution.

Hepatic impairment
Avoid in hepatic coma if risk of renal failure.

Renal impairment
Avoid if eGFR less than 30 mL/minute/1.73 m²—risk of hypermagnesaemia.

Directions for administration
One sachet of sodium picosulfate with magnesium citrate powder should be reconstituted with 150 mL (approx. half a glass) of cold water; patients should be warned that heat is generated during reconstitution and that the solution should be allowed to cool before drinking.

CitraFleet® SACHETS
One sachet should be reconstituted with 150 mL (approx. half a glass) of cold water.

Picolax® SACHETS
One sachet should be reconstituted with 150 mL (approx. half a glass) of cold water.

Prescribing and dispensing information
Flavours of oral powder formulations may include lemon.

Patient and carer advice
Low residue diet recommended on the day before procedure and copious intake of water or other clear fluids recommended during treatment. Patients or carers should be given advice on how to administer sodium picosulfate with magnesium citrate oral powder.

CitraFleet® SACHETS
Low residue diet recommended on the day before procedure and copious intake of water or other clear fluids recommended during treatment. Patients and carers should be given advice on how to administer oral powder; they should be warned that heat is generated during reconstitution and that the solution should be allowed to cool before drinking.

Picolax® SACHETS
Low residue diet recommended on the day before procedure and copious intake of water or other clear fluids recommended during treatment. Patients and carers should be given advice on how to administer oral powder; they should be warned that heat is generated during reconstitution and that the solution should be allowed to cool before drinking.

Medicinal forms
There can be variation in the licensing of different medicines containing the same drug.
Constipation and bowel cleansing

44
BNF 70

co-danthrussate are limited by its potential carcinogenicity (based on rodent carcinogenicity studies) and evidence of genotoxicity. Powerful stimulants such as cascara (an anthraquinone) and castor oil are obsolete. Docusate sodium p. 52 probably acts both as a stimulant and as a softening agent.

Stimulant laxatives increase intestinal motility and often cause abdominal cramp; they should be avoided in intestinal obstruction. Excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia; however, prolonged use may be justifiable in some circumstances.

Bulk laxatives and non-ionic surfactants are therefore useful in the treatment of osmotic diarrhoea of low faecal pH, and discourage the proliferation of ammonia-producing organisms. It is avoided as they may give rise to sodium and water retention salts, such as magnesium sulfate are useful where rapid bowel clearance before radiology, endoscopy, and surgery is necessary.

Bowel cleansing preparations

Bowel cleansing preparations are used before colonic surgery, colonoscopy, or radiological examination to ensure the bowel is free of solid contents. They are not treatments for constipation.

Pregnancy

If dietary and lifestyle changes fail to control constipation in pregnancy, moderate doses of poorly absorbed laxatives may be used. A bulk-forming laxative should be tried first. An osmotic laxative, such as lactulose p. 47, can also be used. Bisacodyl p. 52 or senna p. 53 may be suitable, if a stimulant effect is necessary.

Constipation in children

Laxatives should be prescribed by a healthcare professional experienced in the management of constipation in children. Delays of greater than 3 days between stools may increase the likelihood of pain on passing hard stools leading to anal fissure, anal spasm and eventually to a learned response to avoid defaecation.

In infants, increased intake of fluids, particularly fruit juice containing sorbitol (e.g. prune, pear, or apple), may be sufficient to soften the stool. In infants under 1 year of age with mild constipation, lactulose p. 47 can be used to soften the stool; either an oral preparation containing macrogols or, rarely, glycerol p. 53 suppositories can be used to clear faecal impaction. The infant should be referred to a hospital paediatrician if these measures fail.

The diet of children over 1 year of age should be reviewed to ensure that it includes an adequate intake of fibre and fluid. An osmotic laxative containing macrogols can also be used, particularly in children with chronic constipation; lactulose p. 47 is an alternative in children who cannot tolerate a macrogol. If there is an inadequate response to the osmotic laxative, a stimulant laxative can be added. Treatment of faecal impaction may initially increase symptoms of soiling and abdominal pain. In children over 1 year of age with faecal impaction, an oral preparation containing macrogols is used to clear faecal mass and to establish and maintain soft well-formed stools. If disimpaction does not occur after 2 weeks, a stimulant laxative can be added. If the impacted mass is not expelled following treatment with macrogols and a stimulant laxative, a sodium citrate p. 677 enema can be administered. Although rectal administration of laxatives may be effective, this route is frequently distressing for the child and may lead to persistence of withholding. A phosphate enema may be administered under specialist supervision if disimpaction does not occur after a sodium citrate enema; a bowel cleansing preparation is an alternative. Manual evacuation under anaesthetic may be necessary if disimpaction does not occur after oral and rectal treatment, or if the child is afraid.

Long-term regular use of laxatives is essential to maintain well-formed stools and prevent recurrence of faecal impaction; intermittent use may provoke relapses. In children with chronic constipation, laxatives should be continued for several weeks after a regular pattern of bowel movements or toilet training is established. The dose of laxatives should then be tapered gradually, over a period of...
months, according to response. Some children may require laxative therapy for several years.

**Chronic constipation**
For children with chronic constipation, it may be necessary to exceed the licensed doses of some laxatives. Parents and carers of children should be advised to adjust the dose of laxative in order to establish a regular pattern of bowel movements in which stools are soft, well-formed, and passed without discomfort. Laxatives should be administered at a time that produces an effect that is likely to fit in with the child’s toilet routine.

**BULK FORMING LAXATIVES**

**Ispaghula husk**

- **DRUG ACTION** Bulk-forming laxatives relieve constipation by increasing faecal mass which stimulates peristalsis.

### INDICATIONS AND DOSE

#### ISPAGEL® ORANGE

**Constipation**
- **BY MOUTH**
  - Child 6-11 years: 2.5–5 mL twice daily, dose to be given as a half or whole level spoonful in water, preferably after meals
  - Child 12-17 years: 1 sachet 1–3 times a day, dose to be given in water preferably after meals, alternatively 10 mL 1–3 times a day, dose to be given as level spoonfuls in water, preferably after meals
  - Adult: 1 sachet 1–3 times a day, dose to be made up in water, preferably taken after food

**Dose equivalence and conversion**
1 sachet equivalent to 2 level 5 mL spoonfuls.

#### FYBOGEL®

**Constipation**
- **BY MOUTH**
  - Child 6-11 years: 2.5–5 mL twice daily, dose to be given as a half or whole level spoonfuls in water, preferably after meals
  - Child 12-17 years: 1 sachet twice daily, dose to be made up in water, preferably taken after food, alternatively 10 mL twice daily, dose to be made up in water, preferably taken after food
  - Adult: 1 sachet twice daily, dose to be made up in water, preferably taken after food, alternatively 10 mL twice daily, dose to be made up in water, preferably taken after food

**Dose equivalence and conversion**
1 sachet equivalent to 2 level 5 mL spoonfuls.

- **CONTRA-INDICATIONS** Colonic atony - difficulty in swallowing - faecal impaction - infective bowel disease - intestinal obstruction
- **CAUTIONS** Adequate fluid intake should be maintained to avoid intestinal obstruction

**CAUTIONS, FURTHER INFORMATION**
It may be necessary to supervise elderly or debilitated patients or those with intestinal narrowing or decreased motility to ensure adequate fluid intake.

- **SIDE-EFFECTS** Abdominal distension (especially during the first few days of treatment) - flatulence (especially during the first few days of treatment) - gastro-intestinal impaction - gastro-intestinal obstruction - hypersensitivity

- **PRESCRIBING AND DISPENSING INFORMATION** Ispagel® Orange and Fybofel® effervescent granules are available as GSL medicines. Flavours of soluble granules formulations may include plain, lemon, or orange.

- **PATIENT AND CARER ADVICE** Patients and their carers should be advised that the full effect may take some days to develop. Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Granules

- **CAUTIONARY AND ADVISORY LABELS**
- **ISPAGHULA HUSK (Non-proprietary)**
  - Ispaghula husk 3.5 gram
  - Ispaghula husk granules sachets gluten free | 30 sachet GSK £2.29

#### Effervescent granules

- **CAUTIONARY AND ADVISORY LABELS**
- **ISPAGHULA HUSK (Non-proprietary)**
  - Ispaghula husk 3.5 gram
  - Ispaghula husk 3.5g effervescent granules sachets gluten free sugar free (sugar-free) | 30 sachet price = £2.29

#### Powder

- **CAUTIONARY AND ADVISORY LABELS**
- **ISPAGHULA HUSK (Non-proprietary)**
  - Ispaghula husk 1 mg per 1 mg
  - Husk oral powder (sugar-free) | 200 gram GSK £5.24

Also available in combination with senna, p. 53

**Methycellulose**

- **DRUG ACTION** Bulk-forming laxatives relieve constipation by increasing faecal mass which stimulates peristalsis.

### INDICATIONS AND DOSE

**Constipation**
- **Diarrhoea**
  - **BY MOUTH USING TABLETS**
    - Adult: 3–6 tablets daily

- **CONTRA-INDICATIONS** Colonic atony - difficulty in swallowing - faecal impaction - infective bowel disease - intestinal obstruction

- **CAUTIONS** Adequate fluid intake should be maintained to avoid intestinal obstruction

**CAUTIONS, FURTHER INFORMATION**
It may be necessary to supervise elderly or debilitated patients or those with intestinal narrowing or decreased motility to ensure adequate fluid intake.

- **SIDE-EFFECTS** Abdominal distension (especially during the first few days of treatment) - flatulence (especially during the first few days of treatment) - gastro-intestinal impaction - gastro-intestinal obstruction - hypersensitivity

- **DIRECTIONS FOR ADMINISTRATION** In constipation the dose should be taken with at least 300 mL liquid. In diarrhoea, ileostomy, and colostomy control, avoid liquid intake for 30 minutes before and after dose.

- **PATIENT AND CARER ADVICE** Patients and their carers should be advised that the full effect may take some days to develop. Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, enema

#### Tablet

- **Celevac (AMCo)**
  - Methyccellulose "450" 500 mg Celevac 500mg tablets | 112 tablet £4.64 DT price = £3.22
**Sternula**

**INDICATIONS AND DOSE**

**CONSTIPATION**

**BY MOUTH**

- Child 6-11 years: 0.5–1 sachet 1–2 times a day, alternatively, half to one heaped 5-mL spoonful once or twice a day; washed down without chewing with plenty of liquid after meals.
- Child 12-17 years: 1–2 sachets 1–2 times a day, alternatively, one to two heaped 5-mL spoonfuls once or twice a day; washed down without chewing with plenty of liquid after meals.
- Adult: 1–2 sachets 1–2 times a day, alternatively, one to two heaped 5-mL spoonfuls once or twice a day; washed down without chewing with plenty of liquid after meals.

**CONTRA-INDICATIONS**

Colonic atony, difficulty in swallowing, faecal impaction, intestinal obstruction.

**CAUTIONS**

Adequate fluid intake should be maintained to avoid intestinal obstruction.

**SIDE-EFFECTS**

- Frequency not known: Hyperhidrosis, palpitation.
- Uncommon: Chest pain, muscle spasm, syncope, vomiting.

**PREGNANCY**

Manufacturer advises avoid—toxicity in animal studies.

**BREAST FEEDING**

Manufacturer advises avoid.

**HEPATIC IMPAIRMENT**

In moderate to severe impairment, initially 24 micrograms once daily; if tolerated, and if necessary, increased to 24 micrograms twice daily.

**PRESCRIBING AND DISPENSING INFORMATION**

Dispense capsules in original container; discard any capsules remaining 4 weeks after opening.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

Lubiprostone for treating chronic idiopathic constipation. (July 2014) NICE TA318

Lubiprostone is recommended as an option for treating chronic idiopathic constipation for adults in whom treatment with at least 2 laxatives from different classes, at the highest tolerated recommended doses for at least 6 months, has failed to provide adequate relief and for whom invasive treatment for constipation is being considered. If treatment with lubiprostone is not effective after 2 weeks, the patient should be re-examined and the benefit of continuing treatment reconsidered.

Lubiprostone should only be prescribed by a clinician with experience of treating chronic idiopathic constipation, after careful review of the patient’s previous courses of laxative treatments. www.nice.org.uk/TA318

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (July 2014) that lubiprostone (Amitiza®) is not recommended for use within NHS Scotland.

**MAGNESIUM-CONTAINING DRUGS**

**Magnesium hydroxide**

**INDICATIONS AND DOSE**

**CONSTIPATION**

**BY MOUTH**

- Adult: 30–45 mL as required, dose to be given mixed with water at bedtime.

**CONTRA-INDICATIONS**

Acute gastro-intestinal conditions.

**CAUTIONS**

Debilitated patients, elderly.

**INTERACTIONS**

→ Appendix 1 (antacids).

**SIDE-EFFECTS**

Colic, abdominal pain, diarrhoea, dizziness, dyspepsia, dysphoria, flatulence, headache, hot flush, hyperhidrosis, nausea, oedema, palpitation, palpitation.

**PREGNANCY**

Manufacturer advises avoid.

**HEPATIC IMPAIRMENT**

Avoid in hepatic coma if risk of renal failure.

**RENAI IMPAIRMENT**

Avoid reduce dose. Increased risk of toxicity in renal impairment.

**PRESCRIBING AND DISPENSING INFORMATION**

When prepared extemporaneously, the BP states Magnesium Hydroxide Mixture, BP consists of an aqueous suspension containing about 8% hydrated magnesium oxide.

**MAGNIFICENT FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- Sterculia 620 mg per 1 gram:
  - Normacol granules 7g sachets: 60 sachet (GS) £5.77 OT price = £5.77
  - Normacol granules: 500 gram (GS) £6.85 OT price = £6.85

**CHLORIDE-CHANNEL ACTIVATORS**

**Lubiprostone**

**INDICATIONS AND DOSE**

Chronic idiopathic constipation when response to lifestyle changes (including diet) inadequate.

**BY MOUTH**

- Adult: 24 micrograms twice daily for 2 weeks.

**CONTRA-INDICATIONS**

Gastro-intestinal obstruction.

**SIDE-EFFECTS**

- Common or very common: Abdominal pain, diarrhoea, dizziness, dyspepsia, dysphoria, flatulence, headache, hot flush, hyperhidrosis, nausea, oedema, palpitation.
OPIOID RECEPTOR ANTAGONISTS (PERIPHERAL)

Methylnaltrexone bromide

DRUG ACTION Peripheral acting opioid-receptor antagonist which does not alter the central analgesic effect of opioids.

INDICATIONS AND DOSE
Adjunct to other laxatives in opioid-induced constipation in terminally ill patients, when response to other laxatives is inadequate.

BY SUBCUTANEOUS INJECTION
- Adult (body-weight up to 38 kg): 150 micrograms/kg once daily on alternate days for maximum duration of treatment 4 months, may be given less frequently depending on response; 2 consecutive doses may be given 24 hours apart if no response to treatment on the preceding day.
- Adult (body-weight 38–62 kg): 8 mg once daily on alternate days for maximum duration of treatment 4 months, may be given less frequently depending on response; 2 consecutive doses may be given 24 hours apart if no response to treatment on the preceding day.
- Adult (body-weight 62–114 kg): 12 mg once daily on alternate days for maximum duration of treatment 4 months, may be given less frequently depending on response; 2 consecutive doses may be given 24 hours apart if no response to treatment on the preceding day.
- Adult (body-weight 115 kg and above): 150 micrograms/kg once daily on alternate days for maximum duration of treatment 4 months, may be given less frequently depending on response; 2 consecutive doses may be given 24 hours apart if no response to treatment on the preceding day.

PHARMACOKINETICS
May act with 30–60 minutes.

CONTRA-INDICATIONS Acute surgical abdominal conditions - gastrointestinal obstruction.

CAUTIONS Diverticular disease - faecal impaction - patients with colostomy - patients with peritoneal catheter.

SIDE-EFFECTS
- Common or very common Abdominal pain - diarrhoea - dizziness - flatulence - hyperhidrosis - injection site reactions - nausea.
- Frequency not known Gastro-intestinal perforation.
- PREGNANCY Toxicity at high doses in animal studies—manufacturer advises avoid unless essential.
- BREAST FEEDING Manufacturer advises use only if potential benefit outweighs risk—present in milk in animal studies.
- HEPATIC IMPAIRMENT Manufacturer advises avoid in severe hepatic impairment—no information available.
- RENAL IMPAIRMENT If eGFR less than 30 ml/minute/1.73 m², reduce dose as follows: body-weight under 62 kg, 75 micrograms/kg on alternate days; body-weight 62–114 kg, 8 mg on alternate days; body-weight over 114 kg, 75 micrograms/kg on alternate days.

DIRECTIONS FOR ADMINISTRATION Rotate injection site.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- Relistor (TMC Pharma Services Ltd)
  Methylnaltrexone bromide 20 mg per 1 ml Relistor 12mg/0.6ml solution for injection vials 1 vial  21.05  7 vial  147.35

OSMOTIC LAXATIVES

Lactulose

INDICATIONS AND DOSE
Constipation
BY MOUTH
- Adult: Adjusted according to response to 30–50 mL 3 times a day, subsequently adjusted to produce 2–3 soft stools per day.

PHARMACOKINETICS
Lactulose may take up to 48 hours to act.

UNLICENSED USE
- In children Not licensed for use in children for hepatic encephalopathy.
- In adults Lactulose doses in the BNF may differ from those in product literature.

CONTRA-INDICATIONS Galactosaemia - intestinal obstruction.

CAUTIONS Lactose intolerance.

INTERACTIONS → Appendix 1 (lactulose).

SIDE-EFFECTS
- Common or very common Abdominal discomfort - cramps - flatulence - nausea - vomiting.

SIDE-EFFECTS, FURTHER INFORMATION
Nausea. Nausea can be reduced by administration with water, fruit juice or meals.

PREGNANCY Not known to be harmful.

**INDICATIONS AND DOSE**

### Chronic constipation

**BY MOUTH**
- Child 12-17 years: 1–3 sachets daily in divided doses usually for up to 2 weeks; maintenance 1–2 sachets daily
- Adult: 1–3 sachets daily in divided doses usually for up to 2 weeks; maintenance 1–2 sachets daily

**Faecal impaction**

**BY MOUTH**
- Child 12-17 years: 4 sachets on first day, then increased in steps of 2 sachets daily, total daily dose to be drunk within a 6 hour period, after disimpaction, switch to maintenance laxative therapy if required; maximum 8 sachets per day
- Adult: 4 sachets on first day, then increased in steps of 2 sachets daily, total daily dose to be drunk within a 6 hour period, after disimpaction, switch to maintenance laxative therapy if required; maximum 8 sachets per day

**MOVICOL® LIQUID**

**Chronic constipation**

**BY MOUTH**
- Child 12-17 years: 25 mL 1–3 times a day usually for up to 2 weeks; maintenance 25 mL 1–2 times a day
- Adult: 25 mL 1–3 times a day usually for up to 2 weeks; maintenance 25 mL 1–2 times a day

**MOVICOL-PAEDIATRIC®**

**Chronic constipation | Prevention of faecal impaction**

**BY MOUTH**
- Child 2–5 years: 1 sachet daily, adjust dose to produce regular soft stools; maximum 4 sachets per day
- Child 6–11 years: 2 sachets daily, adjust dose to produce regular soft stools; maximum 4 sachets per day

**Faecal impaction**

**BY MOUTH**
- Child 5–11 years: Initially 4 sachets daily on first day, then increased in steps of 2 sachets daily, total daily dose to be taken over a 12-hour period, after disimpaction, switch to maintenance laxative therapy; maximum 12 sachets per day

**MOVICOL® ORAL POWDER**

**Chronic constipation**

**BY MOUTH**
- Child 12-17 years: 1–3 sachets daily in divided doses usually for up to 2 weeks; maintenance 1–2 sachets daily
- Adult: 1–3 sachets daily in divided doses usually for up to 2 weeks; maintenance 1–2 sachets daily

**Faecal impaction**

**BY MOUTH**
- Child 12-17 years: Initially 4 sachets daily on first day, then increased in steps of 2 sachets daily, total daily dose to be drunk within a 6 hour period, after disimpaction, switch to maintenance laxative therapy if required; maximum 8 sachets per day
- Adult: Initially 4 sachets daily on first day, then increased in steps of 2 sachets daily, total daily dose to be drunk within a 6 hour period, after disimpaction, switch to maintenance laxative therapy if required; maximum 8 sachets per day

**MOVICOL-HALF®**

**Chronic constipation**

**BY MOUTH**
- Child 12-17 years: 2–6 sachets daily in divided doses usually for up to 2 weeks; maintenance 2–4 sachets daily
- Adult: 2–6 sachets daily in divided doses usually for up to 2 weeks; maintenance 2–4 sachets daily

**Faecal impaction**

**BY MOUTH**
- Child 12-17 years: Initially 8 sachets daily on first day, then increased in steps of 4 sachets daily, total daily dose to be drunk within 6 hours, after disimpaction, switch to maintenance laxative therapy; maximum 16 sachets per day
- Adult: Initially 8 sachets daily on first day, then increased in steps of 4 sachets daily, total daily dose to be drunk within 6 hours, after disimpaction, switch to maintenance laxative therapy; maximum 16 sachets per day

**UNLICENSED USE**

**MOVICOL-PAEDIATRIC®**

Movicol® Paediatric not licensed for use in faecal impaction in children under 5 years, or for chronic constipation in children under 2 years.

**CONTRA-INDICATIONS**

- Crohn’s disease
- Intestinal obstruction
- Intestinal perforation
- Paralytic ileus
- Severe inflammatory conditions of the intestinal tract
- Toxic megacolon
- Ulcerative colitis

**MOVICOL-PAEDIATRIC®**

Cardiovascular impairment · renal impairment.

**CAUTIONS**

Cardiovascular impairment (should not take more than 2 ‘full-strength’ sachets or 4 ‘half-strength’ sachets in any one hour) · discontinue if symptoms of fluid and electrolyte disturbance

**MOVICOL-PAEDIATRIC®**

Impaired consciousness (with high doses) · impaired gag reflex (with high doses) · reflux oesophagitis (with high doses)

**INTERACTIONS**

- Appendix 1 (macrogols).

**SIDE-EFFECTS**

- Abdominal distention · abdominal pain · flatulence · nausea

**PREGNANCY**

Limited data, but manufacturer advises that it can be used.

**BREAST FEEDING**

Manufacturer advises that it can be used.

**DIRECTIONS FOR ADMINISTRATION**

Contents of each ‘full strength’ sachet of oral powder to be dissolved in half a glass (approx. 125 mL) of water; after reconstitution the solution should be kept in a refrigerator and discarded if unused after 6 hours.

**MOVICOL® LIQUID**

25 mL of oral concentrate to be diluted with half a glass (approx. 100 mL) of water. After dilution the solution should be discarded if unused after 24 hours.

**MOVICOL-PAEDIATRIC®**

Contents of each sachet to be dissolved in quarter of a glass (approx. 60–65 mL) of water; after reconstitution the solution should be kept in a refrigerator and discarded if unused after 24 hours.

**MOVICOL® ORAL POWDER**

Contents of each sachet to be dissolved in half a glass (approx. 125 mL) of water; after reconstitution the solution should be kept in a refrigerator and discarded if unused after 6 hours.

**MOVICOL-HALF®**

Contents of each sachet to be dissolved in quarter of a glass (approx. 60–65 mL) of water; after reconstitution...
Liquid paraffin with magnesium hydroxide

The properties listed below are those particular to the combination only. For the properties of the components please consider, liquid paraffin above, magnesium hydroxide p. 46.

**INDICATIONS AND DOSE**

**Conipation**
- **BY MOUTH**
  - Adult: 5–20 mL as required

**PRESCRIBING AND DISPENSING INFORMATION**
- Liquid paraffin and magnesium hydroxide preparations are on sale to the public. When prepared extemporaneously, the BP states Liquid Paraffin and Magnesium Hydroxide Oral Emulsion, BP consists of 25% liquid paraffin in aqueous suspension containing 6% hydrated magnesium oxide.
- **LESS SUITABLE FOR PRESCRIBING** Liquid paraffin with magnesium hydroxide is less suitable for prescribing.

**PRESCRIBING AND DISPENSING INFORMATION**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

**Sodium acid phosphate with sodium phosphate**

**INDICATIONS AND DOSE**

**Constipation (using Phosphates Enema BP Formula B)**
- Bowel evacuation before abdominal radiological procedures, endoscopy, and surgery (using Phosphates Enema BP Formula B)
  - **BY RECTUM**
    - Child 3–6 years: 45–65 mL once daily
    - Child 7–11 years: 65–100 mL once daily
    - Child 12–17 years: 100–128 mL once daily
    - Adult: 128 mL daily

**CONTRA-INDICATIONS** Children under 3 years

**CAUTIONS** Avoid prolonged use

**SIDE-EFFECTS** Anal irritation after prolonged use - anal seepage of paraffin after prolonged use - granulomatous reactions caused by absorption of small quantities of liquid paraffin (especially from the emulsion) - interference with the absorption of fat-soluble vitamins - lipid pneumonia

**PRESCRIBING AND DISPENSING INFORMATION**

- When prepared extemporaneously, the BP states Liquid Paraffin Oral Emulsion, BP consists of liquid paraffin 5 mL, vanillin 5 mg, chloroform 0.25 mL, benzoic acid solution 0.2 mL, methylcellulose-20 200 mg, saccharin sodium 500 micrograms, water to 10 mL...

**PATIENT AND CARER ADVICE**
- Oral emulsion should not be taken immediately before going to bed.

**MEDICINES FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops
  - **L I Q U I D PA R A F F I N  ( N o n - p r o p r i e t a r y )**
    - Liquid paraffin 1 ml per 1 ml Liquid paraffin liquid | 150 ml £ 1.32–1.45

**MACROGOL 3350 WITH POTASSIUM CHLORIDE, SODIUM BICARBONATE AND SODIUM CHLORIDE (Non-proprietary)**

- Bicarbonate 17 mmol per 1 litre, Chloride 53 mmol per 1 litre, Macrogol 3350 13.125 gram, Potassium 5.4 mmol per 1 litre, Sodium 65 mmol per 1 litre
  - Movicol Liquid (sugar-free) | 500 ml £ 4.45
  - Powder
  - Liquid paraffin with magnesium hydroxide oral
  - MACROGOL 3350 WITH POTASSIUM CHLORIDE, SODIUM BICARBONATE AND SODIUM CHLORIDE (Non-proprietary)
  - Bicarbonate 17 mmol per 1 litre, Chloride 53 mmol per 1 litre, Macrogol 3350 13.125 gram, Potassium 5.4 mmol per 1 litre, Sodium 65 mmol per 1 litre
  - Movicol Plain oral powder 13.7g sachets sugar free (sugar-free) | 20 sachet (£ 3.26–3.45, sugar-free) | 30 sachet (£ 4.68 DT price = £ 4.27)
  - Bicarbonate 17 mmol per 1 litre, Chloride 53 mmol per 1 litre, Macrogol 3350 13.125 gram, Potassium 5.4 mmol per 1 litre, Sodium 65 mmol per 1 litre
  - Movicol Plain oral powder 13.7g sachets sugar free (sugar-free) | 30 sachet (£ 4.68 DT price = £ 4.27)
  - Movicol (Norgine Pharmaceuticals Ltd)
  - Bicarbonate 17 mmol per 1 litre, Chloride 53 mmol per 1 litre, Macrogol 3350 13.125 gram, Potassium 5.4 mmol per 1 litre, Sodium 65 mmol per 1 litre
  - Movicol Plain oral powder 13.7g sachets sugar free (sugar-free) | 30 sachet (£ 6.68 DT price = £ 4.27)
  - Movicol oral powder 13.8g sachets lemon & lime (sugar-free) | 20 sachet (£ 4.45, sugar-free) | 30 sachet (£ 6.68 DT price = £ 4.27)
  - Bicarbonate 17 mmol per 1 litre, Chloride 53 mmol per 1 litre, Macrogol 3350 13.125 gram, Potassium 5.4 mmol per 1 litre, Sodium 65 mmol per 1 litre
  - Movicol-Half oral powder 6.9g sachets sugar free (sugar-free) | 20 sachet (£ 2.92, sugar-free) | 30 sachet (£ 4.38)
  - Movicol Paediatric Plain oral powder 6.9g sachets sugar free (sugar-free) | 30 sachet (£ 6.95)
  - Movicol Paediatric Chocolate oral powder 6.9g sachets sugar free (sugar-free) | 30 sachet (£ 6.95)
  - Brands may include Cosmoocol, Laxido, Macilax; Molaxole

**PARAFFINS**

**Liquid paraffin**

**INDICATIONS AND DOSE**

**Conipation**
- **BY MOUTH**
  - Adult: 10–30 mL daily if required, to be administered at night

- **CONTRA-INDICATIONS** Children under 3 years
- **CAUTIONS** Avoid prolonged use
- **SIDE-EFFECTS** Anal irritation after prolonged use - anal seepage of paraffin after prolonged use - granulomatous reactions caused by absorption of small quantities of liquid paraffin (especially from the emulsion) -
**FLEET® PHOSPHO-SODA**

Bowel evacuation before colonic surgery | Bowel evacuation before colonoscopy | Bowel evacuation before radiological examination

**BY MOUTH**
- Adult: 45 mL twice daily, each dose must be diluted with half a glass (120 mL) of cold water, followed by one full glass (240 mL) of cold water; timing of doses is dependent on the time of the procedure, for morning procedure, the first dose should be taken at 7 a.m. and second at 7 p.m. on day before the procedure; for afternoon procedure, first dose should be taken at 7 p.m. on day before and second dose at 7 a.m. on day of the procedure

**PHARMACOKINETICS**
Onset of action is within half to 6 hours of first dose.

**FLEET® READY-TO-USE ENEMA**
Constipation | Bowel evacuation before abdominal radiological procedures | Bowel evacuation before endoscopy | Bowel evacuation before surgery

**BY RECTUM**
- Adult: 118 mL.

#### CONTRA-INDICATIONS
- With oral use Acute severe colitis - ascites - congestive cardiac failure - gastric retention - gastro-intestinal obstruction - gastro-intestinal perforation - toxic megacolon
- With rectal use Conditions associated with increased colonic absorption - gastro-intestinal obstruction - inflammatory bowel disease

#### CAUTIONS
- With oral use Cardiac disease (avoid in congestive cardiac failure) - colitis (avoid if acute severe colitis) - elderly and debilitated patients - fluid and electrolyte disturbances - hypovolaemia (should be corrected before administration) - impaired gag reflex or possibility of regurgitation or aspiration
- With rectal use Ascites - congestive heart failure - elderly and debilitated patients - electrolyte disturbances - uncontrolled hypertension

#### INTERACTIONS
- With oral use Other oral drugs should not be taken one hour before or after administration of bowel cleansing preparations because absorption may be impaired. Consider withholding ACE inhibitors, angiotensin-II receptor antagonists, and NSAIDs on the day that bowel cleansing preparations are given and for up to 72 hours after the procedure. Also consider withholding diuretics on the day that bowel cleansing preparations are given.

#### SIDE-EFFECTS
- Common or very common
  - With oral use Abdominal distension - abdominal pain (usually transient - reduced by taking more slowly) - nausea - vomiting
  - Uncommon
    - With oral use Dehydration - dizziness - headache
    - Frequency not known
    - With oral use Arrhythmias - asthenia - chest pain - electrolyte disturbances - renal failure
    - With rectal use Electrolyte disturbances - local irritation
- Pregnancy
  - With oral use Caution.
  - Breast Feeding
    - With oral use Caution.
- Hepatic Impairment
  - Use with caution in cirrhosis.
- Renal Impairment
  - With oral use Avoid if eGFR less than 60 mL/minute/1.73 m².
  - With rectal use Use with caution.

#### MONITORING REQUIREMENTS
- With oral use Renal function should be measured before starting treatment in patients at risk of fluid and electrolyte disturbances.

#### DIRECTIONS FOR ADMINISTRATION
**FLEET® PHOSPHO-SODA**
Copious intake of water or other clear fluids (e.g. clear soup, strained fruit juice without pulp, black tea or coffee) recommended until midnight before morning procedure and until 8 a.m. after afternoon procedure. At least one glass (approx 240 mL) of water or other clear fluid should also be taken immediately before each dose.

#### PRESCRIBING AND DISPENSING INFORMATION
When prepared extemporaneously, the BP states Phosphates Enema BP Formula B consists of sodium dihydrogen phosphate dihydrate 12.8 g, disodium phosphate dodecahydrate 10.24 g, purified water, freshly boiled and cooled, to 128 mL.

#### PATIENT AND CARER ADVICE
**FLEET® PHOSPHO-SODA**
Intake of solid food should be stopped for at least 6 hours before starting treatment and until procedure completed. Patients or carers should be advised that adequate hydration should be maintained during treatment. Patients or carers should be given advice on administration of Fleet Phospho-soda® oral solution.

#### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

**Fleet Phospho-soda (Laboratorios Casen-Fleet S.L.U)**
- Disodium hydrogen phosphate dodecahydrate 240 mg per 1 ml, Sodium dihydrogen phosphate dihydrate 542 mg per 1 ml
- Fleet Phospho-soda oral solution (sugar-free) | 90 ml | £4.79

**Enema**
- Sodium Acid Phosphate with Sodium Phosphate (Non-proprietary)
  - Disodium hydrogen phosphate dodecahydrate 80 mg per 1 ml, Sodium dihydrogen phosphate dihydrate 100 mg per 1 ml
- Phosphates enema (Formula B) 128ml long tube | 1 enema | £1.93
  - Disodium hydrogen phosphate dodecahydrate 80 mg per 1 ml, Sodium dihydrogen phosphate dihydrate 181 mg per 1 ml
- Fleet Ready-to-use (Laboratorios Casen-Fleet S.L.U)
  - Sodium dihydrogen phosphate dihydrate 80 mg per 1 ml, Sodium dihydrogen phosphate dihydrate 181 mg per 1 ml
  - Fleet Ready-to-use 133ml enema | 1 enema | £0.68

#### SELECTIVE 5-HT4 RECEPTOR AGONISTS

**Prucalopride**

#### DRUG ACTION
A selective serotonin 5-HT4-receptor agonist with prokinetic properties.

#### INDICATIONS AND DOSE
Chronic constipation in women when other laxatives fail to provide an adequate response

**BY MOUTH**
- Adult: 2 mg once daily, review treatment if no response after 4 weeks
- Elderly: Initially 1 mg once daily, increased if necessary to 2 mg once daily, review treatment if no response after 4 weeks

#### CONTRA-INDICATIONS
Crohn’s disease - intestinal obstruction - intestinal perforation - severe inflammatory conditions of the intestinal tract - toxic megacolon - ulcerative colitis

#### CAUTIONS
History of arrhythmias - history of ischaemic heart disease - severe, unstable chronic illness
INTERACTIONS Caution with concomitant use of drugs that prolong QT interval.

SIDE-EFFECTS
- Common or very common Abdominal pain · diarrhoea · dizziness · dyspepsia · fatigue · flatulence · gastro-intestinal symptoms · headache · nausea · polyuria · rectal bleeding · vomiting
- Uncommon Anorexia · fever · palpitation · tremor

SIDE-EFFECTS, FURTHER INFORMATION
Side-effects generally occur at the start of treatment and are usually transient.

CONCEPTION AND CONTRACEPTION Manufacturer recommends effective contraception during treatment.

PREGNANCY Manufacturer advises avoid.

BREAST FEEDING
Manufacturer advises avoid—present in milk.

HEPATIC IMPAIRMENT In severe impairment, initially 1 mg once daily, increased if necessary to 2 mg once daily.

RENAL IMPAIRMENT Max. 1 mg daily if eGFR less than 30 ml/minute/1.73 m².

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
- Prucalopride for the treatment of chronic constipation in women (December 2010) NICE TA211
Prucalopride is recommended as an option for the treatment of chronic constipation in women for whom treatment with at least 2 laxatives from different classes, at the highest tolerated recommended doses for at least 6 months, has failed to provide adequate relief and invasive treatment for constipation is being considered. If treatment with prucalopride is not effective after 4 weeks, the patient should be re-examined and the benefit of continuing treatment reconsidered.

Prucalopride should only be prescribed by a clinician with experience of treating chronic constipation, after careful review of the patient’s previous courses of laxative treatments. www.nice.org.uk/TA211

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (November 2010) that prucalopride (Resolor®) is not recommended for use within NHS Scotland because weaknesses in the clinical data prevent an assessment of its efficacy in the target population.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet
- Resolor (Shire Pharmaceuticals Ltd)
  Prucalopride (as Prucalopride succinate) 1 mg Resolor 1mg tablets | 28 tablet (Ref) £38.69 DT price = £38.69
  Prucalopride (as Prucalopride succinate) 2 mg Resolor 2mg tablets | 28 tablet (Ref) £59.52 DT price = £59.52

Arachis oil

INDICATIONS AND DOSE
To soften impacted faeces
BY RECTUM
- Adult: 130 mL as required

CAUTIONS
- Hypersensitivity to soya · intestinal obstruction
- Allergy and Cross-Sensitivity Contraindicated if history of hypersensitivity to arachis oil or peanuts.
- DIRECTIONS FOR ADMINISTRATION Warm enema in warm water before use.

SOFTENING DRUGS

Co-danthrusate

INDICATIONS AND DOSE
Constipation in terminally ill patients
BY MOUTH USING CAPSULES
- Child 6–11 years: 1 capsule once daily, to be taken at night
- Child 12–17 years: 1–3 capsules once daily, to be taken at night
- Adult: 1–3 capsules once daily, to be taken at night

BY MOUTH USING ORAL SUSPENSION
- Child 6–11 years: 5 mL once daily, to be taken at night
- Child 12–17 years: 5–15 mL once daily, to be taken at night
- Adult: 5–15 mL once daily, to be taken at night

Dose equivalence and conversion
Co-danthrusate suspension contains dantron 50 mg and docusate 60 mg per 5 mL.
Co-danthrusate capsules contain dantron 50 mg and docusate 60 mg per capsule.

CONTRA-INDICATIONS
Acute abdominal conditions (in children) · acute inflammatory bowel disease · acute surgical abdominal conditions (in adults) · intestinal obstruction · severe dehydration

CAUTIONS
Rodent studies indicate potential carcinogenic risk · excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia · may cause local irritation

CAUTIONS, FURTHER INFORMATION
Local irritation Avoid prolonged contact with skin (as in incontinent patients or infants wearing nappies—risk of irritation and excoriation).

SIDE-EFFECTS Abdominal cramp · urine may be coloured red

PREGNANCY Manufacturers advise avoid—limited information available.

BREAST FEEDING Manufacturer’s advise avoid—no information available.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS

CO-DANTHRUSATE (Non-proprietary)
- Dantron 50 mg, Docusate sodium 60 mg Co-danthrusate 50mg/60mg capsules | 63 capsule (Ref) £42.50 DT price = £42.50
- Normax (Galen Ltd)
  Dantron 50 mg, Docusate sodium 60 mg Normax capsules | 63 capsule (Ref) £42.50 DT price = £42.50

Oral suspension

CAUTIONARY AND ADVISORY LABELS

Normax (Focus Pharmaceuticals Ltd)
- Dantron 10 mg per 1 mL, Docusate sodium 12 mg per 1 mL Normax oral suspension (sugar-free) | 200 mL (Ref) £89.92 DT price = £89.92
52 Constipation and bowel cleansing

**STIMULANT LAXATIVES**

**Bisacodyl**

**INDICATIONS AND DOSE**

Constitution

**BY MOUTH**

- Child 4–17 years: 5–20 mg once daily, adjusted according to response, dose to be taken before noon and evening
- Adult: 5–10 mg once daily increased if necessary up to 20 mg once daily, dose to be taken at night

**BY RECTUM**

- Child 2–17 years: 5–10 mg once daily, adjusted according to response
- Adult: 10 mg once daily, dose to be taken in the morning

**Bowel clearance before radiological procedures and surgery**

**INITIALLY BY MOUTH**

- Adult: 10 mg twice daily, dose to be taken in the morning and evening on the day before procedure and (by rectum) 10 mg, to be administered 1–2 hours before procedure the following day

**PHARMACOKINETICS**

Tablets act in 10–12 hours; suppositories act in 20–60 minutes.

**CONTRA-INDICATIONS**

- Acute abdominal conditions (in children) - acute inflammatory bowel disease - acute surgical abdominal conditions (in adults) - intestinal obstruction - severe dehydration

**CAUTIONS**

- Excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia - risk of electrolyte imbalance with prolonged use (in children)

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Abdominal cramp - colitis - nausea - vomiting

**SPECIFIC SIDE-EFFECTS**

- With rectal use Local irritation
- **PREGNANCY** May be suitable for constipation in pregnancy, if a stimulant effect is necessary.

**MEDIcINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, enema, suppository

**Gastro-resistant tablet**

  - Bisacodyl 5 mg Bisacodyl 5mg gastro-resistant tablets | 60 tablet  £3.25 DT price = £2.30 | 100 tablet  £3.83–£5.40 | 500 tablet  £25.73 | 1000 tablet  £51.45

- **Suppository**
  - **BISACODYL (Non-proprietary)**
    - Bisacodyl 10 mg Bisacodyl 10mg suppositories | 12 suppository  £3.53 DT price = £3.53
  - Brains may include Dulco-Lax tablets and suppositories.

**Co-danthramer**

**INDICATIONS AND DOSE**

Constipation in terminally ill patients (standard strength capsules)

**BY MOUTH USING CAPSULES**

- Child 6–11 years: 1 capsule once daily, dose should be taken at night
- Child 12–17 years: 1–2 capsules once daily, dose should be taken at night
- Adult: 1–2 capsules once daily, dose should be taken at night

---

**Docsolate sodium** (Diocyl sodium sulphosuccinate)

**INDICATIONS AND DOSE**

**Chronic constipation**

**BY MOUTH**

- Child 6 months–1 year: 12.5 mg 3 times a day, adjusted according to response, use paediatric oral solution
- Child 2–11 years: 12.5–25 mg 3 times a day, adjusted according to response, use paediatric oral solution
- Child 12–17 years: Up to 500 mg daily in divided doses, adjusted according to response
- Adult: Up to 500 mg daily in divided doses, adjusted according to response

**BY RECTUM**

- Adult: 120 mg for 1 dose

**Adjunct in abdominal radiological procedures**

**BY MOUTH**

- Adult: 400 mg, to be administered with barium meal

**BY RECTUM**

- Adult: 120 mg for 1 dose

**PHARMACOKINETICS**

Oral preparations act within 1–2 days; response to rectal administration usually occurs within 20 minutes.

- **UNLICENSED USE**
  - With oral use in children *Adult oral solution and capsules* not licensed for use in children under 12 years.
  - **CONTRA-INDICATIONS** Avoid in intestinal obstruction
  - **CAUTIONS** Do not give with liquid paraffin - excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia - rectal preparations not indicated if haemorrhoids or anal fissure
  - **SIDE-EFFECTS** Abdominal cramp - diarrhoea (excessive use) - hypokalaemia - rash
  - **PREGNANCY** Not known to be harmful — manufacturer advises caution.
  - **BREAST FEEDING**
    - With oral use Present in milk following oral administration — manufacturer advises caution.
    - With rectal use Rectal administration not known to be harmful.

- **DIRECTIONS FOR ADMINISTRATION**
  - With oral use in children For administration by mouth, solution may be mixed with milk or squash.

- **MEDIcINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Capsule**
    - Diocyl (UCB Pharma Ltd)

Adjunct in abdominal radiological procedures}

solution may be mixed with milk or squash.
### Glycerol (Glycerin)

**INDICATIONS AND DOSE**

**Constipation**

- **BY RECTUM**
  - Child 1-11 months: 1 g as required
  - Child 1-11 years: 2 g as required
  - Child 12-17 years: 4 g as required
  - Adult: 4 g as required

- **DIRECTIONS FOR ADMINISTRATION**
  - Moisten suppositories with water before insertion.

**PRESCRIBING AND DISPENSING INFORMATION**

When prepared extemporaneously, the BP states Glycerol Suppositories, BP consists of gelatin 140 mg, glycerol 700 mg, purified water to 1 g.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Glycerin (glycerol) suppositories for constipation [www.medicinesforchildren.org.uk/glycerin-glycerol-suppositories-for-constipation](http://www.medicinesforchildren.org.uk/glycerin-glycerol-suppositories-for-constipation)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Suppository**
  - Glycerol (Non-proprietary)
    - Gelatin 140 mg per 1 gram, Glycerol 700 mg per 1 gram
    - Glycerol 2g suppositories | 12 suppository [GSL £1.65 DT price = £1.53]
    - Glycerol 3g suppositories | 12 suppository [GSL £1.60 DT price = £0.88]
    - Glycerol 4g suppositories | 12 suppository [GSL £3.72 DT price = £1.94]

**Senna**

**INDICATIONS AND DOSE**

**Constipation**

- **BY MOUTH USING TABLETS**
  - Child 6-17 years: 1–4 tablets once daily, adjusted according to response
  - Adult: 2–4 tablets daily, dose usually taken at night; initial dose should be low then gradually increased

- **BY MOUTH USING SYRUP**
  - Child 1 month–3 years: 2.5–10 mL once daily, adjusted according to response
  - Child 4-17 years: 2.5–20 mL once daily, adjusted according to response
  - Adult: 10–20 mL once daily, dose usually taken at bedtime

**PHARMACOKINETICS**

Onset of action 8–12 hours.

- **UNLICENSED USE**
  - Tablets not licensed for use in children under 6 years. Syrup not licensed for use in children under 2 years.

- **CONTRA-INDICATIONS**
  - Intestinal obstruction

- **CAUTIONS**
  - Excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia

- **SIDE-EFFECTS**
  - Abdominal cramp

- **PREGNANCY**
  - May be suitable for constipation in pregnancy if a stimulant effect is necessary.

- **BREAST FEEDING**
  - Not known to be harmful.

- **PATIENT AND CARER ADVICE**
  - Medicines for Children leaflet: Senna for constipation [www.medicinesforchildren.org.uk/senna-for-constipation](http://www.medicinesforchildren.org.uk/senna-for-constipation)
Ispaghula husk with senna
The properties listed below are those particular to the combination only. For the properties of the components please consider, ispaghula husk p. 45, senna p. 53.

**INDICATIONS AND DOSE**

**Constipation**
- **BY MOUTH**
  - Child 12-17 years: 5–10 mL once daily, to be taken at night, 5 mL equivalent to one level teaspoonful of granules
  - Adult: 5–10 mL once daily, to be taken at night, 5 mL equivalent to one level teaspoonful of granules

**DIRECTIONS FOR ADMINISTRATION** Take at night with at least 150 mL water, fruit juice, milk or warm drink.

**PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer ispaghula with senna granules.

**MEDICINAL FORMS**

**Granules**
- **CAUTIONARY AND ADVISORY LABELS** 25
- **EXCIPIENTS:** May contain Sucrose
- **Manufacturers** (IATA Healthcare Ltd)
- Ispaghula 542 mg per 1 gram, Senna fruit 124 mg per 1 gram Manevac granules | 400 gram | £9.50 DT price = £9.50

**Sodium picosulfate** (Sodium picosulphate)

**INDICATIONS AND DOSE**

**Constipation**
- **BY MOUTH**
  - Child 1 month-3 years: 2.5–10 mg once daily, adjusted according to response
  - Child 4-17 years: 2.5–20 mg once daily, adjusted according to response
  - Adult: 5–10 mg once daily, dose to be taken at night

**PHARMACOKINETICS**
Onset of action 6–12 hours.

**UNLICENSED USE**
- In children Sodium picosulfate elixir, licensed for use in children (age range not specified by manufacturer).
- In adults Sodium picosulfate doses in BNF may differ from those in product literature.

**CONTRA-INDICATIONS** Avoid in intestinal obstruction - severe dehydration.

**CAUTIONS**
- Active inflammatory bowel disease (avoid if fulminant) - excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia
- **SIDE-EFFECTS** Abdominal cramp - nausea - vomiting

**BRAND FEEDING**
- Not known to be present in milk but manufacturer advises avoid unless potential benefit outweighs risk.

**PATIENT AND CARER ADVICE**
- Medicines for Children leaflet: Sodium picosulfate for constipation [www.medicinesforchildren.org.uk/sodium-picosulfate-for-constipation](http://www.medicinesforchildren.org.uk/sodium-picosulfate-for-constipation)

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**
- **SENNA (Non-proprietary)**
- Sennoside B (as Sennosides) 7.5 mg | Senna 7.5mg tablets | 20 tablet | £0.99 | 60 tablet | £12.25 DT price = £3.52
- Oral solution no price available DT price = £3.52 | 100 tablet | £2.10 | 1000 tablet no price available | 1000 tablet | £47.50

**3 Diarrhoea**

**Acute diarrhoea**
The priority in acute diarrhoea, as in gastro-enteritis, is the prevention or reversal of fluid and electrolyte depletion. This is particularly important in infants and in frail and elderly patients. **Oral rehydration preparations** are used in the prevention or reversal of fluid and electrolyte depletion. Severe depletion of fluid and electrolytes requires immediate admission to hospital and urgent replacement.

**Antimotility drugs**

**Antimotility drugs** relieve symptoms of acute diarrhoea. They are used in the management of uncomplicated acute diarrhoea in adults; fluid and electrolyte replacement may be necessary in case of dehydration. However, antimotility drugs are not recommended for acute diarrhoea in young children.

Antimotility drugs prolong the duration of intestinal transit by binding to opioid receptors in the gastrointestinal tract. Loperamide hydrochloride p. 56 does not cross the blood-brain barrier readily. Antimotility drugs have a role in the management of uncomplicated *acute diarrhoea* in adults but not in young children. However, in severe cases, fluid and electrolyte replacement are of primary importance.

Antimotility drugs have a role in Inflammatory bowel disease p. 32 and in Stoma care p. 83.

Loperamide hydrochloride p. 56 can be used for faecal incontinence [unlicensed indication] after the underlying cause of incontinence has been addressed.

**Antispasmodics**

Antispasmodics are occasionally of value in treating abdominal cramp associated with diarrhoea but they should not be used for primary treatment. Antispasmodics and antiemetics should be avoided in young children with gastro-enteritis because they are rarely effective and have troublesome side-effects.

**Antibacterial drugs**
Antibacterial drugs are generally unnecessary in simple gastro-enteritis because the complaint usually resolves quickly without them, and infective diarrhoeas in the UK often have a viral cause. Systemic bacterial infection does, however, need appropriate systemic treatment.
Ciprofloxacin p. 490 is occasionally used for prophylaxis against travellers’ diarrhoea, but routine use is not recommended. Lactobacillus preparations have not been shown to be effective.

**Adsorbsents and bulk-forming drugs**

Adsorbsents such as kaolin p. 57 are not recommended for *acute diarrhoeas*. Bulk-forming drugs, such as ispaghula husk p. 45, methylcellulose p. 45, and stercula p. 46 are useful in controlling diarrhoea associated with diverticular disease.

Co-phenotrope p. 173 binds unabsorbed bile salts and provides symptomatic relief of diarrhoea following ileal disease or resection.

**Enkephalinase inhibitors**

Racecadotril p. 57 is a pro-drug of thiorphan. Thiorphan is an enkephalinase inhibitor that inhibits the breakdown of endogenous opioids, thereby reducing intestinal secretions. Racecadotril is licensed, as an adjunct to rehydration, for the symptomatic treatment of un-complicated acute diarrhoea; it should only be used in children over 3 months of age when usual supportive measures, including oral rehydration, are insufficient to control the condition. Racecadotril does not affect the duration of intestinal transit.

**Antimotility drugs**

### Co-phenotrope

**INDICATIONS AND DOSE**

**Adjunct to rehydration in acute diarrhoea**

**BY MOUTH**

- Child 4-8 years: 1 tablet 3 times a day
- Child 9-11 years: 1 tablet 4 times a day
- Child 12-15 years: 2 tablets 3 times a day
- Child 16-17 years: Initially 4 tablets, followed by 2 tablets every 6 hours until diarrhoea controlled
- Adult: Initially 4 tablets, followed by 2 tablets every 6 hours until diarrhoea controlled

**Control of faecal consistency after colostomy or ileostomy**

**BY MOUTH**

- Child 4-8 years: 1 tablet 3 times a day
- Child 9-11 years: 1 tablet 4 times a day
- Child 12-15 years: 2 tablets 3 times a day
- Child 16-17 years: Initially 4 tablets, then 2 tablets 4 times a day
- Adult: Initially 4 tablets, then 2 tablets 4 times a day

**UNLICENSED USE** Not licensed for use in children under 4 years.

**CONTRA-INDICATIONS** Gastro-intestinal obstruction - intestinal atony - myasthenia gravis (but some antimuscarinics may be used to decrease muscarinic side-effects of anticholinesterases) - paralytic ileus - prostatic enlargement (in adults) - pyloric stenosis - severe ulcerative colitis - significant bladder outflow obstruction - toxic megacolon - urinary retention

**CAUTIONS** Presence of subclinical doses of atropine may give rise to atropine side-effects in susceptible individuals or in overdosage - young children are particularly susceptible to overdosage; symptoms may be delayed and observation is needed for at least 48 hours after ingestion

**INTERACTIONS** » Appendix 1 (antimuscarinics, opioid analgesics).

**SIDE-EFFECTS**

- Very rare Angle-closure glaucoma
- Frequency not known Abdominal pain - anorexia - confusion (particularly in the elderly) - constipation - dilution of the pupils with loss of accomodation - dry mouth - dryness of the skin - fever - flushing - giddiness - nausea - photophobia - reduced bronchial secretions - transient bradycardia (followed by tachycardia, palpitation and arrhythmias) - urinary retention - urinary urgency - vomiting

**PREGNANCY** Manufacturer advises caution.

**BREAST FEEDING** May be present in milk.

**HEPATIC IMPAIRMENT** Avoid in jaundice.

**DIRECTIONS FOR ADMINISTRATION** For administration by mouth tablets may be crushed.

**PRESCRIBING AND DISPENSING INFORMATION** A mixture of diphenoxylate hydrochloride and atropine sulfate in the mass proportions 100 parts to 1 part respectively.

**EXCEPTIONS TO LEGAL CATEGORY** Co-phenotrope 2.5/0.025 can be sold to the public for adults and children over 16 years (provided packs do not contain more than 20 tablets) as an adjunct to rehydration in acute diarrhoea (max. daily dose 10 tablets).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

### Tablet

- **CO-PHENOTROPE (Non-proprietary)**
  - Atropine sulfate 25 microgram, Diphenoxylate hydrochloride 2.5 mg
  - Price = £74/100 tablets
  - Schedule 74 DT price = £10.74

### Kaolin with morphine

**INDICATIONS AND DOSE**

**Acute diarrhoea**

**BY MOUTH**

- Adult: 10 mL every 6 hours, dose to be given in water

**CONTRA-INDICATIONS** Acute abdomen - delayed gastric emptying - heart failure secondary to chronic lung disease - phaeochromocytoma

**CAUTIONS** Cardiac arrhythmias - pancreatitis - severe cor pulmonale

**BREAST FEEDING** Therapeutic doses unlikely to affect infant.

**RENAI IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Kaolin and Morphine Mixture, BP consists of light kaolin or light kaolin (natural) 20%, sodium bicarbonate 5%, and chloroform and morphine tincture 4% in a suitable vehicle. Contains anhydrous morphine 550–800 micrograms/10 mL.

**LESS SUITABLE FOR PRESCRIBING** Kaolin and Morphine Mixture, BP (Kaolin and Morphine Oral Suspension) is less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.
### Loperamide hydrochloride

**INDICATIONS AND DOSE**

**Symptomatic treatment of acute diarrhoea**

- **BY MOUTH**
  - Child 4–7 years: 1 mg 3–4 times a day for up to 3 days only
  - Child 8–11 years: 2 mg 4 times a day for up to 5 days
  - Child 12–17 years: Initially 4 mg, followed by 2 mg for up to 5 days, dose to be taken after each loose stool; usual dose 6–8 mg daily; maximum 16 mg per day
  - Adult: Initially 4 mg, followed by 2 mg for up to 5 days, dose to be taken after each loose stool; usual dose 6–8 mg daily; maximum 16 mg per day

**Chronic diarrhoea**

- **BY MOUTH**
  - Adult: Initially 4–8 mg daily in divided doses, adjusted according to response; maintenance up to 16 mg daily in 2 divided doses

**Faecal incontinence**

- **BY MOUTH**
  - Adult: Initially 500 micrograms daily, adjusted according to response, maximum daily dose to be given in divided doses; maximum 16 mg per day

**Pain of bowel colic in palliative care**

- **BY MOUTH**
  - Adult: 2–4 mg 4 times a day

**UNLICENSED USE** Capsules not licensed for use in children under 8 years. Syrup not licensed for use in children under 4 years.

**CONTRA-INDICATIONS** Active ulcerative colitis - antibiotic-associated colitis - conditions where abdominal distension develops - conditions where inhibition of peristalsis should be avoided

**CAUTIONS** Not recommended for children under 12 years

**INTERACTIONS** → Appendix 1 (loperamide).

**SIDE-EFFECTS**

- Common or very common: Dizziness, flatulence, headache, nausea

- Uncommon: Abdominal pain, drowsiness, dry mouth, dyspepsia, rash, vomiting

- Rare: Fatigue, hypertension, paralytic ileus, Stevens-Johnson syndrome, toxic epidermal necrolysis, urinary retention

**PREGNANCY** Manufacturers advise avoid—no information available.

**BREAST FEEDING** Amount probably too small to be harmful.

**HEPATIC IMPAIRMENT** Risk of accumulation—manufacturer advises caution.

**PATIENT AND CARER ADVICE**

**EXCEPTIONS TO LEGAL CATEGORY** Loperamide can be sold to the public, provided it is licensed and labelled for the treatment of acute diarrhoea associated with irritable bowel syndrome (after initial diagnosis by a doctor) in adults over 18 years of age.

---

Loperamide can be sold to the public, for use in adults and children over 12 years, provided it is licensed and labelled for the treatment of acute diarrhoea.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

- **Loperamide hydrochloride (non-proprietary)**
  - Loperamide hydrochloride 2 mg tablets | 30 tablet | £2.15 DT price = £2.15

**Orodispersible tablet**

- **Imodium (McNeil Products Ltd)**
  - Loperamide hydrochloride 2 mg | Imodium Instant Melts 2 mg | orodispersible tablets (sugar-free) | 12 tablet | £3.75 (sugar-free) | 18 tablet | £5.02

**Capsule**

- **Loperamide hydrochloride (non-proprietary)**
  - Loperamide hydrochloride 2 mg | Loperamide 2mg capsules | 6 capsule | £3.15 | 10 capsule | £4.76 | 12 capsule | £1.94 | 30 capsule | £3.19 DT price = £3.19

- **Imodium (McNeil Products Ltd)**
  - Loperamide hydrochloride 2 mg | Imodium IBS Relief 2 mg | capsules | 6 capsule | £2.23 | 12 capsule | £3.79

- **Imodium 2mg Soft capsules**
  - 12 capsule | £3.79

- **Imodium Classic 2mg capsules**
  - 12 capsule | £3.31 | 18 capsule | £4.13

**Oral solution**

- **Imodium (Janssen-Cilag Ltd)**
  - Loperamide hydrochloride 200 microgram per 1 ml | Imodium 1mg/5ml oral solution (sugar-free) | 100 ml | £1.17 DT price = £1.17

**Oral lypophilisate**

- **Imodium (McNeil Products Ltd)**
  - Loperamide hydrochloride 2 mg | Imodium Instant 2mg oral lypophilisates (sugar-free) | 6 tablet | £2.45 (sugar-free) | 12 tablet | £3.76

---

Loperamide with simeticone

The properties listed below are those particular to the combination only. For the properties of the components please consider, loperamide hydrochloride above, simeticone p. 60.

**INDICATIONS AND DOSE**

**Acute diarrhoea with abdominal colic**

- **INITIALLY BY MOUTH**
  - Child 12–17 years: Initially 1 tablet, then (by mouth) 1 tablet, after each loose stool, for up to 2 days; maximum 4 tablets per day

- Adult: Initially 2 tablets, then (by mouth) 1 tablet, after each loose stool, (by mouth) for up to 2 days; maximum 4 tablets per day

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Imodium Plus (McNeil Products Ltd)**
  - Loperamide hydrochloride 2 mg, Dimeticon (as Simeticone) | 125 mg | Imodium Plus caplets | 12 tablet | £3.66
ENKEPHALINASE INHIBITORS

Racecadotril

**INDICATIONS AND DOSE**

Adjunct to rehydration, for the symptomatic treatment of uncomplicated acute diarrhoea

**BY MOUTH**

- Child 3 months–17 years (body-weight up to 9 kg): 10 mg 3 times a day until diarrhoea stops; maximum duration of treatment 7 days
- Child 3 months–17 years (body-weight 9–13 kg): 20 mg 3 times a day until diarrhoea stops; maximum duration of treatment 7 days
- Child 3 months–17 years (body-weight 13–27 kg): 30 mg 3 times a day until diarrhoea stops; maximum duration of treatment 7 days
- Child 3 months–17 years (body-weight 28 kg and above): 60 mg 3 times a day until diarrhoea stops; maximum duration of treatment 7 days
- Adult: Initially 100 mg, then 100 mg 3 times a day until diarrhoea stops; maximum duration of treatment 7 days, dose to be taken preferably before food

**SIDE-EFFECTS**

- Common or very common: Headache
- Uncommon: Rash

**PREGNANCY**

Manufacturer advises avoid—no information available.

**BREAST FEEDING**

Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT**

- In adults: Manufacturer advises caution.
- In children: Manufacturer advises avoid.

**RENAL IMPAIRMENT**

- In adults: Manufacturer advises caution.
- In children: Manufacturer advises avoid.

**DIRECTIONS FOR ADMINISTRATION**

Granules may be added to food or mixed with water or bottle feeds and then taken immediately.

**PATIENT AND CARER ADVICE**

Patients and carers should be given advice on how to administer racecadotril granules.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium, has advised (July 2014) that racecadotril (Hidrasec®) is not recommended for use within NHS Scotland for the treatment of acute diarrhoea in children because there is insufficient evidence that it improves the recovery rate.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- Hidrasec (Lincoln Medical Ltd)
- Racecadotril 100 mg Hidrasec 100mg capsules | 20 capsule (£8.42

**Granules**

EXCipients: May contain Sucrose

- Hidrasec (Lincoln Medical Ltd)
- Racecadotril 10 mg Hidrasec Infants 10mg granules sachets | 20 sachet (£8.42
- Racecadotril 30 mg Hidrasec Children 30mg granules sachets | 20 sachet (£8.42

INTESTINAL ADSORBENTS

Kaolin

**INDICATIONS AND DOSE**

Diarrhoea (not recommended for acute diarrhoea)

**BY MOUTH**

- Adult: 10–20 mL every 4 hours

**INTERACTIONS**

- Appendix 1 (kaolin).

**PRESCRIBING AND DISPENSING INFORMATION**

Flavours of oral liquid formulations may include peppermint. When prepared extemporaneously, the BP states Kaolin Mixture, BP consists of light kaolin or light kaolin (natural) 20%, light magnesium carbonate 5%, sodium bicarbonate 5% in a suitable vehicle with a peppermint flavour.

**LESS SUITABLE FOR PRESCRIBING**

Kaolin Mixture BP is less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**

- KAOLIN (Non-proprietary)
  - Kaolin light 200 mg per 1 ml, Magnesium carbonate light 50 mg per 1 ml, Sodium bicarbonate 50 mg per 1 ml | 80 ml (£6.50 DT price = £0.86
  - Kaolin mixture 200 mg per 1 gram | 100 ml (£0.78 DT price = £0.78

4 Disorders of gastric acid and ulceration

4.1 Dyspepsia

**Dyspepsia**

Dyspepsia covers upper abdominal pain, fullness, early satiety, bloating, and nausea. It can occur with gastric and duodenal ulceration and, gastric cancer, but most commonly it is of uncertain origin.

Urgent endoscopic investigation is required if dyspepsia is accompanied by ‘alarm features’ (e.g. bleeding, dysphagia, recurrent vomiting, or weight loss). Urgent investigation should also be considered for patients over 55 years with unexplained, recent-onset dyspepsia that has not responded to treatment.

Patients with dyspepsia should be advised about lifestyle changes (avoidance of excess alcohol and of aggravating foods such as fats); other measures include weight reduction, smoking cessation, and raising the head of the bed. Some medications may cause dyspepsia—these should be stopped, if possible.

Antacids may provide some symptomatic relief, however if symptoms persist in uninvestigated dyspepsia, treatment involves a proton pump inhibitor for up to 4 weeks. A proton pump inhibitor can be used intermittently to control symptoms long term. Patients with uninvestigated dyspepsia, who do not respond to an initial trial with a proton pump inhibitor, should be tested for Helicobacter pylori and given eradication therapy if H. pylori is present. Alternatively, particularly in populations where H. pylori infection is more likely, the ‘test and treat’ strategy for H. pylori can be used before a trial with a proton pump inhibitor.

If H. pylori is present in patients with functional (investigated, non-ulcer) dyspepsia, eradication therapy should be provided. If symptoms persist, treatment with
either a proton pump inhibitor or a histamine H₂-receptor antagonist can be given for 4 weeks. These antisecretory drugs can be used intermittently to control symptoms long term. However, most patients with functional dyspepsia do not benefit symptomatically from H. pylori eradication therapy or antisecretory drugs.

### Alginate

#### Indications and dose

**Gaviscon infant® powder sachets**

Management of gastro-oesophageal reflux disease

- **By mouth**
  - Infant: 12–24 months: 1 dose as required, to be mixed with feeds (or water, for breast-fed infants); maximum 6 doses per day
  - Child 1 month–2 years: 1 dose as required, to be mixed with feeds (or water, for breast-fed infants); maximum 12 doses per day

#### Contra-indications

- Intestinal obstruction - preterm neonates - where excessive water loss likely (e.g. fever, diarrhoea, vomiting, high room temperature)
- Interactions: Appendix 1 (antacids).
- Not to be used with other preparations containing thickening agents.
- Antacids should preferably not be taken at the same time as other drugs since they may impair absorption.
- Antacids may damage enteric coatings designed to prevent dissolution in the stomach.

#### Hepatic impairment

In patients with fluid retention, avoid antacids containing large amounts of sodium. Avoid antacids containing magnesium salts in hepatic coma if there is a risk of renal failure.

#### Renal impairment

In patients with fluid retention, avoid antacids containing large amounts of sodium.

#### Prescribing and dispensing information

- Each half of the dual-sachet is identified as ‘one dose’. To avoid errors prescribe with directions in terms of ‘dose’.
- There can be variation in the licensing of different medicines containing the same drug.

**Powder**

- **Electrolytes**: May contain Sodium
  - Gaviscon infant (Forum Health Products Ltd)
  - Magnesium alginate 825 mg, Sodium alginate 225 mg Gaviscon infant oral powder sachets (sugar-free) 15 dual dose sachet £3.99

### Calcium carbonate with sodium alginate and sodium bicarbonate

The properties listed below are those particular to the combination only. For the properties of the components please consider, alginic acid above.

#### Indications and dose

**Mild symptoms of gastro-oesophageal reflux disease**

- **By mouth**
  - Child 6–11 years: 5–10 mL, to be taken after meals and at bedtime
  - Child 12–17 years: 10–20 mL, to be taken after meals and at bedtime
  - Adult: 20–40 mL, to be taken after meals and at bedtime

#### Prescribing and dispensing information

- Flavours of oral liquid formulations may include aniseed or peppermint.

#### Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

**Chewable tablet**

- **Excipients**: May contain Aspartame
- **Electrolytes**: May contain Potassium, sodium
  - Potassium bicarbonate sodium alginate (non-proprietary)
    - Potassium bicarbonate 100 mg, Sodium alginate 500mg / Potassium bicarbonate 100mg chewable tablets sugar free (sugar-free) 60 tablet £6.05 no price available
  - Brands may include Gaviscon Advance

**Oral suspension**

- **Electrolytes**: May contain Potassium, sodium
  - Gaviscon advance (Reckitt Benckiser Healthcare (UK) Ltd)
    - Potassium bicarbonate 20 mg per 1 mL, Sodium alginate 100 mg per 1 mL Gaviscon advance oral suspension aniseed (sugar-free) 150 mL £3.23 (sugar-free) 250 mL £5.56 (sugar-free) 300 mL £5.82 (sugar-free) 500 mL £9.12 DT price = £5.12
Antacids

Antacids (usually containing aluminium or magnesium compounds) can often relieve symptoms in ulcer dyspepsia and in non-erosive gastro-oesophageal reflux; they are also sometimes used in functional (non-ulcer) dyspepsia but the evidence of benefit is uncertain. Antacids are best given when symptoms occur or are expected, usually between meals and at bedtime, although additional doses may be required. Conventional doses of liquid magnesium–aluminium antacids promote ulcer healing, but less well than antacids also containing bismuth; they tend to be constipating. They are recommended because absorbed bismuth can be neurotoxic, and prolonged high doses also cause hypophosphataemia and alkalosis, and can precipitate the milk-alkali syndrome. These colonic side-effects are less likely with less bismuth-containing antacids. The acid-neutralising capacity of preparations that contain more than one antacid may be the same as simpler antacids (e.g. aluminium hydroxide p. 859, and magnesium carbonate p. 60, hydroxide and magnesium trisilicate p. 61), being relatively insoluble in water, are long-acting if retained in the gastrointestinal tract. They are suitable for most antacid purposes. Magnesium-containing antacids tend to be laxative whereas aluminium-containing antacids may be constipating; antacids containing both magnesium and aluminium may reduce these colonic side-effects. Aluminium accumulation does not appear to be a risk if renal function is normal. The acid-neutralising capacity of preparations that contain more than one antacid may be the same as simpler preparations. Complexes such as hydrotalcite confer no special advantage.

Sodium bicarbonate p. 848 should no longer be prescribed alone for the relief of dyspepsia but it is present as an ingredient in many indigestion remedies. However, it retains a place in the management of urinary-tract disorders and acidosis.

Bismuth-containing antacids (unless chelates) are not recommended because absorbed bismuth can be neurotoxic, causing encephalopathy; they tend to be constipating.

Calcium-containing antacids can induce rebound acid secretion: with modest doses the clinical significance is doubtful, but prolonged high doses also cause hypercalcaemia and alkalosis, and can precipitate the milk-alkali syndrome.

Simeticone

Simeticone p. 60 (activated dimeticone) is added to an antacid as an antifoaming agent to relieve flatulence. These preparations may be useful for the relief of hiccup in palliative care.

Alginates

Alginates taken in combination with an antacid increases the viscosity of stomach contents and can protect the oesophageal mucosa from acid reflux. Some alginate-containing preparations form a viscous gel (‘raft’) that floats on the surface of the stomach contents, thereby reducing symptoms of reflux.

The amount of additional ingredient or antacid in individual preparations varies widely, as do their sodium content, so that preparations may not be freely interchangeable.

Co-magaldrox

The properties listed below are those particular to the combination only. For the properties of the components please consider, aluminium hydroxide p. 859, magnesium hydroxide p. 46.
**Disorders of gastric acid and ulceration**

**Gastro-intestinal system**

- **HEPATIC IMPAIRMENT** Avoid; can cause constipation which can precipitate coma. Avoid in hepatic coma; risk of renal failure.
- **RENAL IMPAIRMENT** Antacids containing magnesium salts should be avoided or used at a reduced dose because there is an increased risk of toxicity.
  - In adults There is a risk of accumulation and aluminium toxicity with antacids containing aluminium salts. Absorption of aluminium from aluminium salts is increased by citrates, which are contained in many effervescent preparations (such as effervescent analgesics).
  - In children Aluminium-containing antacids should not be used in children with renal impairment, because accumulation may lead to increased plasma-aluminium concentrations.
- **PRESCRIBING AND DISPENSING INFORMATION** Altacite Plus® is low in Na⁺.

**Magnesium carbonate**

**INDICATIONS AND DOSE**

**Dyspepsia**

**BY MOUTH USING ORAL SUSPENSION**

- Adult: 10 ml 3 times a day, dose to be taken in water

**CONTRA-INDICATIONS** Hypophosphataemia

**INTERACTIONS** → Appendix 1 (antacids).

Antacids should preferably not be taken at the same time as other drugs since they may impair absorption. Antacids may damage enteric coatings designed to prevent dissolution in the stomach.

**SIDE-EFFECTS** Belching due to liberated carbon dioxide - diarrhoea

**HEPATIC IMPAIRMENT** In patients with fluid retention, avoid antacids containing large amounts of sodium. Avoid antacids containing magnesium salts in hepatic coma if there is a risk of renal failure.

**RENAL IMPAIRMENT** Avoid or use at a reduced dose; increased risk of toxicity. Magnesium carbonate mixture has a high sodium content; avoid in patients with fluid retention.

**PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Aromatic Magnesium Carbonate Mixture, BP consists of light magnesium carbonate 3%, sodium bicarbonate 5%, in a suitable vehicle containing aromatic cardamom tincture.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

- **Magnesite** (Ennogen Healthcare Ltd)
  - Magnesium carbonate heavy 500 mg Magnesite 500 mg capsules | 30 capsule £9.20

Also available in combination with calcium acetate, p. 61 - magnesium trisilicate and sodium bicarbonate, p. 61

**DEFOAMING DRUGS**

**Simeticone**

(Activated dimeticone)

**DRUG ACTION** Simeticone (activated dimeticone) is an antifoaming agent.

**INDICATIONS AND DOSE**

**INFACOL®**

- Colic | Wind pains
- **BY MOUTH**
  - Child 1 month-1 year: 0.5–1 mL, to be taken before feeds

**DENTINOX®**

- Colic | Wind pains
- **BY MOUTH**
  - Child 1 month-1 year: 2.5 mL, to be taken with or after each feed; may be added to bottle feed; maximum 6 doses per day

**PATIENT AND CARER ADVICE**

INFACOL®

Patients or carers should be given advice on use of the Infacol® dropper.

**LESS SUITABLE FOR PRESCRIBING**

INFACOL®

Infacol® is less suitable for prescribing (evidence of benefit in infantile colic uncertain).

DENTINOX®

Dentinox® colic drops are less suitable for prescribing (evidence of benefit in infantile colic uncertain).

**Aluminium hydroxide with magnesium hydroxide and simeticone**

The properties listed below are those particular to the combination only. For the properties of the components please consider, aluminium hydroxide p. 859, simeticone above.

**INDICATIONS AND DOSE**

**Dyspepsia**

**BY MOUTH**

- Child 12-17 years: 5–10 mL 4 times a day, to be taken after meals and at bedtime, or when required
- Adult: 5–10 mL 4 times a day, to be taken after meals and at bedtime, or when required

**PRESCRIBING AND DISPENSING INFORMATION**

Maalox Plus® is low Na⁺.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**

- **Maalox Plus®** (Sanofi)
  - Aluminium hydroxide gel dried 44 mg per 1 mL, Magnesium hydroxide 39 mg per 1 mL, Simeticone 5 mg per 1 mL Maalox Plus oral suspension (sugar-free) | 500 ml GSK £3.90
Magnesium trisilicate

**INDICATIONS AND DOSE**

**Dyspepsia**

*By mouth using chewable tablets*

- **Adult**: 1–2 tablets as required

- **CONTRA-INDICATIONS** Hypophosphataemia
- **INTERACTIONS** → Appendix 1 (antacids). Antacids should preferably not be taken at the same time as other drugs since they may impair absorption. Antacids may damage enteric coatings designed to prevent dissolution in the stomach.
- **SIDE-EFFECTS** Belching due to liberated carbon dioxide - diarrhoea - silica-based renal stones (with long-term treatment)
- **HEPATIC IMPAIRMENT** Avoid in hepatic coma; risk of renal failure.
- **RENAL IMPAIRMENT** Avoid or used at a reduced dose (increased risk of toxicity).
- **MEDICINAL FORMS** Medicines not identified.

Magnesium carbonate with magnesium trisilicate and sodium bicarbonate

The properties listed below are those particular to the combination only. For the properties of the components please consider, magnesium carbonate p. 60, magnesium trisilicate above, sodium bicarbonate p. 848.

**INDICATIONS AND DOSE**

**Dyspepsia**

- **Child 5-11 years**: 5–10 mL 3 times a day or as required, dose to be made up with water
- **Child 12-17 years**: 10–20 mL 3 times a day or as required, dose to be made up with water
- **Adult**: 10–20 mL 3 times a day or as required, dose to be made up with water

- **HEPATIC IMPAIRMENT** In patients with fluid retention avoid antacids containing large amounts of sodium. Avoid antacids containing magnesium salts in hepatic coma if there is a risk of renal failure.
- **RENAL IMPAIRMENT** Magnesium trisilicate mixture has a high sodium content; avoid in patients with fluid retention.
- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Magnesium Trisilicate Mixture, BP consists of 5% each of magnesium trisilicate, light magnesium carbonate, and sodium bicarbonate in a suitable vehicle with a peppermint flavour.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**

4.2 Gastric and duodenal ulceration

**Peptic ulceration**

Peptic ulceration commonly involves the stomach, duodenum, and lower oesophagus; after gastric surgery it involves the gastro-enterostomy stoma. Healing can be promoted by general measures, stopping smoking and taking antacids and by antisecretory drug treatment, but relapse is common when treatment ceases. Nearly all duodenal ulcers and most gastric ulcers not associated with NSAIDs are caused by *Helicobacter pylori*.

**Helicobacter pylori infection**

Eradication of *Helicobacter pylori* reduces recurrence of gastric and duodenal ulcers and the risk of rebleeding. It also causes regression of most localised gastric mucosa associated lymphoid-tissue (MALT) lymphomas. The presence of *H. pylori* should be confirmed before starting eradication treatment. Acid inhibition combined with antibacterial treatment is highly effective in the eradication of *H. pylori*; re-infection is rare. Antibiotic associated colitis is an uncommon risk.

For initial treatment, a one-week triple-therapy regimen that comprises a proton pump inhibitor, clarithromycin p. 470, and *either* amoxicillin p. 482 or metronidazole p. 475 can be used. However, if a patient has been treated with metronidazole for other infections, a regimen containing a proton pump inhibitor, amoxicillin and clarithromycin is preferred for initial therapy. If a patient has been treated with a macrolide for other infections, a regimen containing a proton pump inhibitor, amoxicillin and metronidazole is preferred for initial therapy. These regimens eradicate *H. pylori* in about 85% of cases. There is usually no need to continue antisecretory treatment (with a proton pump inhibitor or H₂-receptor antagonist), however, if the ulcer is large, or complicated by haemorrhage or perforation, then antisecretory treatment is continued for a further 3 weeks. Treatment failure usually indicates antibacterial resistance or poor compliance. Resistance to amoxicillin is rare. However, resistance to clarithromycin and metronidazole is common and can develop during treatment.

Two-week triple-therapy regimens offer the possibility of higher eradication rates compared to one-week regimens, but adverse effects are common and poor compliance is likely to offset any possible gain.

Two-week dual-therapy regimens using a proton pump inhibitor and a single antibacterial are licensed, but produce low rates of *H. pylori* eradication and are not recommended.

Tinidazole p. 476 is also used occasionally for *H. pylori* eradication as an alternative to metronidazole; tinidazole should be combined with antisecretory drugs and other antibiotics.

Routine retesting, to confirm eradication, is not necessary unless the patient has gastric MALT lymphoma or complicated *H. pylori* associated peptic ulcer.

A two-week regimen comprising a proton pump inhibitor *plus* tripotassium dicitratobismuthate p. 63, *plus* tetracycline p. 496, *plus* metronidazole can be used for eradication failure. Alternatively, the patient can be referred for endoscopy and treatment based on the results of culture and sensitivity testing.

See under NSAID-associated ulcers for the role of *H. pylori* eradication therapy in patients starting or taking a NSAID.

Also see Dyspepsia p. 57 for *H. pylori* eradication in patients with dyspepsia.
Gastro-intestinal system

Overall risk of ulceration.

The most rapid healing; alternatively, the ulcer can be discontinued

The age

Children is available (Helicobacter Test INFAI for children of the age 3–11). However, the appropriateness of testing for H. pylori infection in children has not been established.

NSAID-associated ulcers

Gastro-intestinal bleeding and ulceration can occur with NSAID use. The risk of serious upper gastro-intestinal side-effects varies between individual NSAIDs. Whenever possible, the NSAID should be withdrawn if an ulcer occurs.

Patients at high risk of developing gastro-intestinal complications with a NSAID include those aged over 65 years, those with a history of peptic ulcer disease or serious gastro-intestinal complication, those taking other medicines that increase the risk of gastro-intestinal side-effects, or those with serious co-morbidity (e.g., cardiovascular disease, diabetes, renal or hepatic impairment). In those at risk of ulceration, a proton pump inhibitor can be considered for protection against gastric and duodenal ulcers associated with non-selective NSAIDs; a H₂-receptor antagonist such as ranitidine p. 65 given at twice the usual dose or misoprostol p. 710 are alternatives.

Colic and diarrhoea may limit the dose of misoprostol. Its use is most appropriate for the frail or very elderly from whom NSAIDs cannot be withdrawn. A combination of a cyclo-oxygenase-2 selective inhibitor with a proton pump inhibitor may be more appropriate for those with a history of upper gastro-intestinal bleeding or 3 or more risk factors for gastro-intestinal ulceration, but see NSAIDs and Cardiovascular Events.

NSAID use and H. pylori infection are independent risk factors for gastro-intestinal bleeding and ulceration. In patients already taking a NSAID, eradication of H. pylori is unlikely to reduce the risk of NSAID-induced bleeding or ulceration. However, in patients with dyspepsia or a history of gastric or duodenal ulcer, who are H₂-positives, and who are about to start long-term treatment with a non-selective NSAID, eradication of H. pylori may reduce the overall risk of ulceration.

In a patient who has developed an ulcer, if the NSAID can be discontinued, a proton pump inhibitor usually produces the most rapid healing; alternatively, the ulcer can be treated with a H₂-receptor antagonist or misoprostol p. 710.

On healing, patients should be tested for H. pylori and given eradication therapy if H. pylori is present (see also Test for Helicobacter pylori).

If treatment with a non-selective NSAID needs to continue, the following options are suitable:

- Treat ulcer with a proton pump inhibitor and on healing continue the proton pump inhibitor (dose not normally reduced because asymptomatic ulcer recurrence may occur);
- Treat ulcer with a proton pump inhibitor and on healing switch to misoprostol for maintenance therapy (colic and diarrhoea may limit the dose of misoprostol);
- Treat ulcer with a proton pump inhibitor and switch non-selective NSAID to a cyclo-oxygenase-2 selective inhibitor, but see NSAIDs and Cardiovascular Events; on healing, continuation of the proton pump inhibitor in patients with a history of upper gastro-intestinal bleeding may provide further protection against recurrence.

If treatment with a cyclo-oxygenase-2 selective inhibitor needs to continue, treat ulcer with a proton pump inhibitor; on healing continuation of the proton pump inhibitor in patients with a history of upper gastro-intestinal bleeding may provide further protection against recurrence.

GASTROPROTECTIVE COMPLEXES AND CHELATORS

Chelates and complexes

Tripotassium dichromatobismuthate p. 63 is a bismuth chelate effective in healing gastric and duodenal ulcers. See under Peptic ulceration p. 61 for the role of tripotassium dichromatobismuthate p. 63 in a Helicobacter pylori eradication regimen for those who have not responded to first-line regimens.

The bismuth content of tripotassium dichromatobismuthate p. 63 is low but absorption has been reported; encephalopathy (described with higher dose bismuth preparations) has not been reported.

Sucralfate p. 65 may act by protecting the mucosa from acid-pepsin attack in gastric and duodenal ulcers. It is a complex of aluminium hydroxide and sulfated sucrose but has minimal antacid properties.

Test for Helicobacter pylori

¹³C-Urea breath test kits are available for the diagnosis of gastro-duodenal infection with Helicobacter pylori. The test involves collection of breath samples before and after ingestion of an oral solution of ¹³C-Urea; the samples are sent for analysis by an appropriate laboratory. The test should not be performed within 4 weeks of treatment with an antibacterial or within 2 weeks of treatment with an antisecretory drug. A specific ¹³C-Urea breath test kit for children is available (Helicobacter Test INFAI for children of the age 3–11). However, the appropriateness of testing for H. pylori infection in children has not been established.
Sucralfate

**INDICATIONS AND DOSE**

**Benign gastric ulceration | Benign duodenal ulceration**

**BY MOUTH**

- Child 15-17 years: 2 g twice daily, dose to be taken on rising and at bedtime, alternatively 1 g 4 times a day for 4–6 weeks, or in resistant cases up to 12 weeks, dose to be taken 1 hour before meals and at bedtime; maximum 8 g per day
- Adult: 2 g twice daily, dose to be taken on rising and at bedtime, alternatively 1 g 4 times a day for 4–6 weeks, or in resistant cases up to 12 weeks, dose to be taken 1 hour before meals and at bedtime; maximum 8 g per day

**Chronic gastritis**

**BY MOUTH**

- Child 15-17 years: 2 g twice daily, dose to be taken on rising and at bedtime, alternatively 1 g 4 times a day for 4–6 weeks, or in resistant cases up to 12 weeks, dose to be taken 1 hour before meals and at bedtime; maximum 8 g per day
- Adult: 2 g twice daily, dose to be taken on rising and at bedtime, alternatively 1 g 4 times a day for 4–6 weeks, or in resistant cases up to 12 weeks, dose to be taken 1 hour before meals and at bedtime; maximum 8 g per day

**Prophylaxis of stress ulceration in child under intensive care**

**BY MOUTH**

- Child 15-17 years: 1 g 6 times a day; maximum 8 g per day

**Prophylaxis of stress ulceration**

**BY MOUTH**

- Adult: 1 g 6 times a day; maximum 8 g per day

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, cream, powder, enema

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 5**

- **Antepsin** (Chugai Pharma UK Ltd)
  - Sucralfate 1 gram Antepsin 1g tablets | 50 tablet [P] £6.36 DT price = £6.36

**Oral suspension**

**CAUTIONARY AND ADVISORY LABELS 5**

- **Antepsin** (Chugai Pharma UK Ltd)
  - Sucralfate 200 mg per 1 ml Antepsin 1g/5ml oral suspension (sugar-free) | 250 ml [P] £6.36 DT price = £6.36

**Tripotassium dicitratobismuthate**

**INDICATIONS AND DOSE**

Eradication failure of *Helicobacter pylori* infection (in combination with omeprazole, tetracycline and metronidazole)

**BY MOUTH**

- Adult: 120 mg 4 times a day for 2 weeks

**Benign gastric and duodenal ulceration**

**BY MOUTH**

- Adult: 240 mg twice daily, alternatively 120 mg 4 times a day both dosage regimens taken for 28 days followed by a further 28 days if necessary, maintenance dose not indicated but course may be repeated after interval of 1 month

**INTERACTIONS**

- Appendix 1 (tripotassium dicitratobismuthate).

**SIDE-EFFECTS**

- **Common or very common** May blacken faeces - may darken tongue
- **Uncommon** Constipation - diarrohea - nausea - pruritus - rash - vomiting
- **PREGNANCY** Manufacturer advises avoid on theoretical grounds.
- **BREAST FEEDING** No information available.
- **RENAL IMPAIRMENT** Avoid in severe impairment.

**DIRECTIONS FOR ADMINISTRATION**

To be swallowed with half a glass of water. Twice-daily dosage to be taken 30 minutes before breakfast and main evening meal. Four-times-daily dosage to be taken as follows: one dose 30 minutes before breakfast, midday meal and main evening meal, and one dose 2 hours after main evening meal.

**PATIENT AND CARER ADVICE**

Milk should not be drunk by itself during treatment but small quantities may be taken in tea or coffee or on cereal. Antacids, fruit, or fruit juice should not be taken half an hour before or after a dose. Patients and carers should be aware that the patient may develop darkened tongue and blackened faeces.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**ELECTROLYTES**: May contain Potassium

- **De-Noltab** (Astellas Pharma Ltd)
  - Tripotassium dicitratobismuthate 120 mg De-Noltab 120mg tablets | 112 tablet [P] £5.09

**Gastro-intestinal system**
H₂-RECEPTOR ANTAGONISTS

Histamine H₂-receptor antagonists heal gastric and duodenal ulcers by reducing gastric acid output as a result of histamine H₂-receptor blockade; they are also used to relieve symptoms of gastro-oesophageal reflux disease. H₂-receptor antagonists should not normally be used for Zollinger-Ellison syndrome because proton pump inhibitors are more effective.

Maintenance treatment with low doses for the prevention of peptic ulcer disease has largely been replaced in Helicobacter pylori positive patients by eradication regimens.

In adults, H₂-receptor antagonists are used for the treatment of functional dyspepsia and may be used for the treatment of uninvestigated dyspepsia without alarm features.

H₂-receptor antagonist therapy can promote healing of NSAID-associated ulcers (particularly duodenal).

Treatment with a H₂-receptor antagonist has not been shown to be beneficial in haematemesis and melaena, but prophylactic use reduces the frequency of bleeding from gastroduodenal erosions in hepatic coma, and possibly in other conditions requiring intensive care. H₂-receptor antagonists also reduce the risk of acid aspiration in obstetric patients at delivery (Mendelson’s syndrome).

H₂-receptor antagonists

- **CAUTIONS** Signs and symptoms of gastric cancer

**CAUTIONS, FURTHER INFORMATION**

Gastric cancer H₂-receptor antagonists might mask symptoms of gastric cancer; particular care is required in patients presenting with ‘alarm features’ in such cases gastric malignancy should be ruled out before treatment.

- **SIDE-EFFECTS**
  - Common or very common Diarrhoea · dizziness · headache
  - Uncommon Erythema multiforme · rash · toxic epidermal necrolysis
  - Rare Arthralgia · blood disorders · bradycardia · cholestatic jaundice · confusion · depression · hallucinations · hepatitis · leucopenia · myalgia · pancytopenia · psychiatric reactions · thrombocytopenia
  - Frequency not known Gynaecomastia · impotence

**SIDE-EFFECTS, FURTHER INFORMATION**

Psychiatric reactions Psychiatric reactions, including confusion, depression, and hallucinations occur particularly in the elderly or the very ill.

Cimetidine

**INDICATIONS AND DOSE**

**Benign duodenal ulceration**

- **BY MOUTH**
  - Adult: 400 mg twice daily for at least 4 weeks, to be taken with breakfast and at night, alternatively 800 mg once daily for at least 4 weeks, to be taken at night; increased if necessary up to 400 mg 4 times a day; maintenance 400 mg once daily for 6 weeks, to be taken at night; alternatively maintenance 400 mg twice daily, to be taken in the morning and at night

**Benign gastric ulceration**

- **BY MOUTH**
  - Adult: 400 mg twice daily for 6 weeks, to be taken with breakfast and at night, alternatively 800 mg daily for 6 weeks, to be taken at night; increased if necessary up to 400 mg 4 times a day; maintenance 400 mg once daily for 8 weeks, to be taken at night; increased if necessary up to 400 mg 4 times a day; maintenance 400 mg daily, to be taken at night, alternatively maintenance 400 mg twice daily, to be taken in the morning and at night

**NSAID-associated ulceration**

- **BY MOUTH**
  - Adult: 400 mg twice daily for 8 weeks, to be taken with breakfast and at night, alternatively 800 mg daily for 8 weeks, to be taken at night; increased if necessary up to 400 mg 4 times a day; maintenance 400 mg daily, to be taken at night, alternatively maintenance 400 mg twice daily, to be taken in the morning and at night

**Reflex oesophagitis**

- **BY MOUTH**
  - Adult: 400 mg 4 times a day for 4–8 weeks

**Prophylaxis of stress ulceration**

- **BY MOUTH**
  - Adult: 200–400 mg every 4–6 hours

**Gastric acid reduction in obstetrics**

- **BY MOUTH**
  - Adult: Initially 400 mg, to be administered at start of labour, then increased if necessary up to 400 mg every 4 hours, do not use syrup in prophylaxis of acid aspiration; maximum 2.4 g per day

**Gastric acid reduction during surgical procedures**

- **BY MOUTH**
  - Adult: 400 mg, to be given 90–120 minutes before induction of general anaesthesia

**Short-bowel syndrome**

- **BY MOUTH**
  - Adult: 400 mg twice daily, adjusted according to response, to be taken with breakfast and at bedtime

To reduce degradation of pancreatic enzyme supplements

- **BY MOUTH**
  - Adult: 0.8–1.6 g daily in 4 divided doses, dose to be taken 1–1½ hours before meals

**INTERACTIONS** → Appendix 1 (histamine H₂-antagonists).

**SIDE-EFFECTS**

- Common or very common Malaise
- Uncommon Tachycardia
- Rare Interstitial nephritis
- Very rare Alopecia · galactorrhoea · pancreatitis · vasculitis

**PREGNANCY** Manufacturer advises avoid unless essential.

**BREAST FEEDING** Significant amount present in milk—not known to be harmful but manufacturer advises avoid.

**HEPATIC IMPAIRMENT** Reduce dose. Increased risk of confusion.

**RENAL IMPAIRMENT** Occasional risk of confusion. Reduce dose to 200 mg 4 times daily if eGFR 30–50 mL/minute/1.73 m². Reduce dose to 200 mg 3 times daily if eGFR 15–30 mL/minute/1.73 m². Reduce dose to 200 mg twice daily if eGFR less than 15 mL/minute/1.73 m².

**EXCEPTIONS TO LEGAL CATEGORY** Cimetidine can be sold to the public for adults and children over 16 years (provided packs do not contain more than 2 weeks’ supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity (max. single dose 200 mg, max. daily dose 800 mg), and for the prophylactic management of nocturnal heartburn (single night-time dose 100 mg).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Cimetidine (Non-proprietary) Cimetidine 200 mg Cimetidine 200 mg tablets | 60 tablet (£0.80 DT price = £5.04)
Nizatidine

**INDICATIONS AND DOSE**

**Benign gastric, duodenal or NSAID-associated ulceration**

**BY MOUTH**

- Adult: 300 mg once daily for 4–8 weeks; dose to be taken in the evening, alternatively 150 mg twice daily for 4–8 weeks; maintenance 150 mg once daily, dose to be taken at night.

**Gastro-oesophageal reflux disease**

**BY MOUTH**

- Adult: 150–300 mg twice daily for up to 12 weeks

**INTERACTIONS** → Appendix 1 (histamine H₂-antagonists).

**SIDE-EFFECTS**

- Common or very common Sweating
- Rare Fever · hyperuricaemia · nausea · vasculitis

**PREGNANCY** Manufacturer advises avoid unless essential.

**BREAST FEEDING** Amount too small to be harmful.

**HEPATIC IMPAIRMENT** Manufacturer advises caution.

**RENAL IMPAIRMENT** Use half normal dose if eGFR 20–50 mL/minute/1.73 m². Use one-quarter normal dose if eGFR less than 20 mL/minute/1.73 m².

**EXCEPTIONS TO LEGAL CATEGORY** Nizatidine can be sold to the public for the prevention and treatment of symptoms of food-related heartburn and meal-induced indigestion in adults and children over 16 years; max. single dose 75 mg, max. daily dose 150 mg for max. 14 days.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**Capsule**

- **NIZATIDINE (Non-proprietary)**
  
  Nizatidine 150 mg Nizatidine 150mg capsules | 30 capsule £12.20 DT price = £5.40
  
  Nizatidine 300 mg Nizatidine 300mg capsules | 30 capsule £17.40 DT price = £11.43

Ranitidine

**INDICATIONS AND DOSE**

**Benign gastric ulceration | Duodenal ulceration**

**BY MOUTH**

- Child 1-5 years: 1 mg/kg 3 times a day (max. per dose 3 mg/kg 3 times a day)
- Child 6 months-2 years: 2–4 mg/kg twice daily
- Child 3-11 years: 2–4 mg/kg twice daily (max. per dose 150 mg) for 4–8 weeks
- Child 12-17 years: 150 mg twice daily for 4–8 weeks, alternatively 300 mg once daily for 4–8 weeks, dose to be taken at night
- Adult: 150 mg twice daily for 4–8 weeks, alternatively 300 mg once daily for 4–8 weeks, dose to be taken at night

**Chronic episodic dyspepsia**

**BY MOUTH**

- Child 12-17 years: 150 mg twice daily for 6 weeks, alternatively 300 mg once daily for 6 weeks, dose to be taken at night
- Adult: 150 mg twice daily for 6 weeks, alternatively 300 mg once daily for 6 weeks, dose to be taken at night
NSAID-associated gastric ulceration

**BY MOUTH**
- Child 12-17 years: 150 mg twice daily for up to 8 weeks, alternatively 300 mg once daily for up to 8 weeks, dose to be taken at night
- Adult: 150 mg twice daily for up to 8 weeks, alternatively 300 mg once daily for up to 8 weeks, dose to be taken at night

NSAID-associated duodenal ulcer

**BY MOUTH**
- Child 12-17 years: 300 mg twice daily for 4 weeks, to achieve a higher healing rate
- Adult: 300 mg twice daily

Gastro-oesophageal reflux disease

**BY MOUTH**
- Child 12-17 years: 150 mg twice daily for up to 8 weeks or if necessary 12 weeks, alternatively 300 mg once daily for up to 8 weeks or if necessary 12 weeks, dose to be taken at night
- Adult: 150 mg twice daily for up to 8 weeks or if necessary 12 weeks, alternatively 300 mg once daily for up to 8 weeks or if necessary 12 weeks, dose to be taken at night

**Moderate to severe gastro-oesophageal reflux disease**

**BY MOUTH**
- Child 12-17 years: 600 mg daily in 2–4 divided doses for up to 12 weeks
- Adult: 600 mg daily in 2–4 divided doses for up to 12 weeks

Long-term treatment of healed gastro-oesophageal reflux disease

**BY MOUTH**
- Child 3-11 years: 2.5–5 mg/kg twice daily (max. per dose 300 mg)
- Child 12-17 years: 150 mg twice daily
- Adult: 150 mg twice daily

Gastric acid reduction (prophylaxis of acid aspiration) in obstetrics

**BY MOUTH**
- Child 12-17 years: 150 mg, dose to be given at onset of labour, then 150 mg every 6 hours
- Adult: 150 mg, dose to be given at onset of labour, then 150 mg every 6 hours

Gastric acid reduction (prophylaxis of acid aspiration) in surgical procedures

**INITIALLY BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION**
- Adult: 50 mg, to be given 45–60 minutes before induction of anaesthesia, intravenous injection diluted to 20 mL and given over at least 2 minutes, alternatively (by mouth) 150 mg, to be given 2 hours before induction of anaesthesia and also when possible on the preceding evening

Prophylaxis of stress ulceration

**INITIALLY BY SLOW INTRAVENOUS INJECTION**
- Adult: 50 mg every 8 hours, dose to be diluted to 20 mL and given over at least 2 minutes, then (by mouth) 150 mg twice daily, may be given when oral feeding commences

**Reflex oesophagitis and other conditions where gastric acid reduction is beneficial**

**BY MOUTH**
- Child 1-5 months: 1 mg/kg 3 times a day (max. per dose 3 mg/kg 3 times a day)
- Child 6-months-2 years: 2–4 mg/kg twice daily
- Child 3-11 years: 2–4 mg/kg twice daily (max. per dose 150 mg); increased to up to 5 mg/kg twice daily (max. per dose 300 mg), dose increase for severe gastro-oesophageal disease
- Child 12-17 years: 150 mg twice daily, alternatively 300 mg once daily, dose to be taken at night, then increased if necessary to 300 mg twice daily for up to 12 weeks in moderate to severe gastro-oesophageal reflux disease, alternatively increased if necessary to 150 mg 4 times a day for up to 12 weeks in moderate to severe gastro-oesophageal reflux disease

**Conditions where reduction of gastric acidity is beneficial and oral route not available**

**BY INTRAMUSCULAR INJECTION**
- Adult: 50 mg every 6–8 hours

**BY SLOW INTRAVENOUS INJECTION**
- Adult: 50 mg, dose to be diluted to 20 mL and given over at least 2 minutes; may be repeated every 6–8 hours

- **UNLICENSED USE** Oral preparations not licensed for use in children under 3 years. Injection not licensed for use in children under 6 months.
- In adults Doses given for prophylaxis of NSAID-associated gastric or duodenal ulcer, and prophylaxis of stress ulceration, are not licensed.
- **INTERACTIONS** → Appendix 1 (histamine H₂-antagonists).
- **SIDE-EFFECTS**
  - Uncommon Blurred vision
  - Frequency not known Alopecia • interstitial nephritis • involuntary movement disorders • pancreatitis
- **PREGNANCY** Manufacturer advises avoid unless essential, but not known to be harmful.
- **BREAST FEEDING** Significant amount present in milk, but not known to be harmful.
- **RENAL IMPAIRMENT**
  - In adults Use half normal dose if eGFR less than 50 mL/minute/1.73 m².
  - In children Use half normal dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².
- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use in children For *slow intravenous injection* dilute to a concentration of 2.5 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over at least 3 minutes.
  - With intravenous use in adults For *intravenous infusion* (Zantac®), give intermittently in Glucose 5% or Sodium Chloride 0.9%.
- **PATIENT AND CARER ADVICE**
  - Medicines for Children leaflet: Ranitidine for acid reflux www.medicinesforchildren.org.uk/ranitidine-for-acid-reflux
  - In fat malabsorption syndrome, give oral doses (usually half normal dose) after food to enhance effects of pancreatic enzyme replacement.
- **EXCEPTIONS TO LEGAL CATEGORY** Ranitidine can be sold to the public for adults and children over 16 years (provided packs do not contain more than 2 weeks’ supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity, and for the prevention of these symptoms when associated with consumption of food or drink (max. single dose 75 mg, max. daily dose 300 mg).
for gastric and duodenal ulceration

Proton pump inhibitors

Proton pump inhibitors are effective short-term treatments for gastric and duodenal ulcers; they are also used in combination with antibacterials for the eradication of Helicobacter pylori (see specific regimens). Following endoscopic treatment of severe peptic ulcer bleeding, an intravenous, high-dose proton pump inhibitor reduces the risk of rebleeding and the need for surgery. Proton pump inhibitors can be used for the treatment of dyspepsia and gastro-oesophageal reflux disease.

Proton pump inhibitors are also used for the prevention and treatment of NSAID-associated ulcers. In patients who need to continue NSAID treatment after an ulcer has healed, the dose of proton pump inhibitor should normally not be reduced because asymptomatic ulcer deterioration may occur.

A proton pump inhibitor can be used to reduce the degradation of pancreatic enzyme supplements in patients with cystic fibrosis. They can also be used to control excessive secretion of gastric acid in Zollinger–Ellison syndrome; high doses are often required.

DRUG ACTION Proton pump inhibitors inhibit gastric acid secretion by blocking the hydrogen-potassium adenosine triphosphatase enzyme system (the ‘proton pump’) of the gastric parietal cell.

CAUTIONS Can increase the risk of fractures (particularly when used at high doses for over a year in the elderly) - may increase the risk of gastro-intestinal infections (including Clostridium difficile infection) - may mask the symptoms of gastric cancer - patients at risk of osteoporosis

CAUTIONS, FURTHER INFORMATION

Risk of osteoporosis Patients at risk of osteoporosis should maintain an adequate intake of calcium and vitamin D, and if necessary, receive other preventative therapy.

Gastric cancer Particular care is required in those presenting with ‘alarm features’, in such cases gastric malignancy should be ruled out before treatment.

SIDE-EFFECTS

Common or very common Abdominal pain - constipation - diarrhoea - flatulence - gastro-intestinal disturbances - headache - nausea - vomiting

Uncommon Arthralgia - dizziness - dry mouth - fatigue - myalgia - paraesthesia - peripheral oedema - pruritus - rash - sleep disturbances

Rare Alopecia - anaphylaxis - blood disorders - bronchospasm - confusion - depression - fever - gynaecomastia - hallucinations - hepatitis - hypersensitivity reactions - hypomagnesaemia (usually after 1 year of treatment, but sometimes after 5 months of treatment) - hypotension - intrastitial nephritis - jaundice - leucocytosis - leucopenia - pancytopenia - photosensitivity - Stevens-Johnson syndrome - stomatitis - sweating - taste disturbance - thrombocytopenia - toxic epidermal necrosis - visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

Rebound acid hypersecretion and protracted dyspepsia may occur after stopping prolonged treatment with a proton pump inhibitor.

MONITORING REQUIREMENTS Measurement of serum-magnesium concentrations should be considered before and during prolonged treatment with a proton pump inhibitor, especially when used with other drugs that cause hypomagnesaemia or with digoxin.

PRESCRIBING AND DISPENSING INFORMATION A proton pump inhibitor should be prescribed for appropriate indications at the lowest effective dose for the shortest period; the need for long-term treatment should be reviewed periodically.
Gastro-intestinal system

With intravenous use in adults

**DIRECTIONS FOR ADMINISTRATION**

**HEPATIC IMPAIRMENT**

- In adults: Severe hepatic impairment max. 20 mg daily. Severe peptic ulcer bleeding in severe hepatic impairment, initial intravenous infusion of 80 mg, then by continuous intravenous infusion, 4 mg/hour for 72 hours.
- In children 1–11 years max. 10 mg daily in severe impairment. 12–18 years max. 20 mg daily in severe impairment.

**RENA L IMPAIRMENT**

Manufacturer advises caution in severe renal insufficiency.

**DIRECTIONS FOR ADMINISTRATION**

**With intravenous use in adults** For *intravenous infusion*, dilute reconstituted solution to a concentration not exceeding 800 micrograms/mL with Sodium Chloride 0.9%; give over 10–30 minutes.

**With oral use** Do not chew or crush capsules; swallow whole or mix capsule contents in water and drink within 30 minutes. Do not crush or chew tablets; swallow whole or disperse in water and drink within 30 minutes. Disperse the contents of each sachet of gastro-resistant granules in approx. 15 mL water. Stir and leave to thicken for a few minutes; stir again before administration and use within 30 minutes; rinse container with 15 mL water to obtain full dose. For administration through a gastric tube, consult product literature.

**PATIENT AND CARER ADVICE**

- With oral use Counselling on administration of gastro-resistant capsules, tablets, and granules advised.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

### Gastro-resistant tablet

**ESOMEPRAZOLE (Non-proprietary)**

- **Esomeprazole (as Esomeprazole magnesium trihydrate)**
  - 20 mg Esomeprazole 20mg gastro-resistant tablets | 28 tablet [PO]
  - £18.50 DT price = £3.70

- **Esomeprazole (as Esomeprazole magnesium trihydrate)**
  - 40 mg Esomeprazole 40mg gastro-resistant tablets | 28 tablet [PO]
  - £25.19 DT price = £4.38

- **Nexium (AstraZeneca UK Ltd)**
  - Esomeprazole (as Esomeprazole magnesium trihydrate)
    - 20 mg Nexium 20mg gastro-resistant tablets | 28 tablet [PO]
    - £18.50 DT price = £3.70

  - **Esomeprazole (as Esomeprazole magnesium trihydrate)**
    - 40 mg Nexium 40mg gastro-resistant tablets | 28 tablet [PO]
    - £25.19 DT price = £4.38

### Gastro-resistant capsule

**ESOMEPRAZOLE (Non-proprietary)**

- **Esomeprazole (as Esomeprazole magnesium dihydrate)**
  - 20 mg Esomeprazole 20mg gastro-resistant capsules | 28 capsule [PO]
  - £12.95 DT price = £3.40

  - **Esomeprazole (as Esomeprazole magnesium dihydrate)**
    - 40 mg Esomeprazole 40mg gastro-resistant capsules | 28 capsule [PO]
    - £17.63 DT price = £3.96

  - **Emozul (Consilient Health Ltd)**
    - Esomeprazole (as Esomeprazole magnesium dihydrate)
      - 20 mg Emozul 20mg gastro-resistant capsules | 28 capsule [PO]
      - £13.40 DT price = £3.40

  - **Esomeprazole (as Esomeprazole magnesium dihydrate)**
    - 40 mg Emozul 40mg gastro-resistant capsules | 28 capsule [PO]
    - £13.96 DT price = £3.96

### Gastro-resistant granules

COUNTER AND ADVISORY LABELS 25

- **Nexium (AstraZeneca UK Ltd)**
  - Esomeprazole (as Esomeprazole magnesium trihydrate)
    - 10 mg Nexium 10mg gastro-resistant granules sachets | 28 sachet [PO]
    - £25.19 DT price = £25.19

Power for solution for injection

**ESOMEPRAZOLE (Non-proprietary)**

- **Esomeprazole (as Esomeprazole sodium) 40 mg**
  - Esomeprazole 40mg powder for solution for injection vials | 1 vial [PO] £3.07–£3.13 (Hospital only)

  - **Nexium (AstraZeneca UK Ltd)**
    - Esomeprazole (as Esomeprazole sodium) 40 mg Nexium IV 40mg powder for solution for injection vials | 1 vial [PO] £4.25 (Hospital only)
Lansoprazole

**INDICATIONS AND DOSE**

*Helicobacter pylori* eradication in combination with amoxicillin and clarithromycin; or in combination with amoxicillin and metronidazole; or in combination with clarithromycin and metronidazole

**BY MOUTH**

- Adult: 30 mg twice daily

**Benign gastric ulcer**

**BY MOUTH**

- Adult: 30 mg once daily for 8 weeks, dose to be taken in the morning

**Duodenal ulcer**

**BY MOUTH**

- Adult: 30 mg once daily for 4 weeks, dose to be taken in the morning; maintenance 15 mg once daily

**NSAID-associated duodenal ulcer | NSAID-associated gastric ulcer**

**BY MOUTH**

- Adult: 30 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed

**Prophylaxis of NSAID-associated duodenal ulcer | Prophylaxis of NSAID-associated gastric ulcer**

**BY MOUTH**

- Adult: 15–30 mg once daily

**Zollinger-Ellison syndrome (and other hypersecretory conditions)**

**BY MOUTH**

- Adult: Initially 60 mg once daily, adjusted according to response, daily doses of 120 mg or more given in two divided doses

**Gastro-oesophageal reflux disease**

**BY MOUTH**

- Adult: 30 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed; maintenance 15–30 mg once daily, doses to be taken in the morning

**Acid-related dyspepsia**

**BY MOUTH**

- Adult: 15–30 mg once daily for 2-4 weeks, doses to be taken in the morning

**UNLICENSED USE** Lansoprazole doses in BNF may differ from those in product literature.

**INTERACTIONS** → Appendix 1 (proton pump inhibitors).

**SIDE-EFFECTS**

- **Very rare** Collitis - raised serum cholesterol - raised triglycerides
- **Frequency not known** Anorexia - glossitis - impotence - pancreatitis - petechiae - purpura - restlessness - tremor
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Use half normal dose in moderate to severe liver disease.

**DIRECTIONS FOR ADMINISTRATION** Orodispersible tablets should be placed on the tongue, allowed to disperse and swallowed, or may be swallowed whole with a glass of water. Alternatively, tablets can be dispersed in a small amount of water and administered by an oral syringe or nasogastric tube.

**PATIENT AND CARER ADVICE** Counselling on administration of orodispersible tablet advised.

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners’ formulary

Lansoprazole capsules may be prescribed.

---

Omeprazole

**INDICATIONS AND DOSE**

*Helicobacter pylori* eradication in combination with amoxicillin and clarithromycin; or in combination with amoxicillin and metronidazole; or in combination with clarithromycin and metronidazole

**BY MOUTH**

- Adult: 20 mg twice daily

**Eradication failure of *Helicobacter pylori* infection in combination with tripotassium dicitratobismuthate, tetracycline and metronidazole**

**BY MOUTH**

- Adult: 20 mg twice daily

**Prevention of relapse in gastric ulcer**

**BY MOUTH**

- Adult: 20 mg once daily, increased if necessary to 40 mg once daily, in severe or recurrent cases

**Prevention of relapse in duodenal ulcer**

**BY MOUTH**

- Adult: 20 mg once daily, dose may range between 10–40 mg daily

**NSAID-associated duodenal ulcer | NSAID-associated gastric ulcer | NSAID-associated gastroduodenal erosions**

**BY MOUTH**

- Adult: 20 mg once daily for 4 weeks, continued for a further 4 weeks if not fully healed
Prophylaxis in patients with a history of NSAID-associated duodenal ulcer who require continued NSAID treatment | Prophylaxis in patients with a history of NSAID-associated gastric ulcer who require continued NSAID treatment | Prophylaxis in patients with a history of NSAID-associated gastroduodenal lesions who require continued NSAID treatment | Prophylaxis in patients with a history of NSAID-associated dyspeptic symptoms who require continued NSAID treatment

BY MOUTH
- Adult: 20 mg once daily

Gastro-oesophageal reflux disease

BY MOUTH
- Adult: 20 mg once daily for 4 weeks, continued for a further 4–8 weeks if not fully healed; maintenance 20 mg once daily

Gastro-oesophageal reflux disease refractory to other treatment

BY MOUTH
- Adult: 40 mg once daily for 8 weeks; maintenance 20 mg once daily

Acid reflux disease (long-term management)

BY MOUTH
- Adult: 10 mg once daily, increased to 20 mg once daily, dose only increased if symptoms return

Acid-related dyspepsia

BY MOUTH
- Adult: 10–20 mg once daily for 2–4 weeks according to response

Treatment and prevention of benign gastric ulcers | Treatment and prevention of duodenal ulcers | Treatment and prevention of NSAID-associated ulcers | Treatment and prevention of gastro-oesophageal reflux disease

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION
- Adult: 40 mg once daily until oral administration possible, injection to be given over 5 minutes, infusion to be given over 20–30 minutes

Major peptic ulcer bleeding (following endoscopic treatment)

INITIALLY BY INTRAVENOUS INFUSION
- Adult: Initially 80 mg, to be given over 40–60 minutes, then (by continuous intravenous infusion) 8 mg/hour for 72 hours, subsequent dose then changed to oral therapy

Zollinger–Ellison syndrome

BY MOUTH
- Adult: Initially 60 mg once daily; usual dose 20–120 mg daily, total daily doses greater than 80 mg should be given in 2 divided doses

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION
- Adult: Initially 60 mg once daily, adjusted according to response, total daily doses greater than 60 mg should be given in 2 divided doses, injection to be given over 5 minutes, infusion to be given over 20–30 minutes

UNLICENSED USE
- Treatment of major peptic ulcer bleeding (following endoscopic treatment) is an unlicensed indication.

INTERACTIONS | Appendix 1 (proton pump inhibitors).

SIDE-EFFECTS
- Appetite - impotence

PREGNANCY
- Not known to be harmful.

BREAST FEEDING
- Present in milk but not known to be harmful.

HEPATIC IMPAIRMENT
- Not more than 20 mg daily should be needed.

DIRECTIONS FOR ADMINISTRATION
- For administration by mouth, swallow whole, or disperse Losec MUPS® tablets in water, or mix capsule contents or Losec MUPS® tablets with fruit juice or yoghurt. Preparations consisting of an e/c tablet within a capsule should not be opened.
- With intravenous use For intravenous infusion (Losec®), give intermittently or continuously in Glucose 5% or Sodium chloride 0.9%; reconstitute each 40 mg vial with infusion fluid and dilute to 100 mL; for intermittent infusion give 40 mg over 20–30 minutes; stable for 3 hours in glucose 5% or 12 hours in sodium chloride 0.9%.

PATIENT AND CARER ADVICE
- With oral use Counselling on administration advised.

PROFESSION SPECIFIC INFORMATION
- Dental practitioners’ formulary
- Gastro-resistant omeprazole capsules may be prescribed.

EXCEPTIONS TO LEGAL CATEGORY
- Omeprazole 10 mg tablets can be sold to the public for the short-term relief of reflux-like symptoms (e.g. heartburn) in adults over 18 years, max. daily dose 20 mg for max. 4 weeks, and a pack size of 28 tablets.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Gastro-resistant tablet

CAUTIONARY AND ADVISORY LABELS

OMEPAZOLE (Non-proprietary)

Pantoprazole

**INDICATIONS AND DOSE**

*Helicobacter pylori* eradication in combination with amoxicillin and clarithromycin; or in combination with clarithromycin and metronidazole

**BY MOUTH**

- Adult: 40 mg daily for 8 weeks; increased if necessary up to 80 mg daily, dose increased in severe cases

**Benign gastric ulcer**

**BY MOUTH**

- Adult: 40 mg daily for 8 weeks; increased if necessary up to 80 mg daily, dose increased in severe cases

**Gastric ulcer**

**BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**

- Adult: 40 mg daily until oral administration can be resumed, injection to be given over at least 2 minutes

**Duodenal ulcer**

**BY MOUTH**

- Adult: 40 mg daily for 4 weeks; increased if necessary up to 80 mg daily, dose increased in severe cases

**BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**

- Adult: 40 mg daily until oral administration can be resumed, injection to be given over at least 2 minutes

**Prophylaxis of NSAID-associated gastric ulcer in patients with an increased risk of gastroduodenal complications who require continued NSAID treatment (Prophylaxis of NSAID-associated duodenal ulcer in patients with an increased risk of gastroduodenal complications who require continued NSAID treatment)**

**BY MOUTH**

- Adult: 20 mg daily

**Gastro-oesophageal reflux disease**

**BY MOUTH**

- Adult: 20–80 mg daily for 4 weeks, continued for further 4 weeks if not fully healed, dose to be taken in the morning; maintenance 20 mg daily and increased to 40 mg daily, increased only if symptoms return

**BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**

- Adult: 40 mg daily until oral administration can be resumed, injection to be given over at least 2 minutes

**Zollinger-Ellison syndrome (and other hypersecretary conditions)**

**BY MOUTH**

- Adult: Initially 80 mg daily (max. per dose 80 mg), adjusted according to response

- Elderly: 40 mg daily

**BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**

- Adult: Initially 80 mg, alternatively 160 mg in 2 divided doses, if rapid acid control required, then 80 mg once daily (max. per dose 80 mg), adjusted according to response

**INTERACTIONS** → Appendix 1 (proton pump inhibitors).

**SIDE-EFFECTS**

- Hyperlipidaemia - weight changes

- Pregnancy

  Manufacturer advises avoid unless potential benefit outweighs risk—fetotoxic in animals.

- Breast Feeding

  Manufacturer advises avoid unless potential benefit outweighs risk—small amount present in milk.

- Hepatic Impairment

  Max. 20 mg daily in severe impairment and cirrhosis. Monitor liver function in hepatic impairment (discontinue if deterioration).

- Renal Impairment

  Max. oral dose 40 mg daily.

**DIRECTIONS FOR ADMINISTRATION**

For *intravenous infusion* (*Protium*®), give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute 40 mg with 10 mL sodium chloride 0.9% and dilute with 100 mL of infusion fluid; give 40 mg over 15 minutes.

**EXCEPTIONS TO LEGAL CATEGORY**

Pantoprazole 20 mg tablets can be sold to the public for the short-term treatment of reflux symptoms (e.g. heartburn) in adults over 18 years, max. daily dose 20 mg for max. 4 weeks.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Gastro-resistant tablet**

Rabeprazole sodium

**INDICATIONS AND DOSE**

**Benign gastric ulcer**

**BY MOUTH**

- Adult: 20 mg daily for 8 weeks, dose to be taken in the morning

**Duodenal ulcer**

**BY MOUTH**

- Adult: 20 mg daily for 4 weeks, dose to be taken in the morning

**Gastro-oesophageal reflux disease**

**BY MOUTH**

- Adult: 20 mg once daily for 4–8 weeks; maintenance 10–20 mg daily

**Gastro-oesophageal reflux disease (symptomatic treatment in the absence of oesophagitis)**

**BY MOUTH**

- Adult: 10 mg daily for up to 4 weeks, then 10 mg daily if required

**Zollinger-Ellison syndrome**

**BY MOUTH**

- Adult: Initially 60 mg once daily, adjusted according to response, doses above 100 mg daily given in 2 divided doses; maximum 120 mg per day

*Helicobacter pylori* eradication in combination with amoxicillin or metronidazole and clarithromycin

**BY MOUTH**

- Adult: 20 mg twice daily

**INTERACTIONS** → Appendix 1 (proton pump inhibitors).

**SIDE-EFFECTS**

- Common or very common
  - Cough - influenza like syndrome - rhinitis
  - Uncommon
  - Chest pain - nervousness
4.3 Gastro-oesophageal reflux disease

Gastro-oesophageal reflux disease

Gastro-oesophageal reflux disease (including non-erosive gastro-oesophageal reflux and erosive oesophagitis) is associated with heartburn, acid regurgitation, and sometimes, difficulty in swallowing (dysphagia); oesophageal inflammation (oesophagitis), ulceration, and stricture formation may occur and there is an association with asthma.

The management of gastro-oesophageal reflux disease includes drug treatment, lifestyle changes and, in some cases, surgery. Initial treatment is guided by the severity of symptoms and treatment is then adjusted according to response. The extent of healing depends on the severity of the disease, the treatment chosen, and the duration of therapy.

Patients with gastro-oesophageal reflux disease should be advised about lifestyle changes (avoidance of excess alcohol and of aggravating foods such as fats); other measures associated with heartburn, acid regurgitation, and stricture formation may occur and there is an association with asthma.

For **mild symptoms** of gastro-oesophageal reflux disease, initial management may include the use of **antacids** and **alginates**. Alginate-containing antacids can form a ‘raft’ that floats on the surface of the stomach contents to reduce reflux and protect the oesophageal mucosa. **Histamine H2-receptor antagonists** may relieve symptoms and permit reduction in antacid consumption. However, **proton pump inhibitors** provide more effective relief of symptoms than H2-receptor antagonists. When symptoms abate, treatment is titrated down to a level which maintains remission (e.g. by giving treatment intermittently).

For **severe symptoms** of gastro-oesophageal reflux disease or for patients with a proven or severe pathology (e.g. oesophagitis, oesophageal ulceration, oesophagopharyngeal reflux, Barrett’s oesophagus), initial management involves the use of a **proton pump inhibitor**: patients need to be reassessed if symptoms persist despite treatment for 4–6 weeks with a proton pump inhibitor. When symptoms abate, treatment is titrated down to a level which maintains remission (e.g. by reducing the dose of the proton pump inhibitor or by giving it intermittently, or by substituting treatment with a histamine H2-receptor antagonist). However, for endoscopically confirmed erosive, ulcerative, or stricturing disease, or Barrett’s oesophagus, treatment with a proton pump inhibitor usually needs to be maintained at the minimum effective dose.

**Pregnancy**

If dietary and lifestyle changes fail to control gastro-oesophageal reflux disease in pregnancy, an antacid or an alginate can be used. If this is ineffective, ranitidine p. 65 can be tried. Omeprazole p. 69 is reserved for women with severe or complicated reflux disease.

**Gastro-oesophageal reflux disease in children**

Gastro-oesophageal reflux disease is common in infancy but most symptoms resolve without treatment between 12 and 18 months of age. In infants, mild or moderate reflux without complications can be managed initially by changing the frequency and volume of feed; a feed thickener or thickened formula feed can be used (with advice of a dietitian). If necessary, a suitable alginate-containing preparation can be used instead of thickened feeds. For older children, life-style changes similar to those for adults may be helpful followed if necessary by treatment with an alginate-containing preparation.

Children who do not respond to these measures or who have problems such as respiratory disorders or suspected oesophagitis need to be referred to hospital; an H2-receptor antagonist may be needed to reduce acid secretion. If the oesophagitis is resistant to H2-receptor blockade, the proton pump inhibitor omeprazole p. 69 can be tried.

4.4 Helicobacter pylori diagnosis

**DIAGNOSTICS**

**Urea (13C)**

**INDICATIONS AND DOSE**

Diagnosis of gastro-duodenal *Helicobacter pylori* infection

**BY MOUTH**

- Adult: (consult product literature)

**BY INTRAMUSCULAR INJECTION**

**Tablet**

- diabact UBT (Seahorse Laboratories Ltd)

**Urea (13-C) 50 mg** diabact UBT 50mg tablets | 1 tablet POM £21.25 | 10 tablet kit POM no price available (Hospital only)

**Soluble tablet**

- Pylobactel (Torbet Laboratories Ltd)

**Urea (13-C) 100 mg** Pylobactel breath test kit | 1 kit POM £20.75

**Powder**

- **UREA (13C) (Non-proprietary)**

**Urea (13-C) 45 mg** Helicobacter Test INFAI for children breath test kit (sugar-free) | 1 kit POM £19.20

**Urea (13-C) 75 mg** Helicobacter Test INFAI breath test kit (sugar-free) | 1 kit POM £19.20

5 Food allergy

**Food allergy**

Allergy with classical symptoms of vomiting, colic and diarrhoea caused by specific foods such as cow’s milk or shellfish should be managed by strict avoidance. The
condition should be distinguished from symptoms of occasional food intolerance in those with irritable bowel syndrome. Sodium cromoglicate p. 234 may be helpful as an adjunct to dietary avoidance.

6 Gastro-intestinal smooth muscle spasm

**ANTIMUSCARINICS**

Dicycloverine hydrochloride

(Dicylomine hydrochloride)

The properties listed below are those particular to the drug only. For properties common to the class, see antimuscarinics (systemic), p. 668.

### INDICATIONS AND DOSE

Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm

**BY MOUTH**
- Child 6 months-1 year: 5–10 mg 3–4 times a day, dose to be taken 15 minutes before feeds
- Child 2-11 years: 10 mg 3 times a day
- Child 12-17 years: 10–20 mg 3 times a day
- Adult: 10–20 mg 3 times a day

### CONTRA-INDICATIONS

Child under 6 months

### PREGNANCY

Not known to be harmful; manufacturer advises use only if essential.

### BREAST FEEDING

Avoid—present in milk; apnoea reported in infant.

### EXCEPTIONS TO LEGAL CATEGORY

Dicycloverine hydrochloride can be sold to the public provided that max. single dose is 10 mg and max. daily dose is 60 mg.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **DICYCLOVERINE HYDROCHLORIDE (Non-proprietary)**
  - Dicycloverine hydrochloride 10 mg: Dicycloverine 10mg tablets | 100 tablet [P] £141.68 DT price = £117.72
  - Dicycloverine hydrochloride 20 mg: Dicycloverine 20mg tablets | 84 tablet [P] £149.66 DT price = £123.91

**Oral solution**
- **DICYCLOVERINE HYDROCHLORIDE (Non-proprietary)**
  - Dicycloverine hydrochloride 2 mg per 1 ml: Dicycloverine 10mg/5ml oral solution | 100 ml [P] no price available | 120 ml [P] £138.30 DT price = £115.41 | 300 ml [P] no price available

### Aluminum hydroxide with dicycloverine hydrochloride, magnesium oxide and simeticone

The properties listed below are those particular to the combination only. For the properties of the components please consider, aluminium hydroxide p. 859, dicycloverine hydrochloride above, simeticone p. 60.

### INDICATIONS AND DOSE

Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm

**BY MOUTH**
- Child 12-17 years: 10–20 mL every 4 hours as required
- Adult: 10–20 mL every 4 hours as required

### Hyoscine butylbromide

The properties listed below are those particular to the drug only. For properties common to the class, see antimuscarinics (systemic), p. 668.

### INDICATIONS AND DOSE

Symptomatic relief of gastro-intestinal or genito-urinary disorders characterised by smooth muscle spasm

**BY MOUTH**
- Child 6-11 years: 10 mg 3 times a day
- Child 12-17 years: 20 mg 4 times a day
- Adult: 20 mg 4 times a day

**Irritable bowel syndrome**

**BY MOUTH**
- Adult: 10 mg 3 times a day; increased if necessary up to 20 mg 4 times a day

**Acute spasm** | Spasm in diagnostic procedures

**INITIALLY BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION**
- Adult: 20 mg, then (by intramuscular injection or by slow intravenous injection) 20 mg after 30 minutes if required, dose may be repeated more frequently in endoscopy; maximum 100 mg per day

**Excessive respiratory secretions (in palliative care)**

**BY MOUTH**
- Child 1 month-1 year: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
- Child 2-4 years: 5 mg 3–4 times a day
- Child 5-11 years: 10 mg 3–4 times a day
- Child 12-17 years: 10–20 mg 3–4 times a day

**BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION**
- Child 1 month-3 years: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
- Child 5-11 years: 5–10 mg 3–4 times a day
- Child 12-17 years: 10–20 mg 3–4 times a day

**BY SUBCUTANEOUS INJECTION**
- Adult: 20 mg every 4 hours if required, increased according to response, up to 20 mg every hour

**BY SUBCUTANEOUS INFUSION**
- Adult: 20–120 mg/24 hours

**Bowel colic (in palliative care)**

**BY MOUTH**
- Child 1 month-1 year: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
- Child 2-4 years: 5 mg 3–4 times a day
- Child 5-11 years: 10 mg 3–4 times a day
- Child 12-17 years: 10–20 mg 3–4 times a day

**BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION**
- Child 1 month-3 years: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
- Child 5-11 years: 5–10 mg 3–4 times a day
- Child 12-17 years: 10–20 mg 3–4 times a day

**BY SUBCUTANEOUS INJECTION**
- Adult: 20 mg every 4 hours if required, increased according to response, up to 20 mg every hour

**BY SUBCUTANEOUS INFUSION**
- Adult: 60–300 mg/24 hours

### PHARMACOKINETICS

Administration by mouth is associated with poor absorption.
Gastro-intestinal system

**RENAL IMPAIRMENT**

**HEPATIC IMPAIRMENT**

**BREAST FEEDING**

**UNLICENSED USE**

**PREGNANCY**

Manufacturer advises avoid.

**BREAST FEEDING**

Amount too small to be harmful.

**DIRECTIONS FOR ADMINISTRATION**

- With oral use in children For administration by mouth, injection solution may be used; content of ampoule may be stored in a refrigerator for up to 24 hours after opening.
- With intravenous use in children For intravenous injection, may be diluted with Glucose 5% or Sodium Chloride 0.9%; give over at least 1 minute.

**EXCEPTIONS TO LEGAL CATEGORY**

Hyoscine butylbromide tablets can be sold to the public for medically confirmed irritable bowel syndrome, provided single dose does not exceed 20 mg, daily dose does not exceed 80 mg, and pack does not contain a total of more than 240 mg.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, tablets, solution for injection.

**Tablet**

- Buscopan (Boehringer Ingelheim Self-Medication Division, Boehringer Ingelheim Ltd)
  - Hyoscine butylbromide 10 mg
    - Buscopan Cramps 10mg tablets 120 tablet £2.64
    - Buscopan 10mg tablets 56 tablet £3.00 OT price = £3.00

**Solution for injection**

- Buscopan (Boehringer Ingelheim Ltd)
  - Hyoscine butylbromide 20 mg per 1 ml
    - Buscopan 20mg/1ml solution for injection ampoules 10 ampoule £2.92 OT price = £2.92

**Propantheline bromide**

The properties listed below are those particular to the drug only. For properties common to the class, see antimuscarinics (systemic), p.668.

**INDICATIONS AND DOSE**

Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm

**BY MOUTH**

- Child 12–17 years: 15 mg 3 times a day, dose to be taken at least one hour before food and 30 mg, dose to be taken at night; maximum 120 mg per day
- Adult: 15 mg 3 times a day, dose to be taken at least one hour before food and 30 mg, dose to be taken at night; maximum 120 mg per day

**Adult enuresis**

**BY MOUTH**

- Adult: Initially 15 mg 3 times a day, dose to be taken at least one hour before food and 30 mg, dose to be taken at bedtime, subsequently adjusted according to response; maximum 120 mg per day

**UNLICENSED USE**

Tablets not licensed for use in children under 12 years.

**SIDE-EFFECTS**

- Facial flushing
- Manufacturer advises avoid unless essential—no information available.
- May suppress lactation.
- Manufacturer advises caution.
- Manufacturer advises caution.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension.

**Tablet CAUTIONARY AND ADVISORY LABELS 23**

- Pro-Banthine (Archimedes Pharma UK Ltd)
  - Propantheline bromide 15 mg Pro-Banthine 15mg tablets 112 tablet £20.74 OT price = £20.74

**ANTISPASMODICS**

**Antispasmodics**

**Antimuscarinics**

The intestinal smooth muscle relaxant properties of antimuscarinic and other antispasmodic drugs may be useful in irritable bowel syndrome and in diverticular disease.

Antimuscarinics (formerly termed ‘anticholinergics’) reduce intestinal motility. They can be used for the management of irritable bowel syndrome and diverticular disease. However, their value has not been established and response varies.

Antimuscarinic drugs that are used for gastro-intestinal smooth muscle spasm include the tertiary amines atropine sulfate p.1099 and dicycloverine hydrochloride p.73 and the quaternary ammonium compounds propantheline bromide above and hyoscine butylbromide p.73. The quaternary ammonium compounds are less lipid soluble than atropine sulfate and are less likely to cross the blood–brain barrier; they are also less well absorbed from the gastro-intestinal tract.

Dicycloverine hydrochloride has a much less marked antimuscarinic action than atropine sulfate and may also have some direct action on smooth muscle. Hyoscine butylbromide is advocated as a gastro-intestinal antispasmodic, but it is poorly absorbed; the injection is useful in endoscopy and radiology. Atropine sulfate and the belladonna alkaloids are outmoded treatments, any clinical virtues being outweighed by atropinic side-effects.

Other indications for antimuscarinic drugs include arrhythmias, asthma and airways disease, motion sickness, parkinsonism, urinary incontinence, mydriasis and cycloplegia, premedication, and as an antidote to organophosphorus poisoning.

**Other antispasmodics**

Alverine citrate below, mebeverine hydrochloride p.75, and peppermint oil p.40 are believed to be direct relaxants of intestinal smooth muscle and may relieve pain in irritable bowel syndrome and diverticular disease. They have no serious adverse effects but, like all antispasmodics, should be avoided in paralytic ileus.

**Alverine citrate**

**INDICATIONS AND DOSE**

Adjunct in gastro-intestinal disorders characterised by smooth muscle spasm | Dysmenorrhoea

**BY MOUTH**

- Child 12–17 years: 60–120 mg 1–3 times a day
- Adult: 60–120 mg 1–3 times a day

**CONTRA-INDICATIONS**

Paralytic ileus

**SIDE-EFFECTS**

- Dizziness | dyspepsia | headache | hepatitis | nausea | pruritus | rash

**PREGNANCY**

Use with caution.

**BREAST FEEDING**

Manufacturer advises avoid—limited information available.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.
Mebeverine hydrochloride

INDICATIONS AND DOSE
Adjunct in gastrointestinal disorders characterised by smooth muscle spasm

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 10–17 years: 135–150 mg 3 times a day, dose preferably taken 20 minutes before meals
- Adult: 135–150 mg 3 times a day, dose preferably taken 20 minutes before meals

Irritable bowel syndrome

BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Child 12–17 years: 200 mg twice daily
- Adult: 200 mg twice daily

- CONTRA-INDICATIONS Paralytic ileus
- SIDE-EFFECTS Allergic reactions • angioedema • rash • urticaria
- PREGNANCY Not known to be harmful — manufacturers advise avoid.
- BREAST FEEDING Manufacturers advise avoid — no information available.
- PATIENT AND CARER ADVICE Patients or carers should be given advice on the timing of administration of mebeverine hydrochloride tablets and oral suspension.

Medicines for Children leaflet: Mebeverine for intestinal spasm www.medicinesforchildren.org.uk/mebeverine-for-intestinal-spasms

EXCEPTIONS TO LEGAL CATEGORY Mebeverine hydrochloride can be sold to the public for symptomatic relief of irritable bowel syndrome provided that max. single dose is 135 mg and max. daily dose is 405 mg; for uses other than symptomatic relief of irritable bowel syndrome provided that max. single dose is 100 mg and max. daily dose is 300 mg.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: powder

**Tablet**

- **MEBEVERINE HYDROCHLORIDE (Non-proprietary)**
  - Mebeverine hydrochloride 135 mg Boots IBS Relief 135 mg tablets | 15 tablet | no price available
  - Mebeverine 135 mg tablets | 15 tablet | no price available | 15 tablet | £4.50 | 1 tablet | £2.67 DT price = £8.44

Ispaghula husk with mebeverine

The properties listed below are those particular to the combination only. For the properties of the components please consider, ispaghula husk p. 45, mebeverine hydrochloride above.

INDICATIONS AND DOSE

Irritable bowel syndrome

BY MOUTH
- Child 12–17 years: 1 sachet twice daily, in water, morning and evening, 30 minutes before food and 1 sachet daily if required, taken 30 minutes before midday meal
- Adult: 1 sachet twice daily, in water, morning and evening, 30 minutes before food and 1 sachet daily if required, taken 30 minutes before midday meal

DIRECTIONS FOR ADMINISTRATION
Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed.

PATIENT AND CARER ADVICE
Patients or carers should be given advice on how to administer ispaghula husk with mebeverine granules.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Effervescent granules

CAUTIONARY AND ADVISORY LABELS 13, 22
EXCIPIENTS: May contain Aspartame
ELECTROLYTES: May contain Potassium
- Fybogel Mebeverine (Forum Health Products Ltd)
  - Ispaghula husk 3.5 gram, Mebeverine hydrochloride 135 mg Fybogel Mebeverine effervescent granules sachets orange (sugar-free) | 10 sachet | £3.91 DT price = £3.91

Liver disorders and related conditions

7.1 Biliary disorders

Biliary disorders

Drugs affecting biliary composition and flow

The use of laparoscopic cholecystectomy and of endoscopic biliary techniques has limited the place of the bile acid ursodeoxycholic acid p. 76 in gallstone disease. Ursodeoxycholic acid is suitable for patients with unimpaired gall bladder function, small or medium-sized radiolucent stones, and whose mild symptoms are not amenable to other treatment. Long-term prophylaxis may be needed after complete dissolution of the gallstones has been confirmed because they may recur in up to 25% of patients within one year of stopping treatment. Ursodeoxycholic acid is also used in primary biliary cirrhosis; liver tests improve in most patients but the effect on overall survival is uncertain.

A terpene mixture (Rowachol) raises biliary cholesterol solubility. It is not considered to be a useful adjunct.
Bile acid sequestrants
Colestyramine p. 173 is an anion-exchange resin that is not absorbed from the gastro-intestinal tract. It relieves diarrhea and pruritus by forming an insoluble complex with bile acids in the intestine.

Pancreatin
Supplements of pancreatic enzymes are given by mouth to compensate for reduced or absent exocrine secretion in cystic fibrosis, and following pancreatectomy, gastrectomy, or chronic pancreatitis. Pancreatin may also be necessary if a tumour (e.g. pancreatic cancer) obstructs outflow from the pancreas.

Bile acids

Ursodeoxycholic acid

**INDICATIONS AND DOSE**

**Dissolution of gallstones**

**BY MOUTH**

- Adult: 8–12 mg/kg once daily, dose to be taken at bedtime, alternatively 8–12 mg/kg daily in 2 divided doses for up to 2 years; treatment is continued for 3–4 months after stones dissolve

**Primary biliary cirrhosis**

**BY MOUTH**

- Adult: 12–16 mg/kg daily in 3 divided doses for 3 months, then 12–16 mg/kg once daily, dose to be taken at bedtime

**SIDE-EFFECTS**

- Common or very common: Diarrhoea
- Very rare: Abdominal pain, gallstone calcification, urticaria
- Frequency not known: Nausea, pruritus, vomiting

**PREGNANCY**

No evidence of harm but manufacturer advises avoid.

**BREAST FEEDING**

Not known to be harmful but manufacturer advises avoid.

**HEPATIC IMPAIRMENT**

Avoid in chronic liver disease (but used in primary biliary cirrhosis).

**MONITORING REQUIREMENTS**

In primary biliary cirrhosis, monitor liver function every 4 weeks for 3 months, then every 3 months.

**PATIENT AND CARER ADVICE**

Patients should be given dietary advice (including avoidance of excessive cholesterol and calories).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 21**

- **URSODEOXYCHOLIC ACID (Non-proprietary)**
  - Ursodeoxycholic acid 150 mg: Ursodeoxycholic acid 150 mg tablets | 60 tablet (Pos) £19.02 DT price = £19.01
  - Ursodeoxycholic acid 300 mg: Ursodeoxycholic acid 300 mg tablets | 60 tablet (Pos) £38.86 DT price = £38.86
  - Destolit (Norgine Pharmaceuticals Ltd)
  - Ursodeoxycholic acid 150 mg: Destolit 150 mg tablets | 60 tablet (Pos) £18.39 DT price = £19.01
  - Ursofalk (Dr. Falk Pharma UK Ltd)

**CAUTIONARY AND ADVISORY LABELS 21**

- Ursofalk (Dr. Falk Pharma UK Ltd)
- Ursodeoxycholic acid 50 mg per 1 ml: Ursofalk 250 mg/5ml oral suspension (sugar-free) | 250 ml (Pos) £26.98 DT price = £26.98

**TERPENES**

**Borneol with camphene, cineole, menthol, menthone and pinene**

**INDICATIONS AND DOSE**

**Biliary disorders**

**BY MOUTH**

- Adult: 1–2 capsules 3 times a day, to be taken before food

**LESS SUITABLE FOR PRESCRIBING**

Rowachol® is less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.
### 7.2 Oesophageal varices

**VASOPRESSIN AND ANALOGUES**

Drugs used for Oesophageal varices not listed below; *Vasopressin*, p. 576

---

**Terlipressin acetate**

**INDICATIONS AND DOSE**

**GLYPRESSIN® INJECTION**

**Bleeding from oesophageal varices**

**BY INTRAVENOUS INJECTION**

- Adult (body-weight up to 50 kg): Initially 2 mg every 4 hours until bleeding controlled, then reduced to 1 mg every 4 hours if required, maximum duration 48 hours.
- Adult (body-weight 50 kg and above): Initially 2 mg every 4 hours until bleeding controlled, reduced if not tolerated to 1 mg every 4 hours, maximum duration 48 hours.

**VARIQUEL® INJECTION**

**Bleeding from oesophageal varices**

**BY INTRAVENOUS INJECTION**

- Adult (body-weight up to 49 kg): Initially 1 mg, then 1 mg every 4–6 hours for up to 72 hours, to be administered over 1 minute.
- Adult (body-weight 50–69 kg): Initially 1.5 mg, then 1 mg every 4–6 hours for up to 72 hours, to be administered over 1 minute.
- Adult (body-weight 70 kg and above): Initially 2 mg, then 1 mg every 4–6 hours for up to 72 hours, to be administered over 1 minute.

---

**CAUTIONS**

**INTERCTIONS**

- Caution with concomitant use of drugs that prolong the QT-interval.

**SIDE-EFFECTS**

- Common or very common: Abdominal cramps - arrhythmia - bradycardia - diarrhoea - headache - hypertension - hypotension - pallor - peripheral ischaemia.
- Rare: Dizziness.
- Very rare: Hyperglycaemia - stroke.
- Frequency not known: Heart failure - skin necrosis.

**PREGNANCY**

Avoid unless benefits outweigh risk—uterine contractions and increased intra-uterine pressure in early pregnancy, and decreased uterine blood flow reported.

**BREAST FEEDING**

Avoid unless benefits outweigh risk—no information available.

**RENAI IMPAIRMENT**

Use with caution in chronic renal failure.

---

**8 Obesity**

**Obesity**

Obesity is associated with many health problems including cardiovascular disease, diabetes mellitus, gallstones and osteoarthritis. Factors that aggravate obesity may include depression, other psychosocial problems, and some drugs.

The main treatment of the obese individual is a suitable diet, carefully explained to the individual, with appropriate support and encouragement; the individual should also be advised to increase physical activity. Smoking cessation (while maintaining body weight) may be worthwhile before attempting supervised weight loss since cigarette smoking may be more harmful than obesity. Attendance at weight loss groups helps some individuals.

Obesity should be managed in an appropriate setting by staff who have been trained in the management of obesity; the individual should receive advice on diet and lifestyle modification and be monitored for changes in weight as well as in blood pressure, blood lipids and other associated conditions.

An anti-obesity drug should be considered only for those with a body mass index (BMI, individual’s bodyweight divided by the square of the individual’s height) of 30 kg/m² or greater in whom at least 3 months of managed care involving supervised diet, exercise and behaviour modification fails to achieve a realistic reduction in weight. In the presence of associated risk factors, it may be appropriate to prescribe an anti-obesity drug to individuals with a BMI of 28 kg/m² or greater. Drugs should never be used as the sole element of treatment. The individual should be monitored on a regular basis; drug treatment should be discontinued if the individual regains weight at any time whilst receiving drug treatment.

Combination therapy involving more than one anti-obesity drug is contra-indicated by the manufacturers; there is no evidence-base to support such treatment.

Thyroid hormones have no place in the treatment of obesity except in biochemically proven hypothyroid patients. The use of diuretics, choriionic gonadotrophin, or amphetamines is not appropriate for weight reduction.

**Anti-obesity drugs acting on the gastro-intestinal tract**

Orlistat p. 78 should be used in conjunction with other lifestyle measures to manage obesity; treatment should only be continued beyond 12 months after discussing potential benefits and risks with the patient. On stopping orlistat, there may be a gradual reversal of weight loss.
Some of the weight loss in those taking orlistat below probably results from individuals reducing their fat intake to avoid severe gastro-intestinal effects including steatorrhoea. Methylcellulose p. 45 is claimed to reduce food intake by producing a feeling of satiety, but there is little evidence to support its use in the management of obesity.

**Centrally acting appetite suppressants**

Phentermine and diethylpropion are central stimulants; they are not recommended for the treatment of obesity. Phentermine has been associated with a risk of pulmonary hypertension. Sibutramine, dexfenfluramine, and fenfluramine have been withdrawn because the benefit of treatment does not outweigh the risk of serious adverse effects.

**LIPASE INHIBITORS**

Orlistat

- **DRUG ACTION** Orlistat, a lipase inhibitor, reduces the absorption of dietary fat.

**INDICATIONS AND DOSE**

Adjunct in obesity (in conjunction with a mildly hypocaloric diet in individuals with a body mass index (BMI) of 30 kg/m² or more or in individuals with a BMI of 28 kg/m² or more in the presence of other risk factors such as type 2 diabetes, hypertension, or hypercholesterolaemia)  

- **BY MOUTH**
  - Adult: 120 mg up to 3 times a day, dose to be taken immediately before, during, or up to 1 hour after each main meal, continue treatment beyond 12 weeks only if weight loss since start of treatment exceeds 5% (target for initial weight loss may be lower in patients with type 2 diabetes), if a meal is missed or contains no fat, the dose of orlistat should be omitted

- **CONTRA-INDICATIONS** Cholestasis • chronic malabsorption syndrome

- **CAUTIONS** Chronic kidney disease • may impair absorption of fat-soluble vitamins • volume depletion

- **CAUTIONS, FURTHER INFORMATION**
  - Vitamin supplementation (especially of vitamin D) may be considered if there is concern about deficiency of fat-soluble vitamins.

- **INTERACTIONS** → Appendix 1 (orlistat).
  - Multivitamins If a multivitamin supplement is required, it should be taken at least 2 hours after orlistat dose or at bedtime.

- **SIDE-EFFECTS**
  - Common or very common Abdominal distension (gastro-intestinal effects minimised by reduced fat intake) • abdominal pain (gastro-intestinal effects minimised by reduced fat intake) • anxiety • faecal incontinence • faecal urgency • flatulence • gingival disorders • headache • hypoglycaemia • liquid stools • malaise • menstrual disturbances • oily leakage from rectum • oily stools • respiratory infections • tooth disorders • urinary tract infection
  - Frequency not known Bullous eruptions • cholelithiasis • diverticulitis • hepatitis • hypothyroidism • oxalate nephropathy • rectal bleeding

- **PREGNANCY** Use with caution.

- **BREAST FEEDING** Avoid—no information available.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- **ORLISTAT (Non-proprietary)**
  - Orlistat 120 mg Orlistat 120mg capsules | 84 capsule £26.51-£30.05 DT price = £26.51
  - Alli (GlaxoSmithKline Consumer Healthcare) Orlistat 60 mg Alli 60mg capsules | 42 capsule £19.20 | 84 capsule £29.10 | 120 capsule £36.32
  - Beacita (Actavis UK Ltd) Orlistat 120 mg Beacita 120mg capsules | 84 capsule £31.63 DT price = £26.51
  - Xenical (Roche Products Ltd) Orlistat 120 mg Xenical 120mg capsules | 84 capsule £31.63 DT price = £26.51

9 Rectal and anal disorders

**Rectal and anal disorders**

Anal and perianal pruritus, soreness, and excoriation are best treated by application of bland ointments and suppositories. These conditions occur commonly in patients suffering from haemorrhoids, fistulas, and proctitis. Cleansing with attention to any minor faecal soiling, adjustment of the diet to avoid hard stools, the use of bulk-forming materials such as bran and a high residue diet are helpful. In proctitis these measures may supplement treatment with corticosteroids or sulphasalazine p. 37.

When necessary, topical preparations containing local anaesthetics or corticosteroids are used, provided perianal thrush has been excluded. Perianal thrush is treated with a topical antifungal preparation.

**Soothing haemorrhoidal preparations**

Soothing preparations containing mild astringents such as bismuth subgallate, zinc oxide, and hamamelis may give symptomatic relief in haemorrhoids. Many proprietary preparations also contain lubricants, vasoconstrictors, or mild antiseptics.

Local anaesthetics are used to relieve pain associated with haemorrhoids and pruritus ani but good evidence is lacking. Lidocaine hydrochloride ointment is used before emptying the bowel to relieve pain associated with anal fissure. Alternative local anaesthetics include tetracaine, cinchocaine (dibucaine), and pramoxine (pramoxime), but they are more irritant. Local anaesthetic ointments can be absorbed through the rectal mucosa therefore excessive application should be avoided, particularly in infants and children. Preparations containing local anaesthetics should be used for short periods only (no longer than a few days) since they may cause sensitisation of the anal skin.

**Compound haemorrhoidal preparations with corticosteroids**

Corticosteroids are often combined with local anaesthetics and soothing agents in preparations for haemorrhoids. They are suitable for occasional short-term use after exclusion of infections, such as herpes simplex; prolonged use can cause atrophy of the anal skin.

**Rectal sclerosants**

Oily phenol injection is used to inject haemorrhoids particularly when unprolapsed.

**Anal fissures**

The management of anal fissures requires stool softening by increasing dietary fibre in the form of bran or by using a bulk-forming laxative. Short-term use of local anaesthetic preparations may help. If these measures are inadequate, the patient should be referred for specialist treatment in hospital. The use of a topical nitrate (e.g. glyceryl trinitrate 0.4% ointment p. 190) may be considered. Before considering surgery, topical dilutiazem hydrochloride 2%
may be used twice daily [unlicensed indication] in patients with chronic anal fissures unresponsive to topical nitrates.

**Rectal and anal disorders in children**

Haemorrhoids in children are rare. Treatment is usually symptomatic and the use of a locally applied cream is appropriate for short periods; however, local anaesthetics can cause stinging initially and this may aggravate the child’s fear of defaecation.

**9.1 Haemorrhoids**

**CORTICOSTEROIDS**

**Benzyl benzoate with bismuth oxide, bismuth subgallate, hydrocortisone acetate, peru balsam and zinc oxide**

**INDICATIONS AND DOSE**

Haemorrhoids | Priritus ani
---|---
**BY RECTUM USING SUPPOSITORIES**
- Adult: Apply twice daily for no longer than 7 days, to be applied morning and night, an additional dose after a bowel movement

**CAUTIONS**
- Local anaesthetic component can be absorbed through the rectal mucosa (avoid excessive application, particularly in children and infants) - local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days)
- Proprietary brand Anusol Plus HC® (ointment and suppositories) is on sale to the public.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**
- Benzyl benzoate with bismuth oxide, hydrocortisone acetate, peru balsam, pramocaine hydrochloride and zinc oxide (Non-proprietary)

Benzyl benzoate 12 mg per 1 gram, Bismuth oxide 8.75 mg per 1 gram, Hydrocortisone acetate 5 mg per 1 gram, Pramocaine hydrochloride 10 mg per 1 gram, Zinc oxide 123.5 mg per 1 gram Anugesic-HC cream | 30 gram (Pack) £3.71

**Ointment**
- Benzyl benzoate with bismuth oxide, hydrocortisone acetate, peru balsam and zinc oxide (Non-proprietary)

Benzyl benzoate 12.5 mg per 1 gram, Bismuth oxide 8.75 mg per 1 gram, Hydrocortisone acetate 2.5 mg per 1 gram, Peru Balsam 18.75 mg per 1 gram, Zinc oxide 107.5 mg per 1 gram Anusol Plus HC ointment | 15 gram (£) £3.03
Anusol HC ointment | 30 gram (Pack) £2.49

**Cinchoacaine hydrochloride with fluocortolone caproate and fluocortolone pivalate**

**INDICATIONS AND DOSE**

Haemorrhoids | Priritus ani
---|---
**BY RECTUM USING OINTMENT**
- Adult: Apply twice daily for 5–7 days, apply 3–4 times a day if required, on the first day of treatment, then apply once daily for a few days after symptoms have cleared

**BY RECTUM USING SUPPOSITORIES**
- Adult: Initially 1 suppository daily for 5–7 days, to be inserted after a bowel movement, then 1 suppository once daily on alternate days for 1 week

**CAUTIONS**
- Local anaesthetic component can be absorbed through the rectal mucosa (avoid excessive application, particularly in children and infants) - local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suppository**
- UltraprocT (Meadow Laboratories Ltd)

Cinchoacaine hydrochloride 1 mg, Fluocortolone caproate 630 microgram, Fluocortolone pivalate 610 microgram UltraprocT suppositories | 12 suppository (Pack) £2.15
Cinchoacaine with hydrocortisone

**INDICATIONS AND DOSE**

**UNIROID-HC® SUPPOSITORIES**

Haemorrhoids | Pruritus ani

- Child 12-17 years: 1 suppository, insert twice daily and after a bowel movement, do not use for longer than 7 days
- Adult: 1 suppository, insert twice daily and after a bowel movement, do not use for longer than 7 days

**UNIROID-HC® OINTMENT**

Haemorrhoids | Pruritus ani

- Child 12-17 years: Apply twice daily, and apply after a bowel movement, apply externally or by rectum, do not use for longer than 7 days
- Adult: Apply twice daily, and apply after a bowel movement, apply externally or by rectum, do not use for longer than 7 days

**Suppository**

- CINCHOCAINE WITH HYDROCORTISONE (Non-proprietary)
  - Cinchoacaine hydrochloride 5 mg, Hydrocortisone 5 mg per 1 gram, Fluocortolone caprate 950 microgram per 1 gram, Fluocortolone pivalate 920 microgram per 1 gram
  - Uniproct suppositories | 12 suppository no price available
  - Proctosedyl (Sanofi)
  - Cinchoacaine hydrochloride 5 mg, Hydrocortisone 5 mg per 1 gram, Fluocortolone caprate 950 microgram per 1 gram, Fluocortolone pivalate 920 microgram per 1 gram
  - Uniproct suppositories | 12 suppository no price available

**Ointment**

- CINCHOCAINE WITH HYDROCORTISONE (Non-proprietary)
  - Cinchoacaine hydrochloride 5 mg per 1 gram, Hydrocortisone 5 mg per 1 gram Cinchoacaine 0.9% / Hydrocortisone 0.9% ointment | 30 gram no price available
  - Proctosedyl (Sanofi)
  - Cinchoacaine hydrochloride 5 mg per 1 gram, Hydrocortisone 5 mg per 1 gram Proctosedyl ointment | 30 gram £10.34
  - Uniroid HC (Chemidex Pharma Ltd)
  - Cinchoacaine hydrochloride 5 mg per 1 gram, Hydrocortisone 5 mg per 1 gram Uniroid HC ointment | 30 gram £4.23

**CAUTIONS**

- Local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days)

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Suppository**

- Scheriproct (Bayer Plc)
  - Cinchoacaine hydrochloride 1 mg, Prednisolone hexanoate 1.3 mg Scheriproct suppositories | 12 suppository £1.38

**Ointment**

- Scheriproct (Bayer Plc)
  - Cinchoacaine hydrochloride 5 mg per 1 gram, Prednisolone hexanoate 1.9 mg per 1 gram Scheriproct ointment | 30 gram £2.94

**INDICATIONS AND DOSE**

Haemorrhoids | Pruritus ani

- Adult: Apply twice daily for 5–7 days, apply 3–4 times a day on the first day if necessary, then apply once daily for a few days after symptoms have cleared

**BY RECTUM USING SUPPOSITORIES**

- Adult: Initially 1 suppository daily for 5–7 days, to be inserted after a bowel movement

**Haemorrhoids (severe cases) | Pruritus ani (severe cases)**

- Initially by rectum using suppositories

- Adult: Initially 1 suppository 2–3 times a day, then (by rectum) 1 suppository daily for a total of 5–7 days, to be inserted after a bowel movement

**CAUTIONS**

- Local anaesthetic component may be absorbed through the rectal mucosa (avoid excessive application) - local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days)

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Suppository**

- CINCHOCAINE WITH HYDROCORTISONE (Non-proprietary)
  - Cinchoacaine hydrochloride 5 mg, Hydrocortisone 5 mg per 1 gram, Fluocortolone caprate 950 microgram per 1 gram, Fluocortolone pivalate 920 microgram per 1 gram
  - Uniproct suppositories | 12 suppository no price available
  - Proctosedyl (Sanofi)
  - Cinchoacaine hydrochloride 5 mg, Hydrocortisone 5 mg per 1 gram, Fluocortolone caprate 950 microgram per 1 gram, Fluocortolone pivalate 920 microgram per 1 gram
  - Uniproct suppositories | 12 suppository no price available

**Ointment**

- CINCHOCAINE WITH HYDROCORTISONE (Non-proprietary)
  - Cinchoacaine hydrochloride 5 mg per 1 gram, Hydrocortisone 5 mg per 1 gram Cinchoacaine 0.9% / Hydrocortisone 0.9% ointment | 30 gram no price available
  - Proctosedyl (Sanofi)
  - Cinchoacaine hydrochloride 5 mg per 1 gram, Hydrocortisone 5 mg per 1 gram Proctosedyl ointment | 30 gram £10.34
  - Uniroid HC (Chemidex Pharma Ltd)
  - Cinchoacaine hydrochloride 5 mg per 1 gram, Hydrocortisone 5 mg per 1 gram Uniroid HC ointment | 30 gram £4.23

**CAUTIONS**

- Local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days)

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: mouthwash
Hydrocortisone with pramocaine

INDICATIONS AND DOSE
Haemorrhoids | Proctitis
BY RECTUM
▶ Adult: 1 applicatorful 2–3 times a day and 1 applicatorful, after a bowel movement, do not use for longer than 7 days; maximum 4 applicatorfuls per day

CAUTIONS Local anaesthetic component can be absorbed through the rectal mucosa (avoid excessive application) • local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days)

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Foam
▶ Proctofoam HC (Meda Pharmaceuticals Ltd)
Hydrocortisone acetate 10 mg per 1 gram, Pramocaine hydrochloride 10 mg per 1 gram Proctofoam HC foam enema | 40 dose [DS] £6.07 DT price + £6.07

RECTAL SCLEROSANTS

Phenol

INDICATIONS AND DOSE
Haemorrhoids (particularly when unprolapsed)
BY SUBMUCOSAL INJECTION
▶ Adult: 2–3 mL, dose (using phenol 5%) to be injected into the submucosal layer at the base of the pile; several injections may be given at different sites, max. total injected 10 mL at any one time

SIDE-EFFECTS Irritation • tissue necrosis

PRESCRIBING AND DISPENSING INFORMATION When prepared extemporaneously, the BP states Oily Phenol Injection, BP consists of phenol 5% in a suitable fixed oil.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, cutaneous solution, liquid

Solution for injection
▶ PHENOL (Non-proprietary)
Phenol 50 mg per 1 ml Oily phenol 5% solution for injection 5ml ampoules | 10 ampoule [DS] £47.91-£50.00
Oily phenol 5% solution for injection 2ml ampoules | 10 ampoule [DS] £38.03
82 Reduced exocrine secretions

**NUTRIZYM 22°® GASTRO-RESISTANT CAPSULES**

Pancreatic insufficiency

**BY MOUTH**

- Adult: Initially 1–2 capsules, dose to be taken with meals and 1 capsule as required, dose to be taken with snacks, doses should be swallowed whole or contents taken with water or mixed with soft food (then swallowed immediately without chewing)

**CREON® 25000**

Pancreatic insufficiency

**BY MOUTH**

- Child 2-17 years: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)
- Adult: Initially 1–2 capsules, dose to be taken with each meal either taken whole or contents mixed with acidic fluid or soft food (then swallowed immediately without chewing)

**CREON® MICRO**

Pancreatic insufficiency

**BY MOUTH**

- Child: Initially 100 mg, to be taken before each feed or meal; granules can be mixed with a small amount of milk or soft food and administered immediately (manufacturer recommends mixing with acidic liquid or pureed fruit before administration), granules should not be chewed before swallowing
- Adult: Initially 100 mg, to be taken before each feed or meal; granules can be mixed with a small amount of milk or soft food and administered immediately (manufacturer recommends mixing with acidic liquid or pureed fruit before administration), granules should not be chewed before swallowing

**Dose equivalence and conversion**

100 mg granules = one measured scoopful (scoop supplied with product).

**PANCREX®**

Pancreatic insufficiency

**BY MOUTH**

- Child 2-17 years: 5–10 g, to be taken just before meals, washed down or mixed with milk or water
- Adult: 5–10 g, to be taken just before meals, washed down or mixed with milk or water

**PANCREX® V POWDER**

Pancreatic insufficiency

**BY MOUTH**

- Child: 0.5–2 g, to be taken before or with meals, washed down or mixed with milk or water
- Adult: 0.5–2 g, to be taken before or with meals, washed down or mixed with milk or water

**CONTRA-INDICATIONS**

- **PANCREATE H L®**: Should not be used in children aged 15 years or less with cystic fibrosis.

**CAUTIONS**

- Can irritate the perioral skin and buccal mucosa if retained in the mouth. Excessive doses can cause perianal irritation

**INTERACTIONS** → Appendix 1 (pancreatin).

**SIDE-EFFECTS**

- Abdominal discomfort • hyperuricaemia (associated with very high doses) • hyperuricosuria (associated with very high doses) • mucosal irritation • nausea • skin irritation • vomiting

**PREGNANCY**

- Not known to be harmful.

**DIRECTIONS FOR ADMINISTRATION**

- Enteric-coated preparations deliver a higher enzyme concentration in the duodenum (provided the capsule contents are swallowed whole without chewing). Since pancreatin is inactivated by heat, excessive heat should be avoided if preparations are mixed with liquids or food; the resulting mixtures should not be kept for more than one hour. Gastro-resistant granules should be mixed with milk, slightly acidic soft food or liquid such as apple juice, and then swallowed immediately without chewing. Any left-over food or liquid containing pancreatin should be discarded. Capsules containing enteric-coated granules can be opened and the granules administered in the same way. Pancreatin is inactivated by gastric acid therefore pancreatin preparations are best taken with food (or immediately before or after food). Gastric acid secretion may be reduced by giving cimetidine or ranitidine an hour beforehand. Concurrent use of antacids also reduces gastric acidity.

**HANDLING AND STORAGE**

- Hypersensitivity reactions occur occasionally and may affect those handling the powder.

**PATIENT AND CARER ADVICE**

- Patients or carers should be given advice on administration. It is important to ensure adequate hydration at all times in patients receiving higher-strength pancreatin preparations.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Gastro-resistant tablet**

**CAUTIONARY AND ADVISORY LABELS 5, 25**

- Pancrex (Essential Pharmaceuticals Ltd)
  - Amylase 1700 unit, Lipase 1900 unit, Protease 110 unit Pancrex V gastro-resistant tablets | 300 tablet £38.79
  - Amylase 5000 unit, Lipase 5600 unit, Protease 330 unit Pancrex V Forte gastro-resistant tablets | 300 tablet £48.11

- Capsule
  - Pancrex (Essential Pharmaceuticals Ltd)
    - Amylase 3300 unit, Lipase 2950 unit, Protease 160 unit Pancrex V 125mg capsules | 300 capsule £42.07
    - Amylase 9000 unit, Lipase 8000 unit, Protease 430 unit Pancrex V capsules | 300 capsule £53.20

**Gastro-resistant capsule**

- Creon (BGP Products Ltd)
  - Amylase 8000 unit, Lipase 10000 unit, Protease 600 unit Creon 10000 gastro-resistant capsules | 100 capsule £12.93
  - Amylase 18000 unit, Lipase 25000 unit, Protease 1000 unit Creon 25000 gastro-resistant capsules | 100 capsule £28.25
  - Amylase 25000 unit, Lipase 40000 unit, Protease 1600 unit Creon 40000 gastro-resistant capsules | 100 capsule £41.80

- Nutrizym (Merck Serono Ltd)
  - Amylase 19800 unit, Lipase 22000 unit, Protease 110 unit Nutrizym 22 gastro-resistant capsules | 100 capsule £33.33

- Pancrease (Janssen-Cilag Ltd)
  - Amylase 22500 unit, Lipase 25000 unit, Protease 1250 unit Pancrease HL gastro-resistant capsules | 100 capsule £40.38

**Gastro-resistant granules**

**CAUTIONARY AND ADVISORY LABELS 25**

- Creon (BGP Products Ltd)
  - Amylase 3600 unit, Lipase 5000 unit, Protease 200 unit Creon Micro Pancreate 60.12mg gastro-resistant granules | 40 gram £31.50

- Pancrex (Essential Pharmaceuticals Ltd)
  - Amylase 4000 unit, Lipase 5000 unit, Protease 300 unit Pancrex gastro-resistant granules | 300 gram £57.00

**Powder**

- Pancrex (Essential Pharmaceuticals Ltd)
  - Amylase 30000 unit, Lipase 25000 unit, Protease 1400 unit Pancrex V oral powder (sugar-free) | 300 gram £58.88
11 Stoma care

Prescribing for patients with stoma calls for special care. The following is a brief account of some of the main points to be borne in mind.

Enteric-coated and modified-release preparations are unsuitable, particularly in patients with an ileostomy, as there may not be sufficient release of the active ingredient.

Laxatives
Enemas and washouts should not be prescribed for patients with an ileostomy as they may cause rapid and severe loss of water and electrolytes. Colostomy patients may suffer from constipation and whenever possible should be treated by increasing fluid intake or dietary fibre. Bulk-forming drugs should be tried. If they are insufficient, as small a dose as possible of senna p. 53 should be used.

Antidiarrhoeals
Drugs such as loperamide hydrochloride p. 56, codeine phosphate p. 360, or co-phenotrope p. 55 (diphenoxylate with atropine) are effective. Bulk-forming drugs may be tried but it is often difficult to adjust the dose appropriately. Antibacterials should not be given for an episode of acute diarrhoea.

Antacids
The tendency to diarrhoea from magnesium salts or constipation from aluminium salts may be increased in these patients.

Diuretics
Diuretics should be used with caution in patients with an ileostomy as they may become excessively dehydrated and potassium depletion may easily occur. It is usually advisable to use a potassium-sparing diuretic.

Digoxin
Patients with a stoma are particularly susceptible to hypokalaemia if on digoxin p. 94 therapy and potassium supplements or a potassium-sparing diuretic may be advisable.

Potassium supplements
Liquid formulations are preferred to modified-release formulations.

Analgesics
Opioid analgesics may cause troublesome constipation in colostomy patients. When a non-opioid analgesic is required paracetamol p. 354 is usually suitable but anti-inflammatory analgesics may cause gastric irritation and bleeding.

Iron preparations
Iron preparations may cause loose stools and sore skin in these patients. If this is troublesome and if iron is definitely indicated an intramuscular iron preparation should be used. Modified-release preparations should be avoided for the reasons given above.

Care of stoma
Patients are usually given advice about the use of cleansing agents, protective creams, lotions, deodorants, or sealants whilst in hospital, either by the surgeon or by stoma care nurses. Voluntary organisations offer help and support to patients with stoma.
Chapter 2

Cardiovascular system

1 Arrhythmias

Arrhythmias

Management of an arrhythmia requires precise diagnosis of the type of arrhythmia, and electrocardiography is essential; underlying causes such as heart failure require appropriate treatment.

Ectopic beats

If ectopic beats are spontaneous and the patient has a normal heart, treatment is rarely required and reassurance to the patient will often suffice. If they are particularly troublesome, beta-blockers are sometimes effective and may be safer than other suppressant drugs.

Atrial fibrillation

Treatment of patients with atrial fibrillation aims to reduce symptoms and prevent complications, especially stroke. All patients with atrial fibrillation should be assessed for their risk of stroke and thromboembolism. Atrial fibrillation can be managed by either controlling the ventricular rate (‘rate control’) or by attempting to restore and maintain sinus rhythm (‘rhythm control’). At any stage if treatment fails to control symptoms, or, if symptoms recur after cardioversion and specialised management is required, referral should be made within 4 weeks. If drug treatment fails to control the symptoms of atrial fibrillation or is unsuitable, ablation strategies can be considered. Review anticoagulation, stroke, and bleeding risk at least annually in all patients with atrial fibrillation.

Acute presentation

All patients with life-threatening haemodynamic instability caused by new-onset atrial fibrillation should undergo emergency electrical cardioversion without delaying to achieve anticoagulation. In patients presenting acutely but without life-threatening haemodynamic instability, rate or rhythm control can be offered if the onset of arrhythmia is less than 48 hours; rate control is preferred if onset is more than 48 hours or uncertain. Consideration of pharmacological or electrical cardioversion should be based on clinical circumstances. If pharmacological cardioversion has been agreed, intravenous amiodarone hydrochloride p. 88, or alternatively flecainide acetate p. 91, can be used (amiodarone hydrochloride is preferred if there is structural heart disease). If urgent rate control is required, a beta-blocker or verapamil hydrochloride p. 156 can be given intravenously.

Cardioversion

Sinus rhythm can be restored by electrical cardioversion, or pharmacological cardioversion with an oral or intravenous antiarrhythmic drug e.g. flecainide acetate or amiodarone hydrochloride. If atrial fibrillation has been present for more than 48 hours, electrical cardioversion is preferred and should not be attempted until the patient has been fully anticoagulated for at least 3 weeks; if this is not possible, parenteral anticoagulation should be commenced, and a left atrial thrombus ruled out immediately before cardioversion; oral anticoagulation should be given after cardioversion and continued for at least 4 weeks; prior to cardioversion, offer rate control as appropriate.

Drug treatment

Rate control is the preferred first-line drug treatment strategy for atrial fibrillation except in patients with new-onset atrial fibrillation, heart failure secondary to atrial fibrillation, atrial flutter suitable for an ablation strategy, atrial fibrillation with a reversible cause, or if rhythm control is more suitable based on clinical judgement. Ventricular rate can be controlled with a standard beta-blocker (not sotalol hydrochloride p. 93) or a rate-limiting calcium channel blocker such as diltiazem hydrochloride p. 149 [unlicensed indication], or verapamil hydrochloride p. 156 as monotherapy. Choice of drug should be based on individual symptoms, heart rate, comorbidities, and patient preference. Digoxin p. 94 is usually only effective for controlling the ventricular rate at rest, and should therefore only be used as monotherapy in predominantly sedentary patients with non-paroxysmal atrial fibrillation. When a single drug fails to adequately control the ventricular rate, a combination of two drugs including a beta-blocker, digoxin, or diltiazem hydrochloride can be used. If symptoms are not controlled with a combination of two drugs, a rhythm-control strategy should be considered. If ventricular function is diminished, the combination of a beta-blocker (that is licensed for use in heart failure) and digoxin is preferred. Digoxin is also used when atrial fibrillation is accompanied by congestive heart failure.

If drug treatment is required to maintain sinus rhythm (‘rhythm control’) post-cardioversion, a standard beta-
blocker is used. If a standard beta-blocker is not appropriate or is ineffective, consider an oral anti-arrhythmic drug such as sotalol hydrochloride p. 93, flecainide acetate p. 91, propafenone hydrochloride p. 92, or amiiodarone hydrochloride p. 88; dronedarone p. 50 may be considered in paroxysmal or persistent atrial fibrillation (see NICE guidance). If necessary, amiiodarone hydrochloride can be started 4 weeks before and continuing for up to 12 months after electrical cardioversion to increase success of the procedure, and to maintain sinus rhythm. Flecainide acetate or propafenone hydrochloride should not be given when there is known ischaemic or structural heart disease. Controlled trial data on rate control and its management in patients with left ventricular impairment or heart failure.

**Paroxysmal atrial fibrillation**

In symptomatic paroxysmal atrial fibrillation, ventricular rhythm is controlled with a standard beta-blocker. Alternatively, if symptoms persist or a standard beta-blocker is not appropriate, an oral anti-arrhythmic drug such as dronedarone p. 90 (see NICE guidance), sotalol hydrochloride p. 93, flecainide acetate p. 91, propafenone hydrochloride p. 92, or amiiodarone hydrochloride p. 88 can be given (see also Paroxysmal supraventricular tachycardia and Supraventricular arrhythmias). In selected patients with infrequent episodes of symptomatic paroxysmal atrial fibrillation, sinus rhythm can be restored using the ‘pill-in-the-pocket’ approach; this involves the patient taking oral flecainide acetate or propafenone hydrochloride to self-treat an episode of atrial fibrillation when it occurs.

**Stroke prevention**

All patients with atrial fibrillation should be assessed for their risk of stroke and the need for thromboprophylaxis; this needs to be balanced with the patient’s risk of bleeding; a NICE guideline (NICE clinical guideline 100 (June 2014). Atrial fibrillation: Management of atrial fibrillation) recommends using the CHA2DS2-VASc assessment tool for stroke risk and the HAS-BLED tool for bleeding risk prior to and during anticoagulation. Risk factors for stroke taken into account by CHA2DS2-VASc include prior ischaemic stroke, transient ischaemic attacks, or thromboembolic events, heart failure, left ventricular systolic dysfunction, vascular disease, diabetes, hypertension, females, and patients over 65 years. Patients with a very low risk of stroke (CHA2DS2-VASc score of 0 for men or 1 for women) do not require an antithrombotic for stroke prevention. Parenteral anticoagulation should be offered to patients with new-onset atrial fibrillation who are receiving subtherapeutic or no anticoagulation therapy until assessment is made, and appropriate anticoagulation is started. Oral anticoagulation should be offered to patients with confirmed diagnosis of atrial fibrillation in whom sinus rhythm has not been successfully restored within 48 hours of onset, patients who have had, or are at high risk of recurrence of atrial fibrillation such as those with structural heart disease, prolonged history of atrial fibrillation (more than 12 months), a history of failed attempts at cardioversion, and patients whom the risk of stroke outweighs the risk of bleeding. Anticoagulant treatment should not be withheld solely because of the risk of falls, and choice of treatment should be based on clinical features and patient preferences. Oral anticoagulation may be with a vitamin K antagonist (e.g warfarin sodium p. 121, or in non-valvular atrial fibrillation with apixaban p. 108, dabigatran etexilate p. 117, or rivaroxaban p. 109. Anticoagulants are also indicated during cardioversion procedures. Aspirin p. 104 is less effective than warfarin sodium at preventing emboli; the modest benefit is offset by the risk of bleeding, and aspirin should not be offered as monotherapy solely for stroke prevention in atrial fibrillation. If anticoagulant treatment is contraindicated or not tolerated, left atrial appendage occlusion can be considered.

**Atrial flutter**

Like atrial fibrillation, treatment options for atrial flutter involve either controlling the ventricular rate or attempting to restore and maintain sinus rhythm. However, atrial flutter generally responds less well to drug treatment than atrial fibrillation.

Control of the ventricular rate is usually an interim measure pending restoration of sinus rhythm. Ventricular rate can be controlled by administration of a beta-blocker, diltiazem hydrochloride p. 149 [unlicensed indication], or verapamil hydrochloride p. 156; an intravenous beta-blocker or verapamil hydrochloride is preferred for rapid control. Digoxin p. 94 can be added if rate control remains inadequate, and may be particularly useful in those with heart failure.

Conversion to sinus rhythm can be achieved by electrical cardioversion (by cardiac pacing or direct current), pharmacological cardioversion, or catheter ablation. If the duration of atrial flutter is unknown, or it has lasted for over 48 hours, cardioversion should not be attempted until the patient has been fully anticoagulated for at least 3 weeks; if this is not possible, parenteral anticoagulation should be commenced and a left atrial thrombus ruled out immediately before cardioversion; oral anticoagulation should be given after cardioversion and continued for at least 4 weeks.

Direct current cardioversion is usually the treatment of choice when rapid conversion to sinus rhythm is necessary (e.g. when atrial flutter is associated with haemodynamic compromise); catheter ablation is preferred for the treatment of recurrent atrial flutter. There is a limited role for anti-arrhythmic drugs as their use is not always successful. Flecainide acetate p. 91 or propafenone hydrochloride p. 92 can slow atrial flutter, resulting in 1:1 conduction to the ventricles, and should therefore be prescribed in conjunction with a ventricular rate controlling drug such as a beta-blocker, diltiazem hydrochloride p. 149 [unlicensed indication], or verapamil hydrochloride p. 156. Amiodarone hydrochloride p. 88 can be used when other drug treatments are contra-indicated or ineffective.

All patients should be assessed for their risk of stroke and the need for thromboprophylaxis; the choice of anticoagulant is based on the same criteria as for atrial fibrillation.

**Paroxysmal supraventricular tachycardia**

This will often terminate spontaneously or with reflex vagal stimulation such as a Valsalva manoeuvre, immersing the face in ice-cold water, or carotid sinus massage; such manoeuvres should be performed with ECG monitoring. If the effects of reflex vagal stimulation are transient or ineffective, or if the arrhythmia is causing severe symptoms, or if other drug treatments are contra-indicated or ineffective, treatment with direct current cardioversion is needed in haemodynamically unstable patients or when the above measures have failed to restore sinus rhythm (and an alternative diagnosis has not been found).

Recurrent episodes of paroxysmal supraventricular tachycardia can be treated by catheter ablation, or prevented with drugs such as diltiazem hydrochloride p. 149, verapamil hydrochloride p. 156, beta-blockers including sotalol hydrochloride p. 93, flecainide acetate p. 91 or propafenone hydrochloride p. 92.
86 Arrhythmias

Arterial hypertension

In patients with arterial hypertension related to sodium intake or intravascular volume, the use of an ACE inhibitor may reduce the need for anti-hypertensive therapy.

Cardiovascular system

worsening the condition.

Anti-arrhythmics can further prolong the QT interval, thus increasing the risk of asystole, or if the patient is unstable and has no response, direct current cardioversion or pacing should be considered.

intravenous infusion, and the dose adjusted according to haemodynamic stability.

Beta-blockers or sotalol hydrochloride p. 92 should be considered. Catheter ablation is an alternative if anti-arrhythmic drugs are ineffective. A beta-blocker (but not sotalol hydrochloride) is preferred drug. Flecainide acetate p. 91, propafenone hydrochloride p. 92, and, although less effective, lidocaine hydrochloride p. 91 have all been used. If sinus rhythm is not restored, direct current cardioversion of pacing should be considered. Catheter ablation is an alternative if cessation of the arrhythmia is not urgent. Non-sustained ventricular tachycardia can be treated with a beta-blocker.

All patients presenting with ventricular tachycardia should be referred to a specialist. Following restoration of sinus rhythm, patients who remain at high risk of cardiac arrest will require maintenance therapy. Most patients will be treated with an implantable cardioverter defibrillator. Beta-blockers or sotalol hydrochloride p. 93 (in place of a standard beta-blocker), or amiodarone hydrochloride (in combination with a standard beta-blocker), can be used in addition to the device in some patients; alternatively, they can be used alone when use of an implantable cardioverter defibrillator is not appropriate.

Torsade de pointes

Torsade de pointes is a form of ventricular tachycardia associated with a long QT syndrome (usually drug-induced, but other factors including hypokalaemia, severe bradycardia, and genetic predisposition are also implicated). Episodes are usually self-limiting, but are frequently recurrent and can cause impairment or loss of consciousness. If not controlled, the arrhythmia can progress to ventricular fibrillation and sometimes death. Intravenous infusion of magnesium sulfate p. 858 is usually effective. A beta-blocker (but not sotalol hydrochloride p. 93) and atrial (or ventricular) pacing can be considered. Anti-arrhythmics can further prolong the QT interval, thus worsening the condition.

Drugs for arrhythmias

Anti-arrhythmic drugs can be classified clinically into those that act on supraventricular arrhythmias (e.g. verapamil hydrochloride p. 156), those that act on both supraventricular and ventricular arrhythmias (e.g. amiodarone hydrochloride p. 88, and those that act on ventricular arrhythmias (e.g. lidocaine hydrochloride p. 91).

Anti-arrhythmic drugs can also be classified according to their effects on the electrical behaviour of myocardial cells during activity (the Vaughan Williams classification) although this classification is of less clinical significance:

- Class I: membrane stabilising drugs (e.g. lidocaine, flecainide)
- Class II: beta-blockers
- Class III: amiodarone, sotalol (also Class II)
- Class IV: calcium-channel blockers (includes verapamil but not dihydropyridines)

The negative inotropic effects of anti-arrhythmic drugs tend to be additive. Therefore special care should be taken if two or more are used, especially if myocardial function is impaired. Most drugs that are effective in countering arrhythmias can also provoke them in some circumstances; moreover, hypokalaemia enhances the arrhythmogenic (pro-arrhythmic) effect of many drugs.

Supraventricular arrhythmias

Adenosine p. 87 is usually the treatment of choice for terminating paroxysmal supraventricular tachycardia. As it has a very short duration of action (half-life only about 8 to 10 seconds, but prolonged in those taking dipyridamole p. 107), most side-effects are short-lived. Unlike verapamil hydrochloride p. 156, adenosine can be used after a beta-blocker. Verapamil hydrochloride may be preferable to adenosine in asthma.

Oral administration of a cardiac glycoside (such as digoxin p. 94) slows the ventricular response in cases of atrial fibrillation and atrial flutter. However, intravenous infusion of digoxin is rarely effective for rapid control of ventricular rate. Cardiac glycosides are contra-indicated in supraventricular arrhythmias associated with accessory conducting pathways (e.g. Wolff- Parkinson-White syndrome).

Verapamil hydrochloride is usually effective for supraventricular arrhythmias. An initial intravenous dose (important: serious beta-blocker interaction hazard) may be followed by oral treatment; hypotension may occur with large doses. It should not be used for tachyarrhythmias where the QRS complex is wide (i.e. broad complex) unless a supraventricular origin has been established beyond reasonable doubt. It is also contra-indicated in atrial fibrillation or atrial flutter associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome). It should not be used in children with arrhythmias without specialist advice; some supraventricular arrhythmias in childhood can be accelerated by verapamil hydrochloride with dangerous consequences.

Intravenous administration of a beta-blocker such as esmolol hydrochloride p. 143 or propranolol hydrochloride p. 146, can achieve rapid control of the ventricular rate. Drugs for both supraventricular and ventricular arrhythmias include amiodarone hydrochloride p. 88, beta-blockers, disopyramide p. 89, flecainide acetate p. 91, procainamide (available from ‘special-order’ manufacturers or specialist importing companies), and propafenone hydrochloride p. 92.

Supraventricular and ventricular arrhythmias

Amiodarone hydrochloride is used in the treatment of arrhythmias, particularly when other drugs are ineffective or contraindicated. It can be used for paroxysmal supraventricular, nodal and ventricular tachycardias, atrial fibrillation and flutter, and ventricular fibrillation. It can also be used for tachyarrhythmias associated with Wolff-Parkinson-White syndrome. It should be initiated only under hospital or specialist supervision. Amiodarone hydrochloride may be given by intravenous infusion as well as by mouth, and has the advantage of causing little or no myocardial depression. Unlike oral amiodarone hydrochloride, intravenous amiodarone hydrochloride acts relatively rapidly.

Intravenous injection of amiodarone hydrochloride can be used in cardiopulmonary resuscitation for ventricular
fibrillation or pulseless tachycardia unresponsive to other interventions.

Amiodarone hydrochloride has a very long half-life (extending to several weeks) and only needs to be given once daily (but high doses can cause nausea unless divided). Many weeks or months may be required to achieve steady-state plasma-amiodarone concentration; this is particularly important when drug interactions are likely. **Beta-blockers** act as anti-arrhythmic drugs principally by attenuating the effects of the sympathetic system on automaticity and conductivity within the heart. Sotalol hydrochloride p. 93 has a role in the management of ventricular arrhythmias.

Disopyramide p. 89 can be given by intravenous injection to control arrhythmias after myocardial infarction (including those not responding to lidocaine hydrochloride p. 91), but it impairs cardiac contractility. Oral administration of disopyramide is useful, but it has an antimuscarinic effect which limits its use in patients susceptible to angle-closure glaucoma or with prostatic hyperplasia.

Flecainide acetate p. 91 belongs to the same general class as lidocaine hydrochloride p. 91 and may be of value for serious symptomatic ventricular arrhythmias. It may also be indicated for junctional re-entry tachycardias and for paroxysmal atrial fibrillation. However, it can precipitate serious arrhythmias in a small minority of patients (including those with otherwise normal hearts).

Propafenone hydrochloride p. 92 is used for the prophylaxis and treatment of ventricular arrhythmias and also for some supraventricular arrhythmias. It has complex mechanisms of action, including weak beta-blocking activity (therefore caution is needed in obstructive airways disease—contra-indicated if severe).

Drugs for supraventricular arrhythmias include adenosine below, **cardiac glycosides**, and verapamil hydrochloride p. 156. Drugs for ventricular arrhythmias include lidocaine hydrochloride.

Mexiletine and procainamide are both available from ‘special-order’ manufacturers or specialist importing companies. Mexiletine can be used for life-threatening ventricular arrhythmias; procainamide is given by intravenous injection to control ventricular arrhythmias.

**Ventricular arrhythmias**

Intravenous lidocaine hydrochloride can be used for the treatment of ventricular tachycardia in haemodynamically stable patients, and ventricular fibrillation and pulseless ventricular tachycardia in cardiac arrest refractory to defibrillation, however it is no longer the anti-arrhythmic drug of first choice.

Drugs for both supraventricular and ventricular arrhythmias include amiodarone hydrochloride, **beta-blockers**, disopyramide, flecainide acetate, **procainamide** (available from ‘special-order’ manufacturers or specialist importing companies), and propafenone hydrochloride.

**Mexiletine** is available from ‘special-order’ manufacturers or specialist importing companies for treatment of life-threatening ventricular arrhythmias.

---

**ANTIARRHYTHMICS**

**Adenosine**

**INDICATIONS AND DOSE**

**Rapid reversion to sinus rhythm of paroxysmal supraventricular tachycardias, including those associated with accessory conducting pathways (e.g. Wolf-Parkinson-White syndrome)** | **Used to aid to diagnosis of broad or narrow complex supraventricular tachycardias**

**BY RAPID INTRAVENOUS INJECTION**

- Adult: Initially 6 mg, administer into central or large peripheral vein and give over 2 seconds, cardiac monitoring required, followed by 12 mg after 1–2 minutes if required, then 12 mg after 1–2 minutes if required, increments should not be given if high level AV block develops at any particular dose.

**Rapid reversion to sinus rhythm of paroxysmal supraventricular tachycardias, including those associated with accessory conducting pathways (e.g. Wolf-Parkinson-White syndrome) in patients with a heart transplant** | **Aid to diagnosis of broad or narrow complex supraventricular tachycardias in patients with a heart transplant**

**BY RAPID INTRAVENOUS INJECTION**

- Adult: Initially 3 mg, administer into a central or large peripheral vein and give over 2 seconds, followed by 6 mg after 1–2 minutes if required, then 12 mg after 1–2 minutes if required, patients with a heart transplant are very sensitive to the effects of adenosine.

**Used in conjunction with radioisotope myocardial perfusion imaging in patients who cannot exercise adequately or for whom exercise is inappropriate**

**BY INTRAVENOUS INFUSION**

- Adult: (consult product literature)

**Dose adjustments due to interactions**

If essential to give with dipyridamole reduce adenosine dose to a quarter of the usual dose.

- **UNLICENSED USE** Adenosine doses in the BNF may differ from those in the product literature.

- **CONTRA-INDICATIONS** Asthma, chronic obstructive lung disease—decompensated heart failure—long QT syndrome—second- or third-degree AV block and sick sinus syndrome (unless pacemaker fitted)—severe hypotension.

- **CAUTIONS** Atrial fibrillation with accessory pathway (conduction down anomalous pathway may increase)—atrial flutter with accessory pathway (conduction down anomalous pathway may increase)—autonomic dysfunction—bundle branch block—first-degree AV block—heart transplant—left main coronary artery stenosis—left to right shunt—pericardial effusion—pericarditis—QT-interval prolongation—recent myocardial infarction—severe heart failure—stenotic carotid artery disease with cerebrovascular insufficiency—stenotic valvular heart disease—uncorrected hypovolaemia.

- **INTERACTIONS** | Appendix 1 (adenosine); also possibility of interaction with drugs tending to impair myocardial conduction.

- **SIDE-EFFECTS**

  - **Common or very common** Angina (discontinue)—apprehension—arrhythmia (discontinue if asystole or severe bradyarrhythmia occur)—AV block—dizziness—dyspnoea—flushing—headache—nausea—sinus pause.

  - **Uncommon** Blurred vision—hyperventilation—metallic taste—palpitation—sweating—weakness.

  - **Very rare** Bronchospasm—injection-site reactions—transient worsening of intracranial hypertension.

  - **Frequency not known** Cardiac arrest—convulsions—hypotension (discontinue if severe)—respiratory failure (discontinue)—syncope—vomiting.
Amiodarone hydrochloride

INDICATIONS AND DOSE
Treatment of arrhythmias, particularly when other drugs are ineffective or contra-indicated (including paroxysmal supraventricular, nodal and ventricular tachycardias, atrial fibrillation and flutter, ventricular fibrillation, and tachyarrhythmias associated with Wolff-Parkinson-White syndrome (initiated in hospital or under specialist supervision) by mouth
- Adult: 200 mg 3 times a day for 1 week, then reduced to 200 mg twice daily for a further week, followed by maintenance dose, usually 200 mg daily or the minimum dose required to control arrhythmia by intravenous infusion
- Adult: Initially 5 mg/kg, to be given over 20–120 minutes with ECG monitoring, subsequent infusions given if necessary according to response; maximum 1.2 g per day

Ventricular fibrillation or pulseless ventricular tachycardia refractory to defibrillation initially by intravenous injection
- Adult: Initially 300 mg, dose to be considered after administration of adrenaline, dose should be given from a pre-filled syringe or diluted in 20 mL Glucose 5%, then (by intravenous injection) 150 mg if required, followed by (by intravenous infusion) 900 mg/24 hours

CONTRA-INDICATIONS
GENERAL CONTRA-INDICATIONS
Avoid in severe conduction disturbances (unless pacemaker fitted) - avoid in sinus node disease (unless pacemaker fitted) - iodine sensitivity - sino-atrial heart block (except in cardiac arrest) - sinus bradycardia (except in cardiac arrest) - thyroid dysfunction

SPECIFIC CONTRA-INDICATIONS
- With intravenous use Avoid bolus injection in cardiomyopathy - avoid bolus injection in congestive heart failure - avoid in circulatory collapse - avoid in severe arterial hypotension - avoid in severe respiratory failure

CAUTIONS
GENERAL CAUTIONS
Acute porphyrias p. 864 - conduction disturbances (in excessive dosage) - elderly - heart failure - hypokalaemia - severe bradycardia (in excessive dosage)

SPECIFIC CAUTIONS
- With intravenous use Moderate and transient fall in blood pressure (circulatory collapse precipitated by rapid administration or overdosage) - severe hepatocellular toxicity

INTERACTIONS → Appendix 1 (amiodarone).
Amiodarone has a long half-life; there is a potential for drug interactions to occur for several weeks (or even months) after treatment with it has been stopped.

Use extreme caution or avoid concomitant use of drugs that prolong QT interval. Risk of severe bradycardia or heart block when amiodarone is used in combination with sofosbuvir and daclatasvir for hepatitis C.

SIDE-EFFECTS
GENERAL SIDE-EFFECTS
- Common or very common Bradycardia - hyperthyroidism - hypothyroidism - jaundice - nausea - persistent slate grey skin discoloration - phototoxicity - pulmonary toxicity (including pneumonitis and fibrosis) - raised serum transaminases (may require dose reduction or withdrawal if accompanied by acute liver disorders) - reversible corneal microdeposits (sometimes with night glare) - sleep disorders - taste disturbances - tremor - vomiting

- Uncommon Conduction disturbances - onset or worsening of arrhythmia - peripheral myopathy (usually reversible on withdrawal) - peripheral neuropathy (usually reversible on withdrawal)

- Very rare Alopecia - aplastic anaemia - ataxia - benign intracranial hypertension - bronchospasm (in patients with severe respiratory failure) - chronic liver disease - cirrhosis - epididymo-orchitis - exfoliative dermatitis - haemolytic anaemia - headache - hypersensitivity - impaired vision due to optic neuritis or optic neuropathy (including blindness) - impotence - rash - sinus arrest - thrombocytopenia - vasculitis - vertigo

- Frequency not known Hot flushes - hypotension - respiratory distress syndrome - sweating

SPECIFIC SIDE-EFFECTS
- Common or very common
- With intravenous use injection-site reactions
- Very rare
- With intravenous use anaphylaxis on rapid injection

SIDE-EFFECTS, FURTHER INFORMATION
Corneal microdeposits Most patients taking amiodarone develop corneal microdeposits (reversible on withdrawal of treatment); these rarely interfere with vision, but drivers may be dazzled by headlights at night. However, if vision is impaired or if optic neuritis or optic neuropathy occur, amiodarone must be stopped to prevent blindness and expert advice sought.

Thyroid function Amiodarone contains iodine and can cause disorders of thyroid function; both hypothyroidism and hyperthyroidism may occur. Thyrotoxicosis may be very refractory, and amiodarone should usually be withdrawn at least temporarily to help achieve control; treatment with carbimazole may be required.

Hypothyroidism can be treated with replacement therapy without withdrawing amiodarone if it is essential; careful supervision is required.

Hepatotoxicity Amiodarone is also associated with hepatotoxicity and treatment should be discontinued if
severe liver function abnormalities or clinical signs of liver disease develop.

**Pulmonary toxicity** Pneumonitis should always be suspected if new or progressive shortness of breath or cough develops in a patient taking amiodarone.

**Peripheral neuropathy** Fresh neurological symptoms should raise the possibility of peripheral neuropathy.

- **PREGNANCY** Possible risk of neonatal goitre; use only if no alternative.
- **BREAST FEEDING** Avoid; present in milk in significant amounts; theoretical risk of neonatal hypothyroidism from release of iodine.

**MONITORING REQUIREMENTS**

- Thyroid function tests should be performed before treatment and then every 6 months. Clinical assessment of thyroid function alone is unreliable. Thyroxine (T4) may be raised in the absence of hyperthyroidism; therefore tri-iodothyronine (T3), T4, and thyroid-stimulating hormone (thyrotrophin, TSH) should all be measured. A raised T3 and T4 with a very low or undetectable TSH concentration suggests the development of thyrotoxicosis.
- Liver function tests required before treatment and then every 6 months.
- Serum potassium concentration should be measured before treatment.
- Chest x-ray required before treatment.

If concomitant use of amiodarone with sofosbuvir and daclatasvir cannot be avoided because other anti-arrhythmics are not tolerated or contraindicated, patients should be closely monitored, particularly during the first weeks of treatment.

- Patients at high risk of bradycardia should be monitored continuously for 48 hours in an appropriate clinical setting after starting concomitant treatment.
- Patients who have stopped amiodarone within the last few months and need to start sofosbuvir and daclatasvir should be monitored.
- With intravenous use, ECG monitoring and resuscitation facilities must be available. Monitor liver transaminases closely.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use For intravenous infusion (Cordarone X®), give continuously or intermittently in Glucose 5%. Suggested initial infusion volume 250 mL given over 20–120 minutes; for repeat infusions up to 1.2 g in max. 500 mL; should not be diluted to less than 600 micrograms/mL. See cardio-pulmonary resuscitation for details of infusion in extreme emergency. Incompatible with Sodium Chloride infusion fluids; avoid equipment containing the plasticizer di-2-ethylhexylphthalate (DEHP).
- With oral use For administration by mouth, tablets may be crushed and dispersed in water; injection solution should not be given orally (irritant).

**PATIENT AND CARER ADVICE** Because of the possibility of phototoxic reactions, patients should be advised to shield the skin from light during treatment and for several months after discontinuing amiodarone; a wide-spectrum sunscreen to protect against both long-wave ultraviolet and visible light should be used.

If taking amiodarone with sofosbuvir and daclatasvir, patients and their carers should be told how to recognise signs and symptoms of bradycardia and heart block and advised to seek immediate medical attention if symptoms such as shortness of breath, light-headedness, palpitations, fainting, unusual tiredness or chest pain develop.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, powder for suspension.

**CONTRA-INDICATIONS** Bundle-branch block associated with first-degree AV block - second- and third-degree AV block or bifascicular block (unless pacemaker fitted) - severe heart failure (unless secondary to arrhythmia) - severe sinus node dysfunction

**CAUTIONS** Atrial flutter or atrial tachycardia with partial block - avoid in Acute porphyrias p. 864 - elderly - heart failure (avoid if severe) - myasthenia gravis - prostatic enlargement - structural heart disease - susceptibility to angle-closure glaucoma

**INTERACTIONS** † Appendix 1 (disopyramide).

**SIDE-EFFECTS** Angle-closure glaucoma - antimuscarinic effects - AV block - blurred vision - cholestatic jaundice - dry mouth - gastro-intestinal irritation - hypoglycaemia - hypotension - myocardial depression - psychosis - urinary retention - ventricular tachycardia, ventricular fibrillation or torsade de pointes (usually associated with prolongation of QRS complex or QT interval)

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk; may induce labour if used in third trimester.

**BREAST FEEDING** Present in milk - use only if essential. Monitor infant for antimuscarinic effects.

**HEPATIC IMPAIRMENT** Half-life prolonged — may need dose reduction. Avoid modified-release preparation.

**RENAI IMPAIRMENT** Reduce dose by increasing dose interval; adjust according to response. Avoid modified-release preparation.

**SOLUTION FOR INJECTION**

- **EXCIPIENTS:** May contain Benzyl alcohol
- **AMIODARONE HYDROCHLORIDE (Non-proprietary)**
  - Amiodarone hydrochloride 100 mg Amiodarone 300mg tablets | 28 tablet (£4.25 DT price + £1.08)
  - Amiodarone hydrochloride 200 mg Amiodarone 200mg tablets | 28 tablet (£7.80 DT price + £2.04)
  - Cordarone X (Sanofi) Amiodarone hydrochloride 100 mg Cordarone X 100 tablets | 28 tablet (£4.28 DT price + £1.08)
  - Amiodarone hydrochloride 200 mg Cordarone X 200 tablets | 28 tablet (£6.99 DT price + £2.04)

**Arrhythmias 89**

**INDICATIONS AND DOSE**

Prevention and treatment of ventricular and supraventricular arrhythmias, including after myocardial infarction | Maintenance of sinus rhythm after cardioversion

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- Adult: 300–800 mg daily in divided doses

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- Adult: 250–375 mg every 12 hours

**Disopyramide**
MONITORING REQUIREMENTS
- Monitor for hypotension, hypoglycaemia, ventricular tachycardia, ventricular fibrillation or tordade de pointes (discontinue if occur).
- Monitor serum potassium.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension.

Modified-release tablet
CAUTIONARY AND ADVISORY LABELS 25
- **Rythmodan Retard** (Sanofi)
  - Disopyramide (as Disopyramide phosphate) 250 mg Rythmodan Retard 250mg tablets | 60 tablet [POT] £32.08 DT price = £32.08
- **DISOPYRAMIDE (Non-proprietary)**
  - Disopyramide 100 mg Disopyramide 100mg capsules | 84 capsule [POT] £25.00 DT price = £22.09
  - Disopyramide 150 mg Disopyramide 150mg capsules | 84 capsule [POT] £33.40 DT price = £27.58
- **Rythmodan** (Sanofi)
  - Disopyramide 100 mg Rythmodan 100mg capsules | 84 capsule [POT] £14.14 DT price = £22.09

Dronedarone

**DRUG ACTION** Dronedarone is a multi-channel blocking anti-arrhythmic drug.

**INDICATIONS AND DOSE**
Maintenance of sinus rhythm after cardioversion in clinically stable patients with paroxysmal or persistent atrial fibrillation, when alternative treatments are unsuitable (initiated under specialist supervision)

**MOUTH**
- Adult: 400 mg twice daily

CONTRA-INDICATIONS
- Atrial conduction defects - bradycardia - complete bundle branch block - to block - existing or previous heart failure or left ventricular systolic dysfunction - haemodynamically unstable patients
- liver toxicity associated with previous amiodarone use - permanent atrial fibrillation - prolonged QT interval - second - or third-degree AV block - sick sinus syndrome (unless pacemaker fitted) - sinus node dysfunction

CAUTIONS
- Coronary artery disease - correct hypokalaemia and hypomagnesaemia before starting and during treatment

INTERACTIONS
- Appendix 1 (dronedarone).

SIDE-EFFECTS
- Common or very common: Bradycardia - gastro-intestinal disturbances - heart failure - malaise - pruritus - QT-interval prolongation - raised serum creatinine - rash
- Uncommon: Dermatitis - eczema - erythema - interstitial lung disease (investigate if symptoms such as dyspnoea or dry cough develop and discontinue treatment if confirmed) - photosensitivity - pneumonitis (investigate if symptoms such as dyspnoea or dry cough develop and discontinue treatment if confirmed) - pulmonary fibrosis (investigate if symptoms such as dyspnoea or dry cough develop and discontinue treatment if confirmed) - taste disturbance
- Rare: Liver injury (including life-threatening acute liver failure)

SIDE-EFFECTS, FURTHER INFORMATION
- Liver injury: Liver injury, including life-threatening acute liver failure reported rarely; discontinue treatment if 2 consecutive alanine aminotransferase concentrations exceed 3 times upper limit of normal.

Heart failure: New onset or worsening heart failure reported. If heart failure or left ventricular systolic dysfunction develops, discontinue treatment.

PREGNANCY
- Manufacturer advises avoid—toxicity in animal studies.

BREAST FEEDING
- Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT
- Avoid in severe impairment.

RENAL IMPAIRMENT
- Avoid if eGFR less than 30 mL/minute/1.73 m².

MONITORING REQUIREMENTS
- Ongoing monitoring should occur under specialist supervision.
- Monitor for heart failure.
- Perform ECG at least every 6 months—consider discontinuation if atrial fibrillation reoccurs.
- Measure serum creatinine before treatment and 7 days after initiation—if raised, measure again after a further 7 days and consider discontinuation if creatinine continues to rise.
- Monitor liver function before treatment, 1 week and 1 month after initiation of treatment, then monthly for 6 months, then every 3 months for 6 months and periodically thereafter.

PATIENT AND CARER ADVICE
- Heart failure: Patients or their carers should be told how to recognise signs of heart failure and advised to seek prompt medical attention if symptoms such as weight gain, dependent oedema, or dyspnoea develop or worsen.
- Hepatic disorders: Patients or their carers should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as abdominal pain, anorexia, nausea, vomiting, fever, malaise, itching, dark urine, or jaundice develop.

NATIONAL FUNDING/ACCESS DECISIONS
**NICE technology appraisals (TAs)**
- **Dronedarone for the treatment of non-permanent atrial fibrillation (December 2012) NICE TA197**
  - Dronedarone is an option for the maintenance of sinus rhythm after successful cardioversion in paroxysmal or persistent atrial fibrillation which is not controlled by first-line therapy (usually including beta-blockers), and after alternative options have been considered in patients:
    - who have at least 1 of the following cardiovascular risk factors: hypertension requiring drugs of at least 2 different classes, diabetes mellitus, previous transient ischaemic attack, stroke or systemic embolism, left atrial diameter of 50 mm or greater, or age 70 years or older and
    - who do not have left ventricular systolic dysfunction nor a history of, or current, heart failure
  - Patients who do not meet the above criteria who are currently receiving dronedarone should have the option to continue treatment until they and their clinicians consider it appropriate to stop. [www.nice.org.uk/TA197](http://www.nice.org.uk/TA197)

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet
CAUTIONARY AND ADVISORY LABELS 21
- **DRONEDARONE (Non-proprietary)**
  - Dronedarone (as Dronedarone hydrochloride) 400 mg Dronedarone 400mg tablets | 60 tablet [POT] no price available
  - **Multaq** (Sanofi)
    - Dronedarone (as Dronedarone hydrochloride) 400 mg Multaq 400mg tablets | 20 tablet [POT] £22.50 | 60 tablet [POT] £67.50
Flecainide acetate

INDICATIONS AND DOSE
AV nodal reciprocating tachycardia, arrhythmias associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome), disabling symptoms of paroxysmal atrial fibrillation in patients without left ventricular dysfunction (arrhythmias of recent onset will respond more readily) (specialist supervision in hospital)

Ventricular tachyarrhythmias resistant to other treatment (specialist supervision in hospital)

INITIALLY BY SLOW INTRAVENOUS INJECTION

- Adult: Initially 2 mg/kg (max. per dose 150 mg), to be given over 10–30 minutes with ECG monitoring, followed by (by intravenous infusion) 1.5 mg/kg/hour if required for 1 hour, then (by intravenous infusion) reduced to 100–250 micrograms/kg/hour for up to 24 hours, maximum cumulative dose of 600 mg in first 24 hours, then transfer to oral treatment

Supraventricular arrhythmias

INITIALLY BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 50 mg twice daily, (by mouth) increased if necessary up to 300 mg daily
- By mouth using modified-release medicines
- Adult: 200 mg daily

Ventricular arrhythmias (initiated under direction of hospital consultant)

- Adult: Initially 100 mg twice daily for 3–5 days, maximum 400 mg daily reserved for rapid control or in heavily built patients, then (by mouth) maintenance, reduce to the lowest dose that controls the arrhythmia

Dose equivalence and conversion
Patients stabilised on 200 mg daily immediate-release flecainide may be transferred to modified-release medicines.

- UNLICENSED USE Capsules, tablets and injections: AV nodal reciprocating tachycardia, arrhythmias associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome), disabling symptoms of paroxysmal atrial fibrillation in patients without left ventricular dysfunction (arrhythmias of recent onset will respond more readily). Immediate-release tablets only: symptomatic sustained ventricular tachycardia, disabling symptoms of pre-mature ventricular contractions or non-sustained ventricular tachycardia in patients resistant to or intolerant of other therapy. Injection only: ventricular tachyarrhythmias resistant to other treatment.

- CONTRA-INDICATIONS Abnormal left ventricular function, atrial conduction defects (unless pacing rescue available) - bundle branch block (unless pacing rescue available) - control of arrhythmias in acute situations (for modified-release forms only) - distal block (unless pacing rescue available) - haemodynamically significant valvular heart disease - heart failure - history of myocardial infarction and either asymptomatic ventricular ectopics or asymptomatic non-sustained ventricular tachycardia - long-standing atrial fibrillation where conversion to sinus rhythm not attempted - second-degree or greater AV block (unless pacing rescue available) - sinus node dysfunction (unless pacing rescue available)

- CAUTIONS Atrial fibrillation following heart surgery - elderly (accumulation may occur) - patients with pacemakers (especially those who may be pacemaker dependent because stimulation threshold may rise appreciably)

- INTERACTIONS → Appendix 1 (flecainide).

SIDE-EFFECTS
- Common or very common Asthenia - dizziness - dyspnoea - fatigue - fever - oedema - pro-arrhythmic effects - visual disturbances
- Rare Amnesia - confusion - convulsions - depression - dyskinesia - hallucinations - peripheral neuropathy - pneumonitis

- PREGNANCY Used in pregnancy to treat maternal and fetal arrhythmias in specialist centres; toxicity reported in animal studies; infant hyperbilirubinaemia also reported.

- BREAST FEEDING Significant amount present in milk but not known to be harmful.

- HEPATIC IMPAIRMENT Avoid or reduce dose in severe impairment.

- RENAL IMPAIRMENT Reduce initial oral dose to max. 100 mg daily or reduce intravenous dose by 50%, if eGFR less than 35 mL/minute/1.73 m².

- MONITORING REQUIREMENTS
- With intravenous use ECG monitoring and resuscitation facilities must be available.

- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Tambocor®), give continuously or intermittently in Glucose 5% or Sodium Chloride 0.9%. Minimum volume in infusion fluids containing chlorides 500 mL.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet
- FLECAINIDE ACETATE (Non-proprietary)
  - Flecainide acetate 50 mg Flecainide 50mg tablets | 60 tablet [POS] £19.50 DT price = £3.25
  - Flecainide acetate 100 mg Flecainide 100mg tablets | 60 tablet [POS] £29.00 DT price = £4.96
  - Tambocor (Meda Pharmaceuticals Ltd)
  - Flecainide acetate 50 mg Tambocor tablets 50mg | 60 tablet [POS] £11.57 DT price = £3.25
  - Flecainide acetate 100 mg Tambocor tablets 100mg | 60 tablet [POS] £16.53 DT price = £4.96
  - Modified-release capsule
  - CAUTIONARY AND ADVISORY LABELS 25
  - Tambocor XL (Meda Pharmaceuticals Ltd)
  - Flecainide acetate 200 mg Tambocor XL 200mg capsules | 30 capsule [POS] £14.77
  - Solution for injection
  - Tambocor (Meda Pharmaceuticals Ltd)
  - Flecainide acetate 10 mg per 1 ml Tambocor 10mg/1ml solution for injection ampoules | 3 ampoule [POS] £21.99

Lidocaine hydrochloride
(Lignocaine hydrochloride)

INDICATIONS AND DOSE
Cardiopulmonary resuscitation (as an alternative if amiodarone is not available)

BY INTRAVENOUS INJECTION
- Adult: 1 mg/kg, do not exceed 3 mg/kg over the first hour
Cardiovascular system

MEDICINAL FORMS

MONITORING REQUIREMENTS

RENAL IMPAIRMENT

HEPATIC IMPAIRMENT

PREGNANCY

Rare

CONTRA-INDICATIONS

All grades of atrioventricular block - severe myocardial depression - sino-atrial disorders

CAUTIONS

Acute prophyria (consider infusion with glucose for its anti-porphyrinic effects) - congestive cardiac failure (consider lower dose) - post cardiac surgery (consider lower dose)

INTERACTIONS

→ Appendix 1 (lidocaine).

SIDE-EFFECTS

Common or very common

Bradycardia (may lead to cardiac arrest) - confusion - convulsions - dizziness (particularly if injection too rapid) - hypotension (may lead to cardiac arrest) - paraesthesia (particularly if injection too rapid) - respiratory depression

Rare

Anaphylaxis

PREGNANCY

Crosses the placenta but not known to be harmful in animal studies—use if benefit outweighs risk.

BREAST FEEDING

Present in milk but amount too small to be harmful.

HEPATIC IMPAIRMENT

Caution—increased risk of side-effects.

RENAL IMPAIRMENT

Possible accumulation of lidocaine and active metabolite; caution in severe impairment.

MONITORING REQUIREMENTS

Monitor ECG and have resuscitation facilities available.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

LIDOCAINE HYDROCHLORIDE (Non-proprietary)

Lidocaine hydrochloride 5 mg per 1 ml

Lidocaine hydrochloride 10 mg per 1 ml

Lidocaine hydrochloride 100 mg/10ml

92 Arrhythmias

Propafenone hydrochloride

INDICATIONS AND DOSE

Ventricular arrhythmias (specialist supervision in hospital) | Paroxysmal supraventricular tachyarrhythmias which include paroxysmal atrial flutter or fibrillation and paroxysmal re-entrant tachycardias involving the AV node or accessory pathway, where standard therapy ineffective or contra-indicated (specialist supervision in hospital)

BY MOUTH

Adult: Initially 150 mg 3 times a day, dose to be taken after food, monitor ECG and blood pressure, if QRS interval prolonged by more than 20%, reduce dose or discontinue until ECG returns to normal limits; increased if necessary to 300 mg twice daily (max. per dose 300 mg 3 times a day), dose to be increased at intervals of at least 3 days, reduce total daily dose for patients under 70 kg

Elderly: Initially 150 mg 3 times a day, dose to be taken after food, monitor ECG and blood pressure, if QRS interval prolonged by more than 20%, reduce dose or discontinue until ECG returns to normal limits; increased if necessary to 300 mg twice daily (max. per dose 300 mg 3 times a day), dose to be increased at intervals of at least 5 days, reduce total daily dose for patients under 70 kg

CONTRA-INDICATIONS

Atrial conduction defects (unless adequately paced) - Brugada syndrome - bundle branch block (unless adequately paced) - cardiogenic shock (except arrhythmia induced) - distal block (unless adequately paced) - electrolyte disturbances - marked hypotension - myasthenia gravis - myocardial infarction within last 3 months - second degree or greater AV block (unless adequately paced) - severe bradyarrhythmia - severe obstructive pulmonary disease (due to weak beta-blocking activity) - sinus node dysfunction (unless adequately paced) - uncontrolled congestive heart failure with left ventricular ejection fraction less than 35%
**BETA-ADRENOCEPTOR BLOCKERS**

**INDICATIONS AND DOSE**

- Symptomatic non-sustained ventricular tachyarrhythmias | Prophylaxis of paroxysmal atrial tachycardia or fibrillation, paroxysmal AV re-entrant tachycardias (both nodal and involving accessory pathways), and paroxysmal supraventricular tachycardia after cardiac surgery | Maintenance of sinus rhythm following cardioversion of atrial fibrillation or flutter

**BREAST FEEDING**

- Frequency not known
  - Uncommon
  - Common or very common

**INTERACTIONS** → Appendix 1 (propafenone).

**SIDE-EFFECTS**

- Common or very common

- Uncommon
  - Abdominal distension - anorexia - ataxia - erectile dysfunction - flatulence - hypotension - paraesthesia - pro-arrhythmic effects - rash - syncope - thrombocytopenia - vertigo

- Frequency not known
  - Agranulocytosis - cholestasis - confusion - convulsions - extrapyramidal symptoms - granulocytopenia - hepatitis - jaundice - leukopenia - lupus erythematosus-like syndrome - reduced sperm count (reversible on withdrawal) - restlessness

**PREGNANCY**

- Use only if potential benefit outweighs risk.

**BREAST FEEDING**

- Use with caution — present in milk.

**PATIENT AND CARER ADVICE**

- May affect performance of skilled tasks e.g. driving.

**RECOMMENDATIONS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension.

**BETA-ADRENOCEPTOR BLOCKERS**

**Sotalol hydrochloride**

- The properties listed below are those particular to the drug only. For properties common to the class, see Beta-blockers, p. 139.

**INDICATIONS AND DOSE**

- Symptomatic non-sustained ventricular tachyarrhythmias | Prophylaxis of paroxysmal atrial tachycardia or fibrillation, paroxysmal AV re-entrant tachycardias (both nodal and involving accessory pathways), and paroxysmal supraventricular tachycardia after cardiac surgery | Maintenance of sinus rhythm following cardioversion of atrial fibrillation or flutter

**BREAST FEEDING**

- Frequency not known
  - Uncommon
  - Common or very common

**INTERACTIONS**

- Extreme caution or avoid concomitant use of drugs that prolong QT interval.

**SIDE-EFFECTS**

- Arrhythmogenic (pro-arrhythmic) effect (torsade de pointes — increased risk in females)

**BREAST FEEDING**

- Water soluble beta-blockers such as sotalol are present in breast milk in greater amounts than other beta blockers.

**REMEDIAL ACTION**

- Use half normal dose if eGFR 30–60 mL/minute/1.73 m²; use one-quarter normal dose if eGFR 10–30 mL/minute/1.73 m². Avoid if eGFR less than 10 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

- Measurement of corrected QT interval, and monitoring of ECG and electrolytes required; correct hypokalaemia, hypomagnesaemia, or other electrolyte disturbances.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension.

**CONTRA-INDICATIONS**

- Long QT syndrome (congenital or acquired) — torsade de pointes

**CAUTIONS**

- Diarrhoea (severe or prolonged)

**CARDIAC GLYCOSIDES**

**Cardiac glycosides**

**Digoxin-specific antibody**

- Serious cases of digoxin toxicity should be discussed with the National Poisons Information Service (see further information, under Emergency treatment of poisoning p. 1123). Digoxin-specific antibody p. 1132 fragments are indicated for the treatment of known or strongly suspected life-threatening digoxin toxicity associated with ventricular
**Arrhythmias**

Arrhythmias or bradycardias unresponsive to atropine sulfate p. 949 and when measures beyond the withdrawal of digoxin and correction of any electrolyte abnormalities are considered necessary.

Digoxin is most useful for controlling ventricular response in persistent and permanent atrial fibrillation and atrial flutter. Digoxin also has a role in heart failure.

For management of atrial fibrillation the maintenance dose of digoxin can usually be determined by the ventricular rate at rest, which should not usually be allowed to fall persistently below 60 beats per minute.

Digoxin is now rarely used for rapid control of heart rate (see management of supraventricular arrhythmias). Even with intravenous administration, response may take many hours; persistence of tachycardia is therefore not an indication for exceeding the recommended dose. The intramuscular route is not recommended.

In patients with heart failure who are in sinus rhythm a loading dose is not required, and a satisfactory plasma-digoxin concentration can be achieved over a period of about a week.

Digoxin has a long half-life and maintenance doses need to be given only once daily (although higher doses may be divided to avoid nausea); renal function is the most important determinant of digoxin dosage.

Unwanted effects depend both on the concentration of digoxin in the plasma and on the sensitivity of the conducting system or of the myocardium, which is often increased in heart disease. It can sometimes be difficult to distinguish between toxic effects and clinical deterioration because symptoms of both are similar. The plasma concentration alone cannot indicate toxicity reliably, but the likelihood of toxicity increases progressively through the range 1.5 to 3 micrograms/litre for digoxin. Digoxin should be used with special care in the elderly, who may be particularly susceptible to digitalis toxicity.

Regular monitoring of plasma-digoxin concentration during maintenance treatment is not necessary unless problems are suspected. Hypokalaemia predisposes the patient to digitalis toxicity; it is managed by giving a potassium-sparking diuretic or, if necessary, potassium supplementation.

If toxicity occurs, digoxin should be withdrawn; serious manifestations require urgent specialist management. Digoxin-specific antibody fragments are available for reversal of life-threatening overdosage.

**Digoxin**

**Drug Action** Digoxin is a cardiac glycoside that increases the force of myocardial contraction and reduces conductivity within the atrioventricular (AV) node.

**Indications and Dose**

Rapid digitalisation, for atrial fibrillation or flutter

**By Mouth**
- Adult: 0.75–1.5 mg in divided doses, dose to be given over 24 hours, reduce dose in the elderly

Maintenance, for atrial fibrillation or flutter

**By Mouth**
- Adult: Maintenance 125–250 micrograms daily, dose according to renal function and initial loading dose, reduce dose in the elderly

Heart failure (for patients in sinus rhythm)

**By Mouth**
- Adult: 62.5–125 micrograms once daily, reduce dose in the elderly

**Emergency loading dose, for atrial fibrillation or flutter**

**INITIALLY BY INTRAVENOUS INFUSION**
- Adult: Loading dose 0.75–1 mg, to be given over at least 2 hours, then (by mouth) maintenance, start on the following day, reduce dose in the elderly

**Dose equivalence and conversion**

Dose may need to be reduced if digoxin (or another cardiac glycoside) has been given in the preceding 2 weeks. When switching from intravenous to oral route may need to increase dose by 20–33% to maintain the same plasma-digoxin concentration.

**Unlicensed Use** Digoxin doses in the BNF may differ from those in product literature.

**Contra-Indications** Constrictive pericarditis (unless to control atrial fibrillation or improve systolic dysfunction—but use with caution) · hypertrophic cardiomyopathy (unless concomitant atrial fibrillation and heart failure— but use with caution) · intermittent complete heart block · myocardiatis · second degree AV block · supraventricular arrhythmias associated with accessory conducting pathways e.g. Wolff-Parkinson-White syndrome (although can be used in infancy) · ventricular tachycardia or fibrillation

**Caution**

Hypercalcaemia (risk of digitalis toxicity) · hypokalaemia (risk of digitalis toxicity) · hypomagnesaemia (risk of digitalis toxicity) · hypoxia (risk of digitalis toxicity) · recent myocardial infarction · severe respiratory disease · sick sinus syndrome · thyroid disease

**Interactions** → Appendix 1 (cardiac glycosides).

**Side-effects**

- Common or very common Arrhythmias · blurred vision · conduction disturbances · diarrhoea · dizziness · eosinophilia · nausea · rash · vomiting · yellow vision

- Uncommon · Depression

- Very rare · Anorexia · apathy · confusion · fatigue · gynaecomastia on long-term use · headache · intestinal ischaemia and necrosis · psychosis · thrombocytopenia · weakness

**Overdose** If toxicity occurs, digoxin should be withdrawn; serious manifestations require urgent specialist management.

- Pregnancy May need dosage adjustment.

- Breastfeeding Amount too small to be harmful.

- Renal Impairment Reduce dose. Monitor plasma-digoxin concentration in renal impairment.

**Monitoring Requirements**

- For plasma-digoxin concentration assay, blood should be taken at least 6 hours after a dose.

- Monitor serum electrolytes and renal function. Toxicity increased by electrolyte disturbances.

**Directions for Administration**

- With intravenous use Avoid rapid intravenous administration (risk of hypertension and reduced coronary flow). For intravenous infusion (Lanoxin®), give intermittently in Glucose 5% or Sodium chloride 0.9%; dilute to a concentration of not more than 62.5 micrograms/mL. To be given over at least 2 hours.

- With oral use For oral administration, oral solution must not be diluted.

**Patient and Carer Advice** Patient counselling is advised for digoxin elixir (use pipette).

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, oral suspension, oral solution
2 Bleeding disorders

Antifibrinolytic drugs and haemostatics

Fibrin dissolution can be impaired by the administration of tranexamic acid, which inhibits fibrinolysis. It can be used to prevent bleeding or to treat bleeding associated with excessive fibrinolysis (e.g. in surgery, dental extraction, obstetric disorders, and traumatic haemophilia) and in the management of menorrhagia. Tranexamic acid below may also be used in hereditary angioedema, epistaxis, and in the management of obstetric disorders, and traumatic hyphaema) and in the management of heavy menstrual bleeding and its use in the management of heavy menstrual bleeding and its use is no longer recommended.

ANTIFIBRINOLYTICS

Tranexamic acid

INDICATIONS AND DOSE

Inhibition of fibrinolysis (local)

BY MOUTH

- Adult: 1–1.5 g 2–3 times a day, alternatively 15–25 mg/kg 2–3 times a day

INITIALLY BY SLOW INTRAVENOUS INJECTION

- Adult: 0.5–1 g 2–3 times a day, to be administered at a rate not exceeding 100 mg/minute, dose may be followed by continuous infusion; (by continuous intravenous infusion) 25–50 mg/kg, dose to be given over 24 hours

Menorrhagia

BY MOUTH

- Adult: 1 g 3 times a day for up to 4 days, to be initiated when menstruation has started; maximum 4 g per day

Hereditary angioedema

BY MOUTH

- Adult: 1–1.5 g 2–3 times a day, for short-term prophylaxis of hereditary angioedema, tranexamic acid is started several days before planned procedures which may trigger an acute attack of hereditary angioedema (e.g. dental work) and continued for 2–5 days afterwards

Epistaxis

BY MOUTH

- Adult: 1 g 3 times a day for 7 days

General fibrinolysis

BY SLOW INTRAVENOUS INJECTION

- Adult: 1 g every 6–8 hours, alternatively 15 mg/kg every 6–8 hours, dose to be given at a rate not exceeding 100 mg/minute

ADDITIONAL USE

Use of tranexamic acid by continuous intravenous infusion for treatment of local fibrinolysis is an unlicensed route of administration

CONTRA-INDICATIONS

Fibrinolytic conditions following disseminated intravascular coagulation (unless predominant activation of fibrinolytic system with severe bleeding) - history of convulsions - thromboembolic disease

CAUTIONS

Irregular menstrual bleeding (establish cause before initiating therapy) - massive haematuria (avoid if risk of ureteric obstruction) - patients receiving oral contraceptives (increased risk of thrombosis)

CAUTIONS, FURTHER INFORMATION

Menorrhagia

Before initiating treatment for menorrhagia, exclude structural or histological causes or fibroids causing distortion of uterine cavity.

SIDE-EFFECTS

- Common or very common Diarrhoea (reduce dose) - nausea - vomiting

- Uncommon Dermatitis

- Rare Impairment of colour vision (discontinue) - thromboembolic events - visual disturbances (discontinue)

- Frequency not known Convulsions (usually with high doses) - hypotension (on rapid intravenous injection) - malaise (on rapid intravenous injection)

PREGNANCY

No evidence of teratogenicity in animal studies; manufacturer advises use only if potential benefit outweighs risk—crosses the placenta.

BREAST FEEDING

Small amount present in milk—antifibrinolytic effect in infant unlikely.

RENAI IMPAIRMENT

Reduce dose—consult product literature for details.

MONITORING REQUIREMENTS

Regular liver function tests in long-term treatment of hereditary angioedema.

DIRECTIONS FOR ADMINISTRATION

For intravenous infusion (Cyklokapron®), give continuously in Glucose 5% or Sodium chloride 0.9%.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, mouthwash

Tablet

- TRANEXAMIC ACID (Non-proprietary)
  - Tranexamic acid 500 mg Tranexamic acid 500mg tablets | 60 tablet (PO) £18.87 DT price = £6.60
  - Cyklokapron (Meda Pharmaceuticals Ltd) Tranexamic acid 500 mg Cyklokapron 500mg tablets | 60 tablet (PO) £14.30 DT price = £6.60
HAEMOSTATICS

Etamsylate
(Ethamsylate)

**INDICATIONS AND DOSE**
- Short-term blood loss in menorrhagia

**CONTRA-INDICATIONS**
- Acute porphyrias

**CAUTIONS**
- Exclude structural or histological causes of menorrhagia, or fibroids causing distortion of the uterine cavity, before initiating treatment

**SIDE-EFFECTS**
- Diarrhoea - fever (discontinue treatment)
- Headache - nausea - rashes - vomiting

**BREAST FEEDING**
- Present in milk — manufacturer advises avoid.

**LESS SUITABLE FOR PRESCRIBING**
- Less suitable for prescribing.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

2.1 Coagulation factor deficiencies

BLOOD COAGULATION FACTORS

Dried prothrombin complex
(Human prothrombin complex)

**INDICATIONS AND DOSE**
- Treatment and peri-operative prophylaxis of haemorrhage in patients with congenital deficiency of factors II, VII, IX, or X (e.g. during warfarin treatment)

**CONTRA-INDICATIONS**
- Angina - history of heparin induced thrombocytopenia - recent myocardial infarction (except in life-threatening haemorrhage following overdosage of oral anticoagulants, and before induction of fibrinolytic therapy)

**CAUTIONS**
- Disseminated intravascular coagulation - history of myocardial infarction or coronary heart disease - postoperative use - risk of thrombosis

**SIDE-EFFECTS**
- Rare Headache

**Solution for injection**
- **TRANEXAMIC ACID (Non-proprietary)**
  - Tranexamic acid 100 mg per 1 ml Tranexamic acid 500mg/5ml solution for injection ampoules | 5 ampoules (£7.50) (Hospital only) | 10 ampoules (£14.95—£15.47) (Hospital only)
  - Cyklokapron (Pfizer Ltd)
    - Tranexamic acid 100 mg per 1 ml Cyklokapron 500mg/5ml solution for injection ampoules | 10 ampoule (£15.47)

**Factor IX fraction, dried**

**INDICATIONS AND DOSE**
- Treatment and prophylaxis of haemorrhage in congenital factor IX deficiency (haemophilia B)

**CONTRA-INDICATIONS**
- Disseminated intravascular coagulation

**CAUTIONS**
- Risk of thrombosis — principally with former low purity products

**SIDE-EFFECTS**
- Allergic reactions - chills - dizziness - fever - gastro-intestinal disturbances - headache

**PRESCRIBING AND DISPENSING INFORMATION**
- Dried factor IX fraction is prepared from human plasma by a suitable fractionation technique; it may also contain clotting factors II, VII, and X.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**
- **AlphaNine** (Grifols UK Ltd)
  - Factor IX high purity 500 unit AlphaNine 500 unit powder and solvent for solution for injection vials | 1 vial (£478.43) no price available
  - Factor IX high purity 1000 unit AlphaNine 1000 unit powder and solvent for solution for injection vials | 1 vial (£821.00) no price available
  - Factor IX high purity 1500 unit AlphaNine 1500 unit powder and solvent for solution for injection vials | 1 vial (£1651.80) no price available

- **Mononine** (CSL Behring UK Ltd)
  - Factor IX high purity 1000 unit Mononine 1000 unit powder and solvent for solution for injection vials | 1 vial (£607.15)

- **Repleline-VF** (Bio Products Laboratory Ltd)
  - Factor IX high purity 500 unit Repleline-VF 500 unit powder and solvent for solution for injection vials | 1 vial (£360.00) no price available
  - Factor IX high purity 1000 unit Repleline-VF 1000 unit powder and solvent for solution for injection vials | 1 vial (£792.00)

**Powder and solvent for solution for infusion**
- **BenefIX (Pfizer Ltd)**
  - Nonacog alfa 250 unit BenefIX 250 unit powder and solvent for solution for infusion vials | 1 vial (£151.80)
  - Nonacog alfa 500 unit BenefIX 500 unit powder and solvent for solution for infusion vials | 1 vial (£363.60)
  - Nonacog alfa 1000 unit BenefIX 1000 unit powder and solvent for solution for infusion vials | 1 vial (£607.20)
  - Nonacog alfa 2000 unit BenefIX 2000 unit powder and solvent for solution for infusion vials | 1 vial (£1214.40)
  - Nonacog alfa 3000 unit BenefIX 3000 unit powder and solvent for solution for infusion vials | 1 vial (£2282.00)

**BENEFIX® 2000®, 3000®**
- Available from CSL Behring (BeriPLEX® P/N) Octapharma (Octaplex®)
Factor VIIa (recombinant) (Eptacog alfa (activated))

**INDICATIONS AND DOSE**
Treatment and prophylaxis of haemorrhage in patients with factor VIII deficiency or Glanzmann's thrombasthenia

**SIDE-EFFECTS**
- **Uncommon** Deep vein thrombosis - fever - pulmonary embolism - rash - venous thromboembolic events
- **Rare** Angina - arterial thrombotic events - cerebrovascular accident - coagulation disorders - headache - myocardial infarction - nausea
- **Frequency not known** Anaphylaxis - angioedema - flushing

**CAUTIONS**
Disseminated intravascular coagulation - risk of thrombosis

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**
- **NovoSeven** (Novo Nordisk Ltd)
  - Eptacog alfa activated 250000 unit powder and solvent for solution for injection pre-filled vials | 1 vial (PSt) £525.20 (Hospital only)
  - Eptacog alfa activated 100000 unit powder and solvent for solution for injection pre-filled vials | 1 vial (PSt) £105.40 (Hospital only)
  - Eptacog alfa activated 50000 unit powder and solvent for solution for injection pre-filled vials | 1 vial (PSt) £42.62 (Hospital only)

**Octocog alfa activated 1500 unit**
- Powder and solvent for solution for infusion vials | 1 vial (PSt) £57.00
- Powder and solvent for solution for infusion vials | 1 vial (PSt) £65.00
- Powder and solvent for injection vials | 1 vial (PSt) £49.50

**Coagulation factor deficiencies 97**

**Factor VIII fraction, dried (Human coagulation factor VIII, dried)**

**INDICATIONS AND DOSE**
Treatment and prophylaxis of haemorrhage in patients with congenital factor VIII deficiency (haemophilia A), acquired factor VIII deficiency or von Willebrand’s disease

**SIDE-EFFECTS**

**MONITORING REQUIREMENTS**
Monitor for development of factor VIII inhibitors.

**PRESCRIBING AND DISPENSING INFORMATION**
Dried factor VIII fraction is prepared from human plasma by a suitable fractionation technique; it may also contain varying amounts of von Willebrand factor.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**
- **Advate** (Baxter Healthcare Ltd)
  - Octocog alfa 250 unit Advate 250unit powder and solvent for solution for injection vials | 1 vial (PSt) no price available
  - Octocog alfa 500 unit Advate 500unit powder and solvent for solution for injection vials | 1 vial (PSt) no price available
  - Octocog alfa 1000 unit Advate 1000unit powder and solvent for solution for injection vials | 1 vial (PSt) no price available
  - Octocog alfa 2000 unit Advate 2000unit powder and solvent for solution for injection vials | 1 vial (PSt) no price available

- **Fanhdi** (Grifols Ltd)
  - Factor VIII high purity 500 unit Fanhdi 500unit powder and solvent for solution for injection vials | 1 vial (PSt) £163.00 (Hospital only)
  - Factor VIII high purity 1000 unit Fanhdi 1000unit powder and solvent for solution for injection vials | 1 vial (PSt) £330.00 (Hospital only)
  - Factor VIII high purity 1500 unit Fanhdi 1500unit powder and solvent for solution for injection vials | 1 vial (PSt) £495.00

- **Helixate NexGen** (CSL Behring UK Ltd)
  - Octocog alfa 250 unit Helixate NexGen 250unit powder and solvent for solution for injection vials | 1 vial (PSt) £118.57
  - Octocog alfa 500 unit Helixate NexGen 500unit powder and solvent for solution for injection vials | 1 vial (PSt) £237.15
  - Octocog alfa 1000 unit Helixate NexGen 1000unit powder and solvent for solution for injection vials | 1 vial (PSt) £474.30
  - Octocog alfa 2000 unit Helixate NexGen 2000unit powder and solvent for solution for injection vials | 1 vial (PSt) £948.60

- **Kogenate** (Bayer Plc)
  - Octocog alfa 250 unit Kogenate Bayer 250unit powder and solvent for solution for injection vials | 1 vial (PSt) £115.75
  - Octocog alfa 500 unit Kogenate Bayer 500unit powder and solvent for solution for injection vials | 1 vial (PSt) £331.00
  - Octocog alfa 1000 unit Kogenate Bayer 1000unit powder and solvent for solution for injection vials | 1 vial (PSt) £630.00
  - Octocog alfa 2000 unit Kogenate Bayer 2000unit powder and solvent for solution for injection vials | 1 vial (PSt) £1,260.00

**Powder and solvent for solution for infusion**
- **Advate** (Baxter Healthcare Ltd)
  - Octocog alfa 1500 unit Advate 1500unit powder and solvent for solution for infusion vials | 1 vial (PSt) no price available
  - Octocog alfa 3000 unit Advate 3000unit powder and solvent for solution for infusion vials | 1 vial (PSt) no price available

- **Kogenate** (Bayer Plc)
  - Octocog alfa 3000 unit Kogenate Bayer 3000unit powder and solvent for solution for injection vials | 1 vial (PSt) £1,890.00

**Factor VIII inhibitor bypassing fraction**

**INDICATIONS AND DOSE**
Treatment and prophylaxis of haemorrhage in patients with congenital factor VIII deficiency (haemophilia A) and factor VIII inhibitors | Treatment of haemorrhage in non-haemophilic patients with acquired factor VIII inhibitors

**SIDE-EFFECTS**
Anaphylaxis - disseminated intravascular coagulation - flushing - hypersensitivity - hypotension - myocardial infarction - paraesthesia - pyrexia - rash - thrombosis - urticaria

**PRESCRIBING AND DISPENSING INFORMATION**
Preparations with factor VIII inhibitor bypassing activity are prepared from human plasma.
**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**
- FEIBA Imuno (Baxter Healthcare Ltd)
  - Factor VIII inhibitor bypassing fraction 500 unit
  - Factor VIII inhibitor bypassing fraction 1000 unit
  - FEIBA Imuno (Baxter Healthcare Ltd)

**Powder and solvent for solution for infusion**
- FEIBA Imuno (Baxter Healthcare Ltd)
  - Factor VIII inhibitor bypassing fraction 1000 unit

**SIDE-EFFECTS**
- Very rare

**PRESCRIBING AND DISPENSING INFORMATION**
Fibrinogen is prepared from human plasma.

**INDICATIONS AND DOSE**
Treatment of haemorrhage in congenital hypofibrinogenaemia or afibrinogenaemia

**BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**
- Adult: (consult haematologist)

**CONTRA-INDICATIONS**
Avoid use as a volume expander - IgA deficiency with confirmed antibodies to IgA

**CAUTIONS**
- Cardiac decompensation - need for compatibility - pulmonary oedema - severe protein S deficiency (avoid products with low protein S activity e.g. OctaplasLG®)

**SIDE-EFFECTS**
- Common or very common: Nausea, pruritus, rash
- Uncommon: Oedema, vomiting
- Rare: Agitation, allergic reactions - bronchospasms - cardiorespiratory collapse - chills - fever - tachycardia
- Very rare: Arrhythmia, hypertension, thromboembolism

**BLOOD PRODUCTS**

**Fresh frozen plasma**

**INDICATIONS AND DOSE**
Replacement of coagulation factors or other plasma proteins where their concentration or functional activity is critically reduced

**BY INTRAVENOUS INFUSION**
- Adult: (consult haematologist)

**Major bleeding in patients on warfarin following phytomenadione**
- Adult: 15 mL/kg

**Dose equivalence and conversion**
Fresh frozen plasma is prepared from the supernatant liquid obtained by centrifugation of one donation of whole blood.

**CONTRA-INDICATIONS**
Avoid use as a volume expander - IgA deficiency with confirmed antibodies to IgA

**CAUTIONS**
- Cardiac decompensation - need for compatibility - pulmonary oedema - severe protein S deficiency (avoid products with low protein S activity e.g. OctaplasLG®)

**SIDE-EFFECTS**
- Common or very common: Nausea, pruritus, rash
- Uncommon: Oedema, vomiting
- Rare: Agitation, allergic reactions - bronchospasms - cardiorespiratory collapse - chills, fever, tachycardia
- Very rare: Arrhythmia, hypertension, thromboembolism

**PROVIDING AND DISPENSING INFORMATION**
Fresh frozen plasma is prepared from the supernatant liquid obtained by centrifugation of one donation of whole blood. A preparation of solvent/detergent treated human plasma (frozen) from pooled donors is available from Octapharma (OctaplasLG®)

**Protein C concentrate**

**INDICATIONS AND DOSE**
Congenital protein C deficiency

**BY INTRAVENOUS INJECTION**
- Adult: (consult haematologist)

**CAUTIONS**
- Hypersensitivity to heparins

**SIDE-EFFECTS**
- Very rare: Bleeding, dizziness, fever, hypersensitivity reactions

**PROVIDING AND DISPENSING INFORMATION**
Protein C is prepared from human plasma.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for infusion**
- Ristap (CSL Behring UK Ltd)
  - Fibrinogen 1 gram
  - Ristap 1g powder for solution for infusion vials | 1 vial (PSt) £340.00

**Solution for sealant**
- FIBRINOGEN, DRIED (Non-proprietary)
  - Fibrinogen 91 mg
  - Fibrinogen 91mg powder for solution for sealant vials | 1 vial (PSt) no price available
  - Fibrinogen 182 mg
  - Fibrinogen 182mg powder for solution for sealant vials | 1 vial (PSt) no price available
  - Fibrinogen 70 mg per 1 mL
  - Fibrinogen 350mg/5ml solution for sealant vials | 1 vial (PSt) no price available (Hospital only)

**Fibrinogen 455 mg**
Fibrinogen 455mg powder for solution for sealant vials | 1 vial (PSt) no price available

**Fibrinogen, dried**
(Human fibrin-stabilising factor, dried)

**INDICATIONS AND DOSE**
Treatment of haemorrhage in congenital hypofibrinogenaemia or afibrinogenaemia

**BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**
- Adult: (consult haematologist)

**CAUTIONS**
- Risk of thrombosis

**SIDE-EFFECTS**
- Rare: Allergic reactions, fever
- Very rare: Myocardial infarction, pulmonary embolism, thromboembolic events

**PREGNANCY**
Manufacturer advises not known to be harmful - no information available.

**BREAST-FEEDING**
Manufacturer advises avoid - no information available.

**PROVIDING AND DISPENSING INFORMATION**
Fibrinogen is prepared from human plasma.
2.2 Subarachnoid haemorrhage

CALCIUM-CHANNEL BLOCKERS

Nimodipine

The properties listed below are those particular to the drug. For properties common to the class, see Calcium-channel blockers, p. 147.

DRUG ACTION Nimodipine is a dihydropyridine calcium-channel blocker.

INDICATIONS AND DOSE

Prevention of ischaemic neurological defects following aneurysmal subarachnoid haemorrhage

BY MOUTH

- Adult: 60 mg every 4 hours, to be started within 4 days of aneurysmal subarachnoid haemorrhage and continued for 21 days

Treatment of ischaemic neurological defects following aneurysmal subarachnoid haemorrhage

BY INTRAVENOUS INFUSION

- Adult (body-weight up to 70 kg): Initially 0.5 mg/hour, increased after 2 hours if no severe fall in blood pressure; increased to 2 mg/hour and continue for at least 5 days (max. 14 days); if surgical intervention during treatment, continue for at least 5 days after surgery; max. total duration of nimodipine use 21 days, to be given via central catheter

- Adult (body-weight 70 kg and above): Initially 1 mg/hour, increased after 2 hours if no severe fall in blood pressure; increased to 2 mg/hour and continue for at least 5 days (max. 14 days); if surgical intervention during treatment, continue for at least 5 days after surgery; max. total duration of nimodipine use 21 days, to be given via central catheter

Treatment of ischaemic neurological defects following aneurysmal subarachnoid haemorrhage in patients with unstable blood pressure

BY INTRAVENOUS INFUSION

- Adult: Initially up to 0.5 mg/hour, increased after 2 hours if no severe fall in blood pressure; increased to 2 mg/hour and continue for at least 5 days (max. 14 days); if surgical intervention during treatment, continue for at least 5 days after surgery; max. total duration of nimodipine use 21 days, to be given via central catheter

CONTRA-INDICATIONS Acute porphyrias p. 864 • unstable angina • within 1 month of myocardial infarction

CAUTIONS Cerebral oedema • hypotension • severely raised intracranial pressure

INTERACTIONS → Appendix 1 (calcium-channel blockers, alcohol [infusion only]). Avoid concomitant administration with other calcium-channel blockers, beta-blocker and nephrotoxic drugs.

SIDE-EFFECTS Flushing • gastro-intestinal disorders • headache • hypotension • ileus • nausea • sweating and feeling of warmth • thrombocytopenia • variation in heart-rate

PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.

BREAST FEEDING Manufacturer advises avoid—present in milk.

HEPATIC IMPAIRMENT Elimination reduced in cirrhosis—monitor blood pressure.

RENAL IMPAIRMENT

- With intravenous use Manufacturer advises monitor renal function closely in renal impairment.

DIRECTIONS FOR ADMINISTRATION

Avoid concomitant administration of nimodipine infusion and tablets.

- With oral use For administration by mouth, tablets may be crushed or halved but are light sensitive—administer immediately.

- With intravenous use For intravenous infusion, give via drip tubing in Glucose 5% or Sodium chloride 0.9%. Not to be added to infusion container; administer via an infusion pump through a Y-piece into a central catheter; incompatible with polyvinyl chloride giving sets or containers; protect infusion from light. Polyethylene, polypropylene, or glass apparatus should be used. PVC should be avoided.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

- Nimotop (Bayer PdC) Nimodipine 30 mg Nimotop 30mg tablets | 100 tablet $40.00

Solution for infusion

- Nimotop (Bayer PdC) Nimodipine 200 microgram per 1 ml Nimotop 0.02% solution for infusion 50ml vials | 5 vial $66.00 (Hospital only)

3 Blood clots

3.1 Blocked catheters and lines

Drugs used for Blocked catheters and lines not listed below; Heparin (unfractionated). p. 114 • Urokinase, p. 119

PROSTAGLANDINS (CARDIOVASCULAR)

Epoprostenol

(Prostacyclin)

DRUG ACTION Epoprostenol is a prostaglandin and a potent vasodilator. It is also a powerful inhibitor of platelet aggregation.

INDICATIONS AND DOSE

Inhibition of platelet aggregation during renal dialysis when heparins are unsuitable or contra-indicated | Treatment of primary pulmonary hypertension resistant to other treatments, usually with oral anti-coagulation (initiated by a specialist)

BY CONTINUOUS INTRAVENOUS INFUSION

- Adult: (consult product literature)

PHARMACOKINETICS

Short half-life of approximately 3 minutes, therefore it must be administered by continuous intravenous infusion.

CONTRA-INDICATIONS Severe left ventricular dysfunction

CAUTIONS Avoid abrupt withdrawal when used for primary pulmonary hypertension (risk of rebound pulmonary hypertension) • extreme caution in coronary artery disease • haemorrhagic diathesis • pulmonary veno-occlusive disease • reconstituted solution highly alkaline—avoid extravasation (irritant to tissues) • risk of pulmonary oedema (dose titration for pulmonary hypertension should be in hospital)

INTERACTIONS Caution with concomitant use of drugs that increase risk of bleeding.
2 MEDICINAL FORMS

2.1 Monitoring requirements

BREAST FEEDING

Frequency not known

▶ Very rare

▶ Uncommon

Common or very common

SIDE-EFFECTS

dilute further with glycine buffer diluent only

hypertension

for peripheral vein until central venous access established); diluent) provided to make a concentrate; may be diluted reconstitute using the filter and solvent (glycine buffer pulmonary hypertension).

intravenous infusion

sodium chloride

Flolan

EPOPROSTENOL (Non-proprietary)

▶ Powder and solvent for solution for infusion

EPROPENSTENOL (Non-proprietary)

3.2 Thromboembolism

Venous thromboembolism

Venous thromboembolism includes deep-vein thrombosis and pulmonary embolism, and occurs as a result of thrombus formation in a vein.

Prophylaxis of venous thromboembolism

All patients admitted to hospital should undergo a risk assessment for venous thromboembolism on admission. Patients considered to be at high risk include those anticipated to have a substantial reduction in mobility, those with obesity, malignant disease, history of venous thromboembolism, thrombophilic disorder, or patients over 60 years. Patients with risk factors for bleeding (e.g. acute stroke, thrombocytopaenia, acquired or untreated inherited bleeding disorders) should only receive pharmacological prophylaxis when the risk of bleeding does not outweigh the risk of venous thromboembolism. NICE clinical guideline 92 (January 2010) provides a full list of risk factors, and gives recommendations for prophylaxis. A venous thromboembolism risk assessment checklist is also available from the Department of Health (www.gov.uk/dh).

Patients scheduled for surgery should be offered mechanical prophylaxis (e.g. anti-embolism stockings) on admission if appropriate; prophylaxis should continue until the patient is sufficiently mobile. Choice of mechanical prophylaxis will depend on factors such as the type of surgery, suitability for the patient, and their condition.

Patients undergoing general or orthopaedic surgery, who are considered to be at high risk of venous thromboembolism, should be offered pharmacological prophylaxis. Choice of prophylaxis will depend on the type of surgery, suitability for the patient, and local policy. A low molecular weight heparin is suitable in all types of general and orthopaedic surgery; heparin (unfractionated) p. 114 is preferred for patients in renal failure. Fondaparinux sodium p. 109 is an option for patients undergoing hip or knee replacement surgery, hip fracture surgery, gastro-intestinal, bariatric, or day surgery procedures. The oral anticoagulants apixaban p. 108, dabigatran etexilate p. 117, and rivaroxaban p. 109 are indicated for thromboprophylaxis following hip or knee replacement surgery.

Pharmacological prophylaxis in general surgery should usually continue for 5–7 days, or until sufficient mobility has been re-established. Pharmacological prophylaxis should be extended to 28 days after major cancer surgery in the abdomen or pelvis. Hip or knee replacement surgery, and hip fracture surgery, require an extended duration of pharmacological prophylaxis, depending on the preparation used (consult product literature).

General medical patients who are considered to be at high risk of venous thromboembolism should be offered pharmacological prophylaxis on admission. Choice of prophylaxis will depend on the medical condition, suitability for the patient, and local policy. Patients should receive either a low molecular weight heparin, heparin (unfractionated) (if patient in renal failure), or fondaparinux sodium prophylaxis should continue until the patient is no longer considered to be at significant risk of venous thromboembolism. Mechanical prophylaxis (e.g. anti-embolism stockings) can be offered to medical patients in whom pharmacological prophylaxis is contra-indicated, and continued until the patient is sufficiently mobile.

Treatment of venous thromboembolism

For the initial treatment of deep-vein thrombosis and pulmonary embolism a low molecular weight heparin is used; alternatively, heparin (unfractionated) is given as an intravenous loading dose, followed by continuous intravenous infusion (using an infusion pump) or (for deep-vein thrombosis only) by intermittent subcutaneous injection. Intermittent intravenous injection of heparin (unfractionated) is no longer recommended. An oral anticoagulant (usually warfarin sodium p. 121) is started at the same time as unfractionated or low molecular weight heparin (the heparin needs to be continued for at least 5 days and until the INR is ≥2 for at least 24 hours). Laboratory monitoring for heparin (unfractionated),
preferably on a daily basis, is essential; determination of the activated partial thromboplastin time (APTT) is the most widely used measure (for heparin (unfractionated). A low molecular weight heparin or, in some circumstances, heparin (unfractionated) is also used in regimens for the management of myocardial infarction and unstable angina.

**Management of venous thromboembolism in pregnancy**

Heparins are used for the management of venous thromboembolism in pregnancy because they do not cross the placenta. Low molecular weight heparins are preferred because they have a lower risk of osteoporosis and of heparin-induced thrombocytopenia. Low molecular weight heparins are eliminated more rapidly in pregnancy, requiring alteration of the dosage regimen for drugs such as dalteparin sodium p. 112, enoxaparin sodium p. 113, and tinzaparin sodium p. 115. Treatment should be stopped at the onset of labour and advice sought from a specialist on continuing therapy after birth.

**Extracorporeal circuits**

Heparin (unfractionated) is also used in the maintenance of extracorporeal circuits in cardiopulmonary bypass and haemodialysis.

**Haemorrhage**

If haemorrhage occurs it is usually sufficient to withdraw unfractionated or low molecular weight heparin, but if rapid reversal of the effects of the heparin is required, protamine sulfate p. 113 is a specific antidote (but only partially reverses the effects of low molecular weight heparins).

**Management of stroke**

Stroke is associated with a significant risk of morbidity and mortality. Patients presenting with acute symptoms should be immediately transferred to hospital for accurate diagnosis of stroke type, and urgent initiation of appropriate treatment; patients should be managed by a specialist multidisciplinary stroke team.

The following notes give an overview of the initial and long-term management of transient ischaemic attack, ischaemic stroke, and intracerebral haemorrhage.

**Transient ischaemic attack**

Patients suspected of having a transient ischaemic attack should immediately receive aspirin p. 104 (patients with aspirin hypersensitivity, or those intolerant of aspirin despite the addition of a proton pump inhibitor, should receive clopidogrel p. 106 [unlicensed use] as an alternative). Following a confirmed diagnosis, patients should receive treatment for secondary prevention (see Long-term Management, under Ischaemic Stroke).

**Ischaemic stroke**

**Initial management**

Alteplase p. 194 is recommended in the treatment of acute ischaemic stroke if it can be administered within 4.5 hours of symptom onset; it should be given by medical staff experienced in the administration of thrombolitics and the treatment of acute stroke, preferably within a specialist stroke centre. Treatment with aspirin should be initiated 24 hours after thrombolysis (or as soon as possible within 48 hours of symptom onset in patients not receiving thrombolysis); patients with aspirin hypersensitivity, or those intolerant of aspirin despite the addition of a proton pump inhibitor, should receive clopidogrel [unlicensed use] as an alternative.

Anticoagulants are not recommended as an alternative to antiplatelet drugs in acute ischaemic stroke in patients who are in sinus rhythm. However, parenteral anticoagulants may be indicated in patients who are symptomatic of, or at high risk of developing, deep vein thrombosis or pulmonary embolism; warfarin sodium p. 121 should not be commenced in the acute phase of ischaemic stroke.

Anticoagulants should be considered after cardio-embolic ischaemic stroke in patients with atrial fibrillation, however patients presenting with atrial fibrillation following a disabling ischaemic stroke should receive aspirin before being considered for anticoagulant treatment. Patients already receiving anticoagulation for a prosthetic heart valve who experience a disabling ischaemic stroke and are at significant risk of haemorrhagic transformation, should have their anticoagulant treatment stopped for 7 days and substituted with aspirin.

Treatment of hypertension in the acute phase of ischaemic stroke can result in reduced cerebral perfusion, and should therefore only be instituted in the event of a hypertensive emergency, or in those patients considered for thrombolysis.

**Long-term management**

Patients should receive long-term treatment following a transient ischaemic attack or an ischaemic stroke to reduce the risk of further cardiovascular events.

Following a transient ischaemic attack, long-term treatment with modified-release dipyridamole in combination with aspirin is recommended. If patients are intolerant of aspirin, or it is contra-indicated, then modified-release dipyridamole p. 107 alone is recommended; if patients are intolerant of dipyridamole, or it is contra-indicated, then aspirin alone is recommended.

Patients who are intolerant of both aspirin and dipyridamole should receive clopidogrel alone [unlicensed use].

Following an ischaemic stroke (not associated with atrial fibrillation), clopidogrel is recommended as long-term treatment. If clopidogrel is contra-indicated or not tolerated, patients should receive modified-release dipyridamole in combination with aspirin; if both aspirin and clopidogrel are contra-indicated or not tolerated, then modified-release dipyridamole alone is recommended; if both dipyridamole and clopidogrel are contra-indicated or not tolerated, then aspirin alone is recommended.

Patients with stroke associated with atrial fibrillation should be reviewed for long-term treatment with warfarin sodium or an alternative anticoagulant (see Initial Management under Ischaemic Stroke).

Anticoagulants are not routinely recommended in the long-term prevention of recurrent stroke, except in patients with atrial fibrillation.

A statin should be initiated 48 hours after stroke symptom onset, irrespective of the patient’s serum-cholesterol concentration.

Following the acute phase of ischaemic stroke, blood pressure should be measured and treatment initiated to achieve a target blood pressure of < 130/80 mmHg. Beta-blockers should not be used in the management of hypertension following a stroke, unless they are indicated for a co-existing condition.

All patients should be advised to make lifestyle modifications that include beneficial changes to diet, exercise, weight, alcohol intake, and smoking.

**Intracerebral haemorrhage**

**Initial Management**

Surgical intervention may be required following intracerebral haemorrhage to remove the haematoma and relieve intracranial pressure. Patients taking anticoagulants should have this treatment stopped for 7 days and substituted with aspirin.

Anticoagulant therapy has, however, been used in patients with intracerebral haemorrhage who are symptomatic of...
deep vein thrombosis or pulmonary embolism; placement of a caval filter is an alternative in this situation.

Long-term management
Aspirin therapy should only be given to patients at a high risk of a cardiac ischaemic event. Anticoagulant therapy is not recommended following an intracerebral haemorrhage, even in those with atrial fibrillation, unless the patient is at very high risk of an ischaemic stroke or cardiac ischaemic events; advice from a specialist should be sought in this situation. Blood pressure should be measured and treatment initiated where appropriate, taking care to avoid hypoperfusion. Statins should be avoided following intracerebral haemorrhage, however they can be used with caution when the risk of a vascular event outweighs the risk of further haemorrhage.

Oral anticoagulants
The main use of anticoagulants is to prevent thrombus formation or extension of an existing thrombus in the slower-moving venous side of the circulation, where the thrombus consists of a fibrin web enmeshed with platelets and red cells.

Anticoagulants are of less use in preventing thrombus formation in arteries, for in faster-flowing vessels thrombi are composed mainly of platelets with little fibrin.

Coumarins and phenindione
The oral anticoagulants warfarin sodium p. 121,acenocoumarol p. 120 and phenindione p. 120, antagonise the effects of vitamin K, and take at least 48 to 72 hours for the anticoagulant effect to develop fully; warfarin sodium is the drug of choice. If an immediate effect is required, unfractionated or low molecular weight heparin must be given concomitantly. These oral anticoagulants should not be used in cerebral artery thrombosis or peripheral artery occlusion as first-line therapy; aspirin p. 104 is more appropriate for reduction of risk in transient ischaemic attacks. Unfractionated or a low molecular weight heparin (see under Parenteral anticoagulants p. 104) is usually preferred for the prophylaxis of venous thromboembolism in patients undergoing surgery; alternatively, warfarin sodium can be continued in selected patients currently taking long-term warfarin sodium and who are at high risk of thromboembolism (seek expert advice).

Dose
The base-line prothrombin time should be determined but the initial dose should not be delayed whilst awaiting the result.

Target INR
The following indications and target INRs for adults for warfarin take into account recommendations of the British Society for Haematology guidelines on oral anticoagulation with warfarin—fourth edition. Br J Haematol 2011; 154: 311–324:

An INR which is within 0.5 units of the target value is generally satisfactory; larger deviations require dosage adjustment. Target values (rather than ranges) are now recommended.

INR 2.5 for:
- treatment of deep-vein thrombosis or pulmonary embolism (including those associated with antiphospholipid syndrome or for recurrence in patients no longer receiving warfarin sodium p. 121)
- atrial fibrillation
- cardioversion—target INR should be achieved at least 3 weeks before cardioversion and anticoagulation should continue for at least 4 weeks after the procedure (higher target values, such as an INR of 3, can be used for up to 4 weeks before the procedure to avoid cancellations due to low INR)
- dilated cardiomyopathy
- mitral stenosis or regurgitation in patients with either atrial fibrillation, a history of systemic embolism, a left atrial thrombus, or an enlarged left atrium
- bioprosthetic heart valves in the mitral position (treat for 3 months), or in patients with a history of systemic embolism (treat for at least 3 months), or with a left atrial thrombus at surgery (treat until clot resolves), or with other risk factors (e.g. atrial fibrillation or a low ventricular ejection fraction)
- acute arterial embolism requiring embolectomy (consider long-term treatment)
- myocardial infarction

INR 3.5 for:
- recurrent deep-vein thrombosis or pulmonary embolism in patients currently receiving anticoagulation and with an INR above 2:
  - Mechanical prosthetic heart valves:
    - the recommended target INR depends on the type and location of the valve, and patient-related risk factors
  - consider increasing the INR target or adding an antiplatelet drug, if an embolic event occurs whilst anticoagulated at the target INR.

Duration

- 6 weeks for isolated calf-vein deep-vein thrombosis
- 3 months for venous thromboembolism provoked by surgery or other transient risk factor (e.g. combined oral contraceptive use, pregnancy, plaster cast)
- at least 3 months for unprovoked proximal deep-vein thrombosis or pulmonary embolism; long-term anticoagulation may be required.

Haemorrhage
The main adverse effect of all oral anticoagulants is haemorrhage. Checking the INR and omitting doses when appropriate is essential; if the anticoagulant is stopped but not reversed, the INR should be measured 2–3 days later to ensure that it is falling. The cause of an elevated INR should be investigated. The following recommendations (which take into account the recommendations of the British Society for Haematology Guidelines on Oral Anticoagulation with Warfarin—fourth edition. Br J Haematol 2011; 154: 311–324) are based on the result of the INR and whether there is major or minor bleeding; the recommendations apply to adults taking warfarin:

- Major bleeding—stop warfarin sodium; give phytonadione p. 889 (vitamin K1) by slow intravenous injection; give dried prothrombin complex p. 96 (factors II, VII, IX, and X); if dried prothrombin complex unavailable, fresh frozen plasma can be given but is less effective; recombinant factor VIIa is not recommended for emergency anticoagulation reversal
- INR >8.0, minor bleeding—stop warfarin sodium p. 121; give phytonadione p. 889 (vitamin K1) by slow intravenous injection; repeat dose of phytonadione p. 889 if INR still too high after 24 hours; restart warfarin sodium when INR <5.0
- INR >8.0, no bleeding—stop warfarin sodium; give phytonadione (vitamin K1) by mouth using the intravenous preparation orally (fun of the use); repeat dose of phytonadione if INR still too high after 24 hours; restart warfarin when INR <5.0
Antiplatelet drugs

Antiplatelet drugs decrease platelet aggregation and inhibit thrombus formation in the arterial circulation, because in faster-flowing vessels, thrombi are composed mainly of platelets with little fibrin.

Use of aspirin p. 104 in primary prevention of cardiovascular events, in patients with or without diabetes, is of unproven benefit. Long-term use of aspirin is of benefit in established cardiovascular disease (secondary prevention); unduly high blood pressure must be controlled before aspirin is given. If the patient is at a high risk of gastro-intestinal bleeding, a proton pump inhibitor can be added.

Aspirin is given following coronary bypass surgery. It is also used in atrial fibrillation, for intermittent claudication, for stable angina and acute coronary syndromes, for use following placement of coronary stents and for use in stroke.

prasugrel p. 106 is licensed for the prevention of atherothrombotic events in patients with a history of symptomatic ischaemic disease. Clopidogrel, in combination with low-dose aspirin, is also licensed for acute coronary syndrome without ST-segment elevation; in these circumstances the combination is given for up to 12 months (most benefit occurs during the first 3 months; there is no evidence of benefit beyond 12 months). Clopidogrel, in combination with low-dose aspirin, is also licensed for acute myocardial infarction with ST-segment elevation; the combination is licensed for at least 4 weeks, but the optimum treatment duration has not been established. In patients undergoing percutaneous coronary intervention, clopidogrel is used as an adjunct with aspirin. Patients who are not already taking clopidogrel should receive a loading dose prior to procedure.

Clopidogrel is also licensed, in combination with low-dose aspirin, for the prevention of atherothrombotic and thromboembolic events in patients with atrial fibrillation (and at least one risk factor for a vascular event), and for whom warfarin sodium is unsuitable.

Use of clopidogrel with aspirin increases the risk of bleeding. Clopidogrel monotherapy may be an alternative when aspirin is contra-indicated, for example in those with aspirin hypersensitivity, or when aspirin is not tolerated despite the addition of a proton pump inhibitor (see also NICE guidance). Clopidogrel also has uses in stroke. Dipyridamole is used by mouth as an adjunct to oral antiplatelet therapy for prophylaxis of thromboembolism associated with prosthetic heart valves. Modified-release preparations are licensed for secondary prevention of ischaemic stroke and transient ischaemic attacks.

Prasugrel p. 188, in combination with aspirin, is licensed for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention; the combination is usually given for up to 12 months.

Ticagrelor p. 188, in combination with aspirin, is licensed for the prevention of atherothrombotic events in patients with acute coronary syndrome; the combination is usually given for up to 12 months.

Antiplatelet drugs and coronary stents

Patients selected for percutaneous coronary intervention, with the placement of a coronary stent, will require dual antiplatelet therapy with aspirin and either clopidogrel, prasugrel, or ticagrelor. Aspirin therapy should continue indefinitely. Clopidogrel is recommended for 1 month following elective percutaneous coronary intervention with placement of a bare-metal stent, and for 12 months if percutaneous coronary intervention with placement of a bare-metal stent was for an acute coronary syndrome; clopidogrel should be given for 12 months following placement of a drug-eluting stent. Clopidogrel should not be discontinued prematurely in patients with a drug-eluting stent—there is an increased risk of stent thrombosis as a result of the eluted drug slowing the re-endothelialisation process. Patients considered to be at high risk of developing late stent thrombosis with a drug-eluting stent may require a longer duration of treatment with clopidogrel. Prasugrel or ticagrelor are alternatives to clopidogrel in certain patients undergoing percutaneous coronary intervention.

Glycoprotein Iib/IIia inhibitors

Glycoprotein Iib/IIia inhibitors prevent platelet aggregation by blocking the binding of fibrinogen to receptors on platelets. Abciximab p. 183 is a monoclonal antibody which binds to glycoprotein Iib/IIia receptors and to other related sites; it is licensed as an adjunct to heparin.
Cardiovascular system

Heparin (unfractionated) p. 114 and aspirin for the prevention of ischaemic complications in high-risk patients undergoing percutaneous transluminal coronary intervention. Abciximab should be used once only (to avoid additional risk of thrombocytopenia). Eptifibatide (in combination with heparin (unfractionated) and aspirin) and tiroliban p. 184 (in combination with heparin (unfractionated), aspirin, and clopidogrel) also inhibit glycoprotein IIb/IIIa receptors; they are licensed for use to prevent early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction. Tiroliban is also licensed for use in combination with heparin (unfractionated), aspirin, and clopidogrel, for the reduction of major cardiovascular events in patients with ST-segment elevation myocardial infarction intended for primary percutaneous coronary intervention. Abciximab, eptifibatide p. 183 and tiroliban should be used by specialists only.

Epoprostenol p. 99 is also used to inhibit platelet aggregation during renal dialysis when heparin is unsuitable or contra-indicated.

Parenteral anticoagulants

The main use of anticoagulants is to prevent thrombus formation or extension of an existing thrombus in the slower-moving venous side of the circulation, where the thrombus consists of a fibrin web enmeshed with platelets and red cells.

Anticoagulants are of less use in preventing thrombus formation in arteries, for in faster-flowing vessels thrombi are composed mainly of platelets with little fibrin.

Heparin

Heparin initiates anticoagulation rapidly but has a short duration of action. It is often referred to as ‘standard’ or heparin (unfractionated) p. 114 to distinguish it from the low molecular weight heparins, which have a longer duration of action. Although a low molecular weight heparin is generally preferred for routine use, heparin (unfractionated) can be used in those at high risk of bleeding because its effect can be terminated rapidly by stopping the infusion.

Low molecular weight heparins

Low molecular weight heparins (dalteparin sodium p. 112, enoxaparin sodium p. 113, and tinzaparin sodium p. 115) are usually preferred over heparin (unfractionated) in the prevention of Venous thromboembolism because they are as effective and they have a lower risk of heparin-induced thrombocytopenia. The standard prophylactic regimen does not require anticoagulant monitoring. The duration of action of low molecular weight heparins is longer than that of heparin (unfractionated) and once-daily subcutaneous administration is possible for some indications, making them convenient to use.

Low molecular weight heparins are generally preferred over heparin (unfractionated) in the treatment of deep vein thrombosis and pulmonary embolism, and are also used in the treatment of myocardial infarction, unstable coronary artery disease (see Acute coronary syndromes p. 186) and for the prevention of clotting in extracorporeal circuits.

Dalteparin sodium and tinzaparin sodium (only 20 000 unit/mL syringe) are also licensed for the extended treatment and prophylaxis of venous thromboembolism in patients with solid tumours; treatment is recommended for a duration of 6 months. Treatment should be initiated by healthcare professionals experienced in the treatment of venous thromboembolism.

Heparinoids

Danaparoid sodium p. 111 is a heparinoid used for prophylaxis of deep-vein thrombosis in patients undergoing general or orthopaedic surgery. Providing there is no evidence of cross-reactivity, it also has a role in patients who develop heparin-induced thrombocytopenia.

Argatroban

An oral anticoagulant can be given with argatroban monohydrate p. 116, but it should only be started once thrombocytopenia has substantially resolved.

Hirudins

Bivalirudin, a hirudin analogue, is a thrombin inhibitor which is licensed for unstable angina or non-ST-segment elevation myocardial infarction in patients planned for urgent or early intervention, and as an anticoagulant for patients undergoing percutaneous coronary intervention (including patients with ST-segment elevation myocardial infarction undergoing primary percutaneous coronary intervention—see also Myocardial infarction: ST-segment elevation p. 186).

Heparin flushes

The use of heparin flushes should be kept to a minimum. For maintaining patency of peripheral venous catheters, sodium chloride injection 0.9% is as effective as heparin flushes. The role of heparin flushes in maintaining patency of arterial and central venous catheters is unclear.

Epoprostenol

Epoprostenol (prostacyclin) p. 99 can be given to inhibit platelet aggregation during renal dialysis when heparins are unsuitable or contra-indicated. It is also licensed for the treatment of primary pulmonary hypertension resistant to other treatment, usually with oral anticoagulation; it should be initiated by specialists in pulmonary hypertension. Epoprostenol is a potent vasodilator. It has a short half-life of approximately 3 minutes and therefore it must be administered by continuous intravenous infusion.

Fondaparinux

Fondaparinux sodium p. 109 is a synthetic pentasaccharide that inhibits activated factor X.

Aspirin

(Acetylsalicylic Acid)

**INDICATIONS AND DOSE**

Cardiovascular disease (secondary prevention)

**BY MOUTH**

- Adult: 75 mg daily

Management of unstable angina and non-ST-segment elevation myocardial infarction (NSTEMI) Management of ST-segment elevation myocardial infarction (STEMI)

**BY MOUTH**

- Adult: 300 mg

Suspected transient ischaemic attack

**BY MOUTH**

- Adult: 300 mg daily until diagnosis established

Transient ischaemic attack (long-term treatment following in combination with dipyridamole) Ischaemic stroke not associated with atrial fibrillation (in combination with dipyridamole if clopidogrel contraindicated or not tolerated)

**BY MOUTH**

- Adult: 75 mg daily
Acute ischaemic stroke

By mouth
- Adult: 300 mg daily for 14 days, to be initiated 24 hours after thrombolysis or as soon as possible within 48 hours of symptom onset in patients not receiving thrombolysis

Atrial fibrillation following a disabling ischaemic stroke

By mouth
- Adult: 300 mg daily for 14 days

Following disabling ischaemic stroke in patients receiving anticoagulation for a prosthetic heart valve

By mouth
- Adult: 300 mg daily, anticoagulant treatment stopped for 7 days and to be substituted with aspirin

Following coronary by-pass surgery

By mouth
- Adult: 75–300 mg daily

Mild to moderate pain

By mouth
- Adult: 300–900 mg every 4–6 hours as required; maximum 4 g per day

By rectum
- Adult: 450–900 mg every 4 hours; maximum 3.6 g per day

- CONTRA-INDICATIONS Active peptic ulceration - bleeding disorders (antiplatelet dose) - children under 16 years (risk of Reye’s syndrome) - haemophilia - previous peptic ulceration (analgesic dose) - severe cardiac failure (analgesic dose)

CONTRA-INDICATIONS, FURTHER INFORMATION
Reye’s syndrome. Owing to an association with Reye’s syndrome, aspirin-containing preparations should not be given to children under 16 years, unless specifically indicated, e.g., for Kawasaki disease.

- CAUTIONS Allergic disease - anaemia - asthma - dehydrogen - elderly - G6PD deficiency - preferably avoid during fever or viral infection in children (risk of Reye’s syndrome) - previous peptic ulceration (but manufacturers may advise avoidance of low-dose aspirin in history of peptic ulceration) - thyrotoxicosis - uncontrolled hypertension

- INTERACTIONS Appendix 1 (aspirin). Caution with concomitant use of drugs that increase risk of bleeding.

SIDE-EFFECTS. Blood disorders (with analgesic doses) - bronchospasm - confusion (with analgesic doses) - gastrointestinal haemorrhage (occasionally major) - gastrointestinal irritation (with slight asymptomatic blood loss at higher doses) - haemorrhage including subconjunctival haemorrhage (reported with antiplatelet doses) - increased bleeding time - skin reactions in hypersensitive patients - tinnitus (with analgesic doses)

Overdose The main features of salicylate poisoning are hyperventilation, tinnitus, deafness, vasodilatation, and sweating. Coma is uncommon but indicates very severe poisoning. For specific details on the management of poisoning, see Aspirin, under Emergency treatment of poisoning p. 1123.

- ALLERGY AND CROSS-SENSITIVITY Aspirin is contra-indicated in history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria, or rhinitis have been precipitated by aspirin or any other NSAID.

- PREGNANCY Use antiplatelet doses with caution during third trimester; impaired platelet function and risk of haemorrhage; delayed onset and increased duration of labour with increased blood loss; avoid analgesic doses if possible in last few weeks (low doses probably not harmful); high doses may be related to intra-uterine growth restriction, teratogenic effects, closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of newborn; kernicterus may occur in jaundiced neonates.

- BREAST FEEDING Avoid—possible risk of Reye’s syndrome; regular use of high doses could impair platelet function and produce hypoprothrombinemia in infant if neonatal vitamin K stores low.

- HEPATIC IMPAIRMENT Avoid in severe impairment—increased risk of gastro-intestinal bleeding.

- RENAL IMPAIRMENT Use with caution; avoid in severe impairment; sodium and water retention; deterioration in renal function; increased risk of gastro-intestinal bleeding.

- PRESCRIBING AND DISPENSING INFORMATION BP directs that when no strength is stated the 300 mg strength should be dispensed, and that when soluble aspirin tablets are prescribed, dispersible aspirin tablets shall be dispensed.

- PROFESSION SPECIFIC INFORMATION Dental practitioners’ formulary Aspirin Dispersible Tablets 300 mg may be prescribed.

- EXCEPTIONS TO LEGAL CATEGORY Can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, powder, capsule, liquid

▶ ASPIRIN (Non-proprietary)

Aspirin 150 mg  Aspirin 150mg suppositories  |  10 suppository  £16.57–£21.95
Aspirin 300 mg  Aspirin 300mg suppositories  |  10 suppository  £32.63

Also available in combination with dipyridamole, p. 107

Clopidogrel

INDICATIONS AND DOSE

Prevention of atherothrombotic events in percutaneous coronary intervention (adjunct with aspirin) in patients not already on clopidogrel

BY MOUTH

▶ Adult: Loading dose 300 mg, to be taken prior to the procedure, alternatively loading dose 600 mg, higher dose may produce a greater and more rapid inhibition of platelet aggregation

Transient ischaemic attack for patients with aspirin hypersensitivity, or those intolerant of aspirin / Acute ischaemic stroke for patients with aspirin hypersensitivity, or those intolerant of aspirin

BY MOUTH

▶ Adult: 75 mg once daily

Prevention of atherothrombotic events in peripheral arterial disease or within 35 days of myocardial infarction, or within 6 months of ischaemic stroke

BY MOUTH

▶ Adult: 75 mg once daily

Prevention of atherothrombotic events in acute coronary syndrome without ST-segment elevation (given with aspirin)

BY MOUTH

▶ Adult: Initially 300 mg, then 75 mg daily for up to 12 months

Prevention of atherothrombotic events in acute myocardial infarction with ST-segment elevation (given with aspirin)

BY MOUTH

▶ Adult 18-75 years: Initially 300 mg, then 75 mg for at least 4 weeks

▶ Adult 76 years and over: 75 mg daily

Prevention of atherothrombotic and thromboembolic events in patients with atrial fibrillation (with aspirin) and for whom warfarin is unsuitable

BY MOUTH

▶ Adult: 75 mg once daily

UNLICENSED USE 600 mg loading dose prior to percutaneous coronary intervention is an unlicensed dose. Use in transient ischaemic attack or acute ischaemic stroke, in patients with aspirin hypersensitivity or intolerant of aspirin, is unlicensed.

CONTRA-INDICATIONS  Active bleeding

CAUTIONS Discontinue 7 days before elective surgery if antiplatelet effect not desirable - patients at risk of increased bleeding from trauma, surgery, or other pathological conditions

INTERACTIONS → Appendix 1 (clopidogrel).

Caution with concomitant use of drugs that increase risk of bleeding.

SIDE-EFFECTS

▶ Common or very common  Abdominal pain - bleeding disorders (including gastro-intestinal and intracranial) - diarrhoea - dyspepsia

REACHED Rare  Vertigo

ALLERGY AND CROSS-SENSITIVITY  Caution with history of hypersensitivity reactions to thienopyridines (e.g. prasugrel).

PREGNANCY  Manufacturer advises avoid—no information available.

BREAST FEEDING  Manufacturer advises avoid.

HEPATIC IMPAIRMENT  Manufacturer advises caution (risk of bleeding). Avoid in severe impairment.

RENAL IMPAIRMENT  Manufacturer advises caution.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

▶ Clopidogrel and modified-release dipyridamole in the prevention of occlusive vascular events (December 2010) NICE TA210

The guidance applies to patients who have had an occlusive vascular event, or who have established peripheral arterial disease. The guidance does not apply to patients who have had, or are at risk of, stroke associated with atrial fibrillation, or who need prophylaxis for occlusive events following coronary revascularisation or carotid artery procedures. Clopidogrel monotherapy is recommended as an option to prevent occlusive vascular events in patients who have had:

▶ an ischaemic stroke, or who have peripheral arterial disease or multivascular disease, or

▶ a myocardial infarction, only if aspirin is contra-indicated or not tolerated. www.nice.org.uk/TA210

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (February 2004) that clopidogrel be accepted for restricted use for the treatment of confirmed acute coronary syndrome (without ST-segment elevation), in combination with aspirin. Clopidogrel should be initiated in hospital inpatients only.

The Scottish Medicines Consortium has also advised (July 2007) that clopidogrel be accepted for restricted use for patients with ST-segment elevation acute myocardial infarction in combination with aspirin; treatment with clopidogrel is restricted to 4 weeks only.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, powder

Tablet

▶ CLOPIDOGREL (Non-proprietary)

Clopidogrel 75 mg  Clopidogrel 75mg tablets | 28 tablet  £30.54 DT price = £1.82 | 30 tablet  £32.71

Grepid (Beacon Pharmaceuticals Ltd)

Clopidogrel 75 mg  Grepid 75mg tablets | 30 tablet  £32.28

Plavix (Sanofi)

Clopidogrel 75 mg  Plavix 75mg tablets | 30 tablet  £35.64

Clopidogrel (as Clopidogrel hydrogen sulfate) 300 mg  Plavix 300mg tablets | 30 tablet  £142.54 DT price = £142.54
**Dipyridamole**

**INDICATIONS AND DOSE**
Secondary prevention of ischaemic stroke (not associated with atrial fibrillation) and transient ischaemic attacks (used alone or with aspirin) | Adjunct to oral anticoagulation for prophylaxis of thromboembolism associated with prosthetic heart valves

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 200 mg twice daily, to be taken preferably with food

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: 300–600 mg daily in 3–4 divided doses

- **BY INTRAVENOUS INJECTION**
  - Adult: (consult product literature)

**SIDE-EFFECTS**
Angioedema | dizziness | gastro-intestinal effects | hot flushes | hypersensitivity reactions | hypotension | increased bleeding after surgery | increased bleeding during surgery | myalgia | rash | severe bronchospasm | tachycardia | throbbing headache | urticaria | worsening symptoms of coronary heart disease

**PREGNANCY**
Not known to be harmful.

**BREAST FEEDING**
Manufacturers advise use only if essential—small amount present in milk.

**PRESCRIBING AND DISPENSING INFORMATION**
Modified-release capsules should be dispensed in original container (pack contains a desiccant) and any capsules remaining should be discarded 6 weeks after opening.

**NATIONAL FUNDING/ACCESS DECISIONS**
**NICE technology appraisals (TAs)**
- Clopidogrel and modified-release dipyridamole in the prevention of occlusive vascular events (December 2010) NICE TA210
  - The guidance applies to patients who have had an occlusive vascular event, or who have established peripheral arterial disease. The guidance does not apply to patients who have had, or are at risk of, stroke associated with atrial fibrillation, or who need prophylaxis for occlusive events following coronary revascularisation or carotid artery procedures.
  - Modified-release dipyridamole, in combination with aspirin, is recommended as an option to prevent occlusive vascular events in patients who have had:
    - a transient ischaemic attack, or
    - an ischaemic stroke, only if clopidogrel is contraindicated or not tolerated.
  - Modified-release dipyridamole monotherapy is recommended as an option to prevent occlusive vascular events in patients who have had:
    - an ischaemic stroke, only if aspirin and clopidogrel are contra-indicated or not tolerated, or
    - a transient ischaemic attack, only if aspirin is contraindicated or not tolerated. [www.nice.org.uk/TA210](http://www.nice.org.uk/TA210)

When used for prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation (February 2013) NICE TA275

Apixaban is an option for the prevention of stroke and systemic embolism in non-valvular atrial fibrillation in accordance with its licensed indication; with one or more of the following risk factors:

- previous stroke or transient ischaemic attack
- symptomatic heart failure
- age ≥ 75 years
- diabetes mellitus
- hypertension

The risks and benefits of apixaban compared to warfarin, dabigatran etexilate, and rivaroxaban should be discussed with the patient. www.nice.org.uk/TA275

**Apixaban for the treatment and secondary prevention of deep vein thrombosis and/or pulmonary embolism (June 2015) NICE TA341**

Apixaban is an option for the treatment and prevention of recurrent deep vein thrombosis and pulmonary embolism in adults. www.nice.org.uk/TA341

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Eliquis** (Bristol-Myers Squibb Pharmaceuticals Ltd) ▼

Apixaban 2.5 mg Eliquis 2.5mg tablets | 10 tablet | £10.98 |
20 tablet | £21.96 | 60 tablet | £65.90 | DT price = £65.90

Apixaban 5 mg Eliquis 5mg tablets | 28 tablet | £30.75 |
56 tablet | £61.50 | DT price = £61.50

**FACTOR Xa INHIBITORS**

**Apixaban**

**DRUG ACTION** Apixaban is a direct inhibitor of activated factor X (factor Xa).

**INDICATIONS AND DOSE**

**Prophylaxis of venous thromboembolism following knee replacement surgery**

**BY MOUTH**

- Adult: 2.5 mg twice daily for 10–14 days, to be started 12–24 hours after surgery

**Prophylaxis of venous thromboembolism following hip replacement surgery**

**BY MOUTH**

- Adult: 2.5 mg twice daily for 32–38 days, to be started 12–24 hours after surgery

**Treatment of deep-vein thrombosis | Treatment of pulmonary embolism**

**BY MOUTH**

- Adult: Initially 10 mg twice daily for 7 days, then maintenance 5 mg twice daily

**Prophylaxis of recurrent deep-vein thrombosis | Prophylaxis of recurrent pulmonary embolism**

**BY MOUTH**

- Adult: 2.5 mg twice daily, following completion of 6 months anticoagulant treatment

**Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation and at least one risk factor such as previous stroke or transient ischaemic attack, symptomatic heart failure, diabetes mellitus, hypertension, or age ≥ 75 years**

**BY MOUTH**

- Adult: 2.5 mg twice daily
- Adult 18-79 years: 5 mg twice daily
- Adult 80 years and over (body-weight up to 61 kg): 2.5 mg twice daily

**Dose equivalence and conversion**

For information on changing from, or to, other anticoagulants, consult product literature.

**CONTRA-INDICATIONS** Active bleeding • malignant neoplasms • oesophageal varices • recent brain surgery • recent gastro-intestinal ulcer • recent intracranial haemorrhage • recent ophthalmic surgery • recent spine surgery • significant risk of major bleeding • vascular aneurysm

**CAUTIONS** Anaesthesia with postoperative indwelling epidural catheter (risk of paralysis—monitor neurological signs and wait 20–30 hours after apixaban dose before removing catheter and do not give next dose until at least 5 hours after catheter removal) • prosthetic heart valve (efficacy not established) • risk of bleeding

**INTERACTIONS** ◄ Appendix 1 (apixaban). Caution in concomitant use of drugs that increase risk of bleeding.

**SIDE-EFFECTS**

- **Common or very common** Anaemia • bruising • haemorrhage • nausea
- **Uncommon** Hypotension • rash • thrombocytopenia

**PREGNANCY** Manufacturer advises avoid—no information available.

**BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies

**HEPATIC IMPAIRMENT** Avoid in severe impairment and in hepatic disease associated with coagulopathy.

**RENAL IMPAIRMENT**

- When used for prophylaxis of stroke and systemic embolism in atrial fibrillation Reduce dose to 2.5 mg twice daily if creatinine clearance 15–29 mL/minute, or if serum-creatinine ≥ 133 micromol/litre and age ≥ 80 years or body-weight < 60 kg.
- When used for prophylaxis of venous thromboembolism following knee or hip replacement surgery, prophylaxis of recurrent deep-vein thrombosis or pulmonary embolism, and treatment of deep-vein thrombosis or pulmonary embolism Use with caution if creatinine clearance 15–29 mL/minute. Manufacturer advises avoid if creatinine clearance less than 15 mL/minute—no information available.

**MONITORING REQUIREMENTS**

- Patients should be monitored for signs of bleeding or anaemia; treatment should be stopped if severe bleeding occurs.
- No routine anticoagulant monitoring required (INR tests are unreliable).

**PRESCRIBING AND DISPENSING INFORMATION** Duration of treatment should be determined by balancing the benefit of treatment with the bleeding risk; shorter duration of treatment (at least 3 months) should be based on transient risk factors i.e recent surgery, trauma, immobilisation. Apixaban should not be used as an alternative to unfractionated heparin in pulmonary embolism in patients with haemodynamic instability, or who may receive thrombolysis or pulmonary embolectomy.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (Tas)**

- **Apixaban for the prevention of venous thromboembolism after total hip or knee replacement in adults** (January 2012) NICE TA245

Apixaban is an option for the prevention of venous thromboembolism in adults after elective hip or knee replacement surgery. www.nice.org.uk/TA245

- **Apixaban for the prevention of stroke and systemic embolism in non-valvular atrial fibrillation** (February 2013) NICE TA275

Apixaban is an option for the prevention of stroke and systemic embolism in non-valvular atrial fibrillation in accordance with its licensed indication; with one or more of the following risk factors:

- previous stroke or transient ischaemic attack
- symptomatic heart failure
- age ≥ 75 years

Fondaparinux sodium

**DRUG ACTION** Fondaparinux sodium is a synthetic pentasaccharide that inhibits activated factor X.

**INDICATIONS AND DOSE**

**Prophylaxis of venous thromboembolism in patients after undergoing major orthopaedic surgery of the hip or leg, or abdominal surgery**

**BY SUBCUTANEOUS INJECTION**
- **Adult:** Initially 2.5 mg, dose to be given 6 hours after surgery, then 2.5 mg once daily

**Prophylaxis of venous thromboembolism in medical patients immobilised because of acute illness**

**BY SUBCUTANEOUS INJECTION**
- **Adult:** 2.5 mg once daily

**Treatment of superficial-vein thrombosis**

**BY SUBCUTANEOUS INJECTION**
- **Adult (body-weight 50 kg and above):** 2.5 mg once daily for at least 30 days (max. 45 days if high risk of thromboembolic complications), treatment should be stopped 24 hours before surgery and restarted at least 6 hours post operatively

**Treatment of unstable angina and non-ST-segment elevation myocardial infarction**

**BY SUBCUTANEOUS INJECTION**
- **Adult:** 2.5 mg once daily for up to 8 days (or until hospital discharge if sooner), treatment should be stopped 24 hours before coronary artery bypass graft surgery (where possible) and restarted 48 hours post operatively

**Treatment of ST-segment elevation myocardial infarction**

**INITIALLY BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**
- **Adult:** Initially 2.5 mg daily for the first day, then (by subcutaneous injection) 2.5 mg once daily for up to 8 days (or until hospital discharge if sooner), treatment should be stopped 24 hours before coronary artery bypass graft surgery (where possible) and restarted 48 hours post operatively

**Treatment of deep-vein thrombosis and pulmonary embolism**

**BY SUBCUTANEOUS INJECTION**
- **Adult (body-weight up to 50 kg):** 5 mg every 24 hours, an oral anticoagulant (usually warfarin) is started at the same time as fondaparinux (fondaparinux should be continued for at least 5 days and until INR ≥ 2 for at least 24 hours)
- **Adult (body-weight 50–100 kg):** 7.5 mg every 24 hours, an oral anticoagulant (usually warfarin) is started at the same time as fondaparinux (fondaparinux should be continued for at least 5 days and until INR ≥ 2 for at least 24 hours)
- **Adult (body-weight 101 kg and above):** 10 mg every 24 hours, an oral anticoagulant (usually warfarin) is started at the same time as fondaparinux (fondaparinux should be continued for at least 5 days and until INR ≥ 2 for at least 24 hours)

**CONTRA-INDICATIONS** Active bleeding - bacterial endocarditis

**CAUTIONS** Active gastro-intestinal ulcer disease - bleeding disorders - brain surgery - elderly patients - low body-weight - ophthalmic surgery - recent intracranial haemorrhage - risk of catheter thrombus during percutaneous coronary intervention - spinal or epidural anaesthesia - (risk of spinal haematoma - avoid if using treatment doses) - spinal surgery

**INTERACTIONS** → Appendix 1 (fondaparinux). Caution with concomitant use of drugs that increase risk of bleeding.

**SIDE-EFFECTS**
- Common or very common: Anaemia - bleeding - purpura
- Uncommon: Chest pain - dyspnoea - gastro-intestinal disturbances - hepatic impairment - oedema - pruritus - rash - thrombocythaemia - thrombocytopenia
- Rare: Anxiety - confusion - cough - dizziness - drowsiness - flushing - headache - hyperbilirubinaemia - hypokalaemia - hypotension - injection-site reactions - vertigo
- Frequency not known: Atrial fibrillation - pyrexia - tachycardia

**PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs possible risk — no information available.

**BREAST FEEDING** Present in milk in animal studies — manufacturer advises avoid.

**HEPATIC IMPAIRMENT** Caution in severe impairment (increased risk of bleeding).

**RENAL IMPAIRMENT** Increased risk of bleeding in renal impairment.

- When used for prophylaxis of venous thromboembolism and treatment of superficial-vein thrombosis: Reduce dose to 1.5 mg daily if eGFR 20–50 mL/minute/1.73 m².
- When used for treatment of acute coronary syndromes or prophylaxis of venous thromboembolism and treatment of superficial-vein thrombosis: Avoid if eGFR less than 20 mL/minute/1.73 m².
- When used for treatment of venous thromboembolism: Use with caution if eGFR 30–50 mL/minute/1.73 m², avoid if eGFR less than 30 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Arixtra®), give intermittently in Sodium chloride 0.9%. For ST-segment elevation myocardial infarction, add requisite dose to 25–50 mL infusion fluid and give over 1–2 minutes.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Blood clots

Initial treatment of deep-vein thrombosis | Initial treatment of pulmonary embolism
BY MOUTH
- Adult: Initially 15 mg twice daily for 21 days, to be taken with food

Continued treatment of deep-vein thrombosis (following initial treatment) | Continued treatment of pulmonary embolism (following initial treatment) | Prophylaxis of recurrent deep-vein thrombosis | Prophylaxis of recurrent pulmonary embolism
BY MOUTH
- Adult: 20 mg once daily, to be taken with food

Prophylaxis of stroke and systemic embolism in patients with non-valvular atrial fibrillation and with at least one of the following risk factors: congestive heart failure, hypertension, previous stroke or transient ischaemic attack, age ≥ 75 years, or diabetes mellitus

CONTRA-INDICATIONS
Active bleeding - in acute coronary syndrome—previous stroke - in acute coronary syndrome—transient ischaemic attack - malignant neoplasms - oesophageal varices - recent brain surgery - recent gastrointestinal ulcer - recent intracranial haemorrhage - recent ophthalmic surgery - recent spine surgery - significant risk of major bleeding - vascular aneurysm

CAUTIONS
Anaesthesia with postoperative indwelling epidural catheter (risk of paralysis—monitor neurological signs and wait at least 18 hours after rivaroxaban dose before removing catheter and do not give next dose until at least 6 hours after catheter removal) - bronchiectasis - prostatic heart valve (efficacy not established) - risk of bleeding - rivaroxaban should not be used as an alternative to unfractionated heparin in pulmonary embolism in patients with haemodynamic instability, or who may receive thrombolysis or pulmonary embolectomy - severe hypertension - vascular retinopathy

INTERACTIONS
Appendix 1 (rivaroxaban). Caution in concomitant use of drugs that increase risk of bleeding.

SIDE-EFFECTS
- Common or very common Abdominal pain - constipation - diarrhoea - dizziness - dyspepsia - haemorrhage - headache - hypotenion - nausea - pain in extremities - pruritus - rash - renal impairment - vomiting
- Uncommon Angioedema - dry mouth - malaise - syncope - tachycardia - thrombocythaemia
- Rare Jaundice - oedema

PREGNANCY
Manufacturer advises avoid—toxicity in animal studies.

BREAST FEEDING
Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT
Avoid in liver disease with coagulopathy.

RENAL IMPAIRMENT
When used for treatment of deep-vein thrombosis or pulmonary embolism and prophylaxis of recurrent deep-vein thrombosis and pulmonary embolism Initially 15 mg twice daily for 21 days, then 20 mg once daily (but consider reducing to 15 mg once daily if risk of bleeding outweighs risk of recurrent deep-vein thrombosis or pulmonary embolism) if creatinine clearance 15–49 mL/minute.

When used for prophylaxis of stroke and systemic embolism in atrial fibrillation Reduce dose to 15 mg once daily if creatinine clearance 15–49 mL/minute.

When used for prophylaxis of venous thromboembolism following knee or hip replacement surgery and prophylaxis of atherothrombotic events in acute coronary syndrome Use with caution if creatinine clearance 15–29 mL/minute. Use with caution if concomitant use of drugs that increase plasma-rivaroxaban concentration (consult product literature).

Avoid if creatinine clearance less than 15 mL/minute; manufacturer recommends Cockcroft and Gault formula to calculate creatinine clearance.

MONITORING REQUIREMENTS
- Patients should be monitored for signs of bleeding or anaemia; treatment should be stopped if severe bleeding occurs.
- No routine anticoagulant monitoring required (INR tests are unreliable).

DIRECTIONS FOR ADMINISTRATION
Tablets may be crushed and mixed with water or apple puree just before administration.

PRESCRIBING AND DISPENSING INFORMATION
Low-dose rivaroxaban, in combination with aspirin alone or aspirin and clopidogrel, is licensed for the prevention of atherothrombotic events following an acute coronary syndrome with elevated cardiac biomarkers. Treatment should be started as soon as possible after the patient has been stabilised following the acute coronary event, at the earliest 24 hours after admission to hospital, and at the time when parenteral anticoagulation therapy would normally be discontinued; the usual duration of treatment is 12 months.

- Rivaroxaban is an option for the prophylaxis of venous thromboembolism in adults after total hip replacement or total knee replacement surgery. www.nice.org.uk/TA170
- Rivaroxaban for the prevention of stroke and systemic embolism in atrial fibrillation (May 2012) NICE TA256
- Rivaroxaban is an option for the prevention of stroke and systemic embolism (in accordance with its licensed indication) in patients with non-valvular atrial fibrillation and with at least one of the following risk factors: previous stroke or transient ischaemic attack - congestive heart failure - age ≥ 75 years - diabetes mellitus - hypertension

The risks and benefits of rivaroxaban compared with warfarin should be discussed with the patient. www.nice.org.uk/TA256

- Rivaroxaban for the treatment of deep-vein thrombosis and prevention of recurrent deep-vein thrombosis and pulmonary embolism (July 2012) NICE TA261
- Rivaroxaban is an option for the treatment of deep-vein thrombosis and prevention of recurrent deep-vein thrombosis and pulmonary embolism in adults after diagnosis of acute deep-vein thrombosis. www.nice.org.uk/TA261
- Rivaroxaban for treating pulmonary embolism and preventing recurrent venous thromboembolism (June 2013) NICE TA287
- Rivaroxaban is an option for treating pulmonary embolism and preventing recurrent deep-vein thrombosis and pulmonary embolism in adults. www.nice.org.uk/TA287
Rivaroxaban for preventing adverse outcomes after acute management of acute coronary syndrome (March 2015) NICE TA335

Rivaroxaban is an option within its marketing authorisation, in combination with aspirin plus clopidogrel or aspirin alone, for preventing atherothrombotic events in patients who have had an acute coronary syndrome with elevated cardiac biomarkers.

The patient’s risk of bleeding should be carefully assessed before treatment is initiated and the risks and benefits of rivaroxaban in combination with aspirin plus clopidogrel or with aspirin alone, compared with aspirin plus clopidogrel or aspirin alone should be discussed with the patient.

A decision on continuation of treatment should be taken no later than 12 months after starting treatment. www.nice.org.uk/TA335

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (January 2012) that rivaroxaban (Xarelto®) is accepted for restricted use within NHS Scotland for the prevention of stroke and systemic embolism in accordance with the licensed indication; use is restricted to patients with poor risk of bleeding.

There can be variation in the licensing of different medicines containing the same drug.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- Xarelto (Bayer Plc)
  - Rivaroxaban 2.5 mg: Xarelto 2.5mg tablets | 56 tablet (POD) £58.80
  - Rivaroxaban 10 mg: Xarelto 10mg tablets | 10 tablet (POD) £21.00 | 30 tablet (POD) £63.00 | 100 tablet (POD) £210.00
  - Rivaroxaban 15 mg: Xarelto 15mg tablets | 14 tablet (POD) £29.40 | 28 tablet (POD) £58.80 | 42 tablet (POD) £88.20 | 100 tablet (POD) £210.00
  - Rivaroxaban 20 mg: Xarelto 20mg tablets | 28 tablet (POD) £58.80 | 100 tablet (POD) £210.00

HEPARINOIDS

Danaparoid sodium

INDICATIONS AND DOSE

Prevention of deep-vein thrombosis in general or orthopaedic surgery

BY SUBCUTANEOUS INJECTION

- Adult: 750 units twice daily for 7–10 days, initiate treatment before operation, with last pre-operative dose 1–4 hours before surgery

Thromboembolic disease in patients with history of heparin-induced thrombocytopenia

INITIALLY BY INTRAVENOUS INJECTION

- Adult (body-weight up to 55 kg): Initially 1250 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days

- Adult (body-weight 55–89 kg): Initially 2500 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days

- Adult (body-weight 90 kg and above): Initially 3750 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days

CONTRA-INDICATIONS

Active peptic ulcer (unless this is the reason for operation) - acute bacterial endocarditis - diabetics - clopidogrel - acute myocardial infarction (with treatment doses) - haemophilia and other haemorrhagic disorders - recent cerebral haemorrhage - severe hypertension - spinal anaesthesia (with treatment doses) - thrombocytopenia (unless patient has heparin-induced thrombocytopenia)

CAUTIONS

Antibodies to heparins (risk of antibody-induced thrombocytopenia) - body-weight over 90 kg - recent bleeding - risk of bleeding

INTERACTIONS

Appendix 1 (danaparoid).

Caution with concomitant use of drugs that increase risk of bleeding.

SIDE-EFFECTS

Bleeding - hypersensitivity reactions - rash

PREGNANCY

Manufacturer advises avoid—limited information available but not known to be harmful.

BREAST FEEDING

Amount probably too small to be harmful but manufacturer advises avoid.

HEPATIC IMPAIRMENT

Caution in moderate impairment (increased risk of bleeding). Avoid in severe impairment unless patient has heparin-induced thrombocytopenia and no alternative available.

RENAL IMPAIRMENT

Use with caution in moderate impairment. Avoid in severe impairment unless patient has heparin-induced thrombocytopenia and no alternative available.

MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- Orgaran (Aspen Pharma Trading Ltd)
  - Danaparoid sodium 1250 unit per 1 ml Orgaran 750units/0.6ml solution for injection ampoules | 10 ampoule (POD) £266.73

HEPARINS

Heparins

CONTRA-INDICATIONS

Acute bacterial endocarditis - after major trauma - epidural anaesthesia with treatment doses - haemophilia and other haemorrhagic disorders - peptic ulcer - recent cerebral haemorrhage - recent surgery to eye - recent surgery to nervous system - severe hypertension - spinal anaesthesia with treatment doses - thrombocytopenia (including history of heparin-induced thrombocytopenia)

CAUTIONS

Elderly

INTERACTIONS

Appendix 1 (heparins).

Caution with concomitant use of drugs that increase risk of bleeding.

SIDE-EFFECTS

Rare Alopecia (on prolonged use) - anaphylaxis - angioedema - hyperkalaemia - hypersensitivity reactions - injection-site reactions - osteoporosis (risk lower with low molecular weight heparins) - priapism - rebound hyperlipidaemia (following unfractionated heparin withdrawal) - skin necrosis - urticaria

Frequency not known Haemorrhage - thrombocytopenia
SIDE-EFFECTS, FURTHER INFORMATION

Haemorrhage If haemorrhage occurs it is usually sufficient to withdraw unfractionated or low molecular weight heparin, but if rapid reversal of the effects of the heparin is required, protamine sulfate is a specific antidote (but only partially reverses the effects of low molecular weight heparins).

Heparin-induced thrombocytopenia Clinically important heparin-induced thrombocytopenia is immune-mediated and does not usually develop until after 5–10 days; it can be complicated by thrombosis. Signs of heparin-induced thrombocytopenia include a 30% reduction of platelet count, thrombosis, or skin allergy. If heparin-induced thrombocytopenia is strongly suspected or confirmed, the heparin should be stopped and an alternative anticoagulant, such as danaparoid, should be given. Ensure platelet counts return to normal range in those who require warfarin.

Hyperkalaemia Inhibition of aldosterone secretion by unfractionated or low molecular weight heparin can result in hyperkalaemia; patients with diabetes mellitus, chronic renal failure, acidosis, raised plasma potassium or those taking potassium-sparing drugs seem to be more susceptible. The risk appears to increase with duration of therapy.

ALLERGY AND CROSS-SENSITIVITY Hypersensitivity to unfractionated or low molecular weight heparin.

MONITORING REQUIREMENTS

Heparin-induced thrombocytopenia Platelet counts should be measured just before treatment with unfractionated or low molecular weight heparin, and regular monitoring of platelet counts may be required if given for longer than 4 days. See the British Society for Haematology’s Guidelines on the diagnosis and management of heparin-induced thrombocytopenia: second edition. Br J Haematol 2012; 159: 528–540.

Hyperkalaemia Plasma-potassium concentration should be measured in patients at risk of hyperkalaemia before starting the heparin and monitored regularly thereafter, particularly if treatment is to be continued for longer than 7 days.

Dalteparin sodium

INDICATIONS AND DOSE

FRAGMIN® GRADUATED SYRINGES

Unstable coronary artery disease (including non-ST-segment-elevation myocardial infarction)

BY SUBCUTANEOUS INJECTION

Adult: 120 units/kg every 12 hours (max. per dose 10 000 units twice daily) for up to 8 days

Patients with unstable coronary artery disease (including non-ST-segment-elevation myocardial infarction) awaiting angiography or revascularisation and having already had 8 days treatment with dalteparin

BY SUBCUTANEOUS INJECTION

Adult (body-weight up to 69 kg and male): 5000 units every 12 hours until the day of the procedure (max. 45 days)

Adult (body-weight up to 79 kg and female): 5000 units every 12 hours until the day of the procedure (max. 45 days)

Adult (body-weight 70 kg and above and male): 7500 units every 12 hours until the day of the procedure (max. 45 days)

Adult (body-weight 80 kg and above and female): 7500 units every 12 hours until the day of the procedure (max. 45 days)

Dalteparin sodium

INDICATIONS AND DOSE

FRAGMIN® GRADUATED SYRINGES

Unstable coronary artery disease (including non-ST-segment-elevation myocardial infarction)

BY SUBCUTANEOUS INJECTION

Adult: 120 units/kg every 12 hours (max. per dose 10 000 units twice daily) for up to 8 days

Patients with unstable coronary artery disease (including non-ST-segment-elevation myocardial infarction) awaiting angiography or revascularisation and having already had 8 days treatment with dalteparin

BY SUBCUTANEOUS INJECTION

Adult (body-weight up to 69 kg and male): 5000 units every 12 hours until the day of the procedure (max. 45 days)

Adult (body-weight up to 79 kg and female): 5000 units every 12 hours until the day of the procedure (max. 45 days)

Adult (body-weight 70 kg and above and male): 7500 units every 12 hours until the day of the procedure (max. 45 days)

Adult (body-weight 80 kg and above and female): 7500 units every 12 hours until the day of the procedure (max. 45 days)

Prophylaxis of deep-vein thrombosis in surgical patients—moderate risk

BY SUBCUTANEOUS INJECTION

Adult: Initially 2500 units for 1 dose, dose to be given 1–2 hours before surgery, then 2500 units every 24 hours

Prophylaxis of deep-vein thrombosis in surgical patients—high risk

BY SUBCUTANEOUS INJECTION

Adult: Initially 2500 units for 1 dose, dose to be administered 1–2 hours before surgery, followed by 2500 units after 8–12 hours, then 5000 units every 24 hours, alternatively initially 5000 units for 1 dose, dose to be given on the evening before surgery, followed by 5000 units after 24 hours, then 5000 units every 24 hours

Prophylaxis of deep-vein thrombosis in medical patients

BY SUBCUTANEOUS INJECTION

Adult: 5000 units every 24 hours

Treatment of deep-vein thrombosis, with oral anticoagulant treatment / Treatment of pulmonary embolism, with oral anticoagulant treatment

BY SUBCUTANEOUS INJECTION

Adult (body-weight up to 45 kg): 7500 units daily until adequate oral anticoagulation established

Adult (body-weight 46–56 kg): 10 000 units daily until adequate oral anticoagulation established

Adult (body-weight 57–68 kg): 12 500 units daily until adequate oral anticoagulation established

Adult (body-weight 69–82 kg): 15 000 units daily until adequate oral anticoagulation established

Adult (body-weight 85 kg and above): 18 000 units daily until adequate oral anticoagulation established

Extended treatment and prophylaxis of venous thromboembolism in patients with solid tumours

BY SUBCUTANEOUS INJECTION

Adult (body-weight 40–45 kg): 7500 units once daily for 30 days, then 7500 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature

Adult (body-weight 46–56 kg): 10 000 units once daily for 30 days, then 7500 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature

Adult (body-weight 57–68 kg): 12 500 units once daily for 30 days, then 10 000 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature

Adult (body-weight 69–82 kg): 15 000 units once daily for 30 days, then 12 500 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature

Adult (body-weight 83 kg and above): 18 000 units once daily for 30 days, then 18 000 units once daily for a further 5 months, interrupt treatment or reduce dose in chemotherapy-induced thrombocytopenia—consult product literature
Treatment of venous thromboembolism in pregnancy

BY SUBCUTANEOUS INJECTION
  ▶ Adult (body-weight up to 49 kg): 5000 units twice daily, use body-weight in early pregnancy to calculate the dose
  ▶ Adult (body-weight 50–69 kg): 6000 units twice daily, use body-weight in early pregnancy to calculate the dose
  ▶ Adult (body-weight 70–89 kg): 8000 units twice daily, use body-weight in early pregnancy to calculate the dose
  ▶ Adult (body-weight 90 kg and above): 10 000 units twice daily, use body-weight in early pregnancy to calculate the dose

FRAGMIN®

Treatment of deep-vein thrombosis, with oral anticoagulant treatment

BY SUBCUTANEOUS INJECTION
  ▶ Adult: 200 units/kg daily (max. per dose 18 000 units) until adequate oral anticoagulation established

Treatment of deep-vein thrombosis, with oral anticoagulant treatment (in patients at increased risk of haemorrhage)

BY SUBCUTANEOUS INJECTION
  ▶ Adult: 100 units/kg twice daily until adequate oral anticoagulation established

Unstable coronary artery disease

BY SUBCUTANEOUS INJECTION
  ▶ Adult: 120 units/kg every 12 hours (max. per dose 10 000 units twice daily) for 5–8 days

Prevention of clotting in extracorporeal circuits

TO THE DEVICE AS A FLUSH
  ▶ Adult: (consult product literature)

UNLICENSED USE

Not licensed for treatment of venous thromboembolism in pregnancy.

PREGNANCY

Not known to be harmful, low molecular weight heparins do not cross the placenta. Multidose vial contains benzyl alcohol—manufacturer advises avoid.

BREAST FEEDING

Due to the relatively high molecular weight and inactivation in the gastro-intestinal tract, passage into breast-milk and absorption by the nursing infant are likely to be negligible, however manufacturers advise avoid.

HEPATIC IMPAIRMENT

Dose reduction may be required in severe impairment—risk of bleeding may be increased.

RENAL IMPAIRMENT

Risk of bleeding may be increased—dose reduction may be required. Use of unfractionated heparin may be preferable.

MONITORING REQUIREMENTS

For monitoring during treatment of deep-vein thrombosis and of pulmonary embolism, blood should be taken 3–4 hours after a dose (recommended plasma concentration of anti-Factor Xa 0.5–1 unit/mL); monitoring not required for once-daily treatment regimen and not generally necessary for twice-daily regimen.

Routine monitoring of anti-Factor Xa activity is not usually required during treatment with dalteparin, but may be necessary in patients at increased risk of bleeding (e.g. in renal impairment and those who are underweight or overweight).

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium (SMC) has advised (February 2011) that dalteparin (Fragnim®) is accepted for restricted use within NHS Scotland as extended treatment of symptomatic venous thromboembolism and prevention of its recurrence in patients with solid tumours.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

**EXCIPIENTS:** May contain Benzyl alcohol

- Fragmin (Pfizer Ltd)
  - Dalteparin sodium 2500 unit per 1 ml Fragmin 10,000 units/4ml solution for injection ampoules | 1 ampoule (P) £1.22
  - Dalteparin sodium 10000 unit per 1 ml Fragmin 10,000 units/1ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (P) £28.23
  - Fragmin 10,000 units/1ml solution for injection ampoules | 10 ampoule (P) £51.22
  - Dalteparin sodium 12500 unit per 1 ml Fragmin 2,500 units/0.2ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (P) £18.58

Dalteparin sodium 25000 unit per 1 ml

- Fragmin 18,000 units/0.72ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (P) £50.82
- Fragmin 15,000 units/0.6ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (P) £42.34
- Fragmin 5,000 units/0.2ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (P) £28.23
- Fragmin 12.500 units/0.5ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (P) £32.52
- Fragmin 7,500 units/0.3ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (P) £42.34
- Fragmin 100,000 units/4ml solution for injection vials | 1 vial (P) £68.66
- Fragmin 10,000 units/0.4ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (P) £28.23

Enoxaparin sodium

**INDICATIONS AND DOSE**

Treatment of venous thromboembolism in pregnancy

BY SUBCUTANEOUS INJECTION
  ▶ Adult (body-weight up to 50 kg): 40 mg twice daily, dose based on early pregnancy body-weight
  ▶ Adult (body-weight 50–69 kg): 60 mg twice daily, dose based on early pregnancy body-weight
  ▶ Adult (body-weight 70–89 kg): 80 mg twice daily, dose based on early pregnancy body-weight
  ▶ Adult (body-weight 90 kg and above): 100 mg twice daily, dose based on early pregnancy body-weight

Prophylaxis of deep-vein thrombosis, especially in surgical patients—moderate risk

BY SUBCUTANEOUS INJECTION
  ▶ Adult: 20 mg for 1 dose, dose to be given approximately 2 hours before surgery, then 20 mg every 24 hours

Prophylaxis of deep-vein thrombosis, especially surgical patients—high risk (e.g. orthopaedic surgery)

BY SUBCUTANEOUS INJECTION
  ▶ Adult: 40 mg for 1 dose, dose to be given 12 hours before surgery, then 40 mg every 24 hours

Prophylaxis of deep-vein thrombosis in medical patients

BY SUBCUTANEOUS INJECTION
  ▶ Adult: 40 mg every 24 hours

Treatment of deep-vein thrombosis | Treatment of pulmonary embolism

BY SUBCUTANEOUS INJECTION
  ▶ Adult: 1.5 mg/kg every 24 hours until adequate oral anticoagulation established

Treatment of acute ST-segment elevation myocardial infarction (patients not undergoing percutaneous coronary intervention)

INITIALLY BY INTRAVENOUS INJECTION
  ▶ Adult 18–74 years: Initially 30 mg, followed by (by subcutaneous injection) 1 mg/kg for 1 dose, then (by subcutaneous injection) 1 mg/kg every 12 hours
Solution for injection

**EXCIPIENTS:** May contain Benzyl alcohol

- **Clexane** (Sanofi)
  - Enoxaparin sodium 100 mg per 1 ml
    - Clexane 60mg/0.6ml solution for injection pre-filled syringes 10 pre-filled disposable injection (PFS) £45.65 DT price = £45.65
    - Clexane 300mg/3ml solution for injection multidose vials 1 vial (PFS) £21.33
    - Clexane 80mg/0.8ml solution for injection pre-filled syringes 10 pre-filled disposable injection (PFS) £46.86 DT price = £46.86
    - Clexane 40mg/0.4ml solution for injection pre-filled syringes 10 pre-filled disposable injection (PFS) £30.27 DT price = £30.27
    - Clexane 100mg/1ml solution for injection pre-filled syringes 10 pre-filled disposable injection (PFS) £80.33 DT price = £80.33
    - Clexane 20mg/0.2ml solution for injection pre-filled syringes 10 pre-filled disposable injection (PFS) £22.72 DT price = £22.72
  - Enoxaparin sodium 150 mg per 1 ml
    - Clexane Forte 120mg/0.8ml solution for injection pre-filled syringes 10 pre-filled disposable injection (PFS) £97.70 DT price = £97.70
    - Clexane Forte 150mg/1ml solution for injection pre-filled syringes 10 pre-filled disposable injection (PFS) £111.01 DT price = £111.01

**Heparin (unfractionated)**

**INDICATIONS AND DOSE**

- **Treatment of mild to moderate pulmonary embolism**
- **Treatment of unstable angina**
- **Treatment of acute peripheral arterial occlusion**

**INITIALLY BY INTRAVENOUS INJECTION**

- Adult: Loading dose 5000 units, alternatively (by intravenous injection) loading dose 75 units/kg, followed by (by continuous intravenous infusion) 18 units/kg/hour, laboratory monitoring essential—preferably on a daily basis, and dose adjusted accordingly

**Treatment of severe pulmonary embolism**

**INITIALLY BY INTRAVENOUS INJECTION**

- Adult: Loading dose 10 000 units, followed by (by continuous intravenous infusion) 18 units/kg/hour, laboratory monitoring essential—preferably on a daily basis, and dose adjusted accordingly

**Treatment of deep-vein thrombosis**

**INITIALLY BY INTRAVENOUS INJECTION**

- Adult: Loading dose 5000 units, alternatively (by intravenous injection) loading dose 75 units/kg, followed by (by continuous intravenous infusion) 18 units/kg/hour, alternatively (by subcutaneous injection) 15 000 units every 12 hours, laboratory monitoring essential—preferably on a daily basis, and dose adjusted accordingly

**Thromboprophylaxis in medical patients**

**BY SUBCUTANEOUS INJECTION**

- Adult: 5000 units every 8–12 hours

**Thromboprophylaxis in surgical patients**

**BY SUBCUTANEOUS INJECTION**

- Adult: 5000 units for 1 dose, to be taken 2 hours before surgery, then 5000 units every 8–12 hours

**Thromboprophylaxis during pregnancy**

**BY SUBCUTANEOUS INJECTION**

- Adult: 5000–10 000 units every 12 hours, to be administered with monitoring. Important: prevention of prosthetic heart-valve thrombosis in pregnancy calls for specialist management

**Haemodialysis**

**INITIALLY BY INTRAVENOUS INJECTION**

- Adult: Initially 1000–5000 units, followed by (by continuous intravenous infusion) 250–1000 units/hour

**Prevention of clotting in extracorporeal circuits**

**TO THE DEVICE AS A FLUSH**

- Adult: (consult product literature)
To maintain patency of catheters, cannulas, other indwelling intravenous infusion devices

**TO THE DEVICE AS A FLUSH**
- Adult: 10–200 units, to be flushed through every 4–8 hours, not for therapeutic use

- **PREGNANCY** Does not cross the placenta; maternal osteoporosis reported after prolonged use; multidose vials may contain benzyl alcohol—some manufacturers advise avoid.

- **BREAST FEEDING** Not excreted into milk due to high molecular weight.

- **HEPATIC IMPAIRMENT** Risk of bleeding increased—reduce dose or avoid in severe impairment (including oesophageal varices).

- **RENAL IMPAIRMENT** Risk of bleeding increased in severe impairment—dose may need to be reduced.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, give continuously in Glucose 5% or Sodium chloride 0.9%; administration with a motorised pump is advisable.

- **PRESCRIBING AND DISPENSING INFORMATION**

Doses listed take into account the guidelines of the British Society for Haematology.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, solution for injection, solution for infusion

**Solution for injection**

**EXCIPIENTS:** May contain Benzyl alcohol  
  - **HEPARIN (UNFRACTIONATED) (Non-proprietary)**
    - Heparin sodium 1000 unit per 1 ml Heparin sodium 1,000 units/ml solution for injection ampoule | 10 ampoule (PQM) £14.85
    - Heparin sodium 5,000 units/ml solution for injection vials | 10 vial (PQM) £16.50–£37.41
    - Heparin sodium 20,000 units/ml solution for injection ampoules | 10 ampoule (PQM) £70.80–£70.88
    - Heparin sodium 5,000 units/ml solution for injection ampoules | 10 ampoule (PQM) £37.45–£37.47
    - Heparin sodium 10,000 units/ml solution for injection ampoules | 10 ampoule (PQM) £64.50–£64.59
    - Heparin sodium 5000 unit per 1 ml Heparin sodium 25,000 units/ml solution for injection vials | 10 vial (PQM) £45.00–£54.60
    - Heparin sodium 5,000 units/ml solution for injection ampoules | 10 ampoule (PQM) £29.04
    - Heparin sodium 25,000 units/ml solution for injection ampoules | 10 ampoule (PQM) £75.78
    - Heparin sodium 5000 unit per 1 ml Heparin sodium 5,000 units/ml solution for injection ampoules | 10 ampoule (PQM) £39.12
    - Heparin sodium 25000 unit per 1 ml Heparin sodium 25,000 units/ml solution for injection ampoules | 10 ampoule (PQM) £76.95
    - Heparin sodium 5,000 units/ml solution for injection ampoules | 10 ampoule (PQM) £37.35

**Infusion**

  - **HEPARIN (UNFRACTIONATED) (Non-proprietary)**
    - Heparin sodium 2 unit per 1 ml Heparin sodium 1,000 units/500ml infusion Viaflex bags | 1 bag (PQM) no price available
    - Heparin sodium 2,000 units/1,000ml infusion Viaflex bags | 1 bag (PQM) no price available
    - Heparin sodium 5 unit per 1 ml Heparin sodium 5,000 units/1 litre infusion Viaflex bags | 1 bag (PQM) no price available

**Intravenous Flush**

**EXCIPIENTS:** May contain Benzyl alcohol

  - **HEPARIN (UNFRACTIONATED) (Non-proprietary)**
    - Heparin sodium 10 unit per 1 ml Heparin sodium 50 units/5ml patency solution ampoules | 10 ampoule (PQM) £14.96
    - Heparin sodium 50 units/5ml I.V. flush solution ampoules | 10 ampoule (PQM) £14.96
    - Heparin sodium 100 unit per 1 ml Heparin sodium 200 units/2ml I.V. flush solution ampoules | 10 ampoule (PQM) £15.68

- **SIDE-EFFECTS**

  - Uncommon Headache

- **PREGNANCY** Not known to be harmful, low molecular weight heparins do not cross the placenta. Vials contain benzyl alcohol—manufacturer advises avoid.

- **BREAST FEEDING** Due to the relatively high molecular weight of tinzaparin and inactivation in the gastro-intestinal tract, passage into breast-milk and absorption by the nursing infant are likely to be negligible; however manufacturer advise avoid.

- **RENAL IMPAIRMENT** Risk of bleeding may be increased. Unfractionated heparin may be preferable. Manufacturer advises caution if eGFR less than 30 mL/minute/1.73 m². In renal impairment monitoring of anti-Factor Xa activity is not usually required during treatment with tinzaparin, but may be necessary in patients at increased risk of bleeding (e.g. in renal impairment and those who are underweight or overweight).

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **INDICATIONS AND DOSE**

**INNOHEP® 10,000 UNITS/ML**

**Prophylaxis of deep-vein thrombosis (general surgery)**

**BY SUBCUTANEOUS INJECTION**

- Adult: 3500 units for 1 dose, dose to be given 2 hours before surgery, then 3500 units every 24 hours

**Prophylaxis of deep-vein thrombosis (orthopaedic surgery)**

**BY SUBCUTANEOUS INJECTION**

- Adult: Initially 50 units/kg for 1 dose, dose to be given 2 hours before surgery, then 50 units/kg every 24 hours, alternatively initially 4500 units for 1 dose, dose to be given 12 hours before surgery, then 4500 units every 24 hours

**Prevention of clotting in extracorporeal circuits**

**TO THE DEVICE AS A FLUSH**

- Adult: (consult product literature)

**INNOHEP® 20,000 UNITS/ML**

Extended treatment of venous thromboembolism in patients with solid tumours | Prophylaxis of venous thromboembolism in patients with solid tumours

**BY SUBCUTANEOUS INJECTION**

- Adult: 175 units/kg once daily for up to 6 months

**Treatment of deep-vein thrombosis | Treatment of pulmonary embolism**

**BY SUBCUTANEOUS INJECTION**

- Adult: 175 units/kg once daily, dose based on early pregnancy body-weight, treatment regimens do not require anticoagulation monitoring

**Thromboembolism**

**UNLICENSED USE** Not licensed for the treatment of venous thromboembolism in pregnancy.

**MONITORING REQUIREMENTS** Routine monitoring of anti-Factor Xa activity is not usually required during treatment with tinzaparin, but may be necessary in patients at increased risk of bleeding (e.g. in renal impairment and those who are underweight or overweight).
Solution for injection

EXCIPIENTS: May contain Benzyl alcohol, sulfites

- Innohep
  Tinzaparin sodium 10000 unit per 1 ml

THROMBIN INHIBITORS

Argatroban monohydrate

INDICATIONS AND DOSE

Anticoagulation in patients with heparin-induced thrombocytopenia type II who require parenteral antithrombotic treatment

INITIALLY BY CONTINUOUS INTRAVENOUS INFUSION

- Adult: Initially 2 micrograms/kg/minute, dose to be adjusted according to activated partial thromboplastin time, (by intravenous infusion) increased up to 10 micrograms/kg/minute maximum duration of treatment 14 days

Anticoagulation in patients with heparin-induced thrombocytopenia type II who require parenteral antithrombotic treatment (for dose in cardiac surgery, percutaneous coronary intervention, or critically ill patients)

BY CONTINUOUS INTRAVENOUS INFUSION

- Adult: (consult product literature)

Anticoagulation in patients with heparin-induced thrombocytopenia type II who require parenteral antithrombotic treatment (when initiating concomitant warfarin treatment)

BY CONTINUOUS INTRAVENOUS INFUSION

- Adult: Dose should be temporarily reduced to 2 micrograms/kg/minute, and INR measured after 4–6 hours; warfarin should be initiated at intended maintenance dose (do not give loading dose of warfarin); consult product literature for further details

CAUTIONS

- Bleeding disorders
- Diabetic retinopathy
- Gastro-intestinal ulceration
- Immediately after lumbar puncture
- Major surgery (especially of brain, spinal cord, or eye)
- Risk of bleeding
- Severe hypertension
- Spinal anaesthesia

INTERACTIONS

- Appendix 1 (argatroban).

Caution with concomitant use of drugs that increase risk of bleeding.

SIDE-EFFECTS

- Common or very common
  Haemorrhage - nausea - purpura
- Uncommon

PREGNANCY

Manufacturer advises avoid unless essential—limited information available.

BREAST FEEDING

Avoid—no information available.

HEPATIC IMPAIRMENT

Reduce initial dose to 500 nanograms/kg/minute in moderate impairment. Avoid in severe impairment or in patients with hepatic impairment undergoing percutaneous coronary intervention.

MONITORING REQUIREMENTS

Determine activated partial thromboplastin time 2 hours after start of treatment, then 2 or 4 hours after infusion rate altered (consult product literature), and at least once daily thereafter.

DIRECTIONS FOR ADMINISTRATION

For intravenous infusion (Exembol®) give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute each 2.5–ml vial with 250 ml infusion fluid.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Ethanol

- Exembol (Mitsubishi Pharma Europe Ltd)
  Argatroban monohydrate 100 mg per 1 ml
  Exembol 250mg/2.5ml concentrate for solution for infusion vials | 1 vial no price available

Bivalirudin

DRUG ACTION

Bivalirudin, a hirudin analogue, is a thrombin inhibitor.

INDICATIONS AND DOSE

Unstable angina or non-ST-segment elevation myocardial infarction in patients planned for urgent or early intervention (in addition to aspirin and clopidogrel)

INITIALLY BY INTRAVENOUS INJECTION

- Adult: Initially 100 micrograms/kg, then (by intravenous infusion) 250 micrograms/kg/hour (for up to 72 hours in medically managed patients)

Unstable angina or non-ST-segment elevation myocardial infarction (in addition to aspirin and clopidogrel) in patients proceeding to percutaneous coronary intervention or coronary artery bypass surgery without cardiopulmonary bypass

INITIALLY BY INTRAVENOUS INJECTION

- Adult: Initially 100 micrograms/kg for 1 dose, then (by intravenous injection) 500 micrograms/kg for 1 dose, then (by intravenous infusion) 1.75 mg/kg/hour for duration of procedure; (by intravenous infusion) reduced to 250 micrograms/kg/hour for 4–12 hours as necessary following percutaneous coronary intervention, for patients proceeding to coronary artery bypass surgery with cardiopulmonary bypass, discontinue intravenous infusion 1 hour before procedure and treat with unfractionated heparin
Anticoagulation in patients undergoing percutaneous coronary intervention including patients with ST-segment elevation myocardial infarction undergoing primary percutaneous coronary intervention (in addition to aspirin and clopidogrel)

INITIALLY BY INTRAVENOUS INJECTION

- Adult: Initially 750 micrograms/kg, followed immediately by (by intravenous infusion) 1.75 mg/kg/hour during procedure and for up to 4 hours after procedure, then (by intravenous infusion) reduced to 250 micrograms/kg/hour may be continued for a further 4–12 hours if necessary.

CONTRA-INDICATIONS

- Active bleeding - bleeding disorders
- Severe hypertension - subacute bacterial endocarditis

CAUTIONS

- Brachytherapy procedures - previous exposure to lepirudin (theoretical risk from lepirudin antibodies)

INTERACTIONS

† Appendix 1 (bivalirudin).

SIDE-EFFECTS

- Common or very common - bleeding (discontinue)
- Common - ecchymosis
- Uncommon - anemia - headache - hypotension - isolated reports of anaphylaxis - nausea - thrombocytopenia
- Rare - back pain - bradycardia - dyspnoea - tachycardia - thrombosis - vomiting

PREGNANCY

Manufacturer advises caution—no information available.

BREAST FEEDING

Manufacturer advises caution—no information available.

RENAI IMPAIRMENT

Avoid if eGFR less than 30 mL/minute/1.73 m².

When used for percutaneous coronary intervention, reduce rate of infusion to 1.4 mg/kg/hour and monitor blood clotting parameters if eGFR 30–60 mL/minute/1.73 m².

DIRECTIONS FOR ADMINISTRATION

For intravenous infusion (Angiox®), give continuously in Glucose 5% or Sodium chloride 0.9%. Reconstitute each 250-mg vial with 5 mL water for injections then withdraw 1 mL from vial and dilute to 50 mL with infusion fluid.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Bivalirudin in combination with aspirin and clopidogrel is recommended for the treatment of adults with ST-segment elevation myocardial infarction undergoing primary percutaneous coronary intervention. [www.nice.org.uk/TA230](http://www.nice.org.uk/TA230)

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (November 2008) that bivalirudin (Angiox®) is accepted for restricted use within NHS Scotland for patients with acute coronary syndromes planned for urgent or early intervention who would have been considered for treatment with unfractionated heparin in combination with a glycoprotein IIb/IIIa inhibitor; it should not be used as an alternative to heparin alone.

The Scottish Medicines Consortium has advised (August 2010) that bivalirudin (Angiox®) is accepted for restricted use within NHS Scotland as an anticoagulant in patients undergoing percutaneous coronary intervention who would have been considered for treatment with unfractionated heparin in combination with a glycoprotein IIb/IIIa inhibitor; it should not be used as an alternative to heparin alone.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- Angiox (The Medicines Company UK Ltd)

Bivalirudin 250 mg Angiox 250mg powder for solution for injection vials | 10 vial (P339) no price available

Dabigatran etexilate

DRUG ACTION

Dabigatran etexilate is a direct thrombin inhibitor with a rapid onset of action.

INDICATIONS AND DOSE

Prophylaxis of venous thromboembolism following total knee replacement surgery

BY MOUTH

- Adult 18–74 years: 110 mg, to be taken 1–4 hours after surgery, followed by 220 mg once daily for 9 days, to be followed 12–24 hours after initial dose.
- Adult 75 years and over: 75 mg, to be taken 1–4 hours after surgery, followed by 150 mg once daily for 9 days, to be followed 12–24 hours after initial dose.

Prophylaxis of venous thromboembolism following total knee replacement surgery in patients receiving concomitant treatment with amiodarone or verapamil

BY MOUTH

- Adult: 110 mg, to be taken 1–4 hours after surgery, followed by 150 mg once daily for 9 days, to be followed 12–24 hours after initial dose.

Prophylaxis of venous thromboembolism following total hip replacement surgery

BY MOUTH

- Adult 18–74 years: 110 mg, to be taken 1–4 hours after surgery, followed by 220 mg once daily for 27–34 days, to be followed 12–24 hours after initial dose.
- Adult 75 years and over: 75 mg, to be taken 1–4 hours after surgery, followed by 150 mg once daily for 27–34 days, to be followed 12–24 hours after initial dose.

Prophylaxis of venous thromboembolism following total hip replacement surgery in patients receiving concomitant treatment with amiodarone or verapamil

BY MOUTH

- Adult: 110 mg, to be taken 1–4 hours after surgery, followed by 150 mg daily for 27–34 days, to be followed 12–24 hours after initial dose.

Treatment of deep-vein thrombosis | Treatment of pulmonary embolism | Prophylaxis of recurrent deep-vein thrombosis | Prophylaxis of recurrent pulmonary embolism

BY MOUTH

- Adult 18–74 years: 150 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant.
- Adult 75–79 years: 110–150 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant.
- Adult 80 years and over: 110 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant.
Treatment of deep-vein thrombosis in patients with moderate renal impairment

Prophylaxis of recurrent deep-vein thrombosis in patients at increased risk of bleeding

BY MOUTH
- Adult: 110–150 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant

Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation and with one or more risk factors such as previous stroke or transient ischaemic attack, symptomatic heart failure, age ≥ 75 years, diabetes mellitus, or hypertension

BY MOUTH
- Adult: 110 mg twice daily, following at least 5 days treatment with a parenteral anticoagulant

Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation and with one or more risk factors such as previous stroke or transient ischaemic attack, symptomatic heart failure, age ≥ 75 years, diabetes mellitus, or hypertension in patients receiving concomitant treatment with verapamil

BY MOUTH
- Adult 80 years and over: 75 mg twice daily

Prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation and with one or more risk factors such as previous stroke or transient ischaemic attack, symptomatic heart failure, age ≥ 75 years, diabetes mellitus, or hypertension in patients with moderate renal impairment

BY MOUTH
- Adult: 110–150 mg twice daily

Dose equivalence and conversion
For information on changing from, or to, other anticoagulants, consult product literature.

CONTRA-INDICATIONS
- Active bleeding; do not use as anticoagulant for prosthetic heart valve; malignant neoplasms; oesophageal varices; recent brain surgery; recent gastro-intestinal ulcer; recent intracranial haemorrhage; recent ophthalmic surgery; recent spine surgery; significant risk of major bleeding; vascular aneurysm

CAUTIONS
- Anaesthesia with postoperative indwelling epidural catheter (risk of paralysis—give initial dose at least 2 hours after catheter removal and monitor neurological signs); bacterial endocarditis; bleeding disorders; body-weight less than 50 kg; elderly; gastritis; gastro-oesophageal reflux; oesophagitis; recent biopsy; recent major trauma; thrombocytopenia

INTERACTIONS
- Appendix 1 (dabigatran). Caution in concomitant use of drugs that increase risk of bleeding.

SIDE EFFECTS
- Common or very common Abdominal pain; anaemia; diarrhoea; dyspepsia; haemorrhage; nausea
- Uncommon Dysphagia; gastro-intestinal ulcer; gastro-oesophageal reflux; hepatobiliary disorders; oesophagitis; thrombocytopenia; vomiting

PREGNANCY
- Manufacturer advises avoid unless essential—toxicity in animal studies.

BREAST FEEDING
- Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT
- Avoid in severe liver disease, especially if prothrombin time already prolonged.

RENAL IMPAIRMENT
- When used for prophylaxis of venous thromboembolism following knee or hip replacement surgery Reduce initial dose to 75 mg and subsequent doses to 150 mg once daily if creatinine clearance 30–50 mL/minute; reduce dose to 75 mg once daily if creatinine clearance 30–50 mL/minute and patient receiving concomitant treatment with verapamil.

- When used for treatment of deep-vein thrombosis and pulmonary embolism, prophylaxis of recurrent deep-vein thrombosis and pulmonary embolism, prophylaxis of stroke and systemic embolism in non-valvular atrial fibrillation Consider reduced dose of 110 mg twice daily if creatinine clearance 30–50 mL/minute, based on individual assessment of thromboembolic risk and risk of bleeding. Avoid if creatinine clearance less than 30 mL/minute.

In renal impairment monitor renal function at least annually (manufacturer recommends Cockcroft and Gault formula to calculate creatinine clearance).

MONITORING REQUIREMENTS
- Patients should be monitored for signs of bleeding or anaemia; treatment should be stopped if severe bleeding occurs.

- No routine anticoagulant monitoring required (INR tests are unreliable).

- Assess renal function (manufacturer recommends Cockcroft and Gault formula to calculate creatinine clearance) before treatment in all patients and at least annually in elderly.

DIRECTIONS FOR ADMINISTRATION
- When given concomitantly with amiodarone or verapamil, doses should be taken at the same time.

PRESCRIBING AND DISPENSING INFORMATION
Dabigatran etexilate, is given orally for prophylaxis of venous thromboembolism in adults after total hip replacement or total knee replacement surgery; it is also licensed for the treatment of deep-vein thrombosis and pulmonary embolism, and prophylaxis of recurrent deep-vein thrombosis and pulmonary embolism in adults. Duration of treatment should be determined by balancing the benefit of treatment with the bleeding risk; shorter duration of treatment (at least 3 months) should be based on transient risk factors i.e recent surgery, trauma, immobilisation, and longer duration of treatment should be based on permanent risk factors, or idiopathic deep-vein thrombosis or pulmonary embolism.

NATIONAL FUNDING/ACCESS DECISIONS
NICE technology appraisals (TAs)
- Dabigatran etexilate for the prevention of venous thromboembolism after hip or knee replacement surgery in adults (September 2008) NICE TAs157

Dabigatran etexilate is an option for the prophylaxis of venous thromboembolism in adults after total hip replacement surgery.
replacement or total knee replacement surgery. www.nice.org.uk/Ta157

- Dabigatran etexilate for the prevention of stroke and systemic embolism in atrial fibrillation (March 2012) NICE TA249

Dabigatran etexilate is an option for the prevention of stroke and systemic embolism in patients with non-valvular atrial fibrillation and with one or more of the following risk factors:

- previous stroke, transient ischaemic attack, or systemic embolism
- left ventricular ejection fraction <40%
- symptomatic heart failure
- age >75 years
- age >65 years in patients with diabetes mellitus, coronary artery disease, or hypertension

The risks and benefits of dabigatran compared to warfarin should be discussed with the patient. www.nice.org.uk/Ta249

- Dabigatran etexilate for the treatment and secondary prevention of deep vein thrombosis and/or pulmonary embolism (December 2014) NICE TA327

Dabigatran etexilate is recommended, within its marketing authorisation, as an option for treating and for preventing recurrent deep vein thrombosis and pulmonary embolism in adults. www.nice.org.uk/Ta327

TISSUE PLASMINOGEN ACTIVATORS

Urokinase

The properties listed below are those particular to the drug only. For properties common to the class, see fibrinolytics, p. 154.

INDICATIONS AND DOSE

Deep-vein thrombosis (thromboembolic occlusive vascular disease)

BY INTRAVENOUS INFUSION

- Adult: Initially 4400 units/kg, to be given over 10–20 minutes, followed by 100 000 units/hour for 2–3 days

Pulmonary embolism (thromboembolic occlusive vascular disease)

BY INTRAVENOUS INFUSION

- Adult: Initially 4400 units/kg, to be given over 10–20 minutes, followed by 4400 units/kg/hour for 12 hours

Oclusive peripheral arterial disease (thromboembolic occlusive vascular disease)

BY INTRA-ARTERIAL INFUSION

- Adult: (consult product literature)

Occluded central venous catheters

BY INTRAVENOUS INJECTION

- Adult: Inject directly into occluded catheter, to be dissolved in sodium chloride 0.9% to a concentration of 5000 units/mL; use a volume sufficient to fill the catheter lumen; leave for 20–60 minutes then aspirate the lysate; repeat if necessary

Occluded arteriovenous haemodialysis shunts

BY INTRAVENOUS INFUSION OR BY INTRA-ARTERIAL INFUSION

SYNER-KINASE®

Deep-vein thrombosis (thromboembolic occlusive vascular disease)

BY INTRAVENOUS INFUSION

- Adult: Initially 4400 units/kg, to be given over 10 minutes, dose to be made up in 15 ml sodium chloride 0.9%, followed by 4400 units/kg/hour for 12–24 hours

Pulmonary embolism (thromboembolic occlusive vascular disease)

INITIALLY BY INTRAVENOUS INFUSION

- Adult: Initially 4400 units/kg, to be given over 10 minutes, dose to be made up in 15 ml sodium chloride 0.9%, followed by (by intravenous infusion) 4400 micrograms/kg/hour for 12 hours, alternatively (by intra-arterial injection) initially 15 000 units/kg, to be injected into pulmonary artery, subsequent doses adjusted according to response; maximum 3 doses per day

Occlusive peripheral arterial disease

BY INTRA-ARTERIAL INFUSION

- Adult: (consult product literature)

Occluded catheters and cannulas

BY INTRA-ARTERIAL INJECTION OR BY INTRAVENOUS INJECTION

- Adult: 5000–25 000 units, to be injected directly into catheter or cannula, dose dissolved in suitable volume of sodium chloride 0.9% to fill the catheter or cannula lumen; leave for 20–60 minutes then aspirate the lysate; repeat if necessary

- BREAST FEEDING Manufacturer advises avoid—no information available.

- HEPATIC IMPAIRMENT Dose reduction may be required.

- RENAL IMPAIRMENT Dose reduction may be required.

- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Syner-KINASE®), give continuously or intermittently in sodium chloride 0.9%.

VITAMIN K ANTAGONISTS

Vitamin K antagonists

- CONTRA-INDICATIONS Avoid use within 48 hours postpartum - haemorrhagic stroke - significant bleeding

- CAUTIONS Bacterial endocarditis (use only if warfarin otherwise indicated) - conditions in which risk of bleeding
is increased · history of gastrointestinal bleeding · peptic ulcer · postpartum (delay warfarin until risk of haemorrhage is low—usually 5–7 days after delivery) · recent ischaemic stroke · recent surgery · uncontrolled hypertension

**INTERACTIONS** → Appendix 1 (coumarins, phenindione). Major changes in diet (especially involving salads and vegetables) and in alcohol consumption may affect warfarin control. Caution if concomitant use of drugs that increase risk of bleeding. Avoid cranberry juice.

**SIDE-EFFECTS** Alopecia · diarrhoea · haemorrhage · hepatic dysfunction · jaundice · nausea · pancreatitis · purpura · pyrexia · rash · skin necrosis (increased risk in patients with protein C or protein S deficiency) · vomiting · ‘purple toes’

**CONCEPTION AND CONTRACEPTION** Women of childbearing age should be warned of the danger of teratogenicity.

**PREGNANCY** Should not be given in the first trimester of pregnancy. Warfarin, acenocoumarol, and phenindione cross the placenta with risk of congenital malformations, and placental, fetal, or neonatal haemorrhage, especially during the last few weeks of pregnancy and at delivery. Therefore, if at all possible, they should be avoided in pregnancy, especially in the first and third trimesters (difficult decisions may have to be made, particularly in women with prosthetic heart valves, atrial fibrillation, or with a history of recurrent venous thrombosis or pulmonary embolism). Stopping these drugs before the sixth week of gestation may largely avoid the risk of fetal abnormality.

**MONITORING REQUIREMENTS**
- The base-line prothrombin time should be determined but the initial dose should not be delayed whilst awaiting the result.
- It is essential that the INR be determined daily or on alternate days in early days of treatment, then at longer intervals (depending on response), then up to every 12 weeks.
- Change in patient’s clinical condition, particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing.

**PATIENT AND CARER ADVICE** Anticoagulant treatment booklets should be issued to all patients or their carers; these booklets include advice for patients on anticoagulant treatment, an alert card to be carried by the patient at all times, and a section for recording of INR results and dosage information. In England, Wales, and Northern Ireland, they are available for purchase from: 3M Security Print and Systems Limited Gorse Street, Chadderton Oldham OL9 9QH Tel: 0845 610 1112 GP practices can obtain supplies through their Local Area Team stores. NHS Trusts can order supplies from www.nhsforms.co.uk or by emailing nhsforms@mm.com. In Scotland, treatment booklets and starter information packs can be obtained by emailing stockorders. dppas@theapsgroup.com or by fax on (0131) 6299 967 Electronic copies of the booklets and further advice are also available at www.npsa.nhs.uk/nrls/alerts-and-directives/alerts/anticoagulant.

---

**Acenocoumarol**  
(Nicoumalone)

**INDICATIONS AND DOSE**  
Prophylaxis of embolisation in rheumatic heart disease and atrial fibrillation | Prophylaxis after insertion of prosthetic heart valve | Prophylaxis and treatment of venous thrombosis and pulmonary embolism | Transient ischaemic attacks

**BY MOUTH**
- Adult: Initially 2–4 mg once daily for 2 days, alternatively initially 5 mg on day 1, then 4 mg on day 2; maintenance 1–8 mg daily, adjusted according to response, dose to be taken at the same time each day, lower doses may be required in patients over 65 years, liver disease, severe heart failure with hepatic congestion, and malnutrition

**SIDE-EFFECTS**
- Rare Anorexia
- Very rare Vasculitis

**BREAST FEEDING** Risk of haemorrhage; increased by vitamin K deficiency—manufacturer recommends prophylactic vitamin K for the infant (consult product literature).

**HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment. Avoid in severe impairment, especially if prothrombin time is already prolonged.

**RENAL IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.

**PATIENT AND CARER ADVICE** Anticoagulant card to be provided.

---

**Phenindione**

**INDICATIONS AND DOSE**  
Prophylaxis of embolisation in rheumatic heart disease and atrial fibrillation | Prophylaxis after insertion of prosthetic heart valve | Prophylaxis and treatment of venous thrombosis and pulmonary embolism

**BY MOUTH**
- Adult: Initially 200 mg on day 1, then 100 mg on day 2, then, adjusted according to response; maintenance 50–150 mg daily

**SIDE-EFFECTS**
- Agranulocytosis · eosinophilia · exanthema · exfoliative dermatitis · fever · hypersensitivity reactions · leucopenia · micro-adenopathy · renal damage · urine coloured pink or orange

**BREAST FEEDING** Avoid. Risk of haemorrhage; increased by vitamin K deficiency.

**HEPATIC IMPAIRMENT** Avoid in severe impairment, especially if prothrombin time is already prolonged.

**RENAL IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.
Hypertension 121

4 Blood pressure conditions

4.1 Hypertension

Lowering raised blood pressure decreases the risk of stroke, coronary events, heart failure, and renal impairment. Advice on antihypertensive therapy in this section takes into account the recommendations of NICE clinical guidance 127 (August 2011), Hypertension—Clinical management of primary hypertension in adults.

Possible causes of hypertension (e.g. renal disease, endocrine causes), contributory factors, risk factors, and the presence of any complications of hypertension, such as left ventricular hypertrophy, should be established. Patients should be given advice on lifestyle changes to reduce blood pressure or cardiovascular risk; these include smoking cessation, weight reduction, reduction of excessive intake of alcohol and caffeine, reduction of dietary salt, reduction of total and saturated fat, increasing exercise, and increasing fruit and vegetable intake.

Thresholds and targets for treatment

Patients presenting with a blood pressure of 140/90 mmHg or higher when measured in a clinic setting, should be offered ambulatory blood pressure monitoring (or home blood pressure monitoring if ambulatory blood pressure monitoring is unsuitable) to confirm the diagnosis and stage of hypertension.

Stage 1 hypertension:

- Clinic blood pressure 140/90 mmHg or higher, and ambulatory daytime average or home blood pressure average 135/85 mmHg or higher
- Treat patients under 80 years who have stage 1 hypertension and target-organ damage (e.g. left ventricular hypertrophy, chronic kidney disease, hypertensive retinopathy), cardiovascular disease, renal disease, or diabetes, or a 10 year cardiovascular risk ≥20%; in the absence of these conditions, advise lifestyle changes and review annually. For patients under 40 years with stage 1 hypertension but no overt target-organ damage, cardiovascular disease, renal disease, or diabetes, consider seeking specialist advice for evaluation of secondary causes of hypertension

Stage 2 hypertension:

- Clinic blood pressure 160/100 mmHg or higher, and ambulatory daytime average or home blood pressure average 150/95 mmHg or higher
- Treat all patients who have stage 2 hypertension, regardless of age

Severe hypertension:

- Clinic systolic blood pressure >180 mmHg or clinic diastolic blood pressure >110 mmHg; treat promptly—see Hypertensive Crises p. 123.

A target clinic blood pressure below 140/90 mmHg is suggested for patients under 80 years; a target ambulatory or home blood pressure average (during the patient’s waking hours) of below 135/85 mmHg is suggested for patients under 80 years; see also Hypertension in the Elderly p. 122. A target clinic blood pressure below
130/80 mmHg should be considered for those with established atherosclerotic cardiovascular disease, or diabetes in the presence of kidney, eye, or cerebrovascular disease. In some individuals it may not be possible to reduce blood pressure below the suggested targets despite the use of appropriate therapy.

**Drug treatment of hypertension**

A single antihypertensive drug is often inadequate in the management of hypertension, and additional antihypertensive drugs are usually added in a step-wise manner until control is achieved. Unless it is necessary to lower the blood pressure urgently (see Hypertensive Crises), an interval of at least 4 weeks should be allowed to determine response; clinicians should ensure antihypertensive drugs are titrated to the optimum or maximum tolerated dose at each step of treatment.

Response to drug treatment may be affected by age and ethnicity.

**Patients under 55 years:**

- Step 1
  - ACE inhibitor; if not tolerated, offer an angiotensin-II receptor antagonist. If both ACE inhibitors and angiotensin-II receptor antagonists are contra-indicated or not tolerated, consider a beta-blocker; beta-blockers, especially when combined with a thiazide diuretic, should be avoided for the routine treatment of uncomplicated hypertension in patients with diabetes or at high risk of developing diabetes

- Step 2
  - ACE inhibitor or angiotensin-II receptor antagonist in combination with a calcium-channel blocker. If a calcium-channel blocker is not tolerated or if there is evidence of, or a high risk of, heart failure, give a thiazide-related diuretic (e.g. chlortalidone or indapamide). If a beta-blocker was given at Step 1, add a calcium channel blocker in preference to a thiazide-related diuretic (see Step 1)

- Step 3
  - ACE inhibitor or angiotensin-II receptor antagonist in combination with a calcium-channel blocker and a thiazide-related diuretic

- Step 4 (resistant hypertension)
  - Consider seeking specialist advice
  - Add low-dose spironolactone [unlicensed indication], or use high-dose thiazide related diuretic if plasma-potassium concentration above 4.5 mmol/litre
  - Monitor renal function and electrolytes
  - If additional diuretic therapy is contra-indicated, ineffective, or not tolerated, consider an alpha-blocker or a beta-blocker

**Patients over 55 years, and patients of any age who are of African or Caribbean family origin:**

- Step 1
  - Calcium-channel blocker; if not tolerated or if there is evidence of, or a high risk of, heart failure, give a thiazide-related diuretic (e.g. chlortalidone or indapamide)

- Step 2
  - Calcium-channel blocker or thiazide-related diuretic in combination with an ACE inhibitor or angiotensin-II receptor antagonist (an angiotensin-II receptor antagonist in combination with a calcium-channel blocker is preferred in patients of African or Caribbean family origin)

- Steps 3 and 4
  - Treat as for patients under 55 years

**Other measures to reduce cardiovascular risk**

Aspirin p. 104 reduces the risk of cardiovascular events and myocardial infarction. Unduly high blood pressure must be controlled before aspirin is given. Unless contra-indicated, aspirin is recommended for all patients with established cardiovascular disease. Use of aspirin in primary prevention, in those with or without diabetes, is of unproven benefit. Aspirin also has a role in the prevention of stroke in patients with atrial fibrillation.

Statins are also of benefit in cardiovascular disease or in those who are at high risk of developing cardiovascular disease.

**Hypertension in the elderly**

Benefit from antihypertensive therapy is evident up to at least 80 years of age, but it is probably inappropriate to apply a strict age limit when deciding on drug therapy. Patients who reach 80 years of age while taking antihypertensive drugs should continue treatment, provided that it continues to be of benefit and does not cause significant side-effects. If patients are aged over 80 years when diagnosed with stage 1 hypertension, the decision to treat should be based on the presence of other comorbidities; patients with stage 2 hypertension should be treated as for patients over 55 years. A target clinic blood pressure below 150/90 mmHg is suggested for patients over 80 years; the suggested target ambulatory or home blood pressure average (during the patient’s waking hours) is below 145/85 mmHg.

**Isolated systolic hypertension**

Isolated systolic hypertension (systolic pressure ≥160 mmHg, diastolic pressure <90 mmHg) is common in patients over 60 years, and is associated with an increased cardiovascular disease risk; it should be treated as for patients with both a raised systolic and diastolic blood pressure. Patients with severe postural hypotension should be referred to a specialist.

**Hypertension in diabetes**

For patients with diabetes, a target clinic blood pressure below 140/80 mmHg is suggested (below 130/80 mmHg is advised if kidney, eye, or cerebrovascular disease are also present). However, in some individuals, it may not be possible to achieve this level of control despite appropriate therapy. Most patients require a combination of antihypertensive drugs.

Hypertension is common in type 2 diabetes, and antihypertensive treatment prevents macrovascular and microvascular complications. In type 1 diabetes, hypertension usually indicates the presence of diabetic nephropathy. An ACE inhibitor (or an angiotensin-II receptor antagonist) may have a specific role in the management of diabetic nephropathy; in patients with type 2 diabetes, an ACE inhibitor (or an angiotensin-II receptor antagonist) can delay progression of microalbuminuria to nephropathy.

**Hypertension in renal disease**

A target clinic blood pressure below 140/90 mmHg is suggested (below 130/80 mmHg is advised in patients with chronic kidney disease and diabetes, or if proteinuria exceeds 1 g in 24 hours). An ACE inhibitor (or an angiotensin-II receptor antagonist) should be considered for patients with proteinuria; however, ACE inhibitors should be used with caution in renal impairment. Thiazide diuretics may be ineffective and high doses of loop diuretics may be required.

**Hypertension in pregnancy**

Hypertensive complications in pregnancy can be hazardous for both the mother and the fetus, and are associated with a significant risk of morbidity and mortality; complications can occur in pregnant women with pre-existing chronic hypertension, or in those who develop hypertension in the latter half of pregnancy.
Labetalol hydrochloride p. 143 is widely used for treating hypertension in pregnancy. Methyldopa p. 138 is considered safe for use in pregnancy. Modified-release preparations of nifedipine p. 154 [unlicensed] are also used.

The following advice takes into account the recommendations of NICE Clinical Guideline 107 (August 2010), Hypertension in Pregnancy.

Pregnant women with chronic hypertension who are already receiving antihypertensive treatment should have their drug therapy reviewed. In uncomplicated chronic hypertension, a target blood pressure of <150/100 mmHg is recommended; women with target-organ damage as a result of chronic hypertension, and in women with chronic hypertension who have given birth, a target blood pressure of <140/90 mmHg is advised. Long-term antihypertensive treatment should be reviewed 2 weeks following the birth. Women managed with methyldopa during pregnancy should discontinue treatment and restart their original antihypertensive medication within 2 days of the birth.

Pregnant women are at high risk of developing pre-eclampsia if they have chronic kidney disease, diabetes mellitus, autoimmune disease, chronic hypertension, or if they have had hypertension during a previous pregnancy; these women are advised to take aspirin p. 104 once daily [unlicensed indication] from week 12 of pregnancy until the baby is born. Women with more than one moderate risk factor (first pregnancy, aged ≥40 years, pregnancy interval >10 years, BMI ≥35 kg/m² at first visit, multiple pregnancy, or family history of pre-eclampsia) for developing pre-eclampsia are also advised to take aspirin once daily [unlicensed indication] from week 12 of pregnancy until the baby is born.

Women with pre-eclampsia or gestational hypertension who present with a blood pressure over 150/100 mmHg, should receive initial treatment with oral labetalol hydrochloride to achieve a target blood pressure of <150 mmHg systolic, and diastolic 80–100 mmHg. If labetalol hydrochloride is unsuitable, methyldopa or modified-release nifedipine may be considered. Women with gestational hypertension or pre-eclampsia who have been managed with methyldopa during pregnancy should discontinue treatment within 2 days of the birth. Women with a blood pressure of ≥160/110 mmHg who require critical care during pregnancy or after birth should receive immediate treatment with either oral or intravenous labetalol hydrochloride, intravenous hydralazine hydrochloride p. 157, or oral modified-release nifedipine to achieve a target blood pressure of <150 mmHg systolic, and diastolic 80–100 mmHg.

Also see use of magnesium sulfate in pre-eclampsia and eclampsia p. 858.

**Hypertensive crises**

If blood pressure is reduced too quickly in the management of hypertensive crises, there is a risk of reduced organ perfusion leading to cerebral infarction, blindness, deterioration in renal function, and myocardial ischaemia.

A **hypertensive emergency** is defined as severe hypertension with acute damage to the target organs (e.g. signs of papilloedema or retinal haemorrhage, or the presence of clinical conditions such as acute coronary syndromes, acute aortic dissection, acute pulmonary oedema, hypertensive encephalopathy, acute cerebral infarction, intracerebral or subarachnoid haemorrhage, eclampsia, or rapidly progressing renal failure); prompt treatment with intravenous antihypertensive therapy is generally required. Over the first few minutes or within 2 hours blood pressure should be reduced by 20–25%. When intravenous therapy is indicated, treatment options include sodium nitroprusside p. 161 [unlicensed], nicardipine hydrochloride p. 153, labetalol hydrochloride p. 143, glyceryl trinitrate p. 190, phentolamine mesilate p. 161, hydralazine hydrochloride p. 157, or esmolol hydrochloride p. 143; choice of drug is dependent on concomitant conditions and clinical status of the patient.

Severe hypertension (blood pressure >180/110 mmHg) without acute target-organ damage is defined as a hypertensive urgency; blood pressure should be reduced gradually over 24–48 hours with oral antihypertensive therapy, such as labetalol hydrochloride, or the calcium-channel blockers amloidipine p. 148 or felodipine p. 151. Use of sublingual nifedipine is not recommended.

Also see advice on short-term management of hypertensive episodes in preeclampsia and eclampsia p. 858.

**Phaeochromocytoma**

Long-term management of phaeochromocytoma involves surgery. However, surgery should not take place until there is adequate blockade of both alpha- and beta-adrenoceptors; the optimal choice of drug therapy remains unclear. Alpha-blockers are used in the short-term management of hypertensive episodes in phaeochromocytoma. Once alpha blockade is established, tachycardia can be controlled by the cautious addition of a beta-blocker; a cardioselective beta-blocker is preferred.

Phenoxybenzamine hydrochloride p. 161, a powerful alpha-blocker, is effective in the management of phaeochromocytoma but it has many side-effects. Phentolamine mesilate p. 161 is a short-acting alpha-blocker used mainly during surgery of phaeochromocytoma; its use for the diagnosis of phaeochromocytoma has been superseded by measurement of catecholamines in blood and urine.

Metirosine (available from ‘special-order’ manufacturers or specialist importing companies) inhibits the enzyme tyrosine hydroxylase, and hence the synthesis of catecholamines. It is rarely used in the pre-operative management of phaeochromocytoma, and long term in patients unsuitable for surgery; an alpha-adrenoceptor blocking drug may also be required. Metirosine should not be used to treat essential hypertension.

**Antihypertensive drugs**

**Vasodilator antihypertensive drugs**

Vasodilators have a potent hypotensive effect, especially when used in combination with a beta-blocker and a thiazide. **Important:** see Hypertension (hypertensive crises) for a warning on the hazards of a very rapid fall in blood pressure.

Hydralazine hydrochloride p. 157 is given by mouth as an adjunct to other antihypertensives for the treatment of resistant hypertension but is rarely used; when used alone it causes tachycardia and fluid retention.

Sodium nitroprusside p. 161 [unlicensed] is given by intravenous infusion to control severe hypertensive emergencies when parenteral treatment is necessary.

Minoxidil p. 158 should be reserved for the treatment of severe hypertension resistant to other drugs. Vasodilatation is accompanied by increased cardiac output and tachycardia and the patients develop fluid retention. For this reason the addition of a beta-blocker and a diuretic (usually furosemide p. 201, in high dosage) are mandatory. Hypertrichosis is troublesome and renders this drug unsuitable for females.

Prazosin p. 674, doxazosin p. 673, and terazosin p. 675 have alpha-blocking and vasodilator properties.

Ambrisentan p. 162, bosentan p. 163, iloprost p. 164, macitentan p. 163, sildenafil p. 699, and tadalafil p. 700 are licensed for the treatment of pulmonary arterial hypertension and should be used under specialist supervision. Epoprostenol p. 99 can be used in patients with primary pulmonary hypertension resistant to other
Drugs affecting the renin-angiotensin system

Angiotensin-converting enzyme inhibitors

Angiotensin-converting enzyme inhibitors (ACE inhibitors) inhibit the conversion of angiotensin I to angiotensin II. They have many uses and are generally well tolerated. The main indications of ACE inhibitors are shown below.

Heart Failure

ACE inhibitors are used in all grades of heart failure, usually combined with a beta-blocker. Potassium supplements and potassium-sparing diuretics should be discontinued before introducing an ACE inhibitor because of the risk of hyperkalaemia. However, a low dose of spironolactone p. 166 may be beneficial in severe heart failure and can be used with an ACE inhibitor provided serum potassium is monitored carefully. Profound first-dose hypotension may occur when ACE inhibitors are introduced to patients with heart failure who are already taking a high dose of a loop diuretic (e.g. furosemide p. 201 80 mg daily or more).

Temporary withdrawal of the loop diuretic reduces the risk, but may cause severe rebound pulmonary oedema. Therefore, for patients on high doses of loop diuretics, the ACE inhibitor may need to be initiated under specialist supervision. An ACE inhibitor can be initiated in the community in patients who are receiving a low dose of a diuretic or who are not otherwise at risk of serious hypotension; nevertheless, care is required and a very low dose of the ACE inhibitor is given initially.

Hypertension

An ACE inhibitor may be the most appropriate initial drug for hypertension in younger Caucasian patients; Afro-Caribbean patients, those aged over 55 years, and those with primary aldosteronism respond less well. ACE inhibitors are particularly indicated for hypertension in patients with type 1 diabetes with nephropathy. They may reduce blood pressure very rapidly in some patients particularly in those receiving diuretic therapy.

Diabetic nephropathy

ACE inhibitors have a role in the management of diabetic nephropathy.

Prophylaxis of cardiovascular events

ACE inhibitors are used in the early and long-term management of patients who have had a myocardial infarction. ACE inhibitors may also have a role in preventing cardiovascular events.

Initiation under specialist supervision

ACE inhibitors should be initiated under specialist supervision and with careful clinical monitoring in those with severe heart failure or in those:

- receiving multiple or high-dose diuretic therapy (e.g. more than 80 mg of furosemide daily or its equivalent);
- receiving concomitant angiotensin-II receptor antagonist or aliskiren;
- with hypovolaemia;
- with hyponatraemia (plasma-sodium concentration below 130 mmol/litre);
- with hypotension (systolic blood pressure below 90 mmHg);
- with unstable heart failure;
- receiving high-dose vasodilator therapy;
- known renovascular disease.

Renal effects

Renal function and electrolytes should be checked before starting ACE inhibitors (or increasing the dose) and monitored during treatment (more frequently if features mentioned below present); hyperkalaemia and other side-effects of ACE inhibitors are more common in those with impaired renal function and the dose may need to be reduced. Although ACE inhibitors now have a specialised role in some forms of renal disease, including chronic kidney disease, they also occasionally cause impairment of renal function which may progress and become severe in other circumstances (at particular risk are the elderly). A specialist should be involved if renal function is significantly reduced as a result of treatment with an ACE inhibitor.

Concomitant treatment with NSAIDs increases the risk of renal damage, and potassium-sparing diuretics (or potassium-containing salt substitutes) increase the risk of hyperkalaemia.

In patients with severe bilateral renal artery stenosis (or severe stenosis of the artery supplying a single functioning kidney), ACE inhibitors reduce or abolish glomerular filtration and are likely to cause severe and progressive renal failure. They are therefore not recommended in patients known to have these forms of critical renovascular disease.

ACE inhibitor treatment is unlikely to have an adverse effect on overall renal function in patients with severe...
unilateral renal artery stenosis and a normal contralateral kidney, but glomerular filtration is likely to be reduced (or even abolished) in the affected kidney and the long-term consequences are unknown.

ACE inhibitors are therefore best avoided in patients with known or suspected renovascular disease, unless the blood pressure cannot be controlled by other drugs. If ACE inhibitors are used, they should be initiated only under specialist supervision and renal function should be monitored regularly.

ACE inhibitors should also be used with particular caution in patients who may have undiagnosed and clinically silent renovascular disease. This includes patients with peripheral vascular disease or those with severe generalised atherosclerosis.

Cautions

ACE inhibitors need to be initiated with care in patients receiving diuretics.

Concomitant diuretics

ACE inhibitors can cause a very rapid fall in blood pressure in volume-depleted patients; treatment should therefore be initiated with very low doses. If the dose of diuretic is greater than 80 mg furosemide p. 201 or equivalent, the ACE inhibitor should be initiated under close supervision and in some patients the diuretic dose may need to be reduced or the diuretic discontinued at least 24 hours beforehand (may not be possible in heart failure—risk of pulmonary oedema). If high-dose diuretic therapy cannot be stopped, close observation is recommended after administration of the first dose of ACE inhibitor, for at least 2 hours or until the blood pressure has stabilised.

Combination products

Products incorporating an ACE inhibitor with a thiazide diuretic or a calcium-channel blocker are available for the management of hypertension. Use of these combination products should be reserved for patients whose blood pressure has not responded adequately to a single antihypertensive drug and who have been stabilised on the individual components of the combination in the same proportions.

Angiotensin-II receptor antagonists

Azilsartan medoxomil p. 132, candesartan cilexetil p. 133, eprosartan p. 133, ibrsartan p. 133, losartan potassium p. 134, olmesartan medoxomil p. 135, telmisartan p. 136, and valsartan p. 136 are angiotensin-II receptor antagonists with many properties similar to those of the ACE inhibitors. However, unlike ACE inhibitors, they do not inhibit the breakdown of bradykinin and other kinins, and thus are less likely to cause the persistent dry cough which can complicate ACE inhibitor therapy. They are therefore a useful alternative for patients who have to discontinue an ACE inhibitor because of persistent cough.

An angiotensin-II receptor antagonist may be used as an alternative to an ACE inhibitor in the management of heart failure or diabetic nephropathy. Candesartan cilexetil and valsartan are also licensed as adjuncts to ACE inhibitors under specialist supervision, in the management of heart failure when other treatments are unsuitable.

Renal effects

Angiotensin-II receptor antagonists should be used with caution in renal artery stenosis (see also Renal effects under ACE Inhibitors, above).

Renin inhibitor

Aliskiren is a renin inhibitor that is licensed for the treatment of hypertension.

Concomitant use of drugs affecting the renin-angiotensin system

Combination therapy with two drugs affecting the renin-angiotensin system (ACE inhibitors, angiotensin-II receptor antagonists, and aliskiren p. 158 is not recommended due to an increased risk of hyperkalaemia, hypotension, and renal impairment, compared to use of a single drug. Patients with diabetic nephropathy are particularly susceptible to developing hyperkalaemia and should not be given an ACE inhibitor with an angiotensin-II receptor antagonist. There is some evidence that the benefits of combination use of an ACE inhibitor with candesartan or valsartan may outweigh the risks in selected patients with heart failure for whom other treatments are unsuitable, however, the concomitant use of this combination, together with an aldosterone antagonist or a potassium-sparing diuretic is not recommended.

For patients currently taking combination therapy, the need for continued combined therapy should be reviewed. If combination therapy is considered essential, it should be carried out under specialist supervision, with close monitoring of blood pressure, renal function, and electrolytes (particularly potassium); monitoring should be considered at the start of treatment, then monthly, and also after any change in dose or during intercurrent illness.

Drugs used for Hypertension not listed below;

ANGIOTENSIN-CONVERTING ENZYME INHIBITORS

Angiotensin-converting enzyme inhibitors

● CONTRA-INDICATIONS The combination of an ACE inhibitor with aliskiren is contra-indicated in patients with an eGFR less than 60 mL/minute/1.73 m² - the combination of an ACE inhibitor with aliskiren is contra-indicated in patients with diabetes mellitus

● CAUTIONS Afro-Caribbean patients (may respond less well to ACE inhibitors) - concomitant diuretics - first dose hypotension (especially in patients taking high doses of diuretics, on a low-sodium diet, on dialysis, dehydrated, or with heart failure) - peripheral vascular disease or generalised atherosclerosis (risk of clinically silent renovascular disease) - primary aldosteronism (patients may respond less well to ACE inhibitors) - the risk of agranulocytosis is possibly increased in collagen vascular disease (blood counts recommended) - use with care (or avoid) in those with a history of idiopathic or hereditary angioedema - use with care in patients with hypertrophic cardiomyopathy - use with care in patients with severe or symptomatic aortic stenosis (risk of hypotension)

CAUTIONS, FURTHER INFORMATION

Anaphylactoid reactions To prevent anaphylactoid reactions, ACE inhibitors should be avoided during dialysis with high-flux polycrylonitrile membranes and during low-density lipoprotein apheresis with dextran sulphate; they should also be withheld before desensitization with wasp or bee venom.

● INTERACTIONS → Appendix 1 (ACE inhibitors).

● SIDE-EFFECTS Pruritus - abdominal pain - altered liver function tests - angioedema (onset may be delayed; higher incidence reported in Afro-Caribbean patients) - arthralgia - blood disorders - bronchospasm - cholestatic jaundice -
constipation • diarrhea • dizziness • dyspepsia • eosinophilia • fatigue • fever • fulminant hepatic necrosis • haemolytic anaemia • headache • hepatic failure • hepatitis • hyperkalaemia • hypoglycaemia • leucocytosis • leucopenia • malaise • myalgia • nausea • neutropenia • pancreatitis • paraesthesia • persistent dry cough • photosensitivity • positive antinuclear antibody • profound hypotension • raised erythrocyte sedimentation rate • rash • renal impairment • rhinitis • serotonin • sinusitis • sore throat • taste disturbance • thrombocytopenia • urticaria • vasculitis • vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Hepatic effects
In light of reports of cholestatic jaundice, hepatic, fulminant hepatic necrosis, and hepatic failure, ACE inhibitors should be discontinued if marked elevation of hepatic enzymes or jaundice occur.

ALLERGY AND CROSS-SENSITIVITY
ACE inhibitors are contra-indicated in patients with hypersensitivity to ACE inhibitors (including angioedema).

PREGNANCY
ACE inhibitors should be avoided in pregnancy unless essential. They may adversely affect fetal and neonatal blood pressure control and renal function; skull defects and oligohydramnios have also been reported.

BREAST FEEDING
Information on the use of ACE inhibitors in breast-feeding is limited.

RENAL IMPAIRMENT
Use with caution, starting with low dose, and adjust according to response. Hyperkalaemia and other side-effects of ACE inhibitors are more common in those with impaired renal function and the dose may need to be reduced.

MONITORING REQUIREMENTS
Renal function and electrolytes should be checked before starting ACE inhibitors (or increasing the dose) and monitored during treatment (more frequently if side effects mentioned are present).

DIRECTIONS FOR ADMINISTRATION
For hypertension the first dose should preferably be given at bedtime.

Captopril

INDICATIONS AND DOSE

Hypertension
BY MOUTH
Adult: Initially 12.5–25 mg twice daily, then increased if necessary up to 150 mg daily in 2 divided doses, doses to be increased at intervals of at least 2 weeks, once-daily dosing may be appropriate if other concomitant antihypertensive drugs taken

Essential hypertension if used in volume depletion, cardiac decompensation, or renovascular hypertension
BY MOUTH
Adult: Initially 6.25–12.5 mg for 1 dose (under close medical supervision), then 6.25–12.5 mg twice daily; increased if necessary up to 100 mg daily in 1–2 divided doses, doses to be increased at intervals of at least 2 weeks, once-daily dosing may be appropriate if other concomitant antihypertensive drugs taken

Heart failure
BY MOUTH
Adult (under close medical supervision): Initially 6.25–12.5 mg 2–3 times a day, then increased if tolerated to up to 150 mg daily in divided doses, dose to be increased gradually at intervals of at least 2 weeks

Short-term treatment within 24 hours of onset of myocardial infarction in clinically stable patients
BY MOUTH
Adult: Initially 6.25 mg, then increased to 12.5 mg after 2 hours, followed by 25 mg after 12 hours, increased if tolerated to 50 mg twice daily for 4 weeks

Prophylaxis of symptomatic heart failure after myocardial infarction in clinically stable patients with asymptomatic left ventricular dysfunction (starting 3–16 days after infarction) (under close medical supervision)
BY MOUTH
Adult: Initially 6.25 mg daily, then increased to 12.5 mg 3 times a day for 2 days, then increased if tolerated to 25 mg 3 times a day, then increased if tolerated to 75–150 mg daily in 2–3 divided doses, doses to be increased gradually

Diabetic nephropathy
BY MOUTH
Adult: 75–100 mg daily in divided doses

SIDE-EFFECTS

Common or very common
Alopecia • dry mouth • dyspnoea • sleep disorder

Uncommon
Angina • arthralgia • flushing • pallor • palpitation • Raynaud’s syndrome • tachycardia

Rare
Anorexia • stomatitis

Very rare
Allergic alveolitis • blurred vision • cardiac arrest • cardiogenic shock • cerebrovascular events • confusion • depression • eosinophilic pneumonia • glossitis • gynaecomastia • hyponatraemia • impotence • peptic ulcer • photosensitivity • Stevens-Johnson syndrome • syncpe

BREAST FEEDING
Avoid in first few weeks after delivery, particularly in preterm infants—risk of profound neonatal hypotension; can be used in mothers breast-feeding older infants if essential but monitor infant’s blood pressure.

RENAL IMPAIRMENT
Reduce dose; max. initial dose 50 mg if eGFR above 40 mL/minute/1.73 m²; max. initial dose 25 mg daily (do not exceed 100 mg daily) if eGFR 20–40 mL/minute/1.73 m²; max. initial dose 12.5 mg daily (do not exceed 75 mg daily) if eGFR 10–20 mL/minute/1.73 m²; max. initial dose 6.25 mg daily (do not exceed 37.5 mg daily) if eGFR less than 10 mL/minute/1.73 m².

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution, powder, capsule

Tablet

Captopril (Non-proprietary)
Captopril 12.5 mg Captopril 12.5mg tablets | 56 tablet | £2.80 | DT price = £2.44 | 100 tablet | £5.00
Captopril 25 mg Captopril 25mg tablets | 56 tablet | £4.52 | DT price = £1.30 | 100 tablet | £8.07
Captopril 50 mg Captopril 50mg tablets | 56 tablet | £5.83 | DT price = £2.47 | 100 tablet | £10.41
Capoten (Bristol-Myers Squibb Pharmaceuticals Ltd)
Captopril 25 mg Capoten 25mg tablets | 28 tablet | £5.26
Ecosp ace (AMCo)
Captopril 12.5 mg Ecosp ace 12.5mg tablets | 56 tablet | £6.48 | DT price = £2.44
Captopril 25 mg Ecosp ace 25mg tablets | 56 tablet | £0.60 | DT price = £1.30
Captopril 50 mg Ecosp ace 50mg tablets | 56 tablet | £0.72 | DT price = £2.47

Oral solution

ELECTROLYTES: May contain Sodium
Noyada (Martindale Pharmaceuticals Ltd)
Captopril 1 mg per 1 mL Noyada 1mg/5ml oral solution (sugar-free) | 100 ml | £98.21 | DT price = £98.21
Co-zidocapt
The properties listed below are those particular to the combination only. For the properties of the components please consider, captopril p. 126, hydrochlorothiazide p. 160.

INDICATIONS AND DOSE
Mild to moderate hypertension in patients stabilised on the individual components in the same proportions
BY MOUTH
Adult: (consult product literature)

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet
- CO-ZIDOCAPT (Non-proprietary)
  Captopril 5 mg, Hydrochlorothiazide 12.5 mg Co-zidocapt 12.5mg/25mg tablets | 28 tablet PSt £1.00
  Captopril 50 mg, Hydrochlorothiazide 25 mg Co-zidocapt 25mg/50mg tablets | 28 tablet PSt £4.00
- Capozide (Bristol-Myers Squibb Pharmaceuticals Ltd)
  Captopril 50 mg, Hydrochlorothiazide 25 mg Capozide 25mg/50mg tablets | 30 tablet PSt £7.52

Enalapril maleate

INDICATIONS AND DOSE
Hypertension
BY MOUTH
Adult: Initially 5 mg once daily, lower initial doses may be required when used in addition to diuretic or in renal impairment; maintenance 20 mg once daily; maximum 40 mg per day
Heart failure
BY MOUTH
Adult (under close medical supervision): Initially 2.5 mg once daily, increased if tolerated to 10–20 mg twice daily, dose to be increased gradually over 2–4 weeks
Prevention of symptomatic heart failure in patients with asymptomatic left ventricular dysfunction
BY MOUTH
Adult (under close medical supervision): Initially 2.5 mg once daily, increased if tolerated to 10–20 mg twice daily, dose to be increased gradually over 2–4 weeks

SIDE-EFFECTS
- Common or very common Asthenia · blurred vision · depression · dyspnoea
- Uncommon Alopecia · anorexia · arrhythmias · confusion · drowsiness · dry mouth · flushing · hypotension · impotence · insomnia · muscle cramps · nervousness · palpitation · peptic ulcer · sweating · tinnitus · vertigo
- Rare Abnormal dreams · allergic alveolitis · exfoliative dermatitis · glossitis · gynaecomastia · pemphigus · pulmonary infiltrates · Raynaud’s syndrome · Stevens-Johnson syndrome · stomatitis · toxic epidermal necrolysis
- Very rare Gastro-intestinal angioedema

BREAST FEEDING Avoid in first few weeks after delivery, particularly in preterm infants—risk of profound neonatal hypotension; can be used in mothers breast-feeding older infants if essential but monitor infant’s blood pressure.

HEPATIC IMPAIRMENT Enalapril is a prodrug and requires close monitoring in patients with hepatic impairment.

RENAL IMPAIRMENT Max. initial dose 2.5 mg daily if eGFR less than 30 mL/minute/1.73 m².

DIRECTIONS FOR ADMINISTRATION Tablets may be crushed and suspended in water immediately before use.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet

Fosinopril sodium

INDICATIONS AND DOSE
Hypertension
BY MOUTH
Adult: Initially 10 mg daily for 4 weeks, then increased if necessary up to 40 mg daily, doses over 40 mg not shown to increase efficacy
Congestive heart failure (adjunct) (under close medical supervision)
BY MOUTH
Adult: Initially 10 mg once daily, then increased if tolerated to 40 mg once daily, doses to be increased gradually

SIDE-EFFECTS
Chest pain · musculoskeletal pain

BREAST FEEDING Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

HEPATIC IMPAIRMENT Fosinopril is a prodrug and requires close monitoring in patients with hepatic impairment.

BNF 70
Hypertension 127
Cardiovascular system
**Imidapril hydrochloride**

**INDICATIONS AND DOSE**

**Essential hypertension**
- **BY MOUTH**
  - Adult: Initially 2.5 mg daily, increased if necessary to 10 mg daily, dose to be increased at intervals of at least 3 weeks, to be taken before food; maximum 20 mg per day
  - Elderly: Initially 2.5 mg daily, increased if necessary to 10 mg daily, dose to be increased at intervals of at least 3 weeks

**Essential hypertension in patients with heart failure, angina or cerebrovascular disease, or in renal or hepatic impairment**
- **BY MOUTH**
  - Adult: Initially 2.5 mg daily, increased if necessary to 10 mg daily, dose to be increased at intervals of at least 3 weeks; maximum 20 mg per day

**SIDE-EFFECTS**
- Blurred vision, bronchitis, confusion, depression, dry mouth, dyspnoea, glossitis, ileus, impotence, sleep disturbances, tinnitus

**BREAST FEEDING**
- Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

**HEPATIC IMPAIRMENT**
- Imidapril is a prodrug and requires close monitoring in patients with hepatic impairment.

**RENAL IMPAIRMENT**
- Initial dose 2.5 mg daily if eGFR 30–80 mL/minute/1.73 m². Avoid if eGFR less than 30 mL/minute/1.73 m².

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - Tanatril (Chiesi Ltd)
      - Imidapril hydrochloride 5 mg Tanatril 5mg tablets | 28 tablet £6.40 DT price = £6.40
      - Imidapril hydrochloride 10 mg Tanatril 10mg tablets | 28 tablet £7.22 DT price = £7.22
      - Imidapril hydrochloride 20 mg Tanatril 20mg tablets | 28 tablet £8.67 DT price = £8.67

**Lisinopril**

**INDICATIONS AND DOSE**

**Hypertension**
- **BY MOUTH**
  - Adult: Initially 10 mg once daily; maintenance 20 mg once daily; maximum 80 mg per day
  - Hypertension, when used in addition to diuretic, in cardiac decompensation or in volume depletion
  - Adult: Initially 2.5–5 mg once daily; maintenance 20 mg once daily; maximum 80 mg per day

**SIDE-EFFECTS**
- Uncommon: Raynaud’s syndrome, vertigo, asthma, cerebrovascular accident, confusion, impotence, mood changes, myocardial infarction, palpitation, sleep disturbances, tachycardia
  - Rare: Alopecia, dry mouth, gynaecomastia, psoriasis
  - Very rare: Allergic alveolitis, pemphigus, profuse sweating, pulmonary infiltrates, Stevens-Johnson syndrome, toxic epidermal necrolysis

**BREAST FEEDING**
- Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

**RENAL IMPAIRMENT**
- Max. initial doses 5–10 mg daily if eGFR 30–80 mL/minute/1.73 m² (max. 40 mg daily); 2.5–5 mg daily if eGFR 10–30 mL/minute/1.73 m² (max. 40 mg daily); 2.5 mg daily if eGFR less than 10 mL/minute/1.73 m².

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension
  - **Tablet**
    - Lisinopril (Non-proprietary)
      - Lisinopril 2.5 mg Lisinopril 2.5mg tablets | 28 tablet £6.16 DT price = £6.16
      - Lisinopril 5 mg Lisinopril 5mg tablets | 28 tablet £7.80 DT price = £7.80
      - Lisinopril 10 mg Lisinopril 10mg tablets | 28 tablet £9.60 DT price = £9.60
      - Lisinopril 20 mg Lisinopril 20mg tablets | 28 tablet £10.90 DT price = £10.90
      - Zestril (AstraZeneca UK Ltd)
        - Lisinopril 5 mg Zestril 5mg tablets | 28 tablet £4.71 DT price = £4.71

**Short-term treatment following myocardial infarction in haemodynamically stable patients—systolic blood pressure over 120 mmHg**
- **BY MOUTH**
  - Adult: Initially 5 mg, taken within 24 hours of myocardial infarction, followed by 5 mg, to be taken 24 hours after initial dose, then 10 mg once daily, to be taken 24 hours after second dose, then 10 mg once daily for 6 weeks (or continued if heart failure), temporarily reduce maintenance dose to 5 mg and if necessary 2.5 mg daily if systolic blood pressure 100 mmHg or less during treatment. Withdraw if prolonged hypotension occurs during treatment (systolic blood pressure less than 90 mmHg for more than 1 hour)

**Short-term treatment following myocardial infarction in haemodynamically stable patients—systolic blood pressure 100–120 mmHg**
- **BY MOUTH**
  - Adult: Initially 2.5 mg once daily, maintenance 5 mg once daily, should not be started after myocardial infarction if systolic blood pressure less than 100 mmHg, temporarily reduce maintenance dose to 5 mg and if necessary 2.5 mg daily if systolic blood pressure 100 mmHg or less during treatment. Withdraw if prolonged hypotension occurs (systolic blood pressure less than 90 mmHg for more than 1 hour)

**Renal complications of diabetes mellitus**
- **BY MOUTH**
  - Adult: Initially 2.5–5 mg once daily, adjusted according to response; maintenance 10–20 mg once daily

**Heart failure (adjunct) (under expert supervision)**
- **BY MOUTH**
  - Adult: Initially 2.5 mg once daily; increased in steps of up to 10 mg at least every 2 weeks; maximum 35 mg per day
Hydrochlorothiazide with lisinopril

The properties listed below are those particular to the combination only. For the properties of the components please consider, lisinopril p. 128, hydrochlorothiazide p. 160.

**INDICATIONS AND DOSE**

Mild to moderate hypertension in patients stabilised on the individual components in the same proportions

**BY MOUTH**

- Adult: (consult product literature)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Zestoretic
- Carace Plus
- Hydrochlorothiazide 12.5 mg, Lisinopril 20 mg
- Hydrochlorothiazide 12.5 mg, Lisinopril 10 mg
- Perdix
- Coversyl Arginine
- Moexipril hydrochloride 7.5 mg
- Moexipril hydrochloride 15 mg

**SIDE-EFFECTS**

- Asthenia
- Mood disturbances
- Sleep disturbances
- Seizures
- Hyperuricaemia
- Impotence
- Myocardial infarction

**Hypertension, if used in addition to diuretic, or in renal impairment, cardiac decompensation or volume depletion**

**BY MOUTH**

- Adult: Initially 2.5 mg once daily, then, adjusted according to response; maximum 10 mg per day
- Elderly: Initially 2.5 mg once daily, then, adjusted according to response; maximum 10 mg per day

**Symptomatic heart failure (adjunct) (under close medical supervision)**

**BY MOUTH**

- Adult: Initially 2.5 mg once daily for 2 weeks, then increased if tolerated to 5 mg once daily, dose to be taken in the morning

**Prophylaxis of cardiac events following myocardial infarction or revascularisation in stable coronary artery disease**

**BY MOUTH**

- Adult: Initially 5 mg once daily for 2 weeks, then increased if tolerated to 10 mg once daily, dose to be taken in the morning
- Elderly: Initially 2.5 mg once daily for 1 week, then increased if tolerated to 5 mg once daily for 1 week, then increased if tolerated to 10 mg once daily, dose to be taken in the morning

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Coversyl Arginine (Servier Laboratories Ltd)
- Perindopril arginine 2.5 mg
- Perindopril arginine 5 mg
- Perindopril arginine 10 mg

**Moexipril hydrochloride**

**INDICATIONS AND DOSE**

Essential hypertension (monotherapy)

**BY MOUTH**

- Adult: Initially 7.5 mg once daily, adjusted according to response; maintenance 7.5–15 mg once daily; maximum 30 mg per day
- Elderly: Initially 3.75 mg once daily, adjusted according to response; maintenance 7.5–15 mg once daily; maximum 30 mg per day

**MEDICATIONS**

Significant mitral valve stenosis

**SIDE-EFFECTS**

- Very rare: Numbness
- Frequency not known: Alopecia, angina, appetite, arrhythmias, blurred vision, cerebrovascular accident, confusion, depression, drowsiness, dry mouth, dyspnœa, flushing, hyperuricaemia, impotence, myocardial infarction, palpitation, pemphigus, sleep disturbance, Stevens-Johnson syndrome, sweating, syncope, tachycardia, tinnitus, toxic epidermal necrolysis, weight changes

**BREAST FEEDING**

Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

**Hepatic Impairment**

Initial dose 3.75 mg once daily.

**Renal Impairment**

If eGFR less than 40 mL/minute/1.73 m², initial dose 3.75 mg once daily titrated to max. 15 mg once daily.

**Perindopril arginine**

**INDICATIONS AND DOSE**

Hypertension

**BY MOUTH**

- Adult: Initially 5 mg once daily for 1 month, then, adjusted according to response; maximum 10 mg per day
- Elderly: Initially 2.5 mg once daily, then, adjusted according to response; maximum 10 mg per day

**MEDICATIONS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Coversyl Arginine (Servier Laboratories Ltd)
- Perindopril arginine 2.5 mg
- Perindopril arginine 5 mg
- Perindopril arginine 10 mg
Indapamide with perindopril arginine

The properties listed below are those particular to the combination only. For the properties of the components please consider, perindopril arginine p. 129, indapamide p. 160.

### INDICATIONS AND DOSE

Hypertension not adequately controlled by perindopril alone

BY MOUTH
- Adult: (consult product literature)

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, powder

**Tablet**

**CAUTIONARY AND ADVISORY LABELS. 22**

**PERINDOPRIL ERBUMINE (Non-proprietary)**

Perindopril erbumine 2 mg | Perindopril erbumine 2mg tablets | 30 tablet [Ref] £4.41 DT price = £1.15 | 56 tablet [Ref] £3.34
60 tablet [Ref] £3.90

Perindopril erbumine 4 mg | Perindopril erbumine 4mg tablets | 30 tablet [Ref] £4.50 DT price = £1.56 | 56 tablet [Ref] £3.38
60 tablet [Ref] £27.80

Perindopril erbumine 8 mg | Perindopril erbumine 8mg tablets | 30 tablet [Ref] £5.95 DT price = £1.52 | 56 tablet [Ref] £3.88
60 tablet [Ref] £40.00

---

Quinapril

### INDICATIONS AND DOSE

Essential hypertension

BY MOUTH
- Adult: Initially 10 mg once daily; maintenance 20–40 mg daily in up to 2 divided doses; maximum 80 mg per day
- Elderly: Initially 2.5 mg once daily; maintenance 20–40 mg daily in up to 2 divided doses; maximum 80 mg per day

Essential hypertension if used in addition to diuretic

BY MOUTH
- Adult: Initially 2.5 mg once daily; maintenance 20–40 mg daily in up to 2 divided doses; maximum 80 mg per day

Heart failure (adjunct) (under close medical supervision)

BY MOUTH
- Adult: Initially 2.5 mg daily, increased if tolerated to 10–20 mg daily in 1–2 divided doses, doses to be increased gradually; maximum 40 mg per day

### SIDE-EFFECTS

Impotence · asthenia · back pain · blurred vision · chest pain · depression · flatulence · insomnia · nervousness · oedema

### BREAST FEEDING

Avoid in the first few weeks after delivery, particularly in preterm infants, due to the risk of profound neonatal hypotension; if essential, may be used in mothers breast-feeding older infants – the infant’s blood pressure should be monitored.

### HEPATIC IMPAIRMENT

Quinapril is a prodrug and requires close monitoring in patients with hepatic impairment.

### RENAL IMPAIRMENT

Max. initial dose 2.5 mg once daily if eGFR less than 40 mL/minute/1.73 m².

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**QUINAPRIL (Non-proprietary)**

Quinapril (as Quinapril hydrochloride) 5 mg | Quinapril 5mg tablets | 28 tablet [Ref] £8.59 DT price = £8.47
Quinapril (as Quinapril hydrochloride) 10 mg | Quinapril 10mg tablets | 28 tablet [Ref] £8.59 DT price = £8.46
Quinapril (as Quinapril hydrochloride) 20 mg | Quinapril 20mg tablets | 28 tablet [Ref] £6.00 DT price = £1.86
Quinapril (as Quinapril hydrochloride) 40 mg | Quinapril 40mg tablets | 28 tablet [Ref] £8.00 DT price = £2.41

**Accupro (Pfizer Ltd)**

Quinapril (as Quinapril hydrochloride) 5 mg | Accupro 5mg tablets | 28 tablet [Ref] £8.60 DT price = £8.47
Quinapril (as Quinapril hydrochloride) 10 mg | Accupro 10mg tablets | 28 tablet [Ref] £8.60 DT price = £8.46
Quinapril (as Quinapril hydrochloride) 20 mg | Accupro 20mg tablets | 28 tablet [Ref] £10.79 DT price = £1.86
Quinapril (as Quinapril hydrochloride) 40 mg | Accupro 40mg tablets | 28 tablet (PO) £9.75 DT price = £2.41

Hydrochlorothiazide with quinapril

The properties listed below are those particular to the combination only. For the properties of the components please consider, quinapril p. 130, hydrochlorothiazide p. 160.

INDICATIONS AND DOSE
Hypertension in patients stabilised on the individual components in the same proportions

BY MOUTH

Adult: (consult product literature)

Ramipril

INDICATIONS AND DOSE
Hypertension

BY MOUTH

Adult: Initially 1.25–2.5 mg daily, increased if necessary up to 10 mg daily, dose to be increased at intervals of 1–2 weeks

Symptomatic heart failure (adjunct) (under close medical supervision)

BY MOUTH

Adult: Initially 1.25 mg daily, increased if necessary up to 10 mg daily, preferably taken in 2 divided doses, increase dose gradually at intervals of 1–2 weeks

Prophylaxis after myocardial infarction in patients with clinical evidence of heart failure (started at least 48 hours after infarction)

BY MOUTH

Adult: Initially 2.5 mg twice daily for 3 days, then increased to 5 mg twice daily

Prophylaxis after myocardial infarction in patients with clinical evidence of heart failure (started at least 48 hours after infarction) when initial dose not tolerated

BY MOUTH

Adult: Initially 1.25 mg twice daily for 2 days, then increased to 2.5 mg twice daily, then increased to 5 mg twice daily, withdraw treatment if dose cannot be increased to 2.5 mg twice daily

Prevention of cardiovascular events in patients with atherosclerotic cardiovascular disease or with diabetes mellitus and at least one additional risk factor for cardiovascular disease

BY MOUTH

Adult: Initially 2.5 mg daily for 1–2 weeks, then increased to 5 mg daily for a further 2–3 weeks, then increased to 10 mg daily

Nephropathy (consult product literature)

BY MOUTH

Adult: Initially 1.25 mg daily for 2 weeks, then increased to 2.5 mg daily for a further 2 weeks, then increased if tolerated to 5 mg daily

SIDE-EFFECTS

- Common or very common Bronchitis · dyspnoea · muscle cramps · stomatitis · syncope
- Uncommon Angina · anxiety · arrhythmias · chest pain · decreased libido · depression · dry mouth · flushing · impotence · loss of appetite · myocardial infarction · nervousness · palpitations · peripheral oedema · sweating · tachycardia · visual disturbances
- Rare Confusion · conjunctivitis · impaired hearing · onycholysis · tinnitus · tremor
- Frequency not known Alopecia · cerebrovascular accident · erythema multiforme · gynaecomastia · hyponatraemia · pemphigoid exanthema · precipitation or exacerbation of Raynaud’s syndrome · skin reactions · sleep disturbance · Stevens-Johnson syndrome · toxic epidermal necrolysis

BREAST FEEDING
Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

HEPATIC IMPAIRMENT
Max. daily dose 2.5 mg. Ramipril is a prodrug and requires close monitoring in patients with hepatic impairment.

RENAL IMPAIRMENT
Max. daily dose 5 mg if eGFR 30–60 mL/minute/1.73 m²; max. initial dose 1.25 mg once daily (do not exceed 5 mg daily) if eGFR less than 30 mL/minute/1.73 m².

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution containing the same drug.

Felodipine with ramipril

The properties listed below are those particular to the combination only. For the properties of the components please consider, felodipine p. 151, ramipril above.
**INDICATIONS AND DOSE**

Hypertension in patients stabilised on the individual components in the same proportions

**BY MOUTH**
- **Adult:** (consult product literature)

**SIDE-EFFECTS**
- Alopecia
- angina
- arthralgia
- ashen
- bronchitis
- cerebral haemorrhage
- dry mouth
- dysphonia
- hot flushes
- ileus
- myocardial infarction
- nervousness
- palpitation
- psoriasis-like efflorescence
- skin reactions
- sleep disturbances
- Stevens-Johnson syndrome
- sweating
- syncope
- tachycardia
- toxic epidermal necrolysis
- transient ischaemic attacks

**SIDE-EFFECTS, FURTHER INFORMATION**

Symptomatic hypotension: If symptomatic hypotension develops during titration, do not increase dose further; if possible, reduce dose of any adjunctive treatment and if this is not effective or feasible, reduce dose of trandolapril.

**BREAST FEEDING**
Not recommended; alternative treatment options, with better established safety information during breast-feeding, are available.

**HEPATIC IMPAIRMENT**
Trandolapril is a prodrug and requires close monitoring in patients with hepatic impairment.

**RENAL IMPAIRMENT**
Max. 2 mg daily if eGFR less than 10 mL/minute/1.73 m².

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

- **Capsule**
  - **TRANDOLAPRIL (Non-proprietary)**
    - Trandolapril 500 microgram: 500 microgram capsules | 14 capsule [PO] £1.92 DT price = £1.87
    - Trandolapril 1 mg: 1 mg capsules | 28 capsule [PO] £20.00 DT price = £19.99
    - Trandolapril 2 mg: 2 mg capsules | 28 capsule [PO] £10.40 DT price = £7.60
    - Trandolapril 4 mg: 4 mg capsules | 28 capsule [PO] £14.19 DT price = £14.01

**ANGIOTENSIN-II RECEPTOR ANTAGONISTS**

**Angiotensin-II receptor antagonists**

- **CONTRA-INDICATIONS**
  The combination of an angiotensin-II receptor antagonist with aliskiren is contra-indicated in patients with an eGFR less than 60 mL/minute/1.73 m².

- **CAUTIONS**
  - Afro-Caribbean patients—particularly those with left ventricular hypertrophy (may not benefit from an angiotensin-II receptor antagonist).
  - aortic or mitral valve stenosis—elderly (lower initial doses may be appropriate).
  - hypertrophic cardiomyopathy—patients with a history of angioedema.

**INTERACTIONS**
Appendix 1 (angiotensin-II receptor antagonists).

**SIDE-EFFECTS**
- Hyperkalaemia
- angioedema (may be delayed onset).
- Symptomatic hypotension including dizziness (particularly in patients with intravascular volume depletion).
- Pregnancy
  - Angiotensin-II receptor antagonists should be avoided in pregnancy unless essential.
  - They may adversely affect fetal and neonatal blood pressure control and renal function; neonatal skull defects and oligohydramnios have also been reported.

**BREAST FEEDING**
- Information on the use of angiotensin-II receptor antagonists in breast-feeding is limited.
  - They are not recommended in breast-feeding and alternative treatment options, with better established safety information during breast-feeding, are available.

**RENAL IMPAIRMENT**
- Use with caution, starting with low dose, and adjust according to response.

**MONITORING REQUIREMENTS**
- Monitor plasma-potassium concentration, particularly in the elderly and in patients with renal impairment.

**Azilsartan medoxomil**

**INDICATIONS AND DOSE**

Hypertension

**BY MOUTH**
- **Adult 18–74 years:** Initially 40 mg once daily, increased if necessary to 80 mg once daily
- **Adult 75 years and over:** Initially 20–40 mg once daily, increased if necessary to 80 mg once daily

**Hypertension with intravascular volume depletion**

**BY MOUTH**
- **Adult:** Initially 20–40 mg daily, increased if necessary to 80 mg daily

**SIDE-EFFECTS**
- **Common or very common**
  - Diarrhoea
  - Heart failure
  - Diarrhoea
  - Diarrhoea

**HEPATIC IMPAIRMENT**
- Manufacturer advises to consider initial dose of 20 mg in mild to moderate impairment (limited information available).

Manufacturer advises avoid in severe impairment (no information available). Manufacturer advises monitor closely in mild to moderate hepatic impairment (limited information available).
### Renal Impairment

The manufacturer advises caution in severe impairment—no information available.

### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Edarbi** (Takeda UK Ltd)
  - Azilsartan medoxomil 20 mg | 28 tablet (PO) £16.80 DT price = £16.80
  - Azilsartan medoxomil 40 mg | 28 tablet (PO) £16.80 DT price = £16.80
  - Azilsartan medoxomil 80 mg | 28 tablet (PO) £19.95 DT price = £19.95

### Side-effects

- Common or very common: Headache, vertigo
- Very rare: Arthralgia, back pain, blood disorders, cough, hepatitis, hypotension, myalgia, nausea, pruritus, rash, urticaria

### Hepatic Impairment

Initially 4 mg once daily in mild or moderate impairment. Avoid in severe hepatic impairment.

### Renal Impairment

Initially 4 mg daily, use with caution if eGFR less than 30 mL/minute/1.73 m²—limited experience.

### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**Tablet**

- **Candesartan cilexetil 2 mg** | 7 tablet (PO) £5.53
- **Candesartan cilexetil 4 mg** | 7 tablet (PO) £8.88 DT price = £8.88
- **Candesartan cilexetil 8 mg** | 28 tablet (PO) £9.89 DT price = £9.89
- **Candesartan cilexetil 16 mg** | 28 tablet (PO) £12.72 DT price = £12.72
- **Candesartan cilexetil 32 mg** | 28 tablet (PO) £16.13 DT price = £16.13

**Amias** (Takeda UK Ltd)

- **Candesartan cilexetil 2 mg** | 7 tablet (PO) £3.58 DT price = £3.58
- **Candesartan cilexetil 4 mg** | 7 tablet (PO) £6.83 DT price = £6.83
- **Candesartan cilexetil 8 mg** | 28 tablet (PO) £9.78

### Contra-Indications

- Cholestasis

### Indications and Dose

**Hypertension**

**By Mouth**

- Adult: 600 mg once daily

**Side-effects**

- Common or very common: Headache, vertigo, fatigue, muscular-skeletal pain, nausea, vomiting

**Hepatic Impairment**

Caution in mild or moderate liver disease. Avoid in severe impairment.

**Renal Impairment**

Caution if eGFR less than 30 mL/minute/1.73 m².

### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**Tablet**

- **Eprosartan (as Eprosartan mesilate) 300 mg** | 28 tablet (PO) £7.31 DT price = £7.31
- **Eprosartan (as Eprosartan mesilate) 400 mg** | 56 tablet (PO) £25.98 DT price = £25.98
- **Eprosartan (as Eprosartan mesilate) 600 mg** | 28 tablet (PO) £14.31 DT price = £14.31

**Teveteen** (BGP Products Ltd)

- **Eprosartan (as Eprosartan mesilate) 300 mg** | 28 tablet (PO) £7.31 DT price = £7.31
- **Eprosartan (as Eprosartan mesilate) 600 mg** | 28 tablet (PO) £14.31 DT price = £14.31

### Indications and Dose

**Hypertension**

**By Mouth**

- Adult 18-74 years: Initially 150 mg once daily, increased if necessary to 300 mg once daily
- Adult 75 years and over: Initially 75–150 mg once daily, increased if necessary to 300 mg once daily

**Hypertension in patients receiving haemodialysis**

**By Mouth**

- Adult: Initially 75–150 mg once daily, increased if necessary to 300 mg once daily

**Renal disease in hypertensive type 2 diabetes mellitus**

**By Mouth**

- Adult 18-74 years: Initially 150 mg once daily, increased if tolerated to 300 mg once daily
- Adult 75 years and over: Initially 75–150 mg once daily, increased if tolerated to 300 mg once daily

**Renal disease in hypertensive type 2 diabetes mellitus in patients receiving haemodialysis**

**By Mouth**

- Adult: Initially 75–150 mg once daily, increased if tolerated to 300 mg once daily

### Side-effects

- Common or very common: Fatigue, muscular-skeletal pain, nausea, vomiting
- Uncommon: Chest pain, cough, diarrhoea, dyspepsia, flushing, sexual dysfunction, tachycardia
- Rare: Rash, urticaria

### Candesartan Cilexetil 16 mg

Amias 16mg tablets | 28 tablet (PO) £12.72 DT price = £1.57

### Candesartan Cilexetil 32 mg

Amias 32mg tablets | 28 tablet (PO) £16.13 DT price = £2.20

### Eprosartan

**Indications and Dose**

**Hypertension**

**By Mouth**

- Adult: 600 mg once daily

**Side-effects**

- Common or very common: Headache, vertigo, fatigue, muscular-skeletal pain, nausea, vomiting.

**Hepatic Impairment**

Caution in mild or moderate liver disease. Avoid in severe impairment.

**Renal Impairment**

Caution if eGFR less than 30 mL/minute/1.73 m².

### Irbesartan

**Indications and Dose**

**Hypertension**

**By Mouth**

- Adult 18-74 years: Initially 150 mg once daily, increased if necessary to 300 mg once daily
- Adult 75 years and over: Initially 75–150 mg once daily, increased if necessary to 300 mg once daily

**Hypertension in patients receiving haemodialysis**

**By Mouth**

- Adult: Initially 75–150 mg once daily, increased if necessary to 300 mg once daily

**Renal disease in hypertensive type 2 diabetes mellitus**

**By Mouth**

- Adult 18-74 years: Initially 150 mg once daily, increased if tolerated to 300 mg once daily
- Adult 75 years and over: Initially 75–150 mg once daily, increased if tolerated to 300 mg once daily

**Renal disease in hypertensive type 2 diabetes mellitus in patients receiving haemodialysis**

**By Mouth**

- Adult: Initially 75–150 mg once daily, increased if tolerated to 300 mg once daily

**Side-effects**

- Common or very common: Fatigue, muscular-skeletal pain, nausea, vomiting.
- Uncommon: Chest pain, cough, diarrhoea, dyspepsia, flushing, sexual dysfunction, tachycardia.
- Rare: Rash, urticaria.
Hydrochlorothiazide with irbesartan

The properties listed below are those particular to the combination only. For the properties of the components please consider, irbesartan p. 133, hydrochlorothiazide p. 160.

INDICATIONS AND DOSE

Hypertension not adequately controlled with irbesartan alone

BY MOUTH

Adult: (consult product literature)

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

HYDROCHLOROTHIAZIDE WITH IRBESARTAN (Nonproprietary)

Hydrochlorothiazide 12.5 mg, Irbesartan 150 mg  Irbesartan 150 mg / Hydrochlorothiazide 12.5 mg tablets | 28 tablet (PO) £11.25 DT price = £1.60

Hydrochlorothiazide 25 mg, Irbesartan 300 mg  Irbesartan 300 mg / Hydrochlorothiazide 25 mg tablets | 28 tablet (PO) £11.53 DT price = £1.87

Hydrochlorothiazide 12.5 mg, Irbesartan 300 mg  Irbesartan 300 mg / Hydrochlorothiazide 12.5 mg tablets | 28 tablet (PO) £15.13 DT price = £2.00

CoAprovel (Sanofi)

Hydrochlorothiazide 12.5 mg, Irbesartan 150 mg  CoAprovel 150 mg/12.5 mg tablets | 28 tablet (PO) £11.84 DT price = £1.62

Hydrochlorothiazide 25 mg, Irbesartan 300 mg  CoAprovel 300 mg/25 mg tablets | 28 tablet (PO) £15.93 DT price = £2.35

Losartan potassium

INDICATIONS AND DOSE

Diabetic nephropathy in type 2 diabetes mellitus

BY MOUTH

Adult 18–75 years: Initially 50 mg once daily for several weeks, then increased if necessary to 100 mg once daily

Adult 76 years and over: Initially 25 mg once daily

Chronic heart failure when ACE inhibitors are unsuitable or contra-indicated

BY MOUTH

Adult: Initially 12.5 mg once daily, increased if tolerated up to 150 mg once daily, doses to be increased at weekly intervals

Hypertension

BY MOUTH

Adult 18–75 years: Initially 50 mg once daily for several weeks, then increased if necessary to 100 mg once daily

Adult 76 years and over: Initially 25 mg daily

Hypertension with intravascular volume depletion

BY MOUTH

Adult 18–75 years: Initially 25 mg once daily for several weeks, then increased if necessary up to 100 mg once daily

CAUTIONS

Severe heart failure

SIDE-EFFECTS

Common or very common  Vertigo

Uncommon  Angina, dyspnoea, gastro-intestinal disturbances, headache, malaise, oedema, palpitation, pruritus, rash, sleep disorders, urticaria

Rare  Atrial fibrillation, cerebrovascular accident, hepatitis, paraesthesia, syncope

Frequency not known  Anaemia, anaphylaxis, arthralgia, cough, depression, erectile dysfunction, Henoch–Schönlein purpura, hyponatraemia, myalgia, pancreatitis, photosensitivity, renal impairment, rhabdomyolysis, thrombocytopenia, tinnitus, vasculitis

HEPATIC IMPAIRMENT  Consider dose reduction in mild to moderate impairment. Manufacturer advises avoid in severe impairment—no information available.

PRESCRIBING AND DISPENSING INFORMATION

Flavours of oral liquid formulations may include berry-citrus.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

LOSARTAN POTASSIUM (Nonproprietary)

Losartan potassium 12.5 mg  Losartan 12.5 mg tablets | 28 tablet (PO) £7.48 DT price = £0.97

Losartan potassium 25 mg  Losartan 25 mg tablets | 28 tablet (PO) £16.18 DT price = £2.15

Losartan potassium 50 mg  Losartan 50 mg tablets | 28 tablet (PO) £16.18 DT price = £2.35

Losartan potassium 100 mg  Losartan 100 mg tablets | 28 tablet (PO) £16.18 DT price = £2.35

Cozaar (Merck Sharp & Dohme Ltd)

Losartan potassium 12.5 mg  Cozaar 12.5 mg tablets | 28 tablet (PO) £8.09 DT price = £1.15

Losartan potassium 25 mg  Cozaar 25 mg tablets | 28 tablet (PO) £16.18 DT price = £2.25

Losartan potassium 50 mg  Cozaar 50 mg tablets | 28 tablet (PO) £22.80 DT price = £3.14

Losartan potassium 100 mg  Cozaar 100 mg tablets | 28 tablet (PO) £16.18 DT price = £2.50

Cozaar (Merck Sharp & Dohme Ltd)

Losartan potassium 2.5 mg per 1 ml  Cozaar 2.5 mg/ml oral suspension (sugar-free) | 200 ml (PO) £3.68
Hydrochlorothiazide with losartan

The properties listed below are those particular to the combination only. For the properties of the components please consider, losartan potassium p. 134, hydrochlorothiazide p. 160.

**INDICATIONS AND DOSE**

Hypertension not adequately controlled with losartan alone

**BY MOUTH**

- Adult: (consult product literature)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- HYDROCHLOROTHIAZIDE WITH LOSARTAN (Non-proprietary)

  | Hydrochlorothiazide 12.5 mg, Losartan potassium |
  | 50 mg Losartan 50mg / Hydrochlorothiazide 12.5mg tablets | 28 tablet P trom £13.75 DT price = £1.65

  | Hydrochlorothiazide 25 mg, Losartan potassium |

**Olmesartan medoxomil**

**INDICATIONS AND DOSE**

Hypertension

**BY MOUTH**

- Adult: Initially 10 mg daily, increased if necessary to 20 mg daily; maximum 40 mg per day

**CONTRA-INDICATIONS**

Biliary obstruction

**SIDE-EFFECTS**

Common or very common

- Arthritis, chest pain, cough, fatigue, gastro-intestinal disturbances, haematuria, hypertriglyceridaemia, hyperuricaemia, influenza-like symptoms, musculoskeletal pain, peripheral oedema, pharyngitis, rhinitis, urinary-tract infection

- Uncommon

  | Angina, rash, vertigo |
  | Very rare |

  | Headache, myalgia, pruritus, thrombocytopenia, urticaria |

**HEPATIC IMPAIRMENT**

Dose should not exceed 20 mg daily in moderate impairment. Manufacturer advises avoid in severe impairment—no information available.

**RENAL IMPAIRMENT**

Max. 20 mg daily if eGFR 20–60 mL/minute/1.73 m². Avoid if eGFR less than 20 mL/minute/1.73 m².

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**Tablet**

- Olmetec (Daichi Sankyo UK Ltd)

  | Olmesartan medoxomil 10 mg |
  | Olmetec 10mg tablets | 28 tablet P trom £10.95 DT price = £1.05

  | Olmesartan medoxomil 20 mg |
  | Olmetec 20mg tablets | 28 tablet P trom £12.95 DT price = £1.25

  | Olmesartan medoxomil 40 mg |
  | Olmetec 40mg tablets | 28 tablet P trom £17.50 DT price = £1.75

Amlodipine with olmesartan

The properties listed below are those particular to the combination only. For the properties of the components please consider, amlodipine p. 148, olmesartan medoxomil p. 160.

**INDICATIONS AND DOSE**

Hypertension in patients stabilised on the individual components in the same proportions

**BY MOUTH**

- Adult: (consult product literature)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Sevikar (Daichi Sankyo UK Ltd)

  | Amlodipine (as Amlodipine besilate) 5 mg, Olmesartan medoxomil 20 mg |
  | Sevikar 20mg/5mg tablets | 28 tablet P trom £16.95

  | Amlodipine (as Amlodipine besilate) 10 mg, Olmesartan medoxomil 40 mg |
  | Sevikar 40mg/10mg tablets | 28 tablet P trom £16.95

  | Amlodipine (as Amlodipine besilate) 5 mg, Olmesartan medoxomil 40 mg |
  | Sevikar 40mg/5mg tablets | 28 tablet P trom £16.95

Amlodipine with hydrochlorothiazide and olmesartan

The properties listed below are those particular to the combination only. For the properties of the components please consider, amlodipine p. 148, olmesartan medoxomil, hydrochlorothiazide p. 160.

**INDICATIONS AND DOSE**

Hypertension in patients stabilised on the individual components in the same proportions, or for hypertension not adequately controlled with olmesartan and amlodipine

**BY MOUTH**

- Adult: (consult product literature)
136 Blood pressure conditions

Hydrochlorothiazide with olmesartan

The properties listed below are those particular to the combination only. For the properties of the components please consider, olmesartan medoxomil p. 135, hydrochlorothiazide p. 160.

INDICATIONS AND DOSE

Hypertension not adequately controlled with olmesartan alone

BY MOUTH

Adult: (consult product literature)

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- Olmec Plus (Daichi Sankyo UK Ltd)
  Hydrochlorothiazide 12.5 mg, Olmesartan medoxomil
  20 mg Olmec Plus 20mg/12.5mg tablets [28 tablet £12.95 DT price = £12.95
  Hydrochlorothiazide 25 mg, Olmesartan medoxomil
  20 mg Olmec Plus 20mg/25mg tablets [28 tablet £12.95 DT price = £12.95
  Hydrochlorothiazide 12.5 mg, Olmesartan medoxomil
  40 mg Olmec Plus 40mg/12.5mg tablets [28 tablet £17.50 DT price = £17.50

Telmisartan

INDICATIONS AND DOSE

Hypertension

BY MOUTH

Adult: Initially 20–40 mg once daily for at least 4 weeks, increased if necessary up to 80 mg once daily

Prevention of cardiovascular events in patients with established atherosclerotic cardiovascular disease, or type 2 diabetes mellitus with target-organ damage

BY MOUTH

Adult: 80 mg once daily

- SIDE-EFFECTS

  - Common or very common Arthralgia - back pain - chest pain - eczema - gastro-intestinal disturbances - influenza-like symptoms - leg cramps - myalgia - pharyngitis - sinusitis - urinary-tract infection
  - Uncommon Abnormal vision - anxiety - dry mouth - flatulence - increased sweating - tendinitis-like symptoms - vertigo
  - Rare Blood disorders - bradycardia - depression - dyspepsia - eosinophilia - increase in uric acid - insomnia - pruritus - rash - tachycardia
  - Frequency not known Asthenia - syncope

- HEPATIC IMPAIRMENT

20–40 mg once daily in mild or moderate impairment. Avoid in severe impairment or biliary obstruction.

- RENAL IMPAIRMENT

Manufacturer advises initial dose of 20 mg once daily in severe impairment.

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- TELMISARTAN (Non-proprietary)
  Telmisartan 20 mg Telmisartan 20mg tablets [28 tablet £1.35–£12.93 DT price = £1.49
  Telmisartan 40 mg Telmisartan 40mg tablets [28 tablet £1.35–£12.93 DT price = £1.49
  Telmisartan 80 mg Telmisartan 80mg tablets [28 tablet £1.98–£16.15 DT price = £1.98
  Micardis (Boehringer Ingelheim Ltd)
  Telmisartan 20 mg Micardis 20mg tablets [28 tablet £11.10 DT price = £1.44

Hydrochlorothiazide with telmisartan

The properties listed below are those particular to the combination only. For the properties of the components please consider, telmisartan above, hydrochlorothiazide p. 160.

INDICATIONS AND DOSE

Hypertension not adequately controlled by telmisartan alone

BY MOUTH

Adult: (consult product literature)

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- HYDROCHLOROTHIAZIDE WITH TELMISARTAN (Non-proprietary)
  Hydrochlorothiazide 12.5 mg, Telmisartan 40 mg Telmisartan 40mg / Hydrochlorothiazide 12.5mg tablets [28 tablet £13.61 DT price = £13.61

Valsartan

INDICATIONS AND DOSE

Hypertension

BY MOUTH

Adult: Initially 80 mg once daily, increased if necessary up to 320 mg daily, doses to be increased at intervals of 4 weeks

Hypertension with intravascular volume depletion

BY MOUTH

Adult: Initially 40 mg once daily, increased if necessary up to 320 mg daily, dose to be increased at intervals of 4 weeks
Heart failure when ACE inhibitors cannot be used, or in conjunction with an ACE inhibitor when a beta-blocker cannot be used | Heart failure, in conjunction with an ACE inhibitor when a beta-blocker cannot be used (under expert supervision)

**BY MOUTH**
- Adult: Initially 40 mg twice daily, increased to up to 160 mg twice daily, dose to be increased at intervals of at least 2 weeks

Myocardial infarction with left ventricular failure or left ventricular systolic dysfunction

**BY MOUTH**
- Adult: Initially 20 mg twice daily, increased if necessary up to 160 mg twice daily, dose to be increased over several weeks

**SIDE-EFFECTS**
- Common or very common Renal impairment
- Uncommon Acute renal failure - cough - fatigue - gastrointestinal disturbance - headache - syncope
- Frequency not known Hypersensitivity reactions - myalgia - neutropenia - pruritus - rash - serum sickness - thrombocytopenia - vasculitis

**HEPATIC IMPAIRMENT** Max. dose 80 mg daily in mild to moderate impairment. Avoid in severe hepatic impairment.

**RENAI IMPAIRMENT** Use with caution if eGFR less than 10 mL/minute/1.73 m² — no information available.

**CONTRA-INDICATIONS** Biliary cirrhosis - cholestasis

**ANTIHYPERTENSIVES (CENTRALLY ACTING)**

**Clonidine hydrochloride**

**INDICATIONS AND DOSE**

Hypertension not adequately controlled by valsartan alone

**BY MOUTH**
- Adult: (consult product literature)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **HYDROCHLOROTHIAZIDE WITH VALSARTAN (Non-proprietary)**
  - Hydrochlorothiazide 12.5 mg, Valsartan 80 mg: Co-Diovan 80mg/12.5mg tablets | 28 tablet (POM) £13.97 DT price = £8.47
  - Hydrochlorothiazide 25 mg, Valsartan 160 mg: Co-Diovan 160mg/25mg tablets | 28 tablet DT price = £18.41 DT price = £11.21
  - Hydrochlorothiazide 12.5 mg, Valsartan 160 mg: Co-Diovan 160mg/12.5mg tablets | 28 tablet DT price = £18.41 DT price = £2.52

- **Co-Diovan (Novartis Pharmaceuticals UK Ltd)**
  - Hydrochlorothiazide 12.5 mg, Valsartan 80 mg: Co-Diovan 80mg/12.5mg tablets | 28 tablet (POM) £13.97 DT price = £8.47

</tr>
</tbody>
</table>

**SIDE-EFFECTS**

**SIDE-EFFECTS, FURTHER INFORMATION**

Side-effects are minimised if the daily dose is kept below 2 g.

**PREGNANCY** Not known to be harmful.

**BREAST FEEDING** Amount too small to be harmful.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in history of liver disease. AVOID in active liver disease.

**Renal Impairment** Increased sensitivity to hypotensive and sedative effect. Start with small dose.

**MONITORING REQUIREMENTS** Monitor blood counts and liver-function before treatment and at intervals during first 6–12 weeks or if unexplained fever occurs.

**EFFECT ON LABORATORY TESTS** Interference with laboratory tests. Positive direct Coombs’ test in up to 20% of patients (may affect blood cross-matching).

**PATIENT AND CARER ADVICE**

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, solution for injection, oral suspension, solution for infusion, oral solution, transdermal patch.

**Tablet CAUTIONARY AND ADVISORY LABELS 3, 8**

- Methyldopa anhydrous 125 mg Methyldopa 125mg tablets | 56 tablet | £0.75–£12.10 DT price = £11.16
- Methyldopa anhydrous 250 mg Methyldopa 250mg tablets | 56 tablet | £13.25 DT price = £6.33
- Methyldopa anhydrous 500 mg Methyldopa 500mg tablets | 56 tablet | £18.05 DT price = £3.94
- Aldomet (Aspen Pharma Trading Ltd) Methyldopa anhydrous 250 mg Aldomet 250mg tablets | 60 tablet | £6.15
- Methyldopa anhydrous 500 mg Aldomet 500mg tablets | 30 tablet | £4.55

**Moxonidine**

**INDICATIONS AND DOSE**

Mild to moderate essential hypertension

**BY MOUTH**

- Adult: 200 micrograms once daily for 3 weeks, dose to be increased in the morning, then increased if necessary to 400 micrograms daily in 1–2 divided doses (max. per dose 400 micrograms); maximum 600 micrograms per day in 2 divided doses

**CONTRA-INDICATIONS**

- Bradycardia - conduction disorders - second- or third-degree AV block - severe heart failure - sick sinus syndrome - sino-atrial block

**CAUTIONS**

- First-degree AV block - moderate heart failure - severe coronary artery disease - unstable angina

**INTERACTIONS** → Appendix 1 (moxonidine).

**SIDE-EFFECTS**

- Common or very common Back pain - diarrhoea - dizziness - dry mouth - dyspepsia - insomnia - nausea - pruritus - rash - somnolence - vomiting
- Uncommon Angioedema - bradycardia - neck pain - nervousness - oedema - tinnitus

**PREGNANCY** Manufacturer advises avoidance—no information available.

**BREAST FEEDING** Present in milk—manufacturer advises avoidance.

**RENAL IMPAIRMENT** Max. single dose 200 micrograms and max. daily dose 400 micrograms if eGFR 30–60 mL/minute/1.73 m². Avoid if eGFR less than 30 mL/minute/1.73 m².

**TREATMENT CESSION** Avoid abrupt withdrawal (if concomitant treatment with beta-blocker has to be stopped, discontinue beta-blocker first, then moxonidine after a few days).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet CAUTIONARY AND ADVISORY LABELS 3**

- **Moxonidine (Non-proprietary)**

  Moxonidine 200 microgram Moxonidine 200 microgram tablets | 28 tablet | £10.40 DT price = £2.20
  Moxonidine 300 microgram Moxonidine 300 microgram tablets | 28 tablet | £13.85 DT price = £2.26
  Moxonidine 400 microgram Moxonidine 400 microgram tablets | 28 tablet | £14.24 DT price = £2.38
Beta-adrenoceptor blocking drugs

Beta-adrenoceptor blocking drugs (beta-blockers) block the beta-adrenoceptors in the heart, peripheral vasculature, bronchi, pancreas, and liver.

Many beta-blockers are now available and in general they are all equally effective. There are, however, differences between them, which may affect choice in treating particular diseases or individual patients.

Intrinsic sympathomimetic activity (ISA, partial agonist activity) represents the capacity of beta-blockers to stimulate as well as to block adrenergic receptors. Oxprenolol hydrochloride p. 145, pindolol p. 146, acebutolol p. 141, and celiprolol hydrochloride p. 143 have intrinsic sympathomimetic activity; they tend to cause less bradycardia than the other beta-blockers and may also cause less coldness of the extremities.

Some beta-blockers are lipid soluble and some are water soluble. Atenolol p. 141, celiprolol hydrochloride, nadolol p. 145, and sotalol hydrochloride p. 93 are the most water-soluble; they are less likely to enter the brain, and may therefore cause less sleep disturbance and nightmares. Water-soluble beta-blockers are excreted by the kidneys and dosage reduction is often necessary in renal impairment.

Beta-blockers with a relatively short duration of action have to be given two or three times daily. Many of these are, however, available in modified-release formulations so that administration once daily is adequate for hypertension. For angina twice-daily treatment may sometimes be needed even with a modified-release formulation. Some beta-blockers, such as atenolol, bisoprolol fumarate p. 142, celiprolol hydrochloride, and nadolol, have an intrinsically longer duration of action and need to be given only once daily.

Beta-blockers slow the heart and can depress the myocardium; they are contra-indicated in patients with second- or third-degree heart block. Beta-blockers should also be avoided in patients with worsening unstable heart failure; care is required when initiating a beta-blocker in those with stable heart failure.

Labeltolol hydrochloride p. 143, celiprolol hydrochloride, carvedilol p. 142, and nebivolol p. 145 are beta-blockers that have, in addition, an arteriolar vasodilating action, by diverse mechanisms, and thus lower peripheral resistance. There is no evidence that these drugs have important advantages over other beta-blockers in the treatment of hypertension.

Beta-blockers can precipitate bronchospasm and should therefore usually be avoided in patients with a history of asthma. When there is no suitable alternative, it may be necessary for a patient with well-controlled asthma, or chronic obstructive pulmonary disease (without significant reversible airways obstruction), to receive treatment with a beta-blocker for a co-existing condition (e.g. heart failure or following myocardial infarction). In this situation, a cardioselective beta-blocker should be selected and initiated at a low dose by a specialist; the patient should be closely monitored for adverse effects. Atenolol, bisoprolol fumarate, metoprolol tartrate p. 144, nebivolol, and (to a lesser extent) acebutolol, have less effect on the beta-(bronchial) receptors and are, therefore, relatively cardioselective, but they are not cardioselective. They have a lesser effect on airways resistance but are not free of this side-effect.

Beta-blockers are also associated with fatigue, coldness of the extremities (may be less common with those with ISA), and sleep disturbances with nightmares (may be less common with the water-soluble beta-blockers).

Beta-blockers can affect carbohydrate metabolism, causing hypoglycaemia or hyperglycaemia in patients with or without diabetes; they can also interfere with metabolic and autonomic responses to hypoglycaemia, thereby masking symptoms such as tachycardia. However, beta-blockers are not contra-indicated in diabetes, although the cardioselective beta-blockers may be preferred. Beta-blockers should be avoided altogether in those with frequent episodes of hypoglycaemia. Beta-blockers, especially when combined with a thiazide diuretic, should be avoided for the routine treatment of uncomplicated hypertension in patients with diabetes or in those at high risk of developing diabetes.

Hypertension

The mode of action of beta-blockers in hypertension is not understood, but they reduce cardiac output, alter baroceptor reflex sensitivity, and block peripheral adrenoceptors. Some beta-blockers depress plasma renin secretion. It is possible that a central effect may also partly explain their mode of action.

Beta-blockers are effective for reducing blood pressure but other antihypertensives are usually more effective for reducing the incidence of stroke, myocardial infarction, and cardiovascular mortality, especially in the elderly. Other antihypertensives are therefore preferred for routine initial treatment of uncomplicated hypertension.

In general, the dose of a beta-blocker does not have to be high.

Beta-blockers can be used to control the pulse rate in patients with phaeochromocytoma. However, they should never be used alone as beta-blockade without concurrent alpha-blockade may lead to a hypertensive crisis. For this reason phenoxybenzamine hydrochloride p. 161 should always be used together with the beta-blocker.

Angina

By reducing cardiac work beta-blockers improve exercise tolerance and relieve symptoms in patients with angina (see management of stable angina and acute coronary syndromes for further details). As with hypertension there is no good evidence of the superiority of any one drug, although occasionally a patient will respond better to one beta-blocker than to another. There is some evidence that sudden withdrawal may cause an exacerbation of angina and therefore gradual reduction of dose is preferable when beta-blockers are to be stopped. There is a risk of precipitating heart failure when beta-blockers and verapamil are used together in established ischaemic heart disease.

Myocardial infarction

For specific comments see management of ST-segment elevation myocardial infarction and non-ST-segment elevation myocardial infarction.

Several studies have shown that some beta-blockers can reduce the recurrence rate of myocardial infarction. However, uncontrolled heart failure, hypotension, bradycardias, and obstructive airways disease render beta-blockers unsuitable in some patients following a myocardial infarction. Atenolol p. 141 and metoprolol tartrate p. 144 may reduce early mortality after intravenous and subsequent oral administration in the acute phase, while acebutolol p. 141, metoprolol tartrate, propranolol hydrochloride p. 146, and timolol maleate p. 147 have protective value when started in the early convalescent phase. The evidence relating to other beta-blockers is less
Cardiovascular system

Heart failure; nebivolol p. may induce torsade de pointes in susceptible patients.

Coronary disease or cardiomyopathy. However, it may be more effective than lidocaine in the termination of non-sustained ventricular tachycardia. It has been shown to be cardioselective, should usually be avoided in patients with a history of obstructive airway disease.

Arrhythmias

Beta-blockers act as anti-arrhythmic drugs principally by attenuating the effects of the sympathetic system on automaticity and conductivity within the heart. They can be used in conjunction with digoxin to control the ventricular response in atrial fibrillation, especially in patients with thyrotoxicosis. Beta-blockers are also useful in the management of supraventricular tachycardias, and are used to control those following myocardial infarction.

Esmolol hydrochloride p. 143 is a relatively cardioselective beta-blocker with a very short duration of action, used intravenously for the short-term treatment of supraventricular arrhythmias, sinus tachycardia, or hypertension, particularly in the peri-operative period. It may also be used in other situations, such as acute myocardial infarction, when sustained beta-blockade might be hazardous.

Sotalol hydrochloride p. 93, a non-cardioselective beta-blocker with additional class III anti-arrhythmic activity, is used for prophylaxis in paroxysmal supraventricular arrhythmias. It also suppresses ventricular ectopic beats and non-sustained ventricular tachycardia. It has been shown to be more effective than lidocaine in the termination of spontaneous sustained ventricular tachycardia due to coronary disease or cardiomyopathy. However, it may induce torsade de pointes in susceptible patients.

Heart failure

Beta-blockers may produce benefit in heart failure by blocking sympathetic activity. Bisoprolol fumarate p. 142 and carvedilol p. 142 reduce mortality in any grade of stable heart failure; nebivolol p. 145 is licensed for stable mild to moderate heart failure in patients over 70 years. Treatment should be initiated by those experienced in the management of heart failure.

Thyrotoxicosis

Beta-blockers are used in pre-operative preparation for thyroidectomy. Administration of propranolol hydrochloride p. 146 can reverse clinical symptoms of thyrotoxicosis within 4 days. Routine tests of increased thyroid function remain unaltered. The thyroid gland is rendered less vascular thus making surgery easier.

Other uses

Beta-blockers have been used to alleviate some symptoms of anxiety; probably patients with palpitation, tremor, and tachycardia respond best. Beta-blockers are also used in the prophylaxis of migraine. Betaxolol p. 963, carteolol hydrochloride p. 963, levobunolol hydrochloride p. 964, and timolol maleate p. 965 are used topically in glaucoma.

beta-adrenoceptor blockers (systemic)

CONTRA-INDICATIONS Asthma, cardiogenic shock, hypotension, marked bradycardia, metabolic acidosis, phaeochromocytoma (apart from specific use with alpha-blockers); Prinzmetal’s angina - second-degree AV block severe peripheral arterial disease, sick sinus syndrome, third-degree AV block - uncontrolled heart failure

CONTRA-INDICATIONS, FURTHER INFORMATION

Bronchospasm Beta-blockers, including those considered to be cardioselective, should usually be avoided in patients with a history of asthma, bronchospasm or a history of obstructive airways disease. However, when there is no alternative, a cardioselective beta-blocker can be given to these patients with caution and under specialist supervision. In such cases the risk of inducing bronchospasm should be appreciated and appropriate precautions taken.

CAUTIONS Diabetes - first-degree AV block - history of obstructive airways disease (introduce cautiously); myasthenia gravis - portal hypertension (risk of deterioration in liver function); psoriasis - symptoms of hypoglycaemia may be masked - symptoms of thyrotoxicosis may be masked

INTERACTIONS → Appendix 1 (beta-blockers).

Verapamil and beta-blockers Verapamil injection should not be given to patients recently treated with beta-blockers because of the risk of hypotension and asystole. The suggestion that when verapamil injection has been given first, an interval of 30 minutes before giving a beta-blocker is sufficient has not been confirmed. It may also be hazardous to give verapamil and a beta-blocker together by mouth (should only be contemplated if myocardial function well preserved). There is a risk of precipitating heart failure when beta-blockers and verapamil are used together in established ischaemic heart disease.

SIDE-EFFECTS

Rare Dry eyes (reversible on withdrawal) - rashes (reversible on withdrawal)

Frequency not known Alopecia - bradycardia - bronchospasm - coldness of the extremities - conduction disorders - dizziness - dyspnoea - exacerbation of intermittent claudication - exacerbation of psoriasis - exacerbation of Raynaud’s phenomenon - fatigue - gastrointestinal disturbances - headache - heart failure - hyperglycaemia (in patients with or without diabetes) - hypoglycaemia (in patients with or without diabetes) - hypotension - paraesthesia - peripheral vasoconstriction - psychosis - purpura - sexual dysfunction - sleep disturbances (with nightmares) - symptoms of hypoglycaemia masked - thrombocytopenia - vertigo - visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

Bradycardia With administration by intravenous injection, excessive bradycardia can occur and may be countered with intravenous injection of atropine sulfate. Overdose Therapeutic overdosages with beta-blockers may cause lightheadedness, dizziness, and possibly syncope as a result of bradycardia and hypotension; heart failure may be precipitated or exacerbated. For details on the management of poisoning, see Beta-blockers, under Emergency treatment of poisoning p. 1123

ALLERGY AND CROSS-SENSITIVITY Caution is advised in patients with a history of hypersensitivity—may increase sensitivity to allergens and result in more serious hypersensitivity response. Furthermore beta-adrenoceptor blockers may reduce response to adrenaline (epinephrine).

PREGNANCY Beta-blockers may cause intra-uterine growth restriction, neonatal hypoglycaemia, and bradycardia; the risk is greater in severe hypertension.

BREAST FEEDING With systemic use in the mother, infants should be monitored as there is a risk of possible toxicity due to beta-blockade. However, the amount of most beta-blockers present in milk is too small to affect infants.

MONITORING REQUIREMENTS Monitor lung function (in patients with a history of obstructive airway disease).

TREATMENT CESSION Avoid abrupt withdrawal especially in ischaemic heart disease. Sudden cessation of a beta-blocker can cause a rebound worsening of myocardial ischaemia and therefore gradual reduction of dose is preferable when beta-blockers are to be stopped.
Acebutolol

INDICATIONS AND DOSE

Hypertension
BY MOUTH
- Adult: Initially 400 mg daily for 2 weeks, alternatively initially 200 mg twice daily for 2 weeks, then increased if necessary to 400 mg twice daily; maximum 1.2 g per day.

Arrhythmias
BY MOUTH
- Adult: Initially 400 mg daily, alternatively initially 200 mg twice daily; maximum 1.2 g per day

Angina
BY MOUTH
- Adult: Initially 400 mg daily, alternatively 200 mg twice daily; maximum 1.2 g per day

INDICATIONS AND DOSAGE

Migraine prophylaxis
BY MOUTH
- Adult: 150 micrograms/kg every 12 hours if required, to be given over 20 minutes

Early intervention within 12 hours of myocardial infarction initially by intravenous injection
- Adult: Initially 5 mg, to be given over 5 minutes, followed by (by mouth) 50 mg after 15 minutes, then (by mouth) 50 mg after 12 hours, then (by mouth) 100 mg daily

Breastfeeding

Acebutolol and water soluble beta-blockers are present in breast milk in greater amounts than other beta-blockers.

RENAL IMPAIRMENT
- Halve dose if eGFR 25–50 mg/L/minute/1.73 m²; use quarter dose if eGFR less than 25 mL/minute/1.73 m²; do not administer more than once daily.

Breastfeeding

Acebutolol and water soluble beta-blockers are present in breast milk in greater amounts than other beta-blockers.

RENAL IMPAIRMENT
- With oral use Max. 50 mg daily if eGFR 15–35 mL/minute/1.73 m²; max. 25 mg daily or 50 mg on alternate days if eGFR less than 15 mL/minute/1.73 m².
- With intravenous use Max. 10 mg on alternate days if eGFR 15–35 mL/minute/1.73 m²; max. 10 mg every 4 days if eGFR less than 15 mL/minute/1.73 m².

DIRECTIONS FOR ADMINISTRATION
For intravenous infusion (Tenormin®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Suggested infusion time 20 minutes.

INDICATIONS AND DOSE

Hypertension

BY MOUTH

- Adult: Initially 12.5 mg once daily for 2 days, then increased to 25 mg once daily; increased if necessary up to 50 mg daily, dose to be increased at intervals of at least 2 weeks and can be given as a single dose or in divided doses
- Elderly: Initially 12.5 mg daily, initial dose may provide satisfactory control

Angina

BY MOUTH

- Adult: Initially 12.5 mg twice daily for 2 days, then increased to 25 mg twice daily

Adjunct to diuretics, digoxin, or ACE inhibitors in symptomatic chronic heart failure

BY MOUTH

- Adult: Initially 3.125 mg twice daily, dose to be taken with food, then increased to 6.25 mg twice daily, then increased to 12.5 mg twice daily, then increased to 25 mg twice daily, dose should be increased at intervals of at least 2 weeks up to the highest tolerated dose, max. 25 mg twice daily in patients with severe heart failure or body-weight less than 85 kg; max. 50 mg twice daily in patients over 85 kg

CONTRA-INDICATIONS

Acute or decompensated heart failure requiring intravenous inotropes - sino–atrial block

CAUTIONS

Ensure heart failure not worsening before increasing dose

SIDE-EFFECTS

- Uncommon Cramp - depression - muscle weakness
- Rare Hearing impairment - hypertriglyceridaemia - syncope
- Very rare Conjunctivitis

HEPATIC IMPAIRMENT Max. 10 mg daily in severe impairment.

RENAL IMPAIRMENT Reduce dose if eGFR less than 20 mL/minute/1.73 m² (max. 10 mg daily).

Hypertensive emergencies

**BY INTRAVENOUS INJECTION**
- Adult: 50 mg, to be given over at least 1 minute, then 50 mg every 5 minutes if required until a satisfactory response occurs; maximum 200 mg per course

**BY INTRAVENOUS INFUSION**
- Adult: Initially 2 mg/minute until a satisfactory response is achieved, then discontinue; usual dose 50–200 mg

**Hypertension**

**BY MOUTH**
- Adult: Initially 100 mg twice daily, dose to be increased at intervals of 14 days; usual dose 200 mg twice daily, increased if necessary up to 800 mg daily in 2 divided doses, to be taken with food, higher doses to be given in 3–4 divided doses; maximum 2.4 g per day
- Elderly: Initially 50 mg twice daily, dose to be increased at intervals of 14 days; usual dose 200 mg twice daily, increased if necessary up to 800 mg daily in 2 divided doses, to be taken with food, higher doses to be given in 3–4 divided doses; maximum 2.4 g per day

**BY INTRAVENOUS INJECTION**
- Adult: 50 mg, dose to be given over at least 1 minute, then 50 mg after 5 minutes if required; maximum 200 mg per course

**BY INTRAVENOUS INFUSION**
- Adult: Initially 2 mg/minute until a satisfactory response is achieved, then discontinue; usual dose 50–200 mg

---

**Metoprolol tartrate**

**INDICATIONS AND DOSE**

**Hypertension**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Adult: Initially 100 mg daily, increased if necessary to 200 mg daily in 1–2 divided doses, high doses are rarely required; maximum 400 mg per day

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- Adult: 200 mg once daily

**Angina**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Adult: 50–100 mg 2–3 times a day

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- Adult: 200–400 mg daily

**Arrhythmias**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Adult: Usual dose 50 mg 2–3 times a day, then increased if necessary up to 300 mg daily in divided doses

**BY INTRAVENOUS INJECTION**
- Adult: Up to 5 mg, dose to be given at a rate of 1–2 mg/minute, then up to 5 mg after 5 minutes if required, total dose of 10–15 mg

**Migraine prophylaxis**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Adult: 100–200 mg daily in divided doses

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- Adult: 200 mg daily

**Hyperthyroidism (adjunct)**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Adult: 50 mg 4 times a day

**In surgery**

**BY SLOW INTRAVENOUS INJECTION**
- Adult: Initially 2–4 mg, given at induction or to control arrhythmias developing during anaesthesia, then 2 mg, repeated if necessary; maximum 10 mg per course

**Early intervention within 12 hours of infarction**

**INITIALLY BY INTRAVENOUS INJECTION**
- Adult: Initially 5 mg every 2 minutes to a max. of 15 mg, followed after 15 minutes by (by mouth) 50 mg every 6 hours for 48 hours; (by mouth) maintenance 200 mg daily in divided doses

---

**HEPATIC IMPAIRMENT** Reduce dose in severe impairment.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension.

---

**Side-effects**

- **Rare** Lichenoid rash
- **Frequency not known** Difficulty in micturition, epigastric pain, liver damage, nausea, postural hypotension, vomiting, weakness

**Pregnancy**

The use of labetalol in maternal hypertension is not known to be harmful, except possibly in the first trimester. If labetalol is used close to delivery, infants should be monitored for signs of alpha-blockade (as well as beta blockage).

**Breast feeding**

Infants should be monitored as there is a risk of possible toxicity due to alpha-blockade (in addition to beta-blockade).

**Hepatic impairment**

Avoid—severe hepatocellular injury reported.

**Renal impairment**

Dose reduction may be required.

**Monitoring requirements**

Liver damage Severe hepatocellular damage reported after both short-term and long-term treatment. Appropriate laboratory testing needed at first symptom of liver dysfunction and if laboratory evidence of damage (or if jaundice) labetalol should be stopped and not restarted.

**Effect on laboratory tests**

Interferes with laboratory tests for catecholamines.

**Directions for administration**

Avoid upright position during and for 3 hours after intravenous administration. For intravenous infusion, give intermittently in Glucose 5% or Sodium chloride and glucose. Dilute to a concentration of 1 mg/mL; suggested volume 200 mL; adjust rate with in-line burette.

---

**Hypertension in patient with renal impairment**

**BY MOUTH**

- Adult: Initially 2.5 mg once daily, then increased if necessary to 5 mg once daily

**Adjunct in stable mild to moderate heart failure**

**BY MOUTH**

- Adult 70 years and over: Initially 1.25 mg once daily for 1–2 weeks, then increased if tolerated to 2.5 mg once daily for 1–2 weeks, then increased if tolerated to 5 mg once daily for 1–2 weeks, then increased if tolerated to 10 mg once daily

### Oxprenolol hydrochloride

**INDICATIONS AND DOSE**

**Hypertension**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- Adult: 80–160 mg daily in 2–3 divided doses, then increased if necessary up to 320 mg daily

**Angina**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- Adult: 80–160 mg daily in 2–3 divided doses; maximum 320 mg per day

**Arrhythmias**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- Adult: 40–240 mg daily in 2–3 divided doses; maximum 240 mg per day

**Anxiety symptoms (short-term use)**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- Adult: 40–80 mg daily in 1–2 divided doses

**Hypertension | Angina**

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- Adult: Initially 160 mg once daily, then increased if necessary up to 320 mg daily

**HEPATIC IMPAIRMENT**

Reduce dose.
## Propranolol hydrochloride

### INDICATIONS AND DOSE

#### Thyrotoxicosis
BY MOUTH
- Adult: 10–40 mg 3–4 times a day

#### Thyrotoxic crisis
BY INTRAVENOUS INJECTION
- Adult: 1 mg, to be given over 1 minute, dose may be repeated if necessary at intervals of 2 minutes, maximum total dose is 5 mg in anaesthesia; maximum 10 mg per course

#### Hypertension
BY MOUTH
- Adult: Initially 80 mg twice daily, dose should be increased at weekly intervals as required; maintenance 160–320 mg daily

#### Prophylaxis of variceal bleeding in portal hypertension
BY MOUTH
- Adult: Initially 40 mg twice daily, then increased to 80 mg twice daily (max. per dose 160 mg twice daily), dose to be adjusted according to heart rate

#### Phaeochromocytoma (only with an alpha-blocker) in preparation for surgery
BY MOUTH
- Adult: 60 mg daily for 3 days before surgery

#### Phaeochromocytoma (only with an alpha-blocker) in patients unsuitable for surgery
BY MOUTH
- Adult: 30 mg daily

#### Angina
BY MOUTH
- Adult: Initially 40 mg 2–3 times a day; maintenance 120–240 mg daily

#### Hypertrophic cardiomyopathy | Anxiety tachycardia
BY MOUTH
- Adult: 10–40 mg 3–4 times a day

#### Anxiety with symptoms such as palpitation, sweating and tremor
BY MOUTH
- Adult: 40 mg once daily, then increased if necessary to 40 mg 3 times a day

#### Prophylaxis after myocardial infarction
BY MOUTH
- Adult: Initially 40 mg 4 times a day for 2–3 days, then 80 mg twice daily, start treatment 5 to 21 days after infarction

#### Essential tremor
BY MOUTH
- Adult: Initially 40 mg 2–3 times a day; maintenance 80–160 mg daily

#### Migraine prophylaxis
BY MOUTH
- Adult: 80–240 mg daily in divided doses

#### Arrhythmias
BY INTRAVENOUS INJECTION
- Adult: 1 mg, to be given over 1 minute, dose may be repeated if necessary at intervals of 2 minutes, maximum total dose is 5 mg in anaesthesia; maximum 10 mg per course

#### SIDE-EFFECTS
- Rare Dry eyes (reversible on withdrawal)

#### HEPATIC IMPAIRMENT
Reduce oral dose.

#### RENAL IMPAIRMENT
Manufacturer advises caution; dose reduction may be required.
### Timolol maleate

#### INDICATIONS AND DOSE

**Hypertension**
- **BY MOUTH**
  - Adult: 10–20 mg daily in 1–2 divided doses

**Angina**
- **BY MOUTH**
  - Adult: Initially 5 mg twice daily, then increased in steps of 10 mg daily every 3–4 days (max. 30 mg twice daily)

**Prophylaxis after myocardial infarction**
- **BY MOUTH**
  - Adult: Initially 5 mg twice daily for 2 days, then increased if tolerated to 10 mg twice daily

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**Tablet**

**CAUTIONARY AND ADVISORY LABELS**

- **Adult:**
  - **BY MOUTH**
    - Hypertension

**PROPRANOLOL HYDROCHLORIDE (Non-proprietary)**
- Propranolol hydrochloride 10 mg
- Propranolol 10mg tablets | 28 tablet (P) £1.90 DT price = £1.69
- Propranolol hydrochloride 40 mg
- Propranolol 40mg tablets | 28 tablet (P) £4.50 DT price = £3.88
- Propranolol hydrochloride 80 mg
- Propranolol 80mg tablets | 28 tablet (P) no price available | 50 tablet (P) £9.33 DT price = £3.43
- Propranolol hydrochloride 160 mg
- Propranolol 160mg tablets | 56 tablet (P) £6.23 DT price = £5.57

**Modified-release capsule**

**PROPRANOLOL HYDROCHLORIDE (Non-proprietary)**
- Propranolol hydrochloride 80 mg
- Propranolol 80mg modified-release capsules | 28 capsule (P) £6.98 DT price = £6.58
- Propranolol hydrochloride 160 mg
- Propranolol 160mg modified-release capsules | 28 capsule (P) £4.88 DT price = £5.13
- Bedranol SR (Sandoz Ltd, Almus Pharmaceuticals Ltd)
- Bedranol hydrochloride 80 mg
- Bedranol SR 80mg capsules | 28 capsule (P) £4.16 DT price = £6.58
- Bedranol hydrochloride 160 mg
- Bedranol SR 160mg capsules | 28 capsule (P) £5.09 DT price = £5.13
- Beta-Prograne (Tillomed Laboratories Ltd, Actavis UK Ltd, Teva UK Ltd)
- Propranolol hydrochloride 160 mg
- Beta-Prograne 160mg modified-release capsules | 28 capsule (P) £4.31-$6.11 DT price = £5.13
- Half Beta-Prograne (Teva UK Ltd, Actavis UK Ltd, Tillomed Laboratories Ltd)
- Propranolol hydrochloride 80 mg
- Half Beta-Prograne 80mg modified-release capsules | 28 capsule (P) £4.67-$4.95 DT price = £4.98

**Oral solution**

**PROPRANOLOL HYDROCHLORIDE (Non-proprietary)**
- Propranolol hydrochloride 1 mg
- 1 ml
- Propranolol 5mg/5ml oral solution sugar free (sugar-free) | 150 ml (P) no price available
- Propranolol hydrochloride 2 mg
- 1 ml
- Propranolol 10mg/5ml oral solution sugar free (sugar-free) | 150 ml (P) no price available
- Propranolol hydrochloride 8 mg
- 1 ml
- Propranolol 40mg/5ml oral solution sugar free (sugar-free) | 150 ml (P) no price available
- Propranolol hydrochloride 10 mg
- 1 ml
- Propranolol 50mg/5ml oral solution sugar free (sugar-free) | 150 ml (P) no price available
- Brands may include Syprol

### Amiloride with hydrochlorothiazide and timolol

The properties listed below are those particular to the combination only. For the properties of the components please consider, amiloride hydrochloride p. 103, timolol maleate above.

#### INDICATIONS AND DOSE

**Hypertension**
- **BY MOUTH**
  - Adult: 1–2 tablets daily

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS**

- **Adult:**
  - **BY MOUTH**
    - Hypertension

**AMILORIDE WITH HYDROCHLOROTHIAZIDE AND TIMOLOL (Non-proprietary)**
- Amiloride hydrochloride 2.5 mg, Hydrochlorothiazide 25 mg, Timolol maleate 10 mg
- Prestim 10 mg tablets | 42 tablet (P) £12.59 DT price = £10.66

**Amiloride hydrochloride 2.5 mg, Hydrochlorothiazide 25 mg, Timolol maleate 10 mg**
- Prestim 10 mg tablets | 28 tablet (P) £29.87

---

### Bendroflumethiazide with timolol

The properties listed below are those particular to the combination only. For the properties of the components please consider, timolol maleate above, bendroflumethiazide p. 159.

#### INDICATIONS AND DOSE

**Hypertension**
- **BY MOUTH**
  - Adult: 1–2 tablets daily; maximum 4 tablets per day

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS**

- **Adult:**
  - **BY MOUTH**
    - Hypertension

**Bendroflumethiazide with timolol**
- Bendroflumethiazide 2.5 mg, Timolol maleate 10 mg
- Prestim tablets | 30 tablet (P) £3.49

---

### Calcium-channel blockers

Calcium-channel blockers differ in their predilection for the various possible sites of action and, therefore, their therapeutic effects are disparate, with much greater variation than those of beta-blockers. There are important...
Calcium-channel blockers

- **DRUG ACTION** Calcium-channel blockers (less correctly called 'calcium-antagonists') interfere with the inward displacement of calcium ions through the slow channels of active cell membranes. They influence the myocardial cells, the cells within the specialised conducting system of the heart, and the cells of vascular smooth muscle. Thus, myocardial contractility may be reduced, the formation and propagation of electrical impulses within the heart may be depressed, and coronary or systemic vascular tone may be diminished.

- **SIDE-EFFECTS**
  - **Overdose** Features of calcium-channel blocker poisoning include nausea, vomiting, dizziness, agitation, confusion, and coma in severe poisoning. Metabolic acidosis and hyperglycaemia may occur. For details on the management of poisoning, see Calcium-channel blockers, under Emergency treatment of poisoning p. 1123.
  - **TREATMENT CESSATION** There is some evidence that sudden withdrawal of calcium-channel blockers may be associated with an exacerbation of myocardial ischaemia.

### Amlodipine

- **DRUG ACTION** Amlodipine is a dihydropyridine calcium-channel blocker.

#### INDICATIONS AND DOSE

- **Angina**
  - **BY MOUTH**
  - **Adult:** Initially 5 mg once daily; maximum 10 mg per day

- **Hypertension**
  - **BY MOUTH**
  - **Adult:** Initially 5 mg once daily; maximum 10 mg per day

#### Dose equivalence and conversion

Tablets from various suppliers may contain different salts (e.g. amlodipine besilate, amlodipine maleate, and amlodipine mesilate) but the strength is expressed in terms of amlodipine (base); tablets containing different salts are considered interchangeable.

- **CONTRA-INDICATIONS** Cardiogenic shock · significant aortic stenosis · unstable angina
- **INTERACTIONS** Appendix 1 (calcium-channel blockers).
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain · dizziness · fatigue · flushing · headache · nausea · oedema · palpitation · sleep disturbances
  - **Uncommon** Alopecia · arthralgia · asthenia · back pain · chest pain · dry mouth · dyspnoea · gastro-intestinal disturbances · gynaecomastia · hypotension · impotence · mood changes · muscle cramps · myalgia · paraesthesia · pruritus · purpura · rashes · rhinitis · skin discoloration · sweating · syncope · taste disturbances · tinnitus · tremor · urinary disturbances · visual disturbances · weight changes
  - **Very rare** Angioedema · arrhythmias · cholestasis · coughing · gastritis · gingival hyperplasia · hepatitis · hyperglycaemia · jaundice · myocardial infarction · pancreatitis · peripheral neuropathy · tachycardia · thrombocytopения · urticaria · vasculitis
  - **Frequency not known** Erythema multiforme

- **Overdose** In overdose, the dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

- **PREGNANCY** No information available—manufacturer advises avoid, but risk to fetus should be balanced against risk of uncontrolled maternal hypertension.
Diltiazem hydrochloride

INDICATIONS AND DOSE
Angina
BY MOUTH
- Adult: Initially 60 mg 3 times a day, adjusted according to response; maximum 360 mg per day
- Elderly: Initially 60 mg twice daily, adjusted according to response; maximum 360 mg per day

Dose equivalence and conversion
The standard formulations containing 60 mg diltiazem hydrochloride are licensed as generics and there is no requirement for brand name dispensing. Although their means of formulation has called for the strict designation 'modified-release', their duration of action corresponds to that of tablets requiring administration more frequently.

TILDIE RETARDO®
Mild to moderate hypertension
BY MOUTH
- Adult: Initially 90–120 mg twice daily; increased if necessary to 360 mg daily in divided doses
- Elderly: Initially 120 mg daily; increased if necessary to 120 mg twice daily

Angina
BY MOUTH
- Adult: Initially 90–120 mg twice daily; increased if necessary to 480 mg daily in divided doses
- Elderly: Up to 120 mg twice daily, dose form not appropriate for initial dose titration

ADIZEM-SR® TABLETS
Mild to moderate hypertension
BY MOUTH
- Adult: 120 mg twice daily, dose form not appropriate for initial dose titration

Angina
BY MOUTH
- Adult: Initially 90 mg twice daily; increased if necessary to 180 mg twice daily, dose form not appropriate for initial dose titration in the elderly

ADIZEM-SR® CAPSULES
Mild to moderate hypertension
BY MOUTH
- Adult: 120 mg twice daily, dose form not appropriate for initial dose titration

Angina
BY MOUTH
- Adult: Initially 90 mg twice daily; increased if necessary to 360 mg daily; dose form not appropriate for initial dose titration in the elderly

TILDIE LA
Angina | Mild to moderate hypertension
BY MOUTH
- Adult: Initially 200 mg daily, to be taken with or before food, increased if necessary to 300–400 mg daily; maximum 500 mg per day
- Elderly: Initially 200 mg daily, increased if necessary to 300 mg daily

VIAZEM® XL
Angina | Mild to moderate hypertension
BY MOUTH
- Adult: Initially 180 mg once daily, adjusted according to response to 240 mg once daily; maximum 360 mg per day
- Elderly: Initially 120 mg once daily, adjusted according to response

DILZEM® XL
Angina | Mild to moderate hypertension
BY MOUTH
- Adult: Initially 180 mg daily; increased if necessary to 360 mg daily
- Elderly: Initially 120 mg daily; increased if necessary to 360 mg daily

Amlozin with valsartan

The properties listed below are those particular to the combination only. For the properties of the components please consider, amlodipine p. 148, valsartan p. 136.

INDICATIONS AND DOSE
Hypertension in patients stabilised on the individual components in the same proportions
BY MOUTH
- Adult: (consult product literature)

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet
- Exforge (Novartis Pharmaceuticals UK Ltd)
- Amlodipine (as Amlodipine besilate) 5 mg, Valsartan 80 mg
- Exforge 5mg/80mg tablets | 28 tablet [P] £16.76 DT price = £16.76
- Amlodipine (as Amlodipine besilate) 10 mg, Valsartan 160 mg
- Exforge 10mg/160mg tablets | 28 tablet [P] £22.09 DT price = £22.09

Oral solution
- Amlodipine (Non-proprietary)
- Amlodipine 1 mg per 1 ml Amlodipine 5mg/5ml oral solution sugar free (sugar-free) | 150 ml [P] £110.00
- Amlodipine 2 mg per 1 ml Amlodipine 10mg/5ml oral solution sugar free (sugar-free) | 150 ml [P] £110.00

Also available in combination with olmesartan, p. 135 - hydrochlorothiazide and olmesartan, p. 135 - valsartan, below

Diltiazem hydrochloride

INDICATIONS AND DOSE
Angina
BY MOUTH
- Adult: Initially 60 mg 3 times a day, adjusted according to response; maximum 360 mg per day
- Elderly: Initially 60 mg twice daily, adjusted according to response; maximum 360 mg per day

Hypertension
BY MOUTH
- Adult: Initially 90–120 mg twice daily; increased if necessary to 360 mg daily in divided doses
- Elderly: Initially 120 mg daily; increased if necessary to 120 mg twice daily

HEPATIC IMPAIRMENT
May need dose reduction—half-life prolonged.

DIRECTIONS FOR ADMINISTRATION
Tablets may be dispersed in water.
**DILZEM® SR**

**Angina | Mild to moderate hypertension**

**BY MOUTH**
- **Adult:** Initially 90 mg twice daily; increased if necessary up to 180 mg twice daily
- **Elderly:** Initially 60 mg twice daily; increased if necessary up to 180 mg twice daily

---

**ADIZEM-XL®**

**Angina | Mild to moderate hypertension**

**BY MOUTH**
- **Adult:** Initially 240 mg daily, increased if necessary to 300 mg daily
- **Elderly:** Initially 120 mg daily, increased if necessary up to 300 mg daily

---

**ZEMTARD®**

**Angina**

**BY MOUTH**
- **Adult:** 180–300 mg daily, increased if necessary to 480 mg daily
- **Elderly:** Initially 120 mg daily, increased if necessary to 480 mg daily

---

**Mild to moderate hypertension**

**BY MOUTH**
- **Adult:** 180–300 mg daily, increased if necessary to 360 mg daily
- **Elderly:** Initially 120 mg daily, increased if necessary to 360 mg daily

---

**SLOZEM®**

**Angina | Mild to moderate hypertension**

**BY MOUTH**
- **Adult:** Initially 240 mg daily; increased if necessary to 360 mg daily
- **Elderly:** Initially 120 mg daily; increased if necessary to 360 mg daily

---

**DILCARDIA® SR**

**Angina | Mild to moderate hypertension**

**BY MOUTH**
- **Adult:** Initially 90 mg twice daily; increased if necessary to 180 mg twice daily
- **Elderly:** Initially 60 mg twice daily; increased if necessary to 90 mg twice daily

---

- Acute porphyrias p. 864: left ventricular failure with pulmonary congestion. second- or third-degree AV block (unless pacemaker fitted): severe bradycardia: sick sinus syndrome
- Bradycardia (avoid if severe): first degree AV block: heart failure: prolonged PR interval: significantly impaired left ventricular function
- Appendix 1 (calcium-channel blockers).
Felodipine

- **DRUG ACTION** Felodipine is a dihydropyridine calcium-channel blocker.

## INDICATIONS AND DOSE

### Angina

#### BY MOUTH

- **Adult:** Initially 5 mg daily; increased if necessary to 10 mg daily, to be taken in the morning
- **Elderly:** Initially 2.5 mg daily; increased if necessary to 10 mg daily, to be taken in the morning

### Hypertension

#### BY MOUTH

- **Adult:** Initially 5 mg daily, to be taken in the morning; usual maintenance 5–10 mg once daily, doses above 20 mg daily rarely needed
- **Elderly:** Initially 2.5 mg daily, to be taken in the morning; usual maintenance 5–10 mg once daily, doses above 20 mg daily rarely needed

### CONTRA-INDICATIONS

Cardiac outflow obstruction - significant cardiac valvular obstruction (e.g. aortic stenosis) - uncontrolled heart failure - unstable angina - within 1 month of myocardial infarction
Cardiovascular system

Very rare

INTERACTIONS

SIDE-EFFECTS
- Common or very common Flushing • headache • peripheral oedema
- Uncommon Abdominal pain • dizziness • malaise • nausea • palpitation • paraesthesia • pruritus • rash • tachycardia
- Rare Arthralgia • impotence • myalgia • syncope • vomiting
- Very rare Gum hyperplasia • leucocytoclastic vasculitis • photosensitivity • urinary frequency

PREGNANCY
- Avoid; toxicity in animal studies; may inhibit labour.

BREAST FEEDING
- Present in milk but amount probably too small to be harmful.

HEPATIC IMPAIRMENT

BREAST FEEDING
- Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT
- 1.25 mg twice daily, increased if necessary after 3–4 weeks according to response; maintenance dose of 2.5 mg or 5 mg once daily may be sufficient.

RENAL IMPAIRMENT
- Use with caution.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet
- ISRADIPINE (Non-proprietary) Isradipine 2.5 mg Isradipine 2.5mg tablets | 56 tablet £21.11-£21.11 DT price = £185.64

Lacidipine

- DRUG ACTION Lacidipine is a dihydropyridine calcium-channel blocker.

INDICATIONS AND DOSE

Hypertension

BY MOUTH
- Adult: Initially 2 mg daily; increased if necessary to 4 mg daily, then increased if necessary to 6 mg daily, dose increases should occur at intervals of 3–4 weeks, to be taken preferably in the morning

CONTRA-INDICATIONS
- Acute porphyrias p. 864 • aortic stenosis • avoid within 1 month of myocardial infarction • cardiogenic shock • unstable angina

CAUTIONS
- Cardiac conduction abnormalities • poor cardiac reserve

INTERACTIONS
- Appendix 1 (calcium-channel blockers).

SIDE-EFFECTS
- Common or very common Dizziness • flushing • headache • oedema • palpitation
- Rare Aggravation of angina • asthenia • erythema • gastrointestinal disturbances • gum hyperplasia • mood disturbances • muscle cramps • polyuria • pruritus • skin rash

Overdose
- In overdose, the dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

PREGNANCY
- Manufacturer advises avoid; may inhibit labour.

BREAST FEEDING
- Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT
- Antihypertensive effect possibly increased.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet
- LACIDIPINE (Non-proprietary) Lacidipine 2 mg Lacidipine 2mg tablets | 28 tablet £2.95 DT price = £2.90

Isradipine

INDICATIONS AND DOSE

Hypertension

BY MOUTH
- Adult: 2.5 mg twice daily for 3–4 weeks, then increased if necessary to 5 mg twice daily, dose increased exceptionally up to 10 mg twice daily
- Elderly: 1.25 mg twice daily, increased if necessary after 3–4 weeks according to response; maintenance 2.5–5 mg once daily

CONTRA-INDICATIONS
- Acute porphyrias p. 864 • cardiogenic shock • during or within 1 month of myocardial infarction • unstable angina

CAUTIONS
- Chronic heart failure • poor cardiac reserve • severe aortic stenosis • sick sinus syndrome (if pacemaker not fitted)

INTERACTIONS
- Appendix 1 (calcium-channel blockers).

SIDE-EFFECTS
- Common or very common Abdominal discomfort • dizziness • dyspnoea • fatigue • flushing • headache • palpitation • peripheral oedema • polyuria • rash • tachycardia
- Uncommon Hypotension • weight gain
- Very rare Anaemia • anorexia • anxiety • arrhythmia • arthralgia • blood disorders • bradycardia • cough • depression • drowsiness • erectile dysfunction • gum hyperplasia • heart failure • hypersensitivity reactions • leucopenia • nausea • paraesthesia • thrombocytopenia • visual disturbance • vomiting

FREQUENCY NOT KNOWN Gynaecomastia • hepatitis

Overdose
- In overdose, the dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

PREGNANCY
- May inhibit labour. Risk to fetus should be balanced against risk of uncontrolled maternal hypertension.

BREAST FEEDING
- Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT
- 1.25 mg twice daily, increased if necessary after 3–4 weeks according to response; maintenance dose of 2.5 mg or 5 mg once daily may be sufficient.

RENAL IMPAIRMENT
- Use with caution.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet
- ISRADIPINE (Non-proprietary) Isradipine 2.5 mg Isradipine 2.5mg tablets | 56 tablet £21.11-£21.11 DT price = £185.64
Lercanidipine hydrochloride

**DRUG ACTION** Lercanidipine is a dihydropyridine calcium-channel blocker.

**INDICATIONS AND DOSE**

**Mild to moderate hypertension**

**BY MOUTH**

- Adult: Initially 10 mg once daily; increased if necessary to 20 mg daily, dose can be adjusted after 2 weeks

**CONTRA-INDICATIONS**

- Acute porphyrias p. 864
- Aortic stenosis
- Uncontrolled heart failure
- Unstable angina
- Within 1 month of myocardial infarction

**CAUTIONS**

- Left ventricular dysfunction
- Sick sinus syndrome (if pacemaker not fitted)

**INTERACTIONS**

- Appendix 1 (calcium-channel blockers).

**SIDE-EFFECTS**

- **Uncommon**
  - Dizziness, flushing, headache, palpitation, peripheral oedema, tachycardia
  - Angina, asthenia, drowsiness, gastrointestinal disturbances, myalgia, polyuria, rash

- **Very rare**
  - Gingival hyperplasia
  - Hypotension - myocardial infarction

**OVERDOSE** In overdose, the dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

**PREGNANCY**

- Manufacturer advises avoid—no information available.

**BREAST FEEDING**

- Manufacturer advises avoid.

**HEPATIC IMPAIRMENT**

- Avoid in severe disease.

**RENAL IMPAIRMENT**

- Avoid if eGFR less than 30 mL/minute/1.73 m².

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- CAUTIONARY AND ADVISORY LABELS 22
  - Lercanidipine hydrochloride (Non-proprietary)
    - Lercanidipine hydrochloride 10 mg
      - Lercanidipine 10mg tablets | 28 tablet | £5.89 DT price = £1.57
      - Lercanidipine hydrochloride 20 mg
        - Lercanidipine 20mg tablets | 28 tablet | £10.82 DT price = £1.84
  - Zanidip (Recordati Pharmaceuticals Ltd)
    - Lercanidipine hydrochloride 10 mg
      - Zanidip 10mg tablets | 28 tablet | £5.70 DT price = £1.57
    - Lercanidipine hydrochloride 20 mg
      - Zanidip 20mg tablets | 28 tablet | £10.82 DT price = £1.84

Nicardipine hydrochloride

**DRUG ACTION** Nicardipine is a dihydropyridine calcium-channel blocker.

**INDICATIONS AND DOSE**

**Prophylaxis of angina**

- **BY MOUTH USE IMMEDIATE-RELEASE MEDICINES**
  - Adult: Initially 20 mg 3 times a day, then increased to 30 mg 3 times a day, dose increased after at least 3 days; usual dose 60–120 mg daily

**CONTRA-INDICATIONS**

- Acute porphyrias p. 864
- Aortic stenosis
- Uncontrolled heart failure
- Unstable angina
- Within 1 month of myocardial infarction

**CAUTIONS**

- Left ventricular dysfunction
- Sick sinus syndrome (if pacemaker not fitted)

**INTERACTIONS**

- Appendix 1 (calcium-channel blockers).

**SIDE-EFFECTS**

- **Uncommon**
  - Dizziness, flushing, headache, palpitation, peripheral oedema, tachycardia
  - Angina, asthenia, drowsiness, gastrointestinal disturbances, myalgia, polyuria, rash

- **Very rare**
  - Gingival hyperplasia
  - Hypotension - myocardial infarction

**OVERDOSE** In overdose, the dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

**PREGNANCY**

- For treatment of acute life-threatening hypertension only. May inhibit labour. Not to be used in...
multiple pregnancy (twins or more) unless there is no other acceptable alternative. Toxicity in animal studies. Risk of severe maternal hypotension and fatal foetal hypoxia—avoid excessive decrease in blood pressure.

- **BREAST FEEDING** Manufacturer advises avoid—present in breast milk.
- **HEPATIC IMPAIRMENT**
  - With oral use Use with caution—consider using lowest initial dose and extending dosing interval according to individual response.
  - With intravenous use Use with caution—use lower initial dose.
- **RENAL IMPAIRMENT**
  - With oral use Consider using lowest initial dose and extending dosing interval according to individual response.
  - With intravenous use Use with caution—use lower initial dose.
- **MONITORING REQUIREMENTS**
  - With intravenous use Monitor blood pressure and heart rate at least every 5 minutes during intravenous infusion, and then until stable, and continue monitoring for at least 12 hours after end of infusion.
- **DIRECTIONS FOR ADMINISTRATION**
  - Intravenous nicardipine should only be administered under the supervision of a specialist and in a hospital or intensive care setting in which patients can be closely monitored. For *intravenous infusion* give continuously in Glucose 5%; dilute dose in infusion fluid to a final concentration of 100–200 micrograms/mL (undiluted solution via central venous line only) and give via volumetric infusion pump or syringe driver; protect from light; to minimise peripheral venous irritation, change site of infusion every 12 hours; risk of adsorption on to plastic of infusion set in the presence of saline solutions; incompatible with bicarbonate or alkaline solutions—consult product literature.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Capsule**
- NICARDIPINE HYDROCHLORIDE (Non-proprietary)
  - Nicardipine hydrochloride 20 mg Nicardipine 20mg capsules | 56 capsule  £8.38 DT price = £6.00

**Solution for infusion**
- NICARDIPINE HYDROCHLORIDE (Non-proprietary)
  - Nicardipine hydrochloride 1 mg per 1 ml Nicardipine 10mg/10ml solution for injection ampoules | 5 ampoule  £50.00

---

**INDICATIONS AND DOSE**

**Raynaud’s syndrome**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: Initially 5 mg 3 times a day, then adjusted according to response to 20 mg 3 times a day

**Angina prophylaxis (not recommended)**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: Initially 5 mg 3 times a day, then adjusted according to response to 20 mg 3 times a day

**Postponement of premature labour**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: Initially 20 mg, followed by 10–20 mg 3–4 times a day, adjusted according to uterine activity

**Hiccups in palliative care**
- **BY MOUTH**
  - Adult: 10 mg 3 times a day

**ADALAT®**

**Angina prophylaxis (not recommended) | Raynaud’s phenomenon**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: Initially 5 mg 3 times a day, then adjusted according to response to 20 mg 3 times a day

**Dose equivalence and conversion**
Adalat liquid gel capsules contain 5 mg nifedipine in 0.17 mL and 10 mg nifedipine in 0.34 mL.

**ADALAT® LA**

**Hypertension**
- **BY MOUTH**
  - Adult: 20–30 mg once daily, increased if necessary up to 90 mg once daily

**Angina prophylaxis**
- **BY MOUTH**
  - Adult: 30 mg once daily, increased if necessary up to 90 mg once daily

**FORTIPINE® LA 40**

**Hypertension | Angina prophylaxis**
- **BY MOUTH**
  - Adult: Initially 40 mg once daily, increased if necessary up to 80 mg daily in 1–2 divided doses

**VALMI® XL**

**Severe hypertension | Prophylaxis of angina**
- **BY MOUTH**
  - Adult: 30 mg once daily, increased if necessary up to 90 mg once daily

**ADALAT RETARD®**

**Hypertension | Angina prophylaxis**
- **BY MOUTH**
  - Adult: 10 mg twice daily, adjusted according to response to 40 mg twice daily

**ADIPINE® XL**

**Hypertension | Angina prophylaxis**
- **BY MOUTH**
  - Adult: 30 mg daily, increased if necessary up to 90 mg daily

**ADIPINE® MR**

**Hypertension | Angina prophylaxis**
- **BY MOUTH**
  - Adult: 10 mg twice daily, adjusted according to response to 40 mg twice daily

**NIFEDI PRESS® MR**

**Hypertension | Angina prophylaxis**
- **BY MOUTH**
  - Adult: 10 mg twice daily, adjusted according to response to 40 mg twice daily

---

**Nifedipine**

- **DRUG ACTION** Nifedipine is a dihydropyridine calcium-channel blocker.
Hypertension

PREGNANCY

▶ Frequency not known

Rare

▶ Common or very common

SIDE-EFFECTS

INTERACTIONS

CAUTIONS

l UNLICENSED USE Not licensed for use in postponing premature labour.

l CONTRA-INDICATIONS Acute attacks of angina - cardiogenic shock - significant aortic stenosis - unstable angina - within 1 month of myocardial infarction

l CAUTIONS Diabetes mellitus - elderly - heart failure - poor cardiac reserve - severe hypotension - short-acting formulations are not recommended for angina or long-term management of hypertension; their use may be associated with large variations in blood pressure and reflex tachycardia - significantly impaired left ventricular function (heart failure deterioration observed) - withdrawn if ischaemic pain occurs or existing pain worsens shortly after initiating treatment

ADALAT® LA

Crohn’s disease - decreased lumen diameter of the gastro-intestinal tract - history of gastro-intestinal obstruction - inflammatory bowel disease

CAUTIONS, FURTHER INFORMATION

ADALAT® LA, VALNI® XL

Dose form not appropriate for use where there is a history of oesophageal or gastro-intestinal obstruction, decreased lumen diameter of the gastro-intestinal tract, or inflammatory bowel disease (including Crohn’s disease).

l INTERACTIONS ▶ Appendix 1 (calcium-channel blockers).

l SIDE-EFFECTS

▶ Common or very common Asthenia - dizziness - gastrointestinal disturbance - headache - hypotension - lethargy - oedema - palpitation - vasodilatation

▶ Rare Anorexia - gum hyperplasia - hyperglycaemia - male infertility - mood disturbances - photosensitivity reactions - purpura

▶ Frequency not known Agranulocytosis - anaphylaxis - bezoar formation (with some modified-release preparations) - dysphagia - gynaecomastia - intestinal obstruction - intestinal ulcer

Overdose In overdose, the dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

▶ PREGNANCY May inhibit labour; manufacturer advises avoid before week 20, but risk to fetus should be balanced against risk of uncontrolled maternal hypertension. Use only if other treatment options are not indicated or have failed.

l BREAST FEEDING Amount too small to be harmful but manufacturers advise avoid.

l HEPATIC IMPAIRMENT Dose reduction may be required in severe liver disease. Some modified-release formulations may not be suitable for dose titration in hepatic disease—consult product literature.

ADALAT® LA, VALNI® XL Dose form not appropriate.

l DIRECTIONS FOR ADMINISTRATION

FORTIPINE® LA 40 Take with or just after food, or a meal.

l PRESCRIBING AND DISPENSING INFORMATION Different versions of modified-release preparations may not have the same clinical effect. To avoid confusion between these different formulations of nifedipine, prescribers should specify the brand to be dispensed.

l PATIENT AND CARER ADVICE

ADALAT® LA Tablet membrane may pass through gastrointestinal tract unchanged, but being porous has no effect on efficacy.

l MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral drops

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 25

BNF 70

Cardiovascular system
Verapamil hydrochloride

**INDICATIONS AND DOSE**

**Treatment of supraventricular arrhythmias**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 40–120 mg 3 times a day
  - Adult: 5–10 mg, to be given over 2 minutes, preferably with ECG monitoring
  - Elderly: 5–10 mg, to be given over 3 minutes, preferably with ECG monitoring

**Paroxysmal tachyarrhythmias**
- **BY SLOW INTRAVENOUS INJECTION**
  - Adult: Initially 5–10 mg, followed by 5 mg after 5–10 minutes if required, to be given over 2 minutes, preferably with ECG monitoring
  - Elderly: Initially 5–10 mg, followed by 5 mg after 5–10 minutes if required, to be given over 3 minutes, preferably with ECG monitoring

**Angina**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 80–120 mg 3 times a day

**Hypertension**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 240–480 mg daily in 2–3 divided doses

**Prophylaxis of cluster headache (initiated under specialist supervision)**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 240–960 mg daily in 3–4 divided doses

**HALF SECURON® SR**

**Hypertension (in patients new to verapamil)**
- **BY MOUTH**
  - Adult: Initially 120 mg daily, increased if necessary up to 480 mg daily, doses above 240 mg daily as 2 divided doses

**Hypertension**
- **BY MOUTH**
  - Adult: 240 mg daily, increased if necessary up to 480 mg daily, doses above 240 mg daily as 2 divided doses

**Securion® SR**

**Hypertension (in patients new to verapamil)**
- **BY MOUTH**
  - Adult: Initially 120 mg daily, increased if necessary up to 480 mg daily, doses above 240 mg daily as 2 divided doses

**Prophylaxis after myocardial infarction where beta-blockers not appropriate**

**CAUTIONS**
- Acute phase of myocardial infarction (avoid if bradycardia, hypotension, left ventricular failure) - first-degree AV block

**INTERACTIONS**
- Appendix 1 (calcium-channel blockers).
Verapamil and beta-blockers Verapamil injection should not be given to patients recently treated with beta-blockers because of the risk of hypotension and asystole. The suggestion that when verapamil injection has been given first, an interval of 30 minutes before giving a beta-blocker is sufficient has not been confirmed.

It may also be hazardous to give verapamil and a beta-blocker together by mouth (should only be contemplated if myocardial function well preserved).

SIDE-EFFECTS
- Common or very common: Constipation
- Uncommon: Ankle oedema, dizziness, fatigue, flushing, headache, nausea, vomiting
- Rare: Allergic reactions, angioedema, arthralgia, asystole, bradycardia, erythema, erythroemalgia, gingival hyperplasia after long-term treatment, gynaecomastia after long-term treatment, heart block, heart failure, hypotension, increased prolactin concentration, myalgia, parasthesia, pruritus, Stevens-Johnson syndrome, urticaria

SIDE-EFFECTS, FURTHER INFORMATION
Intravenous administration or high doses Hypotension, heart failure, bradycardia, heart block, and asystole are side-effects associated with intravenous administration or high doses.

Overdose In overdose, verapamil has a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole.

PREGNANCY May reduce uterine blood flow with fetal hypoxia. Manufacturer advises avoid in first trimester unless absolutely necessary. May inhibit labour.

BREAST FEEDING Amount too small to be harmful.

HEPATIC IMPAIRMENT Oral dose may need to be reduced.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet
- VERAPAMIL HYDROCHLORIDE (Non-proprietary)

Modified-release tablet
- CAUTIONARY AND ADVISORY LABELS 25
  - VERAPAMIL HYDROCHLORIDE (Non-proprietary)
  - Verapamil hydrochloride 120 mg Verapamil 120mg modified-release tablets [28 tablet (P) £7.71 DT price = £7.71]
  - Verapamil hydrochloride 240 mg Verapamil 240mg modified-release tablets [28 tablet (P) £5.25 DT price = £5.55]
  - Half Securon (BGP Products Ltd)
  - Securon SR (BGP Products Ltd)
  - Verapamil hydrochloride 240 mg Securon SR 240mg tablets [28 tablet (P) £5.55 DT price = £5.95]
  - Brands may include Vera-Til SR

Contra-Indications Acute porphyrias p. 864 - cor pulmonale - dissecting aortic aneurysm - high output heart failure - idiopathic systemic lupus erythematosus - myocardial insufficiency due to mechanical obstruction - severe tachycardia

CAUTIONS Cerebrovascular disease - coronary artery disease (may provoke angina, avoid after myocardial infarction until stabilised) - occasionally blood pressure reduction too rapid even with low parenteral doses

INTERACTIONS → Appendix 1 (hydralazine).

SIDE-EFFECTS
- Rare: Rash
- Frequency not known Abnormal liver function - agitation - anorexia - anxiety - arthralgia - blood disorders - dizziness - dyspnoea - fever - fluid retention - flushing - gastro-intestinal disturbances - haematuria - haemolytic anaemia - headache - hypotension - increased lactation - jaundice - leucopenia - myalgia - nasal congestion - palpitation - paraesthesia - peripheral neuritis - polynuerritis - proteinuria - raised plasma creatinine - systemic lupus erythematosus-like syndrome after long-term therapy with over 100 mg daily (or less in women and in slow acetylator individuals) - tachycardia - thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION
The incidence of side-effects is lower if the dose is kept below 100 mg daily, but systemic lupus erythematosus should be suspected if there is unexplained weight loss, arthritis, or any other unexplained ill health.

Hypertension

Verapamil hydrochloride 180 mg Univer 180mg modified-release capsules | 56 capsule (P) £11.38 DT price = £11.38
Verapamil hydrochloride 240 mg Univer 240mg modified-release capsules | 28 capsule (P) £6.67 DT price = £7.67

Oral solution
- VERAPAMIL HYDROCHLORIDE (Non-proprietary)

Solution for injection
- Securon (BGP Products Ltd)
  - Verapamil hydrochloride 2.5 mg per 1 ml Securon IV 5mg/2ml solution for injection ampoules | 5 ampoule (P) £5.41
  - Brands may include Zolvera

Peripheral Vasodilators

Hydralazine hydrochloride

INDICATIONS AND DOSE
Moderate to severe hypertension (adjunct)
- BY MOUTH
  - Adult: Initially 25 mg twice daily, increased if necessary up to 50 mg twice daily

Heart failure (with long acting nitrate) (initiated in hospital or under specialist supervision)
- BY MOUTH
  - Adult: Initially 25 mg 3–4 times a day, then increased if necessary to every 2 days; maintenance 50–75 mg 4 times a day

Hypertensive emergencies (including during pregnancy)
  - Hypertension with renal complications
  - BY INTRAVENOUS INFUSION
    - Adult: Initially 200–300 micrograms/minute; maintenance 50–150 micrograms/minute

Hypertensive emergencies (including during pregnancy)
  - Hypertension with renal complications
  - BY SLOW INTRAVENOUS INJECTION
    - Adult: 5–10 mg, to be diluted with 10 ml sodium chloride 0.9%, dose may be repeated after 20–30 minutes

Excipients: May contain Propylene glycol

Univer (Teva UK Ltd)
  - Verapamil hydrochloride 120 mg Univer 120mg modified-release capsules | 28 capsule (P) £2.86 DT price = £4.86
Cardiovascular system

Minoxidil

INDICATIONS AND DOSE
Severe hypertension, in addition to a diuretic and a beta-blocker

BY MOUTH
- Adult: Initially 5 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg, increased at intervals of at least 3 days, seldom necessary to exceed 50 mg daily; maximum 100 mg per day
- Elderly: Initially 2.5 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg, increased at intervals of at least 3 days, seldom necessary to exceed 50 mg daily; maximum 100 mg per day

CONTRA-INDICATIONS Phaeochromocytoma

CAUTIONS Acute porphyrias p. 864 - after myocardial infarction (until stabilised) - angina

INTERACTIONS Appendix 1 (vasodilator antihypertensives).

SIDE-EFFECTS Breast tenderness - gastro-intestinal disturbances - hypertrichosis - peripheral oedema - rashes - reversible rise in creatinine and blood urea nitrogen - sodium retention - tachycardia - water retention - weight gain

PREGNANCY Avoid - possible toxicity including reduced placental perfusion. Neonatal hirsutism reported.

BREAST FEEDING Present in milk but not known to be harmful.

RENAI IMPAIRMENT Use with caution in significant impairment.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Table
- Lonten (Pfizer Ltd)
  - Minoxidil 2.5 mg Lonten 2.5mg tablets | 60 tablet (P) £8.88 DT price = £8.88
  - Minoxidil 5 mg Lonten 5mg tablets | 60 tablet (P) £15.83 DT price = £15.83
  - Minoxidil 10 mg Lonten 10mg tablets | 60 tablet (P) £30.68 DT price = £30.68

RENN INHIBITORS

Aliskiren

DRUG ACTION Renin inhibitors inhibit renin directly; renin converts angiotensinogen to angiotensin I.

INDICATIONS AND DOSE
Essential hypertension either alone or in combination with other antihypertensives

BY MOUTH
- Adult: 150 mg once daily, increased if necessary to 300 mg once daily

CONTRA-INDICATIONS Concomitant treatment with an ACE inhibitor or an angiotensin-II receptor antagonist in patients with an eGFR less than 60 mL/minute/1.73 m² - concomitant treatment with an ACE inhibitor or an angiotensin-II receptor antagonist in patients with diabetes mellitus - hereditary angioedema - idiopathic angioedema

CAUTIONS Combination treatment with an ACE inhibitor - combination treatment with an angiotensin-II receptor antagonist - concomitant use of diuretics (first doses may cause hypotension—initiate with care) - history of angioedema - moderate to severe congestive heart failure - patients at risk of renal impairment - salt depletion (first doses may cause hypotension—initiate with care) - volume depletion (first doses may cause hypotension—initiate with care)

CAUTIONS, FURTHER INFORMATION
Concomitant use of drugs affecting the renin-angiotensin system Combination therapy with two drugs affecting the renin-angiotensin system (ACE inhibitors, angiotensin-II receptor antagonists, and aliskiren) is not recommended due to an increased risk of hyperkalaemia, hypotension, and renal impairment, compared to use of a single drug. Patients with diabetic nephropathy are particularly susceptible to developing hyperkalaemia and should not be given an ACE inhibitor with an angiotensin-II receptor antagonist. There is some evidence that the benefits of combination use of an ACE inhibitor with candesartan or valsartan may outweigh the risks in selected patients with heart failure for whom other treatments are unsuitable, however, the concomitant use of this combination, together with an aldosterone antagonist or a potassium-sparing diuretic is not recommended. For patients currently taking combination therapy, the need for continued combined therapy should be reviewed. If combination therapy is considered essential, it should be carried out under specialist supervision, with close monitoring of blood pressure, renal function, and electrolytes (particularly potassium); monitoring should be considered at the start of treatment, then monthly, and also after any change in dose or during intercurrent illness.

INTERACTIONS Appendix 1 (aliskiren).

SIDE-EFFECTS
- Common or very common Arthralgia - dizziness - hyperkalaemia - diarrhoea
- Uncommon Acute renal failure (reversible on discontinuation of treatment) - hypotension - palpitation - peripheral oedema - cough - pruritus - rash - Stevens-Johnson syndrome - toxic epidermal necrolysis - urticaria
Hypertension

Thiazides and related diuretics can exacerbate diabetes, gout, and systemic lupus erythematosus.

INTERACTIONS → Appendix 1 (diuretics).

SIDE-EFFECTS
- Common or very common Altered plasma–lipid concentrations - gout - hypercalcaemia - hyperglycaemia - hyperuricaemia - hypochloremic alkalosis - hypokalaemia - hypomagnesaemia - hyponatraemia - metabolic and electrolyte disturbances - mild gastrointestinal disturbances - postural hypotension
- Uncommon Agranulocytosis - blood disorders - impotence - leucopenia - thrombocytopenia
- Frequency not known Cardiac arrhythmias - dizziness - headache - hypersensitivity reactions - intrahepatic cholestasis - pancreatitis - paraesthesia - photosensitivity - pneumonitis - pulmonary oedema - severe skin reactions - visual disturbances

PREGNANCY Thiazides and related diuretics should not be used to treat gestational hypertension. They may cause neonatal thrombocytopenia, bone marrow suppression, jaundice, electrolyte disturbances, and hypoglycaemia; placental perfusion may also be reduced. Stimulation of labour, uterine inertia, and meconium staining have also been reported.

HEPATIC IMPAIRMENT Caution in mild to moderate impairment. Avoid in severe liver disease. Hypokalaemia may precipitate coma in hepatic impairment, although hypokalaemia can be prevented by using a potassium-sparing diuretic. There is an increased risk of hypomagnesaemia in alcoholic cirrhosis.

RENAL IMPAIRMENT Thiazides and related diuretics are ineffective if eGFR is less than 30 mL/minute/1.73 m² and should be avoided. Metolazone remains effective if eGFR is less than 30 mL/minute/1.73 m² but is associated with a risk of excessive diuresis. Electrolytes should be monitored in renal impairment.

MONITORING REQUIREMENTS Electrolytes should be monitored, particularly with high doses and long-term use.

Bendroflumethiazide (Bendrofluazide)

INDICATIONS AND DOSE
- Oedema BY MOUTH
  - Adult: Initially 5–10 mg once daily or on alternate days, dose to be taken in the morning, then maintenance 5–10 mg 1–3 times a week

- Hypertension BY MOUTH
  - Adult: 2.5 mg daily, dose to be taken in the morning, higher doses are rarely necessary

BREAST FEEDING The amount present in milk is too small to be harmful. Large doses may suppress lactation.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet
- BENDROFLUMETHIAZIDE (Non-proprietary)
  - Bendroflumethiazide 2.5 mg Bendroflumethiazide 2.5mg tablets | 28 tablet (PSt) £3.68 DT price + £0.86 | 500 tablet (PSt) £60.71
  - Bendroflumethiazide 5 mg Bendroflumethiazide 5mg tablets | 28 tablet (PSt) £7.36 DT price + £0.97 | 500 tablet (PSt) £73.60
- Aprinox (AMCo)
  - Bendroflumethiazide 2.5 mg Aprinox 2.5mg tablets | 500 tablet (PSt) £27.31

Existing conditions Thiazides and related diuretics are seldom necessary when thiazides are used in the elderly because they are particularly susceptible to the side-effects. The dose should then be adjusted according to renal function. Diuretics should not be used continuously on a long-term basis to treat simple gravitational oedema (which will usually respond to increased movement, raising the legs, and support stockings).
Cyclophreniazide with amiloride
The properties listed below are those particular to the
combination only. For the properties of the components please
consider, amiloride hydrochloride p. 203, cyclophreniazide
p. 204.

**INDICATIONS AND DOSE**

**Hypertension**

**BY MOUTH**

- Adult: 1–2 tablets daily, dose to be taken in the morning

Indapamide

**INDICATIONS AND DOSE**

Essential hypertension

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- Adult: 2.5 mg daily, dose to be taken in the morning

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- Adult: 1.5 mg daily, dose to be taken preferably in the morning

**CAUTIONS**

- Acute porphyrias p. 864

**SIDE-EFFECTS**

- Diuresis (with doses above 2.5 mg daily)

**ALLERGY AND CROSS-SENSITIVITY**

- Contraindicated if history of hypersensitivity to sulfonamides.

**BREAST FEEDING**

- Present in milk—manufacturer advises avoid.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines
containing the same drug. Forms available from special-order
manufacturers include: oral suspension

**Tablet**

- **Indapamide (Non-proprietary)**

  Indapamide hemihydrate 2.5 mg Indapamide 2.5mg tablets | 28
  tablet £40.99 DT price = £1.56 | 30 tablet £27.99 | 56
  tablet £52.00
4.2 Hypertension associated with phaeochromocytoma

Drugs used for Hypertension associated with phaeochromocytoma not listed below; Propanolol hydrochloride, p. 146

ALPHA-ADRENOCEPTOR BLOCKERS

Phenoxybenzamine hydrochloride

INDICATIONS AND DOSE
Hypertension in phaeochromocytoma
BY MOUTH
Adult: Initially 10 mg daily, increased in steps of 10 mg daily until hypertension controlled or treatment not tolerated; maintenance 1–2 mg/kg daily in 2 divided doses

CONTRA-INDICATIONS History of cerebrovascular accident

CAUTIONS Avoid contact with skin (risk of contact sensitisation) - avoid in Acute porphyrias p. 864 - carcinogenic in animals - cerebrovascular disease - congestive heart failure - elderly - severe ischaemic heart disease

SIDE-EFFECTS
- Rare Gastro-intestinal disturbances
- Frequency not known Inhibition of ejaculation - lassitude - miosis - nasal congestion - postural hypotension (with dizziness and marked compensatory tachycardia)

PREGNANCY Hypotension may occur in newborn.

BREAST FEEDING May be present in milk.

RENAL IMPAIRMENT Use with caution.

HANDLING AND STORAGE Owing to risk of contact sensitisation healthcare professionals should avoid contamination of hands.

MEDICINAL FORMS Medicines not identified.

4.3 Hypertensive crises

PERIPHERAL VASODILATORS

Sodium nitroprusside

INDICATIONS AND DOSE
Hypertensive emergencies
BY INTRAVENOUS INFUSION
Adult: 0.5–1.5 micrograms/kg/minute, adjusted in steps of 500 nanograms/kg/minute every 5 minutes, usual dose 0.5–8 micrograms/kg/minute, use lower doses if already receiving other antihypertensives, stop if response unsatisfactory with max. dose in 10 minutes, lower initial dose of 300 nanograms/kg/minute has been used

Maintenance of blood pressure at 30–40% lower than pretreatment diastolic blood pressure
BY INTRAVENOUS INFUSION
Adult: 20–400 micrograms/minute, use lower doses for patients being treated with other antihypertensives

Controlled hypotension in anaesthesia during surgery
BY INTRAVENOUS INFUSION
Adult: Up to 1.5 micrograms/kg/minute

Heart failure
BY INTRAVENOUS INFUSION
Adult: Initially 10–15 micrograms/minute, increased every 5–10 minutes as necessary; usual dose 10–200 micrograms/minute normally for max. 3 days
Cardiovascular system

PREGNANCY

SIDE-EFFECTS

INTERACTIONS

GUANETHIDINE MONOSULFATE

INHIBITORS

SELECTIVE POSTGANGLIONIC ADRENERGIC INHIBITORS

Guanethidine monosulfate

INDICATIONS AND DOSE

Hypertensive crisis (but no longer recommended)

BY INTRAMUSCULAR INJECTION

► Adult: 10–20 mg, dose may be repeated after 3 hours if necessary

CONTRA-INDICATIONS

Heart failure • phaeochromocytoma

CAUTIONS

Asthma • cerebral arteriosclerosis • coronary arteriosclerosis • history of peptic ulceration

INTERACTIONS

Appendix 1 (adrenergic neurons blockers).

SIDE-EFFECTS

Diarrhoea • drowsiness • failure of ejaculation • fluid retention • headache • nasal congestion • postural hypotension

PREGNANCY

Postural hypotension and reduced uteroplacental perfusion. Should not be used to treat hypertension in pregnancy.

RENAL IMPAIRMENT

Reduce dose if eGFR 40–65 mL/minute/1.73 m². Avoid if eGFR less than 40 mL/minute/1.73 m².

LESS SUITABLE FOR PRESCRIBING

Guanethidine monosulfate is less suitable for prescribing.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

GUANETHIDINE MONOSULFATE (Non-proprietary)

Guanethidine monosulfate 10 mg per 1 ml

Guanethidine 10mg/1ml solution for injection ampoules | 5 ampoule

4.4 Pulmonary hypertension

Drugs used for Pulmonary Hypertension not listed below

Epoprostenol, p. 99 • Sildenafil, p. 699 • Tadalafil, p. 700

ENDOTHELIN RECEPTOR ANTAGONISTS

Ambrisentan

INDICATIONS AND DOSE

Pulmonary arterial hypertension

BY MOUTH

► Adult: 5 mg once daily, increased if necessary to 10 mg once daily

Dose adjustments due to interactions

Max. 5 mg daily with concomitant ciclosporin.

CONTRA-INDICATIONS

Idiopathic pulmonary fibrosis

CAUTIONS

Not to be initiated in significant anaemia

INTERACTIONS

Appendix 1 (ambrisentan).

SIDE-EFFECTS

► Common or very common Abdominal pain • anaemia • chest pain • constipation • diarrhoea • dizziness • dyspnoea • epistaxis • flushing • headache • heart failure • hypotension • malaise • nausea • palpitation • peripheral oedema • upper respiratory-tract disorders • vomiting

► Uncommon Autoimmune hepatitis • hepatic injury • syncope

CONCEPTION AND CONTRACEPTION

Exclude pregnancy before treatment and ensure effective contraception during treatment. Monthly pregnancy tests advised.

PREGNANCY

Avoid (teratogenic in animal studies).

BREAST FEEDING

Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT

Avoid in severe impairment.

RENAL IMPAIRMENT

Use with caution if eGFR less than 30 mL/minute/1.73 m².

MONITORING REQUIREMENTS

Monitor haemoglobin concentration or haematocrit before treatment and ensure effective contraception during treatment. Monthly pregnancy tests advised.

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (October 2008) that ambrisentan (Volibris®) should be prescribed only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists.
#### Macitentan

**INDICATIONS AND DOSE**

**Pulmonary arterial hypertension**

**BY MOUTH**

- Adult: Initially 62.5 mg twice daily for 4 weeks, then increased to 125 mg twice daily (max. per dose 250 mg), maximum 500 mg per day.

**Systemic sclerosis with ongoing digital ulcer disease (to reduce number of new digital ulcers)**

**BY MOUTH**

- Adult: Initially 62.5 mg twice daily for 4 weeks, then increased to 125 mg twice daily.

- **CONTRA-INDICATIONS** Acute porphyrias p. 864
- **CAUTIONS** Not to be initiated if systemic systolic blood pressure is below 85 mmHg.
- **INTERACTIONS** → Appendix 1 (bosentan).
- **SIDE-EFFECTS**
  - Common or very common Anaemia, diarrhoea, flushing, gastro-oesophageal reflux, headache, hypotension, oedema, palpititation, syncope.
  - Uncommon Leucopenia, neutropenia, thrombocytopenia.
  - Rare Liver cirrhosis, liver failure.
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during administration (hormonal contraception not considered effective). Monthly pregnancy tests advised.
- **PREGNANCY** Avoid (teratogenic in animal studies).
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Avoid in moderate and severe impairment.
- **MONITORING REQUIREMENTS**
  - Monitor liver function before treatment, then monthly thereafter (discontinue if unexplained persistent raised serum transaminases or signs of hepatic injury—can restart on advice on hepatologist if liver function tests return to normal and no hepatic injury).
  - Monitor haemoglobin concentration before treatment and monthly.
- **PATIENT AND CARER ADVICE** Patient card should be provided. Patients should be told how to recognise signs of liver disorder and advised to seek immediate medical attention if symptoms such as dark urine, nausea, vomiting, fatigue, abdominal pain, or pruritus develop.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **Scottish Medicines Consortium (SMC) Decisions**
    - The Scottish Medicines Consortium has advised (March 2014) that macitentan (Opsumit®) should be initiated and prescribed only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists.
  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Tracleer** (Actelion Pharmaceuticals UK Ltd)
  - Bosentan (as Bosentan monohydrate) 62.5 mg Tracleer 62.5mg tablets | 56 tablet [POM] £1,510.21
  - Bosentan (as Bosentan monohydrate) 125 mg Tracleer 125mg tablets | 56 tablet [POM] £1,510.21

#### Bosentan

**INDICATIONS AND DOSE**

**Pulmonary arterial hypertension**

**BY MOUTH**

- Adult: Initially 62.5 mg twice daily for 4 weeks, then increased to 125 mg twice daily (max. per dose 250 mg), maximum 500 mg per day.

**Systemic sclerosis with ongoing digital ulcer disease (to reduce number of new digital ulcers)**

**BY MOUTH**

- Adult: Initially 62.5 mg twice daily for 4 weeks, then increased to 125 mg twice daily.

- **CONTRA-INDICATIONS** Severe anaemia.
- **CAUTIONS** Patients over 75 years - pulmonary veno-occlusive disease.
- **INTERACTIONS** → Appendix 1 (macitentan).
- **SIDE-EFFECTS**
  - Common or very common Anaemia, bronchitis, headache, hypotension, upper respiratory-tract disorders, urinary-tract infection.
  - Frequency not known Leucopenia, thrombocytopenia.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises avoid pregnancy before treatment and ensure effective contraception during and for one month after stopping treatment. Monthly pregnancy tests advised.
- **PREGNANCY** Toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Do not initiate if serum transaminases exceed 3 times upper limit of normal. Avoid in moderate and severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment and avoid in patients undergoing dialysis (no information available).
- **SPECIAL FEATURES** In renal impairment consider monitoring blood pressure (risk of hypotension).
- **MONITORING REQUIREMENTS**
  - Monitor liver function before treatment, then monthly thereafter (discontinue if unexplained persistent raised serum transaminases or signs of hepatic injury—can restart on advice on hepatologist if liver function tests return to normal and no hepatic injury).
  - Monitor haemoglobin concentration before treatment and then as indicated.
  - **PATIENT AND CARER ADVICE** Patient card should be provided. Patients should be told how to recognise signs of liver disorder and advised to seek immediate medical attention if symptoms such as dark urine, nausea, vomiting, fatigue, abdominal pain, or pruritus develop.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **Scottish Medicines Consortium (SMC) Decisions**
    - The Scottish Medicines Consortium has advised (March 2014) that bosentan (Opsumit®) should be initiated and prescribed only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists.
  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Tracleer** (Actelion Pharmaceuticals UK Ltd)
  - Bosentan (as Bosentan monohydrate) 62.5 mg Tracleer 62.5mg tablets | 30 tablet [POM] £1,618.08
  - Bosentan 10 mg Volibris 10mg tablets | 30 tablet [POM] £1,618.08
only if systolic blood pressure $\geq 95$ mmHg and no signs of hypotension, if treatment interrupted for 3 or more days, restart at $\geq 0.5$ mg three times daily for 2 weeks and titrate as before, during titration, reduce dose by $\geq 0.5$ mg three times daily if systolic blood pressure falls below $95$ mmHg and patient shows signs of hypotension

- **CONTRA-INDICATIONS** History of serious haemoptysis - previous bronchial artery embolisation - pulmonary veno-occlusive disease
- **CAUTIONS** Autonomic dysfunction - elderly (risk of hypotension) - hypotension (do not initiate if systolic blood pressure below $95$ mmHg) - hypovolaemia - severe left ventricular outflow obstruction

**CAUTIONS, FURTHER INFORMATION**

- **Smoking** Smoking cessation advised (response possibly reduced); dose adjustment may be necessary if smoking started or stopped during treatment.
- **INTERACTIONS** $\rightarrow$ Appendix 1 (riociguat).
- **SIDE-EFFECTS**
  - Common or very common: Anaemia - constipation - diarrhoea - dizziness - dyspepsia - dysphagia - epistaxis - gastritis - gastro-oesophageal reflux - haemoptysis - headache - hypotension - nasal congestion - nausea - palpitation - peripheral oedema - vomiting
  - Uncommon: Pulmonary haemorrhage
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment. Monthly pregnancy tests advised.
- **PREGNANCY** Avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Titrate dose cautiously in moderate impairment. Manufacturer advises avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** Titrate dose cautiously—risk of hypotension. Manufacturer advises avoid if eGFR less than $30$ mL/minute/1.73 m$^2$—limited information available.
- **PATIENT AND CARER ADVICE** Smoking cessation advised (response possibly reduced). Patients should inform prescriber if smoking started or stopped during treatment; dose adjustment may be necessary.
- **NATIONAL FUNDING/ACCESS DECISIONS**

  **Scottish Medicines Consortium (SMC) Decisions**

  The Scottish Medicines Consortium has advised (November 2014) that riociguat (Adempas®) is accepted for restricted use within NHS Scotland for the treatment of chronic thromboembolic pulmonary hypertension in patients for whom a phosphodiesterase type-5 inhibitor is inappropriate, not tolerated, or ineffective, and should only be prescribed by specialists in the Scottish Pulmonary Vascular Unit.

  **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  - **Tablet**
    - Adempas (Bayer Plc)
      - Riociguat 500 microgram | Adempas 0.5mg tablets | 42 tablet | £997.36 | 84 tablet | £1,994.72
      - Riociguat 1 mg | Adempas 1mg tablets | 42 tablet | £997.36 | 84 tablet | £1,994.72
      - Riociguat 1.5 mg | Adempas 1.5mg tablets | 42 tablet | £997.36 | 84 tablet | £1,994.72
      - Riociguat 2 mg | Adempas 2mg tablets | 42 tablet | £997.36 | 84 tablet | £1,994.72
      - Riociguat 2.5 mg | Adempas 2.5mg tablets | 42 tablet | £997.36 | 84 tablet | £1,994.72

**PROSTAGLANDINS (CARDIOVASCULAR)**

**Iloprost**

**INDICATIONS AND DOSE**

Idiopathic or familial pulmonary arterial hypertension (initiated under specialist supervision)

- Adult: Initially 2.5 micrograms for 1 dose, increased to 5 micrograms for 1 dose, if tolerated maintain at 5 micrograms 6–9 times a day, according to response; reduced if higher dose not tolerated to 2.5 micrograms 6–9 times a day

**CONTRA-INDICATIONS** Conditions which increase risk of haemorrhage - congenital or acquired valvular defects of the myocardium - decompensated cardiac failure (unless under close medical supervision) - pulmonary veno-occlusive disease - severe arrhythmias - unstable angina - within 3 months of cerebrovascular events - within 6 months of myocardial infarction

**CAUTIONS**

- **GENERAL CAUTIONS** Hypotension (do not initiate if systolic blood pressure below 85 mmHg) - unstable pulmonary hypertension with advanced right heart failure - acute pulmonary infection - chronic obstructive pulmonary disease - severe asthma
- **INTERACTIONS** $\rightarrow$ Appendix 1 (Iloprost).
- **SIDE-EFFECTS**
  - Common or very common: Chest pain - cough - diarrhoea - dyspnoea - haemorrhage - headache - hypotension - jaw pain - nausea - oral irritation - rash - throat pain - vomiting
  - Frequency not known: Bronchospasm - taste disturbance - thrombocytopenia - wheezing
- **PREGNANCY** Use if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Elimination reduced. Initially 2.5 micrograms at intervals of 3–4 hours (max. 6 times daily), adjusted according to response (consult product literature).
- **DIRECTIONS FOR ADMINISTRATION** To minimise accidental exposure use only with nebulisers listed in Ventavis® product literature in a well ventilated room.
- **PRESCRIBING AND DISPENSING INFORMATION** Delivery characteristics of nebuliser devices may vary—only switch devices under medical supervision.
- **NATIONAL FUNDING/ACCESS DECISIONS**

  **Scottish Medicines Consortium (SMC) Decisions**

  The Scottish Medicines Consortium has advised (November 2005) that iloprost (Ventavis®) is accepted for restricted use within NHS Scotland in patients in whom bosentan is ineffective or not tolerated, and should only be prescribed by specialists in the Scottish Pulmonary Vascular Unit.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Nebuliser liquid**

- Ventavis (Bayer Plc)
  - Iloprost (as iloprost trometamol) 10 microgram per $1$ ml Ventavis 10micrograms/ml nebuliser solution $1$ml ampoules | 30 ampoule | £1,400.19 | 168 ampoule | £2,241.08
4.5 Hypotension and shock

Sympathomimetics

Inotropic sympathomimetics

Shock
Shock is a medical emergency associated with a high mortality. The underlying causes of shock such as haemorrhage, sepsis, or myocardial insufficiency should be corrected. The profound hypotension of shock must be treated promptly to prevent tissue hypoxia and organ failure. Volume replacement is essential to correct the hypovolaemia associated with haemorrhage and sepsis but may be detrimental in cardiogenic shock. Depending on haemodynamic status, cardiac output may be improved by the use of sympathomimetic inotropes such as adrenaline/epinephrine p. 196, dobutamine p. 193 or dopamine hydrochloride below. In septic shock, when fluid replacement and inotropic support fail to maintain blood pressure, the vasoconstrictor noradrenaline/norepinephrine p. 166 may be considered. In cardiogenic shock peripheral resistance is frequently high and to raise it further may worsen myocardial performance and exacerbate tissue ischaemia.

The use of sympathomimetic inotropes and vasoconstrictors should preferably be confined to the intensive care setting and undertaken with invasive haemodynamic monitoring.

See also advice on the management of anaphylactic shock p. 242.

Vasoconstrictor sympathomimetics

Vasoconstrictor sympathomimetics raise blood pressure transiently by acting on alpha-adrenergic receptors to constrict peripheral vessels. They are sometimes used as an emergency method of elevating blood pressure where other measures have failed.

The danger of vasoconstrictors is that although they raise blood pressure they also reduce perfusion of vital organs such as the kidney.

Spinal and epidural anaesthesia may result in sympathetic block with resultant hypotension. Management may include intravenous fluids (which are usually given prophylactically), oxygen, elevation of the legs, and injection of a pressor drug such as ephedrine hydrochloride p. 237. As well as constricting peripheral vessels ephedrine hydrochloride p. 237 also accelerates the heart rate (by acting on beta receptors). Use is made of this dual action of ephedrine hydrochloride p. 237 to manage associated bradycardia (although intravenous injection of atropine sulfate p. 949 may also be required if bradycardia persists).

Metaraminol

INDICATIONS AND DOSE
Acute hypotension
BY INTRAVENOUS INFUSION
Adult: 15–100 mg, adjusted according to response
Emergency treatment of acute hypotension
INITIALLY BY INTRAVENOUS INJECTION
Adult: Initially 0.5–5 mg, then (by intravenous infusion) 15–100 mg, adjusted according to response
Priapism (alternative to intracavernosal injections of phentolamine and adrenaline)
BY INTRACAVERNOSAL INJECTION
Adult: 1 mg every 15 minutes

Drugs used for Hypotension and shock not listed below; Dobutamine, p. 193 · Ephedrine hydrochloride, p. 237 · Labetalol hydrochloride, p. 143 · Sodium nitroprusside, p. 161

Dopamine hydrochloride

Drug action
Dopamine is a cardiac stimulant which acts on beta, receptors in cardiac muscle, and increases contractility with little effect on rate.

INDICATIONS AND DOSE
Cardiogenic shock in infarction or cardiac surgery
BY INTRAVENOUS INFUSION
Adult: Initially 2–5 micrograms/kg/minute

CONTRA-INDICATIONS
Phaeochromocytoma · tachyarrhythmia

CAUTIONS
Correct hypovolaemia · hyperthyroidism · low dose in shock due to acute myocardial infarction

INTERACTIONS
Appendix 1 (sympathomimetics).

SIDE-EFFECTS
Common or very common Chest pain · dyspnoea · headache · hypotension · nausea · palpitation · tachycardia · vasodilatation · vomiting

Uncommon Bradycardia · gangrene · hypertension · mydriasis

Rare Fatal ventricular arrhythmias

PREGNANCY
No evidence of harm in animal studies—manufacturer advises use only if potential benefit outweighs risk.

BREAST FEEDING
May suppress lactation—not known to be harmful.

DIRECTIONS FOR ADMINISTRATION
For intravenous infusion give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute to max. concentration of 3.2 mg/ml; incompatible with bicarbonate. Dopamine concentrate for intravenous infusion to be diluted before use.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from specialist-order manufacturers include: solution for infusion

Solution for infusion
DOPAMINE HYDROCHLORIDE (Non-proprietary)
Dopamine hydrochloride 100 mg per 1 ml
Dopamine hydrochloride 200 mg per 1 ml

DOPAMINE HYDROCHLORIDE (proprietary)

Dopamine hydrochloride 1 mg/mL; incompatible with bicarbonate. Dopamine concentrate for intravenous infusion to be diluted before use.

SYMPATHOMIMETICS (VASOCONSTRICTOR)

Metaraminol
vasoconstrictor response may cause a prolonged rise in blood pressure.

- **INTERACTIONS** → Appendix 1 (sympathomimetics).
- **SIDE-EFFECTS** Angle-closure glaucoma, anorexia, anxiety, arrhythmias, bradycardia, confusion, dyspnoea, fatal ventricular arrhythmia reported in Laennec’s cirrhosis, headache, hypotension, hypoxia, insomnia, nausea, palpititation, peripheral ischaemia, psychosis, tachycardia, tremor, urinary retention, vomiting, weakness.
- **PREGNANCY** May reduce placental perfusion—manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS** Monitor blood pressure and rate of flow frequently.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Aramine®), give continuously or via drip tubing in Glucose 5% or Sodium chloride 0.9%. Suggested volume 500 mL.
  - For **intracavernosal injection**, dilute 1 mg (0.1 mL of 10 mg/mL metaraminol injection to 50 mL with Sodium chloride injection 0.9% and give carefully by slow injection into the corpora in 5–10 mL injections.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

**Noradrenaline/norepinephrine**

**INDICATIONS AND DOSE**

**Acute hypotension**

- **BY INTRAVENOUS INFUSION**
  - Adult: Initially 0.16–0.33 mL/minute, adjusted according to response, to be given via central venous catheter, of a solution containing noradrenaline 40 micrograms/base/mL.

**Dose equivalence and conversion**

1 mg of noradrenaline base is equivalent to 2 mg of noradrenaline acid tartrate. **Doses expressed as the base.**

- **CONTRA-INDICATIONS** Hypertension
- **CAUTIONS** Coronary vascular thrombosis, diabetes mellitus, elderly, extravasation at injection site may cause necrosis, following myocardial infarction, hypercapnia, hyperthyroidism, hypoxia, mesenteric vascular thrombosis, peripheral vascular thrombosis, Prinzmetal’s variant angina, uncorrected hypovolaemia
- **INTERACTIONS** → Appendix 1 (sympathomimetics).
- **SIDE-EFFECTS** Angle-closure glaucoma, anorexia, anxiety, arrhythmias, bradycardia, confusion, dyspnoea, headache, hypertension, hypoxia, insomnia, nausea, palpitation, peripheral ischaemia, psychosis, tachycardia, tremor, urinary retention, vomiting, weakness.
- **PREGNANCY** Avoid—may reduce placental perfusion.
- **MONITORING REQUIREMENTS** Monitor blood pressure and rate of flow frequently.
- **DIRECTIONS FOR ADMINISTRATION** For treatment of acute hypotension in adults, use a solution containing noradrenaline 40 micrograms (base)/mL.
  - For intravenous infusion, give continuously in Glucose 5% or Sodium Chloride and glucose via a controlled infusion device. For administration via syringe pump, dilute 2 mg (2 mL of solution) noradrenaline base with 48 mL infusion fluid. For administration via drip counter dilute 20 mg (20 mL of solution) noradrenaline base with 480 mL

**Phenylephrine hydrochloride**

**INDICATIONS AND DOSE**

- **Acute hypotension**
  - **BY SUBCUTANEOUS INJECTION**
    - Adult: Initially 2–5 mg, followed by further doses of 1–10 mg, after at least 15 minutes if required.
  - **BY INTRAVENOUS INJECTION**
    - Adult: 100–500 micrograms, repeated as necessary after at least 15 minutes; a 1 mg/1 mL solution to be used.

- **Priapism**
  - **BY INTRACavernOSAL INJECTION**
    - Adult: 100–200 micrograms every 5–10 minutes; maximum 1 mg per course

- **UNLICENSED USE** Use of phenylephrine hydrochloride injection in priapism is an unlicensed indication.
- **CONTRA-INDICATIONS** Hypertension, Severe hyperthyroidism
- **CAUTIONS** Coronary disease, coronary vascular thrombosis, diabetes, elderly, extravasation at injection site may cause necrosis, following myocardial infarction, hypercapnia, hyperthyroidism, hypoxia, mesenteric vascular thrombosis, peripheral vascular thrombosis, Prinzmetal’s variant angina, susceptibility to angle-closure glaucoma, uncorrected hypovolaemia

**CAUTIONS, FURTHER INFORMATION**

**Hypertensive response** Phenylephrine has a longer duration of action than noradrenaline (norepinephrine), and an excessive vasoconstrictor response may cause a prolonged rise in blood pressure.

- **INTERACTIONS** → Appendix 1 (sympathomimetics). Phenylephrine may interact with systemically administered monoamine oxidase inhibitors.
- **SIDE-EFFECTS** Arrhythmias, hypertension, palpitation, tachycardia, angle-closure glaucoma, anorexia, anxiety, bradycardia (also reflex bradycardia), confusion, dyspnoea, headache, hypoxia, insomnia, nausea, peripheral ischaemia, psychosis, tremor, urinary retention, vomiting, weakness.
- **PREGNANCY** Avoid if possible; malformations reported following use in first trimester; fetal hypoxia and bradycardia reported in late pregnancy and labour.
5 Heart failure

Heart failure

Drug treatment of heart failure associated with a reduced left ventricular ejection fraction (left ventricular systolic dysfunction) is covered below; optimal management of heart failure with a preserved left ventricular ejection fraction has not been established.

The treatment of chronic heart failure aims to relieve symptoms, improve exercise tolerance, reduce the incidence of acute exacerbations, and reduce mortality. An ACE

inhibitor, titrated to a ‘target dose’ (or the maximum tolerated dose if lower), together with a beta-blocker, form the basis of treatment for all patients with heart failure due to left ventricular systolic dysfunction.

An ACE inhibitor is generally advised for patients with asymptomatic left ventricular systolic dysfunction or symptomatic heart failure. An angiotensin-II receptor antagonist may be a useful alternative for patients who, because of side-effects such as cough, cannot tolerate ACE inhibitors; a relatively high dose of the angiotensin-II receptor antagonist may be required to produce benefit. Candesartan cilexetil p. 133 or valsartan p. 136 may be given under specialist supervision as adjuncts to an ACE inhibitor in the treatment of heart failure when other treatments are unsuitable; the concomitant use of this combination, together with an aldosterone antagonist or a potassium-sparking diuretic is not recommended.

The beta-blockers bisoprolol fumarate p. 142 and carvedilol p. 142 are of value in any grade of stable heart failure due to left ventricular systolic dysfunction; nebivolol p. 145 is licensed for stable mild to moderate heart failure in patients over 70 years. Beta-blocker treatment should be started by those experienced in the management of heart failure, at a very low dose and titrated very slowly over a period of weeks or months. Symptoms may deteriorate initially, calling for adjustment of concomitant therapy.

The aldosterone antagonist spironolactone p. 168 can be added to an ACE inhibitor and a beta-blocker in patients who continue to remain symptomatic (particularly in those with moderate to severe heart failure); low doses of spironolactone reduce symptoms and mortality in these patients. If spironolactone cannot be used, eplerenone below may be considered for the management of heart failure after an acute myocardial infarction with evidence of left ventricular systolic dysfunction, or for chronic mild heart failure with left ventricular systolic dysfunction. Close monitoring of serum creatinine, eGFR, and potassium is necessary, particularly following any change in treatment or any change in the patient’s clinical condition.

Patients who cannot tolerate an ACE inhibitor or an angiotensin-II receptor antagonist, or in whom they are contra-indicated, may be given isosorbide dinitrate p. 191 with hydralazine hydrochloride p. 157 but this combination may be poorly tolerated. The combination of isosorbide dinitrate p. 191 and hydralazine hydrochloride p. 157 may be considered in addition to standard therapy with an ACE inhibitor and a beta-blocker in patients who continue to remain symptomatic (particularly in patients of African or Caribbean origin who have moderate to severe heart failure).

Digoxin p. 94 improves symptoms of heart failure and exercise tolerance and reduces hospitalisation due to acute exacerbations but it does not reduce mortality. Digoxin is reserved for patients with worsening or severe heart failure due to left ventricular systolic dysfunction who remain symptomatic despite treatment with an ACE inhibitor and a beta-blocker in combination with either an aldosterone antagonist, candesartan cilexetil, or isosorbide dinitrate with hydralazine hydrochloride.

Patients with fluid overload should also receive either a loop or a thiazide diuretic (with salt or fluid restriction where appropriate). A thiazide diuretic may be of benefit in patients with mild heart failure and good renal function; however, thiazide diuretics are ineffective in patients with poor renal function (eGFR less than 30 mL/minute/1.73 m²) and a loop diuretic is preferred. If diuresis with a single diuretic is insufficient, a combination of a loop diuretic and a thiazide diuretic may be tried; addition of metolazone p. 205 may also be considered but the resulting diuresis may be profound and care is needed to avoid potentially dangerous electrolyte disturbances.

Drugs used for Heart failure not listed below:
Candesartan cilexetil, p. 133. Captopril, p. 126.
Isosorbide mononitrate, p. 192. Ivalradine, p. 185.
Perindopril erbumine, p. 130. Prazosin, p. 674.
Valsartan, p. 136.

ALDOSTERONE ANTAGONISTS

Eplerenone

INDICATIONS AND DOSE
Adjunct in stable patients with left ventricular ejection fraction < 40% with evidence of heart failure, following myocardial infarction (start therapy within 3–14 days of event) | Adjunct in chronic mild heart failure with left ventricular ejection fraction ≤ 30%

BY MOUTH
Adult: Initially 25 mg daily, then increased to 50 mg daily, increased within 4 weeks of initial treatment.

CONTRA-INDICATIONS Hyperkalaemia
CAUTIONS Elderly
INTERACTIONS | Appendix 1 (diuretics).
Concomitant use of potassium-sparking diuretics or potassium supplements is contra-indicated.
SIDE-EFFECTS
Common or very common Azotaemia, constipation, cough, diarrhoea, dizziness, hyperkalaemia, hypotension.
Cardiovascular system

Spironolactone

INDICATIONS AND DOSE

Oedema | Ascites in cirrhosis of the liver
BY MOUTH
• Adult: 100–400 mg daily, adjusted according to response

Malignant ascites
BY MOUTH
• Adult: Initially 100–200 mg daily, then increased if necessary to 400 mg daily, maintenance dose adjusted according to response

Nephrotic syndrome
BY MOUTH
• Adult: 100–200 mg daily

Oedema in congestive heart failure
BY MOUTH
• Adult: Initially 100 mg daily, alternatively initially 25–200 mg daily, dose may be taken as a single dose or divided doses, maintenance dose adjusted according to response

Moderate to severe heart failure (adjunct)
BY MOUTH
• Adult: Initially 25 mg once daily, then adjusted according to response to 50 mg once daily

Resistant hypertension (adjunct)
BY MOUTH
• Adult: 25 mg once daily

Primary hyperaldosteronism in patients awaiting surgery
BY MOUTH
• Adult: 100–400 mg daily, may be used for long-term maintenance if surgery inappropriate, use lowest effective dose

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet
• EPLERENONE (Non-proprietary)
  Eplerenone 25 mg Eplerenone 25mg tablets | 28 tablet | £35.45-£42.72 DT price = £39.04
  Eplerenone 50 mg Eplerenone 50mg tablets | 28 tablet | £35.45-£42.72 DT price = £38.95
• Inspra (Pfizer Ltd)
  Eplerenone 25 mg Inspra 25mg tablets | 28 tablet | £42.72 DT price = £39.04
  Eplerenone 50 mg Inspra 50mg tablets | 28 tablet | £42.72 DT price = £38.95

Co-flumecine

The properties listed below are those particular to the combination only. For the properties of the components please consider, spironolactone above and Thiazides, p. 159.
PHOSPHODIESTERASE TYPE-3 INHIBITORS

Enoximone

**DRUG ACTION** Enoximone is a phosphodiesterase type-3 inhibitor that exerts most effect on the myocardium; it has positive inotropic properties and vasodilator activity.

**INDICATIONS AND DOSE**

**Congestive heart failure where cardiac output reduced and filling pressures increased**

**BY SLOW INTRAVENOUS INJECTION (RATE NOT EXCEEDING 12.5 ML/MINUTE)**

- Adult: Initially 0.5–1 mg/kg, then 500 micrograms/kg every 30 minutes until a satisfactory response is achieved or a total dose of 3 mg/kg is reached; maintenance, initial dose of up to 3 mg/kg every 3–6 hours as required

- **BY INTRAVENOUS INFUSION**
  - Adult: Initially 90 micrograms/kg/minute, dose to be given over 10–30 minutes, followed by 5–20 micrograms/kg/minute, dose to be given as either a continuous or intermittent infusion; maximum 24 mg/kg per day

**CAUTIONS** Heart failure associated with hypertrophic cardiomyopathy, stenotic or obstructive valvular disease or other outlet obstruction

**INTERACTIONS** → Appendix 1 (phosphodiesterase type-3 inhibitors).

**SIDE-EFFECTS**

- Chills · diarrhoea · ectopic beats · fever · headache · hypotension · insomnia · nausea · oliguria · supraventricular arrhythmias (more likely in patients with pre-existing arrhythmias) · upper and lower limb pain · urinary retention · ventricular tachycardia (more likely in patients with pre-existing arrhythmias) · vomiting

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT** Dose reduction may be required.

**RENAL IMPAIRMENT** Consider dose reduction.

**MONITORING REQUIREMENTS** Monitor blood pressure, heart rate, ECG, central venous pressure, fluid and electrolyte status, renal function, platelet count and hepatic enzymes.

**DIRECTIONS FOR ADMINISTRATION** Incompatible with glucose solutions. Use only plastic containers or syringes; crystal formation if glass used. Avoid extravasation.

For intravenous infusion (Perfan®), give continuously or intermittently in Sodium chloride 0.9% or Water for injections; dilute to a concentration of 2.5 mg/mL.

**PRESCRIBING AND DISPENSING INFORMATION** Sustained haemodynamic benefit has been observed after administration of phosphodiesterase type-3 inhibitors, but there is no evidence of any beneficial effect on survival.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

**EXCipients:** May contain Alcohol, propylene glycol

- Perfan (Myogen GmbH)
  - Enoximone 5 mg per 1 ml. Perfan 100mg/20ml solution for injection ampoules | 10 ampoule (PBN) no price available (hospital only)

**Milorinone**

**DRUG ACTION** Milrinone is a phosphodiesterase type-3 inhibitor that exerts most effect on the myocardium; it has positive inotropic properties and vasodilator activity.

**INDICATIONS AND DOSE**

**Short-term treatment of severe congestive heart failure unresponsive to conventional maintenance therapy (not immediately after myocardial infarction) / Acute heart failure, including low output states following heart surgery**

**INITIALLY BY INTRAVENOUS INJECTION**

- Adult: Initially 50 micrograms/kg, given over 10 minutes, followed by (by intravenous infusion) 375–750 nanograms/kg/minute usually given following surgery for up to 12 hours or in congestive heart failure for 48–72 hours; maximum 1.13 mg/kg per day

**CONTRA-INDICATIONS** Severe hypovolaemia

**CAUTIONS** Correct hypokalaemia · heart failure associated with hypertrophic cardiomyopathy, stenotic or obstructive valvular disease or other outlet obstruction

**INTERACTIONS** → Appendix 1 (phosphodiesterase type-3 inhibitors).

**SIDE-EFFECTS**

- Common or very common Ectopic beats · headache · hypotension · supraventricular arrhythmias (more likely in patients with pre-existing arrhythmias) · ventricular tachycardia

- Uncommon Chest pain · hypokalaemia · thrombocytopenia · tremor · ventricular fibrillation

- Very rare Anaaphylaxis · bronchospasms · rash

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**RENAI IMPAIRMENT** Reduce dose and monitor response if eGFR less than 50 mL/minute/1.73 m²—consult product literature for details.

**MONITORING REQUIREMENTS** Monitor blood pressure, heart rate, ECG, central venous pressure, fluid and electrolyte status, renal function, platelet count and hepatic enzymes.

**DIRECTIONS FOR ADMINISTRATION** Avoid extravasation. For intravenous injection, may be given either undiluted or diluted before use. For intravenous infusion (Primacor®) give continuously in Glucose 5% or Sodium chloride 0.9%; dilute to a suggested concentration of 200 micrograms/mL.
Hyperlipidaemia

6 Hyperlipidaemia

Primary and secondary prevention of cardiovascular disease

Preventative measures should be taken in individuals with a high risk of developing cardiovascular disease (primary prevention) and to prevent recurrence of events in those with established cardiovascular disease (secondary prevention).

Primary prevention

Individuals at high risk of developing cardiovascular disease include those who have diabetes mellitus, chronic kidney disease (eGFR < 60 mL/minute/1.73 m²) and/or albuminuria, and those with familial hypercholesterolaemia. The risk also increases with age; those aged 85 years and over are at particularly high risk, especially if they smoke or have hypertension. Preventative measures are also required for other individuals who are considered to be at high risk of developing atherosclerotic cardiovascular disease based on risk estimated using risk calculators (see Risk calculators); those with a 10-year risk of cardiovascular disease of 10% or more stand to benefit most from drug treatment. Patients with a 10-year cardiovascular risk of less than 10% may benefit from an assessment of their lifetime risk (using the JBS3 tool—see Risk calculators for more detail), discussion on the impact of lifestyle interventions and, if necessary, drug therapy.

Risk calculators

Risk assessment calculators are recommended by both NICE (clinical guideline 181 (July 2014). Lipid Modification—Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease) and JBS3 (Joint British Societies’ consensus recommendations for the prevention of cardiovascular disease 2014). They should not be used in patients at high cardiovascular risk. Both calculators are unsuitable for assessing risk in those aged 85 years and over, and NICE advises against using a risk assessment tool in those with type 1 diabetes mellitus.

The QRSiK®2 risk calculator www.qrisk.org/ is recommended by NICE clinical guideline 181, and the JBS3 risk calculator www.jbs3risk.com/pages/risk_calculator.htm is endorsed by JBS3. Both tools assess cardiovascular risk—coronary heart disease (angina and myocardial infarction), stroke, and transient ischaemic attack, on the basis of lipid profile, systolic blood pressure, gender, age, ethnicity, smoking status, BMI, chronic kidney disease, diabetes mellitus, atrial fibrillation, treated hypertension, rheumatoid arthritis, or a family history of premature cardiovascular disease. Risk assessment tools underestimate risk in patients with additional risk due to existing conditions or medication, such as:

- serious mental disorder
- autoimmune disorders such as systemic lupus erythematosus and other systemic inflammatory disorders
- antiretroviral treatment
- medication causing dyslipidaemia as a side-effect e.g. antipsychotics, corticosteroids, or immunosuppressants
- triglyceride concentration > 4.5 mmol/litre

Cardiovascular disease risk is also underestimated in those who are already taking antihypertensive or lipid-regulating drugs, and in those who have recently stopped smoking. Severe obesity (BMI > 40 kg/m²) also increases cardiovascular risk; the need for further treatment of risk

Dopexamine hydrochloride

**Drug action**

Dopexamine acts on beta, receptors in cardiac muscle to produce a positive inotropic effect; and on peripheral dopamine receptors to increase renal perfusion; it is reported not to induce vasoconstriction.

**Indications and dose**

Inotropic support and vasodilator in exacerbations of chronic heart failure and in heart failure associated with cardiac surgery

**By intravenous infusion**

- Adult: 0.5 microgram/kg/minute, to be administered into central or large peripheral vein, then increased if necessary to 1 microgram/kg/minute, increased if necessary up to 6 micrograms/kg/minute, in increments of 0.5–1 microgram/kg/minute at intervals of not less than 15 minutes

**Contra-indications**

Aortic stenosis • hypertrophic cardiomyopathy • left ventricular outlet obstruction • phaeochromocytoma • thrombocytopenia

**Caution**

Correct hypovolaemia before starting and during treatment • hyperglycaemia • hyperthyroidism • hypokalaemia • myocardial infarction • recent angina

**Interactions**

- Appendix 1 (sympathomimetics).

**Side-effects**

- Common or very common Angina • arrhythmias • bradycardia • dyspnoea • headache • myocardial infarction • nausea • reversible thrombocytopenia • sweating • tachycardia • tremor • vomiting

**Pregnancy**

No information available—manufacturer advises avoid.

**Monitoring requirements**

Monitor blood pressure, pulse, plasma potassium, and blood glucose.

**Treatment cessation**

Avoid abrupt withdrawal.

**Directions for administration**

Concentrate for intravenous infusion to be diluted before use. For continuous intravenous infusion, dilute to a concentration of 400 or 800 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; max. concentration via large peripheral vein 1 mg/mL, concentrations up to 4 mg/mL may be infused via central veins; give via infusion pump or other device which provides accurate control of rate; contact with metal in infusion apparatus should be minimised; incompatible with bicarbonate.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- Dopcard (Neva UK Ltd)
  - Dopexamine hydrochloride 10 mg per 1 ml Dopcard 50mg/5ml concentrate for solution for infusion ampoules | 10 ampoule £252.00 (Hospital only)
factors in patients below the cardiovascular risk threshold for treatment should be based on clinical judgement.

**Preventative measures for primary prevention**

All patients at high risk of cardiovascular disease should be advised to make lifestyle modifications that include beneficial changes to diet, exercise, weight management, alcohol consumption, and smoking cessation.

Offer a statin as first-line drug treatment if lifestyle modifications are inappropriate or ineffective (see also Statins for the prevention of cardiovascular disease). Lipid-regulating drug treatment must be combined with advice on diet and lifestyle measures, and where appropriate, treatment of comorbidities and secondary causes of dyslipidaemia.

**Secondary prevention**

Statins should be offered to all patients, including the elderly, with cardiovascular disease such as those with coronary heart disease (including history of angina or acute myocardial infarction), occlusive arterial disease (including peripheral vascular disease, non-haemorrhagic stroke, or transient ischaemic attacks).

**Preventative measures for secondary prevention**

Patients should be advised to make lifestyle modifications that include beneficial changes to diet, exercise, weight management, alcohol consumption, and smoking cessation, however, initiation of lipid-regulating drug treatment should not be delayed to manage modifiable risk factors, and must be combined with advice on diet and lifestyle measures, and where appropriate, treatment of comorbidities and secondary causes of dyslipidaemia.

**Statins for the prevention of cardiovascular disease**

A statin reduces the risk of cardiovascular disease events, and is the drug of first choice for primary and secondary prevention of cardiovascular disease. Before starting treatment with statins, secondary causes of dyslipidaemia should be addressed; these include uncontrolled diabetes mellitus, hepatic disease, nephrotic syndrome, and excessive alcohol consumption. Patients with hypothyroidism should receive adequate thyroid replacement therapy (before assessing the requirement for lipid-regulating treatment if for primary prevention) because correcting hypothyroidism itself may resolve the lipid abnormality. Untreated hypothyroidism increases the risk of myositis with lipid-regulating drugs.

For the purpose of reducing cardiovascular risk, NICE Clinical Guideline 181 (NICE clinical guideline 181 (July 2014). Lipid Modification—Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease)—see JBS3 recommendations for further details. In type 2 diabetes, assess level of risk using the risk calculator and treat for primary prevention if necessary.

Total cholesterol, HDL-cholesterol, and non-HDL cholesterol concentrations should be checked 3 months after starting treatment with a high intensity statin. NICE Clinical Guideline 181 recommends aiming for a reduction in non-HDL cholesterol concentration below 2.5 mmol/litre. If these are not achieved, ensure lifestyle modifications are optimised and consider increasing the dose of the statin if started on less than atorvastatin 80 mg and the patient is judged to be at higher risk because of comorbidities, risk score or, using clinical judgement.

Specialist advice should be sought about treatment options for patients at high risk of cardiovascular disease or those with existing cardiovascular disease, who are intolerant of three different statins.

**Fibrates** should not be routinely used for primary or secondary prevention. Nicotinic acid p. 177, bile acid sequestrants, and omega-3 fatty acid compounds are not recommended for primary or secondary prevention.

**Hypercholesterolaemia, hypertriglyceridaemia, and familial hypercholesterolaemia**

A statin is also the drug of first choice for treating hypercholesterolaemia and moderate hypertriglyceridaemia. Severe hypercholesterolaemia not adequately controlled with a maximal dose of a statin may require the use of an additional lipid-regulating drug such as ezetimibe p. 173; such treatment should generally be supervised by a specialist.

Advice from the MHRA: there is an increased risk of myopathy associated with high-dose (80 mg) simvastatin. The 80 mg dose should be considered only in patients with severe hypercholesterolaemia and high risk of cardiovascular complications who have not achieved their treatment goals on lower doses, when the benefits are expected to outweigh the potential risks.
A number of conditions, some familial, are characterised by very high LDL-cholesterol concentration, high triglyceride concentration, or both. Fenofibrate p. 175 may be added to statin therapy if triglycerides remain high even after the LDL-cholesterol concentration has been reduced adequately; nicotinic acid may also be used to further lower triglyceride or LDL-cholesterol concentration.

Combination of a statin with a fibrate with nicotinic acid carries an increased risk of side-effects (including rhabdomyolysis) and should be used under specialist supervision; monitoring of liver function and creatine kinase should also be considered. The concomitant administration of gemfibrozil with a statin increases the risk of rhabdomyolysis considerably—this combination should not be used.

A statin is recommended for all patients with familial hypercholesterolaemia. A ‘high-intensity’ statin (as defined in NICE Clinical Guideline 71, August 2008. Identification and management of familial hypercholesterolaemia) e.g. rosvuastatin p. 180 (initiated by a specialist) or atorvastatin should be considered in order to achieve the recommended reduction in LDL-cholesterol concentration of greater than 50% from baseline; a ‘high-intensity’ statin is one that produces a greater LDL-cholesterol reduction than simvastatin 40 mg. Patients with heterozygous familial hypercholesterolaemia who have contra-indications to, or are intolerant of, statins should receive ezetimibe p. 173. The combination of a statin and ezetimibe can be considered if a statin alone fails to provide adequate control (or if intolerance limits dose titration), and when a switch to an alternative statin is being considered. Patients for whom statins and ezetimibe are inappropriate, should be referred to a specialist for the consideration of treatment with a bile acid sequestrant, nicotinic acid, or a fibrate.

The prescribing of drug therapy in homozygous familial hypercholesterolaemia should be undertaken in a specialist centre.

Bile acid sequestrants
Bile acid sequestrants effectively reduce LDL-cholesterol but can aggravate hypertriglyceridaemia. Treatment with bile acid sequestrants may be inappropriate under specialist supervision if statins and ezetimibe are inappropriate, and when LDL-cholesterol is severely raised, for example in familial hypercholesterolaemia.

Fibrates
Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

Lomitapide
Lomitapide p. 176 is licensed as an adjunct to dietary measures and other lipid-regulating drugs for the treatment of homozygous familial hypercholesterolaemia.

Nicotinic acid group
The value of nicotinic acid p. 177 is limited by its side-effects, especially vasodilatation.

Nicotinic acid is used by specialists in combination with a statin if the statin alone cannot adequately control dyslipidaemia (raised LDL-cholesterol, triglyceridaemia, and low HDL-cholesterol).

Acipimox p. 177 seems to have fewer side-effects than nicotinic acid but may be less effective in its lipid-regulating capabilities.

Omega-3 fatty acid compounds
There is no evidence that omega-3 fatty acid compounds reduce the risk of cardiovascular disease.

Statins
Statins are more effective than other lipid-regulating drugs at lowering LDL-cholesterol concentration but they are less effective than the fibrates in reducing triglyceride concentration. However, statins reduce cardiovascular disease events and total mortality irrespective of the initial cholesterol concentration.

Bile acid sequestrants

- **DRUG ACTION** Bile acid sequestrants act by binding bile acids, preventing their reabsorption; this promotes hepatic conversion of cholesterol into bile acids; the resultant increased LDL-receptor activity of liver cells increases the clearance of LDL-cholesterol from the plasma.

- **CAUTIONS** Interference with the absorption of fat-soluble vitamins (supplements of vitamins A, D, K, and folic acid may be required when treatment is prolonged).

- **SIDE-EFFECTS** Constipation · diarrhoea · gastro-intestinal discomfort · hypertriglyceridaemia (aggravation) · hypoprothrombinaemia associated with vitamin K deficiency · increased risk of bleeding · nausea · vomiting

- **PREGNANCY** Bile acid sequestrants should be used with caution as although the drugs are not absorbed, they may cause fat-soluble vitamin deficiency on prolonged use.

- **BREAST FEEDING** Bile acid sequestrants should be used with caution as although the drugs are not absorbed, they may cause fat-soluble vitamin deficiency on prolonged use.

Colesevelim hydrochloride

**INDICATIONS AND DOSE**
Primary hypercholesterolaemia as an adjunct to dietary measures (monotherapy)

渤

**CONTRA-INDICATIONS**
Biliary obstruction · bowel obstruction

**CAUTIONS**
Gastro-intestinal motility disorders · inflammatory bowel disease · major gastro-intestinal surgery

**INTERACTIONS** → Appendix 1 (colesevelim).

**SIDE-EFFECTS**
Headache · myalgia

**HEPATIC IMPAIRMENT**
Manufacturer advises caution.

**MONITORING REQUIREMENTS**
Patients receiving ciclosporin should have their blood-ciclosporin concentration monitored before, during, and after treatment with colesevelim.

**DIRECTIONS FOR ADMINISTRATION**
Other drugs should be taken at least 4 hours before or after colesevelim to reduce possible interference with absorption.

**PATIENT AND CARER ADVICE**
Patient counselling on administration is advised for colesevelim hydrochloride tablets (avoid other drugs at same time).
COLESTYRAMINE (Non-proprietary)

INDICATIONS AND DOSE

Hyperlipidaemias, particularly type IIa, in patients who have not responded adequately to diet and other appropriate measures

BY MOUTH

Adult: Initially 5 g 1–2 times a day, increased in steps of 5 g every 1 month if required, total daily dose may be given in 1–2 divided doses; maximum 30 g per day

INTERACTIONS → Appendix 1 (colestipol).

DIRECTIONS FOR ADMINISTRATION

The contents of each sachet should be mixed with at least 150 mL of water or other suitable liquid such as fruit juice, skimmed milk, thin soups, and pulpy fruits ensuring at least 100 mL of liquid is provided. Other drugs should be taken at least 1 hour before or 4–6 hours after colestipol to reduce possible interference with absorption.

PATIENT AND CARER ADVICE

Patient counselling on administration is advised for colestipol hydrochloride granules (avoid other drugs at same time).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Granules

CHOLESTEROL ABSORPTION INHIBITORS

Ezetimibe

DRUG ACTION

Ezetimibe inhibits the intestinal absorption of cholesterol. If used alone, it has a modest effect on lowering LDL-cholesterol, with little effect on other lipoproteins.

INDICATIONS AND DOSE

Adjunct to dietary measures and statin treatment in primary hypercholesterolaemia | Adjunct to dietary measures and statin in homozygous familial hypercholesterolaemia | Primary hypercholesterolaemia (if statin inappropriate or not tolerated) | Adjunct to dietary measures in homozygous sitosterolaemia

BY MOUTH

Adult: 10 mg daily

INTERACTIONS → Appendix 1 (ezetimibe).

There is an increased risk of rhabdomyolysis if ezetimibe is used in combination with a statin.

SIDE-EFFECTS

- Common or very common Fatigue · gastro-intestinal disturbances · headache · myalgia
Hyperlipidaemia

Bezafibrate

**INDICATIONS AND DOSE**

Adjunct to diet and other appropriate measures in mixed hyperlipidaemia if statin contra-indicated or not tolerated. Adjunct to diet and other appropriate measures in severe hypertriglyceridaemia.

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: 200 mg 3 times a day

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: 400 mg once daily, modified-release dose form is not appropriate in patients with renal impairment

**CONTRA-INDICATIONS**

- Gall bladder disease
- Hypoaalbuminaemia
- Nephrotic syndrome
- Photosensitivity to fibrates

**CAUTIONS**

Correct hypothyroidism before initiating treatment.

**INTERACTIONS**

Appendix 1 (fibrates).

Combination of a fibrate with a statin increases the risk of muscle effects (especially rhabdomyolysis) and should be used with caution.

**SIDE-EFFECTS**

- Common or very common: Abdominal distension ± anorexia ± diarrhoea ± nausea
- Uncommon: Alopecia ± cholestasis ± dizziness ± erectile dysfunction ± headache ± myotoxicity (with myasthenia, myalgia, or very rarely rhabdomyolysis)—special risk in renal impairment ± photosensitivity reactions ± pruritus ± rash ± renal failure ± urticaria
- Rare: Pancreatitis ± peripheral neuropathy
- Very rare: Anaemia ± gallstones ± increased platelet count ± interstitial lung disease ± leucopenia ± pancytopenia ± Stevens-Johnson syndrome ± thrombocytopenic purpura ± toxic epidermal necrolysis

**PREGNANCY**

Manufacturers advise avoid—no information available.

**SIDE-EFFECTS**

- Abdominal distension ± anorexia ± diarrhoea ± nausea

**PRESCRIBING AND DISPENSING INFORMATION**

Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholesterol.

**PRECAUTIONS AND ADVISORY LABELS**

- Consider monitoring of liver function and creatine kinase when fibrates are used in combination with a statin.

Ciprofibrate

**INDICATIONS AND DOSE**

Adjunct to diet and other appropriate measures in mixed hyperlipidaemia if statin contra-indicated or not tolerated. Adjunct to diet and other appropriate measures in severe hypertriglyceridaemia.

BY MOUTH

- Adult: 100 mg daily

**CONTRA-INDICATIONS**

- Gall bladder disease
- Hypoaalbuminaemia
- Nephrotic syndrome
- Photosensitivity to fibrates

**CAUTIONS**

Correct hypothyroidism before initiating treatment.

**INTERACTIONS**

Appendix 1 (fibrates).

Combination of a fibrate with a statin increases the risk of muscle effects (especially rhabdomyolysis) and should be used with caution.

**SIDE-EFFECTS**

- Abdominal distension ± anorexia ± diarrhoea ± nausea
• Uncommon Alopecia - cholestasis - dizziness - erectile dysfunction - headache - myotoxicity (with myasthenia, myalgia, or very rarely rhabdomyolysis)—special risk in renal impairment - photosensitivity reactions - pruritus - rash - renal failure - urticaria

• Rare Pancreatitis - peripheral neuropathy

• Very rare Anaemia - gallstones - increased platelet count - interstitial lung disease - leucopenia - pancyclopenia - Stevens-Johnson syndrome - thrombocytopenic purpura - toxic epidermal necrolysis

• Frequency not known Pneumonitis - pulmonary fibrosis

• PREGNANCY Manufacturers advise avoid—toxicity in animal studies.

• BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.

• HEPATIC IMPAIRMENT Use with caution in mild to moderate impairment. Avoid in severe impairment.

• RENAL IMPAIRMENT Reduce dose to 100 mg on alternate days in moderate impairment. Avoid in severe impairment.

Myotoxicity Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly.

• MONITORING REQUIREMENTS

• Liver function tests recommended every 3 months for first year (discontinue treatment if significantly raised).

• Consider monitoring liver function and creatine kinase when fibrates used in combination with a statin.

• PRESCRIBING AND DISPENSING INFORMATION Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Table

Fenofibrate

• DRUG ACTION Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholesterol.

• INDICATIONS AND DOSE

Adjunct to diet and other appropriate measures in mixed hyperlipidaemia if statin contraindicated or not tolerated | Adjunct to diet and other appropriate measures in severe hypertriglyceridaemia | Adjunct to statin in mixed hyperlipidaemia if triglycerides and HDL-cholesterol inadequately controlled in patients at high cardiovascular risk

BY MOUTH USING CAPSULES

• Adult: Initially 200 mg daily, then increased if necessary to 267 mg daily, maximum 200 mg daily with concomitant statin; 200 mg capsules not appropriate for use in renal impairment; 267 mg capsules not appropriate for initial dose titration or in renal impairment

BY MOUTH USING TABLETS

• Adult: 160 mg daily, tablets not appropriate in renal impairment

• CONTRA-INDICATIONS Gall bladder disease - pancreatitis (unless due to severe hypertriglyceridaemia) - photosensitivity to ketoprofen

• CAUTIONS Correct hypothyroidism before initiating treatment

• INTERACTIONS → Appendix 1 (fibrates). Combination of a fibrate with a statin increases the risk of muscle effects (especially rhabdomyolysis) and should be used with caution.

• SIDE-EFFECTS

• Common or very common Abdominal distension - anorexia - diarrhoea - nausea

• Uncommon Alopecia - cholestasis - dizziness - erectile dysfunction - headache - myotoxicity (with myasthenia, myalgia, or very rarely rhabdomyolysis)—special risk in renal impairment - pancreatitis - photosensitivity reactions - pruritus - pulmonary embolism - rash - renal failure - urticaria

• Very rare Anaemia - gallstones - increased platelet count - interstitial lung disease - leucopenia - pancyclopenia - Stevens-Johnson syndrome - thrombocytopenic purpura - toxic epidermal necrolysis

• Frequency not known Interstitial pneumopathies

• PREGNANCY Avoid—embryotoxicity in animal studies.

• BREAST FEEDING Manufacturers advise avoid—no information available.

• HEPATIC IMPAIRMENT Avoid.

• RENAL IMPAIRMENT Reduce dose to 134 mg daily if eGFR less than 60 mL/minute/1.73 m². Reduce dose to 67 mg daily if eGFR less than 20 mL/minute/1.73 m². Avoid if eGFR less than 15 mL/minute/1.73 m².

Myotoxicity Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly.

• MONITORING REQUIREMENTS

• Liver function tests recommended every 3 months for first year (discontinue treatment if significantly raised).

• Consider monitoring liver function and creatine kinase when fibrates used in combination with a statin.

• PRESCRIBING AND DISPENSING INFORMATION Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

- Adjunct to diet and other appropriate measures in primary hypercholesterolaemia if statin contra-indicated or not tolerated
- Adjunct to diet and other appropriate measures in severe hypertriglyceridaemia
- Adjunct to diet and other appropriate measures in primary prevention of cardiovascular disease in men with hyperlipidaemias if statin contra-indicated or not tolerated

**CONTRA-INDICATIONS** History of gall-bladder or biliary tract disease including gallstones - photosensitivity to light - photosensitivity to sunlight

**CAUTIONS** Correct hypothyroidism before initiating treatment - elderly

**INTERACTIONS** Appendix 1 (fibrates).

The combination of gemfibrozil and a statin should preferably be avoided; high risk of muscle effects (especially rhabdomyolysis).

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain - constipation - diarrhoea - dyspepsia - eczema - fatigue - flatulence - headache - nausea - rash - vertigo - vomiting
- **Uncommon** Atrial fibrillation
- **Rare** Hepatitis - paraesthesia - alopecia - anaemia - angioedema - appendicitis - blurring vision - bone-marrow suppression - cholestatic jaundice - depression - disturbances in hepatic function - dizziness - drowsiness - eosinophilia - exfoliative dermatitis - leucopenia - myalgia - myasthenia - myopathy - myositis accompanied by increase in creatine kinase (discontinue if raised significantly) - pancreatitis - photosensitivity - pruritus - sexual dysfunction - thrombocytopenia - urticaria
- **PREGNANCY** Manufacturers advise avoid unless essential - toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Avoid.
- **RENAL IMPAIRMENT** Initially 900 mg daily if eGFR 30–80 mL/minute/1.73 m². Avoid if eGFR less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
  - Monitor blood counts for first year.
  - Monitor liver-function (discontinue treatment if abnormalities persist).
  - Consider monitoring creatine kinase if used in combination with a statin.
- **PRESCRIBING AND DISPENSING INFORMATION** Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**MICROSOMAL TRIGLYCERIDE TRANSFER PROTEIN INHIBITORS**

Lomitapide

**DRUG ACTION** Lomitapide, an inhibitor of microsomal triglyceride transfer protein (MTP), reduces lipoprotein secretion and circulating concentrations of lipoprotein-borne lipids such as cholesterol and triglycerides.

**INDICATIONS AND DOSE** Adjunct to dietary measures and other lipid-regulating drugs with or without low-dose lipoprotein apheresis in homozygous familial hypercholesterolaemia (under expert supervision)

**CONTRA-INDICATIONS** Significant or chronic bowel disease

**CAUTIONS** Concomitant use of hepatotoxic drugs - lomitapide can interfere with the absorption of fat-soluble nutrients and supplementation of vitamin E and fatty acids is required - patients over 65 years

**INTERACTIONS** Appendix 1 (lomitapide).

**SIDE-EFFECTS**
- **Common or very common** Bloating - abdominal pain - appetite changes - constipation - diarrhoea - dizziness - dyspepsia - eczema - eructation - eye swelling - gastro-oesophageal reflux disease - gastroenteritis - haemorrhoids - headache - hepatic steatosis - hepatomegaly - hypokalaemia - leucopenia - malaise - migraine - muscle spasms - nausea - neutropenia - raised serum transaminases - tenesmus - vomiting - weight loss
- **BY MOUTH**
  - Adult: Initially 5 mg daily for 2 weeks, dose to be taken at least 2 hours after evening meal, then increased if necessary to 10 mg daily, for at least 4 weeks, then increased to 20 mg daily for at least 4 weeks, then increased in steps of 20 mg daily, adjusted at intervals of at least 4 weeks; maximum 60 mg per day

**SIDE-EFFECTS, FURTHER INFORMATION**

Raised transaminases Reduce dose if serum transaminases raised during treatment (consult product literature).

**CONCEPTION AND CONTRACEPTION** Manufacturer advises exclude pregnancy before treatment and ensure effective contraception used.

**PREGNANCY** Avoid — teratogenicity and embryotoxicity in animal studies.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT** Reduce dose if serum transaminases raised during treatment (consult product literature). Max. 40 mg daily in mild impairment.
Avoid in moderate to severe impairment, or if unexplained persistent abnormal liver function tests.

- **RENAI L IMPAIRMENT** Max. 40 mg daily in end-stage renal disease.
- **MONITORING REQUIREMENTS**
  - Monitor liver function tests before treatment, then at least monthly and before each dose increase for first year, then at least every 3 months and before each dose increase thereafter.
  - Screen for hepatic steatosis and fibrosis before treatment, then annually thereafter.
- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Capsule**
    - Lojuxta (Aegerion Pharmaceuticals Ltd)
      - Lomitapide 5 mg Lojuxta 5mg capsules | 28 capsule [POM] £17,765.00
      - Lomitapide 10 mg Lojuxta 10mg capsules | 28 capsule [POM] £17,765.00
      - Lomitapide 20 mg Lojuxta 20mg capsules | 28 capsule [POM] £17,765.00

### NICOTINIC ACID DERIVATIVES

### Acipimox

#### INDICATIONS AND DOSE

Adjunct or alternative treatment in hyperlipidaemias of types IIb and IV in patients who have not responded adequately to other lipid-regulating drugs such as a statin or fibrate, and lifestyle changes (including diet, exercise, and weight reduction)

**BY MOUTH**
- Adult: 250 mg 2–3 times a day

- **CONTRA-INDICATIONS** Peptic ulcer
- **SIDE-EFFECTS**
  - Common or very common Abdominal pain - dyspepsia - diarrhoea - flushing - headache - malaise - myalgia - myopathy - nausea - pruritus - rash
  - Uncommon Anaphylactoid reaction - arthralgia - bronchospasm - erythema - myalgia - myositis - pruritus - rash
  - Frequency not known Diarrhoea - dry eyes - vasodilatation
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAI L IMPAIRMENT** Reduce dose to 250 mg 1–2 times daily if eGFR 30–60 mL/minute/1.73 m². Avoid if eGFR less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor hepatic and renal function.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Capsule**
    - Olbetam (Pfizer Ltd)
      - Acipimox 250 mg Olbetam 250mg capsules | 90 capsule [POM] £46.33 DT price = £46.33

### Nicotinic acid

- **DRUG ACTION** In doses of 1.5 to 3 g daily, it lowers both cholesterol and triglyceride concentrations by inhibiting synthesis; it also increases HDL-cholesterol.

---

**INDICATIONS AND DOSE**

Adjunct to statin in dyslipidaemia or used alone if statin not tolerated

**BY MOUTH**
- Adult: (consult product literature)

- **CONTRA-INDICATIONS** Active peptic ulcer disease - arterial bleeding
- **CAUTIONS** Acute myocardial infarction - diabetes mellitus - gout - history of peptic ulceration - unstable angina
- **INTERACTIONS** → Appendix 1 (nicotinic acid).

- **SIDE-EFFECTS**
  - Common or very common Abdominal pain - diarrhoea - dyspepsia - flushing - nausea - pruritus - rash - vomiting
  - Uncommon Dizziness - headache - hypophosphataemia - increase in uric acid - palpititation - peripheral oedema - prolonged prothrombin time - reduced platelet count - shortness of breath - tachycardia
  - Rare Hypotension - insomnia - myalgia - myasthenia - myopathy - reduced glucose tolerance - rhinitis - syncope
  - Very rare Anorexia - rhabdomyolysis - visual disturbance
  - Frequency not known Jaundice

**SIDE-EFFECTS, FURTHER INFORMATION**

Prostaglandin-mediated symptoms (such as flushing) can be reduced by low initial doses taken with meals or, if patient taking aspirin, aspirin dose should be taken 30 minutes before nicotinic acid.

- **PREGNANCY** No information available—manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Present in milk—avoid.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment. Discontinue if severe abnormalities in liver function tests. Manufacturer advises monitor liver function in mild to moderate hepatic impairment.
- **RENAI L IMPAIRMENT** Manufacturer advises use with caution—no information available.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: modified-release tablet, powder, tablet, capsule

### OMEGA-3 FATTY ACIDS

#### Omega-3-acid ethyl esters

- **INDICATIONS AND DOSE** Adjunct to diet and statin in type IIb or III hypertriglyceridaemia | Adjunct to diet in type IV hypertriglyceridaemia

**BY MOUTH**
- Adult: Initially 2 capsules daily, dose to be taken with food, increased if necessary to 4 capsules daily
- Adult: 1 capsule daily, dose to be taken with food

- **CAUTIONS** Anticoagulant treatment (bleeding time increased) - haemorrhagic disorders

- **SIDE-EFFECTS**
  - Common or very common Dyspepsia - headache - nausea
  - Uncommon Abdominal pain - dizziness - gastritis - taste disturbances
  - Rare Acne - headache - hepatic disorders - hyperglycaemia - rash
  - Very rare Gastro-intestinal haemorrhage - hypotension - increased white cell count - nasal dryness - urticaria
Cardiovascular system

PREGNANCY Manufacturers advise use only if potential benefit outweighs risk—no information available.

BREAST FEEDING Manufacturers advise avoid—no information available.

HEPATIC IMPAIRMENT Monitor liver function in hepatic impairment.

NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (November 2002) that omega-3 acid ethyl esters are not recommended for use within NHS Scotland for the treatment of hypertriglyceridaemia.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Capsule

  Brands may include Dualis, Nebbaro

STATINS

Statins

Drug action Statins competitively inhibit 3-hydroxy-3-methylglutaryl coenzyme A (HMG CoA) reductase, an enzyme involved in cholesterol synthesis, especially in the liver.

Caution Elderly - high alcohol intake - history of liver disease - hypothyroidism - patients at increased risk of muscle toxicity, including myopathy or rhabdomyolysis (e.g. those with a personal or family history of muscular disorders, previous history of muscular toxicity and a high alcohol intake)

Caution further information
Muscle effects Muscle toxicity can occur with all statins, however the likelihood increases with higher doses and in certain patients (see below). Statins should be used with caution in patients at increased risk of muscle toxicity, including those with a personal or family history of muscular disorders, previous history of muscular toxicity, a high alcohol intake, renal impairment or hypothyroidism.

In patients at increased risk of muscle effects, a statin should not usually be started if the baseline creatine kinase concentration is more than 5 times the upper limit of normal (some patients may present with an extremely elevated baseline creatine kinase concentration, for example because of a physical occupation or rigorous exercise—specialist advice should be sought regarding consideration of statin therapy in these patients).

Hypothyroidism Hypothyroidism should be managed adequately before starting treatment with a statin.

Interactions → Appendix 1 (statins).

There is an increased incidence of myopathy if a statin is given with a fibrate (the combination of a statin and gemfibrozil should preferably be avoided), with lipid-lowering doses of nicotinic acid, with fusidic acid (risk of rhabdomyolysis—the combination of a statin and fusidic acid should be avoided; temporarily discontinue statin and restart 7 days after last fusidic acid dose), or with drugs that increase the plasma-statin concentration, such as macrolide antibiotics, imidazole and triazole antifungals, and ciclosporin; close monitoring of liver function and, if muscular symptoms occur, of creatine kinase is necessary.

Side-effects

Rare Hepatitis, jaundice

Very rare Hepatic failure, interstitial lung disease, lupus erythematosus-like reactions, pancreatitis

Frequency not known Alopecia, altered liver function tests, anemia, arthralgia, asthenia, depression, dizziness, fatigue, gastro-intestinal disturbances, headache, hyperglycaemia, hypersensitivity reactions, may be associated with the development of diabetes mellitus (particularly in those already at risk of the condition), myalgia, myopathy, myositis, parasthesia, peripheral neuropathy, pruritus, rash, rhabdomyolysis, sexual dysfunction, sleep disturbance, thrombocytopenia, urticaria, visual disturbance

Side-effects, further information
Muscle effects The risk of myopathy, myositis, and rhabdomyolysis associated with statin use is rare. Although myalgia has been reported commonly in patients receiving statins, muscle toxicity truly attributable to statin use is rare. Muscle toxicity can occur with all statins, however the likelihood increases with higher doses.

If muscular symptoms or raised creatine kinase occur during treatment, other possible causes (e.g. rigorous physical activity, hypothyroidism, infection, recent trauma, and drug or alcohol addiction) should be excluded before statin therapy is implicated, particularly if statin treatment has previously been tolerated for more than 3 months. When a statin is suspected to be the cause of myopathy, and creatine kinase concentration is markedly elevated (more than 5 times upper limit of normal), or if muscular symptoms are severe, treatment should be discontinued. If symptoms resolve and creatine kinase concentrations return to normal, the statin should be reintroduced at a lower dose and the patient monitored closely; an alternative statin should be prescribed if unacceptable side-effects are experienced with a particular statin. Statins should not be discontinued in the event of small, asymptomatic elevations of creatine kinase. Routine monitoring of creatine kinase is unnecessary in asymptomatic patients.

Statins should not be discontinued if there is an increase in the blood-glucose concentration or HbA1c as the benefits continue to outweigh the risks.

Interstitial lung disease If patients develop symptoms such as dyspnoea, cough, and weight loss, they should seek medical attention.

Conception and contraception Adequate contraception is required during treatment and for 1 month afterwards.

Pregnancy Statins should be avoided in pregnancy (discontinue 3 months before attempting to conceive) as congenital anomalies have been reported and the decreased synthesis of cholesterol possibly affects fetal development.
PATIENT AND CARER ADVICE

▶ Diabetes Before starting treatment with statins, at least one full lipid profile (non-fasting) should be measured, including total cholesterol, HDL-cholesterol, non-HDL-cholesterol (calculated as total cholesterol minus HDL-cholesterol), and triglyceride concentrations, thyroid-stimulating hormone, and renal function should also be assessed.

▶ Liver function There is little information available on a rational approach to liver-function monitoring; however, NICE suggests that liver enzymes should be measured before treatment, and repeated within 3 months and at 12 months of starting treatment, unless indicated at other times by signs or symptoms suggestive of hepatotoxicity (NICE clinical guideline 181 (July 2014). Lipid Modification—Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease). Those with serum transaminases that are raised, but less than 3 times the upper limit of the reference range, should not be routinely excluded from statin therapy. Those with serum transaminases of more than 3 times the upper limit of the reference range should discontinue statin therapy.

▶ Creatine kinase Before initiation of statin treatment, creatine kinase concentration should be measured in patients who have had persistent, generalised, unexplained muscle pain (whether associated or not with previous lipid-regulating drugs); if the concentration is more than 5 times the upper limit of normal, a repeat measurement should be taken after 7 days. If the repeat concentration remains above 5 times the upper limit, statin treatment should not be started; if concentrations are still raised but less than 5 times the upper limit, the statin should be started at a lower dose.

▶ Diabetes Patients at high risk of diabetes mellitus should have fasting blood-glucose concentration or HbA1c checked before starting statin treatment, and then repeated after 3 months.

PATIENT AND CARER ADVICE Advise patients to report promptly unexplained muscle pain, tenderness, or weakness.

Atorvastatin

INDICATIONS AND DOSE

Primary hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures | Combined hyperlipidaemia in patients who have not responded adequately to diet in other appropriate measures

BY MOUTH

Adult: Usual dose 10 mg daily; increased if necessary up to 80 mg daily, dose to be increased at intervals of at least 4 weeks

Heterozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures | Homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures

BY MOUTH

Adult: Initially 10 mg daily for at least 4 weeks, then increased if necessary to 40 mg daily for at least a further 4 weeks, then increased if necessary up to 80 mg daily.

Primary prevention of cardiovascular events in patients at high risk of a first cardiovascular event

BY MOUTH

Adult: 20 mg daily, dose can be increased if necessary

Secondary prevention of cardiovascular events

BY MOUTH

Adult: 80 mg once daily

Dose adjustments due to interactions

Reduced dose required (max. 10 mg daily) with concomitant ciclosporin, or tipranavir combined with ritonavir—seek specialist advice.

Maximum dose of 40 mg once daily when combined with anion-exchange resin for heterozygous familial hypercholesterolaemia.

UNLICENSED USE Not licensed for use in secondary prevention of cardiovascular events. Starting dose of 20 mg once daily is not licensed for the primary prevention of cardiovascular events.

CAUTIONS Haemorrhagic stroke

SIDE-EFFECTS

▶ Common or very common Back pain - epistaxis - hyperglycaemia - nasopharyngitis - pharyngolaryngeal pain

▶ Uncommon Anorexia - blurred vision - chest pain - hypoglycaemia - malaise - neck pain - peripheral oedema - pyrexia - tinnitus - weight gain

▶ Rare Cholestasis - Stevens-Johnson syndrome - toxic epidermal necrolysis

▶ Very rare Cynaecomasia - hearing loss

BREAST FEEDING Manufacturer advises avoid—no information available.

RENAL IMPAIRMENT In chronic kidney disease, for primary and secondary prevention of cardiovascular events [unlicensed starting dose in primary prevention; unlicensed in secondary prevention], initially 20 mg once daily, increased if necessary (on specialist advice if eGFR < 30 mL/minute/1.73 m²); max. 80 mg once daily.

PATIENT AND CARER ADVICE Patient counselling is advised for atorvastatin tablets (muscle effects).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet

Fluvastatin

**INDICATIONS AND DOSE**

Adjunct to diet in primary hypercholesterolaemia or combined (mixed) hyperlipidaemia (types IIa and IIb)

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- Adult: Initially 20–40 mg daily, dose to be taken in the evening, increased if necessary up to 80 mg daily in 2 divided doses, dose to be adjusted at intervals of at least 4 weeks

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- Adult: 80 mg daily

**Cautionary and Advisory Labels**

- **SIDE-EFFECTS**
  - Very rare  Vasculitis
  - **BREAST FEEDING**  Manufacturer advises avoid—no information available.
  - **RENAL IMPAIRMENT**  Manufacturer advises doses above 40 mg daily should be initiated with caution if eGFR less than 30 mL/minute/1.73 m².
  - **PATIENT AND CARER ADVICE**  Patient counselling is advised for pravastatin tablets/capsules (muscle effects).

**National Funding/Access Decisions**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (February 2004) that fluvastatin is accepted for restricted use for the secondary prevention of coronary events after percutaneous coronary angioplasty; if the patient has previously been receiving another statin, then there is no need to change the statin.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Modified-release tablet**

Cautionary and Advisory Labels 25

- **FLUVASTATIN (Non-proprietary)**
  - Fluvastatin (as Fluvastatin sodium) 80 mg  Fluvastatin 80mg modified-release tablets  |  28 tablet  $19.20 DT price = $19.20
  - Lescol XL (Novartis Pharmaceuticals UK Ltd)
    - Fluvastatin (as Fluvastatin sodium) 80 mg  Fluvastatin 80mg tablets  |  28 tablet  $19.20 DT price = $19.20
  - Brands may include Dorisin XL; Lescol XL; Luvinsta XL; Nandovar XL; Pinmactil; Stefluvin XL

**Capsule**

- **FLUVASTATIN (Non-proprietary)**
  - Fluvastatin (as Fluvastatin sodium) 20 mg  Fluvastatin 20mg capsules  |  28 capsule  $6.96 DT price = $2.48
  - Fluvastatin (as Fluvastatin sodium) 40 mg  Fluvastatin 40mg capsules  |  28 capsule  $7.42 DT price = $2.72

    - Fluvastatin (as Fluvastatin sodium) 40 mg  Fluvastatin 40mg capsules  |  28 capsule  $15.26 DT price = $2.72

**Pravastatin sodium**

**INDICATIONS AND DOSE**

Adjunct to diet for primary hypercholesterolaemia or combined (mixed) hyperlipidaemias in patients who have not responded adequately to dietary control

**BY MOUTH**

- Adult: 10–40 mg daily, dose to be taken at night, dose to be adjusted at intervals of at least 4 weeks

Prevention of cardiovascular events in patients with previous myocardial infarction or unstable angina

**BY MOUTH**

- Adult: 40 mg daily, dose to be taken at night

Reduction of hyperlipidaemia in patients receiving immunosuppressive therapy following solid-organ transplantation

**BY MOUTH**

- Adult: Initially 20 mg daily, then increased if necessary up to 40 mg daily, dose to be taken at night, close medical supervision is required if dose is increased to maximum dose

**SIDE-EFFECTS**

- Uncommon  Abnormal urination • dysuria • nocturia • urinary frequency
  - **BREAST FEEDING**  Manufacturer advises avoid—small amount of drug present in breast milk.
  - **RENAL IMPAIRMENT**  Manufacturer advises initial dose of 10 mg once daily in moderate to severe impairment.
  - **PATIENT AND CARER ADVICE**  Patient counselling is advised for pravastatin tablets (muscle effects).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, powder tablet

- **PRAVASTATIN SODIUM (Non-proprietary)**
  - Pravastatin sodium 10 mg  Pravastatin 10mg tablets  |  28 tablet  $16.10 DT price = $1.31
  - Pravastatin sodium 20 mg  Pravastatin 20mg tablets  |  28 tablet  $29.60 DT price = $1.57

    - Pravastatin sodium 40 mg  Lipostat 40mg tablets  |  28 tablet  $26.01 DT price = $1.37

**Rosuvastatin**

**INDICATIONS AND DOSE**

Primary hypercholesterolaemia (type IIa including heterozygous familial hypercholesterolaemia), mixed dyslipidaemia (type IIb), or homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures

**BY MOUTH**

- Adult 18–69 years: Initially 5–10 mg once daily, then increased if necessary to 20 mg once daily, dose to be increased at intervals of at least 4 weeks
  - Adult (patients of Asian origin): Initially 5 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased at intervals of at least 4 weeks.
Primary hypercholesterolaemia (type IIA including heterozygous familial hypercholesterolaemia), mixed dyslipidaemia (type IIb), or homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures and who have risk factors for myopathy or rhabdomyolysis

BY MOUTH

- Adult: Initially 5 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased at intervals of at least 4 weeks.
- Severe primary hypercholesterolaemia (type IIA including heterozygous familial hypercholesterolaemia), mixed dyslipidaemia (type IIb), or homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures, in patients with high cardiovascular risk (under expert supervision).

Dose adjustments due to interactions

- Initially 5 mg once daily, then increased if necessary up to 20 mg once daily.
- Doses above 20 mg once daily are used with caution if eGFR less than 60 mL/minute/1.73 m².

Prevention of cardiovascular events in patients at high risk of a first cardiovascular event

BY MOUTH

- Adult 18–69 years: 20 mg once daily.
- Adult (patients of Asian origin): Initially 5 mg once daily, then increased if necessary up to 20 mg once daily.
- Adult 70 years and over: Initially 5 mg once daily, then increased if necessary up to 20 mg once daily.

Prevention of cardiovascular events in patients at high risk of a first cardiovascular event and with risk factors for myopathy or rhabdomyolysis

BY MOUTH

- Adult: Initially 5 mg once daily, then increased if necessary up to 20 mg once daily.

Dose adjustments due to interactions

- Initially 5 mg once daily, then increased if necessary up to 20 mg once daily.
- For dose adjustments with concomitant atazanavir, darunavir, dronedarone, eltrombopag, ezetimibe, itraconazole, lopinavir, or tipranavir, consult product information available.

Patient counselling is advised for rosuvastatin tablets (muscle effects).

้าย _existing hypothyroidism.

SIDE-EFFECTS

- Rare Anaemia
- Frequency not known Tendinopathy

BREAST FEEDING

Manufacturer advises avoid—no information available.

RENAL IMPAIRMENT

Doses above 10 mg daily should be used with caution if eGFR less than 30 mL/minute/1.73 m².

PATIENT AND CARER ADVICE

Patient counselling is advised for simvastatin tablets/oral suspension (muscle effects).

EXCEPTIONS TO LEGAL CATEGORY

Simvastatin 10 mg tablets can be sold to the public to reduce risk of first coronary event in individuals at moderate risk of coronary heart disease (approx. 10–15 % risk of major event in 10 years), max. daily dose 10 mg and pack size of 28 tablets; treatment should form part of a programme to reduce risk of coronary heart disease.

MEDIcINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

- SIMVASTATIN (Non-proprietary) Simvastatin 10 mg Simvastatin 10mg tablets | 28 tablet £18.00 DT price = £0.90
- Simvastatin 20 mg Simvastatin 20mg tablets | 28 tablet £29.60 DT price = £1.02
Acute attacks of stable angina should be managed with risk of cardiovascular events. Management to prevent angina attacks and to reduce the long-term management of acute anginal pain, and long-term exertion and relieved by rest. Treatment involves oxygen supply to the heart; it is often precipitated by Stable angina angina.

**Ezetimibe with simvastatin**

The properties listed below are those particular to the combination only. For the properties of the components please consider, ezetimibe p. 173, simvastatin p. 181.

**INDICATIONS AND DOSE**

Homozygous familial hypercholesterolaemia, primary hypercholesterolaemia, and mixed hyperlipidaemia in patients stabilised on the individual components in the same proportions, or for patients not adequately controlled by statin alone.

**BY MOUTH**

- Adult: (consult product literature)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**

  - Inegy (Merck Sharp & Dohme Ltd)
  - Ezetimibe 10 mg, Simvastatin 20 mg Inegy 10mg/20mg tablets | 28 tablet £33.42 DT price = £33.42
  - Ezetimibe 10 mg, Simvastatin 40 mg Inegy 10mg/40mg tablets | 28 tablet £38.98 DT price = £38.98
  - Ezetimibe 10 mg, Simvastatin 80 mg Inegy 10mg/80mg tablets | 28 tablet £41.21 DT price = £41.21

7  **Myocardial ischaemia**

**Stable angina**

It is important to distinguish stable angina from unstable angina. Stable angina usually results from atherosclerotic plaques in the coronary arteries that restrict blood flow and oxygen supply to the heart; it is often precipitated by exertion and relieved by rest. Treatment involves management of acute anginal pain, and long-term management to prevent angina attacks and to reduce the risk of cardiovascular events.

**Management**

Acute attacks of stable angina should be managed with sublingual glyceryl trinitrate p. 190 which can be taken immediately before performing activities that are known to bring on an attack. If attacks occur more than twice a week, regular drug therapy is required and should be introduced in a step-wise manner according to response.

Patients with stable angina should be given a beta-blocker or a calcium-channel blocker. In those with left-ventricular dysfunction, beta-blocker treatment should be started at a very low dose and titrated very slowly over a period of weeks or months. If a beta-blocker or a calcium-channel blocker alone fails to control symptoms adequately, a combination of a beta-blocker and a dihydropyridine calcium-channel blocker (e.g. amiodipine p. 148, felodipine p. 151, modified-release nifedipine p. 154) should be used; if this combination is not appropriate due to intolerance of, or contra-indication to, either beta-blockers or calcium-channel blockers, addition of a long-acting nitrate, ivabradine p. 185, nicorandil p. 185, or ranolazine p. 184 can be considered.

For those patients in whom both beta-blockers and calcium-channel blockers are not tolerated or are contra-indicated, monotherapy with a long-acting nitrate, ivabradine, nicorandil, or ranolazine should be considered.

Response to treatment should be assessed every 2–4 weeks after initiating or changing drug therapy; the drug should be titrated (according to symptom control) to the maximum tolerated dose. Consider referring the patient to a specialist if a combination of two drugs fails to control symptoms. Addition of a third antianginal drug should only be considered if symptom control is not achieved with two drugs and the patient is either due to undergo a revascularisation procedure, or a revascularisation procedure is considered inappropriate. See the use of antiplatelet drugs in patients undergoing coronary stenting.

For long-term prevention of cardiovascular events, see Prevention of cardiovascular events.

**Antiangular drugs**

Nitrites, calcium-channel blockers, and potassium channel activators (use in adults only) have a vasodilating and, consequently, blood pressure lowering effect. Vasodilators can act in heart failure by arteriolar dilatation which reduces both peripheral vascular resistance and left ventricular pressure during systole resulting in improved cardiac output. They can also cause venous dilatation which results in dilatation of capacitance vessels, increase of venous pooling, and diminution of venous return to the heart (decreasing left ventricular end-diastolic pressure). Nicorandil p. 185, a potassium-channel activator with a nitrate component, has both arterial and venous vasodilating properties and is licensed for the prevention and long-term treatment of angina. Nicorandil has similar efficacy to other antiangular drugs in controlling symptoms; it may produce additional symptomatic benefit in combination with other antiangular drugs [unlicensed indication].

Ivabradine p. 185 lowers the heart rate by its action on the sinus node. It is licensed for the treatment of angina in patients who are in normal sinus rhythm in combination with a beta-blocker, or when beta-blockers are contraindicated or not tolerated. Ivabradine, in combination with standard therapy including a beta-blocker (unless contra-indicated or not tolerated), is also licensed for mild to severe stable chronic heart failure in patients who are in sinus rhythm.

Ranolazine p. 184 is licensed as adjunctive therapy in patients who are inadequately controlled or intolerant of first-line antiangular drugs.
GLYkoprotein IIB/IIIA INHIBITORS

Abciximab

INdICATIONS AND DOSE
Prevention of ischaemic cardiac complications in patients undergoing percutaneous coronary intervention (specialist use only)

INITIALLY BY INTRAVENOUS INJECTION

- Adult: Initially 250 micrograms/kg, to be given over 1 minute, then (by intravenous infusion) 125 nanograms/kg/minute (max. 10 micrograms/minute), to be started 10–60 minutes before percutaneous coronary intervention and continue for 12 hours

Short-term prevention of myocardial infarction in patients with unstable angina not responding to conventional treatment and who are scheduled for percutaneous coronary intervention (specialist use only)

INITIALLY BY INTRAVENous INJECTION

- Adult: Initially 250 micrograms/kg, to be given over 1 minute, then (by intravenous infusion) 125 nanograms/kg/minute (max. 10 micrograms/minute), to be started up to 24 hours before possible percutaneous coronary intervention and continue infusion for 12 hours after intervention

- CONTRA-INDICATIONS Active internal bleeding - arteriovenous malformation or aneurysm - haemorrhagic diathesis - hypertensive retinopathy - intracranial neoplasm - intracranial or intraspinal surgery or trauma within last 2 months - major surgery within last 2 months - severe hypertension - stroke within last 2 years - thrombocytopenia - vasculitis

- CAUTIONS Discontinue if uncontrollable serious bleeding occurs or emergency cardiac surgery needed (consult product literature for details of procedures to minimise bleeding) - elderly

- INTERACTIONS Caution with concomitant use of drugs that increase risk of bleeding.

- SIDE-EFFECTS
  - Common or very common Back pain - bleeding manifestations - bradycardia - chest pain - fever - headache - hypotension - nausea - puncture site pain - thrombocytopenia - vomiting
  - Rare Adult respiratory distress - cardiac tamponade - hypersensitivity reactions

- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk — no information available.

- BREAST FEEDING Manufacturer advises avoid—no information available.

- HEPATIC IMPAIRMENT Avoid in severe liver disease—increased risk of bleeding.

- RENAL IMPAIRMENT Caution in severe impairment—increased risk of bleeding.

- MONITORING REQUIREMENTS
  - Measure baseline prothrombin time, activated clotting time, activated partial thromboplastin time, platelet count, haemoglobin, and haematocrit.
  - Monitor haemoglobin and haematocrit 12 hours and 24 hours after start of treatment and platelet count 2–4 hours and 24 hours after start of treatment.

- DIRECTIONS FOR ADMINISTRATION
  - For intravenous infusion (ReoPro®), give continuously in Glucose 5% or Sodium Chloride 0.9%. Dilute requisite dose in infusion fluid and give via infusion pump; filter upon dilution through a non-pyrogenic low protein-binding 0.2, 0.22, or 2.0 micron filter or upon administration through an in-line non-progenic low protein-binding 0.2 or 0.22 micron filter

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

  Solution for injection
  - ReoPro (Eli Lilly and Company Ltd)
    Abciximab 2 mg per 1 ml ReoPro 10mg/5ml solution for injection vials | 1 vial £25.24

Eptifibatide

INdICATIONS AND DOSE
In combination with aspirin and unfractionated heparin for the prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction and with last episode of chest pain within 24 hours (specialist use only)

INITIALLY BY INTRAVENOUS INJECTION

- Adult: Initially 180 micrograms/kg, then (by intravenous infusion) 2 micrograms/kg/minute for up to 72 hours (up to 96 hours if percutaneous coronary intervention during treatment)

- CONTRA-INDICATIONS Abnormal bleeding within 30 days - aneurysm - arteriovenous malformation - haemorrhagic diathesis - history of haemorrhagic stroke - increased INR - increased prothrombin time - intracranial disease - major surgery or severe trauma within 6 weeks - neoplasm - severe hypertension - stroke within last 30 days - thrombocytopenia

- CAUTIONS Discontinue if emergency cardiac surgery necessary - discontinue if intra-aortic balloon pump necessary - discontinue if thrombolytic therapy necessary - risk of bleeding—discontinue immediately if uncontrolled serious bleeding

- INTERACTIONS Caution with concomitant drugs that increase risk of bleeding—discontinue immediately if uncontrolled serious bleeding.

- SIDE-EFFECTS
  - Common or very common Bleeding manifestations
  - Very rare Anaphylaxis - rash

- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk — no information available.

- BREAST FEEDING Manufacturer advises avoid—no information available.

- HEPATIC IMPAIRMENT Avoid in severe liver disease—increased risk of bleeding.

- RENAL IMPAIRMENT Reduce infusion to 30–50 mL/minute/1.73 m². Avoid if eGFR less than 30 mL/minute/1.73 m².

- MONITORING REQUIREMENTS
  - Measure baseline prothrombin time, activated partial thromboplastin time, platelet count, haemoglobin, haematocrit and serum creatinine.
  - Monitor haemoglobin, haematocrit and platelets within 6 hours after start of treatment, then at least once daily.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

  Solution for injection
  - Integrilin (GlaxoSmithKline UK Ltd)
    Eptifibatide 2 mg per 1 ml Integrilin 20mg/10ml solution for injection vials | 1 vial £13.61 (Hospital only)

  Solution for infusion
  - Integrilin (GlaxoSmithKline UK Ltd)
    Eptifibatide 750 microgram per 1 ml Integril 75mg/100ml solution for infusion vials | 1 vial £42.79 (Hospital only)
Tirofiban

INDICATIONS AND DOSE
In combination with unfractionated heparin, aspirin, and clopidogrel for prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction (NSTE-MI) and with last episode of chest pain within 12 hours (with angiography planned for 4–48 hours after diagnosis (initiated under specialist supervision))

BY INTRAVENOUS INFUSION
- Adult: Initially 400 nanograms/kg/minute for 30 minutes, then 100 nanograms/kg/minute for at least 48 hours (continue during and for 12–24 hours after percutaneous coronary intervention), maximum duration of treatment 108 hours
In combination with unfractionated heparin, aspirin, and clopidogrel for prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction (NSTE-MI) and with last episode of chest pain within 12 hours (with angiography within 4 hours of diagnosis) (initiated under specialist supervision)

INITIALLY BY INTRAVENOUS INJECTION
- Adult: 25 micrograms/kg, to be given over 3 minutes at start of percutaneous coronary intervention, then (by intravenous infusion) 150 nanograms/kg/minute for 12–24 hours, maximum duration of treatment 48 hours
In combination with unfractionated heparin, aspirin, and clopidogrel for reduction of major cardiovascular events in patients with ST-segment elevation myocardial infarction (STEMI) intended for primary percutaneous coronary intervention (PCI) (initiated under specialist supervision)

INITIALLY BY INTRAVENOUS INJECTION
- Adult: 25 micrograms/kg, to be given over 3 minutes at start of percutaneous coronary intervention, then (by intravenous infusion) 150 nanograms/kg/minute for 12–24 hours, maximum duration of treatment 48 hours

CONTRA-INDICATIONS
Abnormal bleeding within 30 days - history of aneurysm - history of arteriovenous malformation - history of haemorrhagic stroke - history of intracranial disease - history of neoplasm - increased INR - increased prothrombin time - severe hypertension - stroke within 50 days - thrombocytopenia

CAUTIONS
Active peptic ulcer (within 3 months) - acute pericarditis - anaemia - aortic dissection - cardiogenic shock - discontinue if intra-aortic balloon pump necessary - discontinue if thrombolytic therapy necessary - discontinue immediately if serious or uncontrollable bleeding occurs - discontinue if emergency cardiac surgery necessary - elderly - faecal occult blood - haematuria - haemorrhagic retinopathy - low body-weight - major surgery within 3 months (avoid if within 6 weeks) - organ biopsy or lithotripsy within last 2 weeks - puncture of non-compressible vessel within 24 hours - risk of bleeding (within 3 months) - severe heart failure - severe trauma within 5 months (avoid if within 6 weeks) - traumatic or protracted cardiopulmonary resuscitation within last 2 weeks - uncontrolled severe hypertension - vasculitis

INTERACTIONS → Appendix 1 (tirofiban).
Concomitant drugs that increase risk of bleeding (including within 48 hours of thrombolytic administration)

SIDE-EFFECTS
Bleeding manifestations - fever - headache - nausea - reversible thrombocytopenia

PREGNANCY
Manufacturer advises use only if potential benefit outweighs risk — no information available.

- BREAST FEEDING
  Manufacturer advises avoid — no information available.
- HEPATIC IMPAIRMENT
  Caution in mild to moderate liver disease. Avoid in severe liver disease — increased risk of bleeding.
- RENAL IMPAIRMENT
  Increased risk of bleeding. Use half normal dose if eGFR less than 30 mL/minute/1.73 m². Monitor carefully if eGFR less than 60 mL/minute/1.73 m².
- MONITORING REQUIREMENTS
  Monitor platelet count, haemoglobin and haematocrit before treatment, 2–6 hours after start of treatment and then at least once daily.
- DIRECTIONS FOR ADMINISTRATION
  For intravenous infusion (Aggrastat®), give continuously in Glucose 5% or Sodium chloride 0.9%. Withdraw 50 mL infusion fluid from 250 mL bag and replace with 50 mL tirofiban concentrate (250 micrograms/mL) to give a final concentration of 50 micrograms/mL.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Infusion
ELECTROLYTES: May contain Sodium
- Aggrastat (Correvio GmbH)
  Tirofiban (as Tirofiban hydrochloride) 50 microgram per 1 ml
  Aggrastat 12.5 mg/250 mL infusion bags | 1 bag £0 no price available (Hospital only)

Solution for infusion
ELECTROLYTES: May contain Sodium
- Aggrastat (Correvio GmbH)
  Tirofiban (as Tirofiban hydrochloride) 250 microgram per 1 ml
  Aggrastat 12.5 mg/50 mL concentrate for solution for infusion vials | 1 vial £0 no price available (Hospital only)

Piperazine derivatives

Ranolazine

INDICATIONS AND DOSE
As adjunctive therapy in the treatment of stable angina in patients inadequately controlled or intolerant of first-line antianginal therapies

BY MOUTH
- Adult: Initially 375 mg twice daily for 2–4 weeks, then increased to 500 mg twice daily, then increased if necessary up to 750 mg twice daily; reduced if not tolerated to 375–500 mg twice daily

CAUTIONS
Body-weight less than 60 kg - elderly - moderate to severe congestive heart failure - QT interval prolongation

INTERACTIONS → Appendix 1 (ranolazine).

SIDE-EFFECTS
Common or very common
- Asthenia - constipation - dizziness - headache - nausea - vomiting
- Uncommon
- Rare
  - Allergic dermatitis - amnesia - angioedema - cold extremities - erectile dysfunction - errosive duodenitis - impaired hearing - loss of consciousness - pancreatitis - parosmia - rash - renal failure - throat tightness - urticaria

PREGNANCY
Manufacturer advises avoid unless essential — no information available.
**Potassium-channel openers**

Nicolandil

**Indications and dose**

Prophylaxis and treatment of stable angina (including risk reduction of acute coronary syndromes in patients at high risk)

- **By mouth**
  - Adult: Initially 10 mg twice daily, alternatively initially 5 mg twice daily, use lower initial dose regimen if susceptible to headache; usual dose 10–20 mg twice daily (max. per dose 30 mg twice daily)

- **Contra-indications** Cardiogenic shock - hypotension - left ventricular failure with low filling pressures

- **Caution** Acute myocardial infarction with acute left ventricular failure and low filling pressures - acute pulmonary oedema - hypovolaemia - low systolic blood pressure

- **Interactions** → Appendix 1 (nicorandil).

- **Side-effects**
  - Common or very common: Cutaneous vasodilation with flushing - dizziness - headache (especially on initiation, usually transitory) - increase in heart rate (at high doses) - nausea - rectal bleeding - vomiting - weakness
  - Uncommon: Angioedema - hypotension - myalgia - oral ulceration
  - Rare: Abdominal pain - anal ulceration - cholestasis - hepatitis - intestinal ulceration - jaundice - pruritus - rash - skin ulceration

- **Pregnancy** Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **Breastfeeding** No information available—manufacturer advises avoid.

- **Patient and Carer Advice** Patients should be warned not to drive or operate machinery until it is established that their performance is unimpaired.

- **Medicinal forms**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: powder

- **Scottish Medicines Consortium (SMC) Decisions**

- **National funding/access decisions**

**SELECTIVE SINUS NODE I F INHIBITORS**

Ivabradine

**Indications and dose**

Treatment of angina in patients in normal sinus rhythm

- **By mouth**
  - Adult: Initially 5 mg twice daily for 3–4 weeks, then increased if necessary to 7.5 mg twice daily; reduced if not tolerated to 2.5–5 mg twice daily, heart rate at rest should not be allowed to fall below 50 beats per minute
  - Elderly: Initially 2.5 mg twice daily, heart rate at rest should not be allowed to fall below 50 beats per minute

Mild to severe chronic heart failure

- **By mouth**
  - Adult: Initially 5 mg twice daily for 2 weeks, then increased if necessary to 7.5 mg twice daily; reduced if not tolerated to 2.5 mg twice daily, heart rate at rest should not be allowed to fall below 50 beats per minute

**Contra-indications** Acute myocardial infarction - cardiogenic shock - congenital QT syndrome - do not initiate for angina if heart rate below 70 beats per minute - do not initiate for chronic heart failure if heart rate below 75 beats per minute - immediately after cerebrovascular accident - patients dependent on pacemaker - second- and third-degree heart block - severe hypotension - sick-sinus syndrome - sino-atrial block - unstable angina - unstable or acute heart failure

**Caution** Atrial fibrillation or other arrhythmias (treatment ineffective) - elderly - in angina, consider stopping if there is no or limited symptom improvement after 5 months - intraventricular conduction defects - mild to moderate hypotension (avoid if severe) - retinopathy pigmentosa

**Interactions** → Appendix 1 (ivabradine).

**Side-effects**

- Common or very common: Atrial fibrillation - blurred vision - bradycardia - dizziness - first-degree heart block - headache - hypotension - myalgia - oral ulceration - palpitations - raised plasma-creatinine concentration - rash - venous thrombolysis - vertigo

- Very rare: Second and third-degree heart block - sick sinus syndrome

**Pregnancy** Manufacturer advises avoid—toxicity in animal studies.

**Breastfeeding** Present in milk in animal studies—manufacturer advises avoid.

**Hepatic impairment** Manufacturer advises caution in moderate impairment. Avoid in severe impairment.
myocardial necrosis (less significant than with STEMI) will be evident. There is a risk of progression to STEMI or sudden death, particularly in patients who experience pain at rest.

Management of unstable angina and non-ST-segment elevation myocardial infarction (NSTEMI)

These conditions are managed similarly; the aims of management are to provide supportive care and pain relief during the acute attack and to prevent further cardiac events and death. For advice on the management of patients with acute ST-segment elevation myocardial infarction (STEMI), see below.

Initial management

Oxygen should be administered if there is evidence of hypoxia, pulmonary oedema, or continuing myocardial ischaemia; hypoxia should be avoided and particular care is required in patients with chronic obstructive airways disease.

Nitrates are used to relieve ischaemic pain. If sublingual glyceryl trinitrate p. 190 is not effective, intravenous or buccal glyceryl trinitrate or intravenous isosorbide dinitrate p. 191 is given. If pain continues, dimorphine or hydrochloride p. 361 or morphine p. 367 can be given by slow intravenous injection; an antiemetic such as metoclopramide hydrochloride p. 347 should also be given. Aspirin p. 104 (chewed or dispersed in water) is given for its antiplatelet effect. If aspirin is given before arrival at hospital, a note saying that it has been given should be sent with the patient. Clopidogrel p. 106 should also be given. Prasugrel p. 188 is an alternative to clopidogrel in certain patients undergoing percutaneous coronary intervention (see NICE guidance p. 188). Ticagrelor p. 188 is also an alternative to clopidogrel (see NICE guidance p. 188). Patients should also receive either heparin (unfractionated) p. 114, a low molecular weight heparin, or fondaparinux sodium p. 109.

Patients without contra-indications should receive beta-blockers which should be continued indefinitely. In patients without left ventricular dysfunction and in whom beta-blockers are inappropriate, diltiazem hydrochloride p. 149 or verapamil hydrochloride p. 156 can be given. The glycoprotein IIB/IIIa inhibitors epifibatide p. 183 (in combination with heparin (unfractionated) p. 114 and aspirin) and tirofiban p. 184 (in combination with heparin (unfractionated) aspirin, and clopidogrel) can be used for unstable angina or for NSTEMI in patients at a high risk of either myocardial infarction or death.

In intermediate- and high-risk patients, abciximab or eptifibatide (in combination with heparin (unfractionated) and aspirin), or tirofiban (in combination with heparin (unfractionated), aspirin, and clopidogrel) can also be used in patients undergoing percutaneous coronary intervention, to reduce the immediate risk of vascular occlusion. In intermediate- and high-risk patients in whom early intervention is planned, bivalirudin p. 116 can be considered as an alternative to the combination of a glycoprotein IIB/IIIa inhibitor plus a heparin. Revascularisation procedures are often appropriate for patients with unstable angina or NSTEMI; the use of antiplatelet drugs in patients undergoing coronary stenting.

Long-term management

The need for long-term angina treatment or for coronary angiography should be assessed. Most patients will require standard angina treatment to prevent recurrence of symptoms.

ST-segment elevation myocardial infarction (STEMI)

This is an acute coronary syndrome where atheromatous plaque rupture leads to thrombosis and myocardial ischaemia, with irreversible necrosis of the heart muscle, often leading to long-term complications. STEMI can also
occasionally occur as a result of coronary spasm or embolism, arteritis, spontaneous thrombosis, or sudden severe elevation in blood pressure.

**Management of ST-segment elevation myocardial infarction (STEMI)** These notes give an overview of the initial and long-term management of myocardial infarction with ST segment elevation (STEMI). For advice on the management of non-ST-segment elevation myocardial infarction (NSTEMI) and unstable angina, see above. The aims of management of STEMI are to provide supportive care and pain relief, to promote reperfusion and to reduce mortality. Oxygen, nitrates, and dexamethasone hydrochloride p. 361 or morphine p. 367 can provide initial support and pain relief; aspirin and percutaneous coronary intervention or thrombolitics promote reperfusion; antiagulants help to reduce re-occlusion and systemic embolisation; long-term use of aspirin, beta-blockers, ACE inhibitors, and statins help to reduce mortality further.

Local guidelines for the management of myocardial infarction should be followed where they exist.

**Initial management**

**Oxygen** should be administered if there is evidence of hypoxia, pulmonary oedema, or continuing myocardial ischaemia; hyperoxia should be avoided and particular care is required in patients with chronic obstructive airways disease.

The pain (and anxiety) of myocardial infarction is managed with slow intravenous injection of dexamethasone hydrochloride or morphine; an aminetic such as metoclopramide hydrochloride p. 347 (or, if left ventricular function is not compromised, cyclazine p. 343) by intravenous injection should also be given. Aspirin (chewed or dispersed in water) is given for its antiplatelet effect. If aspirin is given before arrival at hospital, a note saying that it has been given should be sent with the patient. Clopidogrel p. 106, should also be given. Prasugrel p. 188, is an alternative to clopidogrel in certain patients undergoing percutaneous coronary intervention (see NICE guidance p. 188). Ticagrelor p. 188, is also an alternative to clopidogrel (see NICE guidance p. 188).

Patency of the occluded artery can be restored by percutaneous coronary intervention or by giving a thrombolytic drug, unless contra-indicated. Percutaneous coronary intervention is the preferred method; a **glycoprotein IIb/IIIa inhibitor** can be used to reduce the risk of immediate vascular occlusion in intermediate- and high-risk patients. Patients undergoing percutaneous coronary intervention should also receive either heparin (unfractionated) or a low molecular weight heparin (e.g. enoxaparin sodium p. 113); bivalirudin p. 116 is an alternative to the combination of a glycoprotein IIb/IIIa inhibitor plus a heparin (see also NICE guidance p. 117). In patients who cannot be offered percutaneous coronary intervention within 90 minutes of diagnosis, a thrombolytic drug should be administered along with either heparin (unfractionated) (for maximum 2 days), a low molecular weight heparin (e.g. enoxaparin sodium), or fondaparinux sodium. See use of antiplatelet drugs in patients undergoing coronary stenting p. 103.

Patients who do not receive reperfusion therapy (with percutaneous coronary intervention or a thrombolytic) should be treated with either fondaparinux sodium, enoxaparin sodium, or heparin (unfractionated). Prescribers should consult product literature and local protocols (where they exist) for details of antiagulants dose and duration.

**Nitrates** are used to relieve ischaemic pain. If sublingual glyceryl trinitrate p. 190 is not effective, intravenous glyceryl trinitrate or isosorbide dinitrate p. 191 is given. Early administration of some beta-blockers has been shown to be of benefit and should be given to patients without contra-indications.

**ACE inhibitors**, and angiotensin-II receptor antagonists if an ACE inhibitor cannot be used, are also of benefit to patients who have no contra-indications; in hypertensive and normotensive patients treatment with an ACE inhibitor, or an angiotensin-II receptor antagonist, can be started within 24 hours of the myocardial infarction and continued for at least 5–6 weeks (see below for long-term treatment).

All patients should be closely monitored for hyperglycaemia; those with diabetes or raised blood-glucose concentration should receive insulin p. 603.

**Long-term management**

Long-term management following STEMI involves the use of several drugs which should ideally be started before the patient is discharged from hospital.

Aspirin should be given to all patients, unless contra-indicated. The addition of clopidogrel has been shown to reduce morbidity and mortality. Prasugrel p. 188 or ticagrelor are alternatives to clopidogrel in certain patients. For those intolerant of clopidogrel, and who are at low risk of bleeding, the combination of warfarin sodium p. 121 and aspirin should be considered. In those intolerant of both aspirin and clopidogrel, warfarin sodium alone can be used. Warfarin sodium should be continued for those who are already being treated for another indication, such as atrial fibrillation, with the addition of aspirin if there is a low risk of bleeding. The combination of aspirin with clopidogrel or warfarin sodium increases the risk of bleeding. The combination of aspirin with clopidogrel or warfarin sodium increases the risk of bleeding. Low-dose rivaroxaban p. 109, in combination with aspirin alone or aspirin and clopidogrel, is licensed for the prevention of atherothrombotic events following STEMI—see Prevention of cardiovascular events p. 187. For details of antiplatelet drug duration following coronary stenting—see also Antiplatelet drugs and coronary stents p. 103.

**Beta-blockers** should be given to all patients in whom they are not contra-indicated. Acebutolol p. 141, metoprolol tartrate p. 144, propranolol hydrochloride p. 146 and timolol maleate p. 147 are suitable; for patients with left ventricular dysfunction, carvedilol p. 142, bisoprolol fumarate p. 142, or long-acting metoprolol tartrate may be appropriate.

Diltiazem hydrochloride p. 149 [unlicensed] or verapamil hydrochloride p. 156 can be considered if a beta-blocker cannot be used; however, they are contra-indicated in those with left ventricular dysfunction. Other calcium-channel blockers have no place in routine long-term management after a myocardial infarction.

An **ACE inhibitor** should be considered for all patients, especially those with evidence of left ventricular dysfunction. If an ACE inhibitor cannot be used, an angiotensin-II receptor antagonist may be used for patients with heart failure. A relatively high dose of either the ACE inhibitor or angiotensin-II receptor antagonist may be required to produce benefit.

**Nitrates** are used for patients with angina. Eplerenone p. 167 is licensed for use following a myocardial infarction in those with left ventricular dysfunction and evidence of heart failure. See also the role of **statins** in preventing recurrent cardiovascular events p. 178.

**Prevention of cardiovascular events**

Patients with stable angina, unstable angina, or NSTEMI should be given advice and treatments to reduce their cardiovascular risk. The importance of life-style changes, especially stopping smoking, should be emphasised. Aspirin should be given indefinitely. Antihypertensive treatment should be initiated if appropriate, and a **statin** should also be given.
In patients with stable angina, addition of an ACE inhibitor should be considered for patients with diabetes (and should be continued if indicated for a co-morbidity).

In patients with unstable angina or NSTEMI, clopidogrel is given, in combination with aspirin, for up to 12 months—most benefit occurs during the first 3 months. Prasugrel or ticagrelor below are alternatives to clopidogrel in certain patients. An ACE inhibitor should also be given.

Low-dose rivaroxaban p. 109, in combination with aspirin alone or aspirin and clopidogrel, is licensed for the prevention of atherothrombotic events following an acute coronary syndrome with elevated cardiac biomarkers.

### Drugs used for Acute coronary syndromes not listed below
- Captopril, p. 126
- Clopidogrel, p. 106
- Dalteparin sodium, p. 112
- Enoxaparin sodium, p. 113
- Heparin (unfractionated), p. 114
- Lisinopril, p. 126
- Perindopril arginine, p. 129
- Perindopril erbumine, p. 130
- Ramipril, p. 131
- Trandolapril, p. 132
- Valsartan, p. 136

### Antiplatelets

#### Prasugrel

**INDICATIONS AND DOSE**

In combination with aspirin for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention

**BY MOUTH**

- Adult 18-74 years (body-weight up to 60 kg): Initially 60 mg for 1 dose, then 5 mg once daily usually for up to 12 months
- Adult 18-74 years (body-weight 60 kg and above): Initially 60 mg for 1 dose, then 10 mg once daily usually for up to 12 months
- Adult 75 years and over: Initially 60 mg for 1 dose, then 5 mg once daily usually for up to 12 months

**Patients undergoing coronary angiography within 48 hours of admission for unstable angina or NSTEMI**

**BY MOUTH**

- Adult: Initially 60 mg, to be administered at the time of percutaneous coronary intervention to minimise the risk of bleeding, maintenance dose of 10 mg or 5 mg daily should then be selected as appropriate

**Alternative to clopidogrel in certain patients undergoing percutaneous coronary intervention by appropriate**

**BY MOUTH**

- Adult: 60 mg as a single dose

- **CONTRA-INDICATIONS** Active bleeding - history of stroke or transient ischaemic attack
- **CAUTIONS** Body-weight less than 60 kg - discontinue at least 7 days before elective surgery if antiplatelet effect not desirable - elderly - patients at increased risk of bleeding (e.g. from recent trauma, surgery, gastro-intestinal bleeding, or active peptic ulcer disease)
- **INTERACTIONS** $\rightarrow$ Appendix 1 (prasugrel), Caution with concomitant use of drugs that increase risk of bleeding.
- **SIDE-EFFECTS**
  - Common or very common Anaemia - gastro-intestinal haemorrhage - haematoma - haematuria - haemorrhage - intracranial haemorrhage - rash
  - Uncommon Angioedema - hypersensitivity reactions
  - Rare Thrombocytopenia
  - Frequency not known Thrombotic thrombocytopenic purpura
- **ALLERGY AND CROSS-SENSITIVITY** Caution in patients with history of hypersensitivity reactions to thienopyridines (e.g. clopidogrel).

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- ** BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Use with caution in moderate impairment—increased risk of bleeding. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Use with caution—increased risk of bleeding.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - Prasugrel with percutaneous coronary intervention for treating acute coronary syndromes (July 2014) NICE TA317
    - Prasugrel 10 mg in combination with aspirin is recommended as an option, within its marketing authorisation, for preventing atherothrombotic events in adults with acute coronary syndrome (unstable angina (UA), non-ST segment elevation myocardial infarction (NSTEMI) or ST segment elevation myocardial infarction (STEMI)) having primary or delayed percutaneous coronary intervention. www.nice.org.uk/TA317
- **Scottish Medicines Consortium (SMC) Decisions**
  - The Scottish Medicines Consortium has advised (August 2009) that prasugrel (Efient®), in combination with aspirin, be accepted for restricted use within NHS Scotland for the prevention of atherothrombotic events in patients with acute coronary syndrome undergoing percutaneous coronary intervention who are eligible to receive the 10 mg dose of prasugrel.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Efient** (Eli Lilly and Company Ltd)
  - Prasugrel (as Prasugrel hydrochloride) 5 mg $\rightarrow$ Efient 5 mg tablets $\rightarrow$ 28 tablet (BD) $\rightarrow$ £47.56 07 price = £47.56
  - Prasugrel (as Prasugrel hydrochloride) 10 mg Efient 10 mg tablets $\rightarrow$ 28 tablet (BD) $\rightarrow$ £47.56 07 price = £47.56

#### Ticagrelor

**INDICATIONS AND DOSE**

In combination with aspirin for the prevention of atherothrombotic events in patients with acute coronary syndrome

**BY MOUTH**

- Adult: Initially 180 mg for 1 dose, then 90 mg twice daily usually for up to 12 months

**Alternative to clopidogrel in patients undergoing percutaneous coronary intervention by mouth**

- Adult: 180 mg as a single dose

- **CONTRA-INDICATIONS** Active bleeding - history of intracranial haemorrhage
- **CAUTIONS** Asthma - bradycardia (unless pacemaker fitted) - chronic obstructive pulmonary disease - discontinue 7 days before elective surgery if antiplatelet effect not desirable - history of hyperuricaemia - patients at increased risk of bleeding (e.g. from recent trauma, surgery, gastro-intestinal bleeding, or coagulation disorders) - second- or third-degree AV block (unless pacemaker fitted) - sick sinus syndrome (unless pacemaker fitted)

**INTERACTIONS** Caution with concomitant use of drugs that increase risk of bleeding.

**SIDE-EFFECTS**

- Common or very common Bruising - dyspnoea - haemorrhage
Acute coronary syndromes

Nitrates

CONTRA-INDICATIONS
- Aortic stenosis
- Cardiac tamponade
- Constrictive pericarditis
- Hypertrophic cardiomyopathy
- Hypotensive conditions
- Hypovolaemia
- Marked anaemia
- Mitral stenosis
- Raised intracranial pressure due to cerebral haemorrhage
- Raised intracranial pressure due to head trauma
- Toxoplasmosis

CAUTIONS
- Heart failure due to obstruction
- Hypothyroidism
- Hypoxaemia
- Malnutrition
- Metal-containing transdermal systems should be removed before magnetic resonance imaging procedures, cardioversion, or diathermy
- Recent history of myocardial infarction
- Susceptibility to angle-closure glaucoma
- Tolerance
- Ventilation and perfusion abnormalities

Nitrates have a useful role in angina. Although they are potent coronary vasodilators, their principal benefit follows from a reduction in venous return which reduces left ventricular work. Unwanted effects such as flushing, headache, and postural hypotension may limit therapy, especially when angina is severe or when patients are unusually sensitive to the effects of nitrates.

Sublingual glyceryl trinitrate p. 190 is one of the most effective drugs for providing rapid symptomatic relief of angina, but its effect lasts only for 20 to 30 minutes; the 300-microgram tablet is often appropriate when glyceryl trinitrate is first used. The aerosol spray provides an alternative method of rapid relief of symptoms for those who find difficulty in dissolving sublingual preparations. Duration of action may be prolonged by transdermal preparations (but tolerance may develop).

Isosorbide dinitrate p. 191 is active sublingually and is a more stable preparation for those who only require nitrates infrequently. It is also effective by mouth for prophylaxis; although the effect is slower in onset, it may persist for several hours. Duration of action of up to 12 hours is claimed for modified-release preparations. The activity of isosorbide dinitrate may depend on the production of active metabolites, the most important of which is isosorbide mononitrate. Isosorbide mononitrate itself is also licensed for angina prophylaxis; modified-release formulations (for once daily administration) are available.

Glyceryl trinitrate p. 190 or isosorbide dinitrate may be tried by intravenous injection when the sublingual form is ineffective in patients with chest pain due to myocardial infarction or severe ischaemia. Intravenous injections are also useful in the treatment of congestive heart failure.
Glyceryl trinitrate

### INDICATIONS AND DOSE

**Prophylaxis and treatment of angina**

**BY SUBLINGUAL ADMINISTRATION USING SUBLINGUAL TABLETS**
- Adult: 0.3–1 mg; dose may be repeated as required.

**Control of hypertension and myocardial ischaemia during and after cardiac surgery**
- Induction of controlled hypotension during surgery
- Congestive heart failure

**Unstable angina**
- **BY INTRAVENOUS INFUSION**
  - Adult: 10–200 micrograms/minute (max. per dose 400 micrograms/minute), adjusted according to response. Consult product literature for recommended starting doses specific to indication.

**Treatment or prophylaxis of angina**
- **BY SUBLINGUAL ADMINISTRATION USING AEROSOL SPRAY**
  - Adult: 1–2 sprays, dose be administered under tongue and then close mouth.

**NITRO-DUR®**

**Prophylaxis of angina**
- **BY TRANSDERMAL APPLICATION**
  - Adult: One ‘0.2mg/h’ patch to be applied to chest or outer upper arm and replaced every 24 hours, siting replacement patch on different area, dose adjusted according to response; maximum 15 mg per day.

**DEPONIT®**

**Prophylaxis of angina**
- **BY TRANSDERMAL APPLICATION**
  - Adult: One ‘0.5’ or one ‘10’ patch to be applied to lateral chest wall, upper arm, thigh, abdomen, or shoulder; increase to two ‘10’ patches every 24 hours if necessary, to be replaced every 24 hours, siting replacement patch on different area.

**MINITRAN®**

**Prophylaxis of angina**
- **BY TRANSDERMAL APPLICATION**
  - Adult: One ‘5’ patch to be applied to chest or upper arm; replace every 24 hours, siting replacement patch on different area, dose to be adjusted according to response.

**Maintenance of venous patency (‘5’ patch only)**
- **BY TRANSDERMAL APPLICATION**
  - Adult: (consult product literature)

### SIDE-EFFECTS

- **With rectal use**
  - Burning, diarrhoea, itching, rectal bleeding.
- **PREGNANCY**
  - Not known to be harmful.
- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use
    - Glass or polyethylene apparatus is preferable; loss of potency will occur if PVC is used.
    - For intravenous infusion (Nitrocin®, Nitronal®), give continuously in Glucose 5% or Sodium Chloride 0.9%. For Nitrocin®, suggested infusion concentration 100 micrograms/mL; incompatible with polyvinyl chloride infusion containers such as Viaflex® or Steriflex®; use glass or polyethylene containers or give via a syringe pump.
    - Glyceryl trinitrate 1 mg/ml to be diluted before use or given undiluted with syringe pump. Glyceryl trinitrate 5 mg/ml to be diluted before use.

### PRESCRIBING AND DISPENSING INFORMATION

- With sublingual use
  - Glyceryl trinitrate tablets should be supplied in glass containers of not more than 100 tablets, closed with a foil-lined cap, and containing no cotton wool wadding; they should be discarded after 8 weeks in use.
- **PATIENT AND CARER ADVICE**
  - Rectal ointment should be discarded 8 weeks after first opening.
- **PERCUTOL®**
  - Patients or carers should be given advice on how to administer glyceryl trinitrate ointment.

### NATIONAL FUNDING/ACCESS DECISIONS

#### Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (January 2008) that glyceryl trinitrate 0.4% ointment (Rectogesic®) is not recommended for use within NHS Scotland for the relief of pain associated with chronic anal fissure.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment.
Ointment

EXCIPIENTS: May contain Wool fat and related substances including lanolin
- Percurtal (Aspire Pharma Ltd)
  Glyceryl trinitrate 20 mg per 1 gram Percurtal 2% ointment
  60 gram [PO] £79.00 DT price = £79.00

Rectal ointment
- Rectogesic (Prostrakan Ltd)
  Glyceryl trinitrate 4 mg per 1 gram Rectogesic 0.4% rectal ointment
  30 gram [PO] £39.30 DT price = £39.30

Isosorbide dinitrate

INDICATIONS AND DOSE

Prophylaxis and treatment of angina

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: 30–120 mg daily in divided doses

BY INTRAVENOUS INFUSION
- Adult: 2–10 mg/hour, increased if necessary up to 20 mg/hour

BY SUBLINGUAL ADMINISTRATION USING AEROSOL SPRAY
- Adult: 1–3 sprays, to be administered under tongue whilst holding breath, allow a 30 second interval between each dose

Left ventricular failure

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: 40–160 mg daily in divided doses, increased if necessary up to 240 mg daily in divided doses

BY INTRAVENOUS INFUSION
- Adult: Initially 2–10 mg/hour, increased if necessary up to 20 mg/hour

Prophylaxis of angina

BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: 40 mg daily in 1–2 divided doses, increased if necessary to 60–80 mg daily in 2–3 divided doses

PREGNANCY
May cross placenta—manufacturers advise avoid unless potential benefit outweighs risk.

DIRECTIONS FOR ADMINISTRATION
For intravenous infusion (Isoket 0.05%, Isoket 0.1%), give continuously in Glucose 5% or Sodium chloride 0.9%. Adsorbed to some extent by polyvinyl chloride infusion containers; preferably use glass or polyethylene containers or give via a syringe pump; Isoket 0.05%® can alternatively be administered undiluted using a syringe pump with a glass or rigid plastic syringe. Glass or polyethylene infusion apparatus is preferable; loss of potency if PVC used.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, solution for infusion, oral solution

Tablet
- ISOSORBIDE DINITRATE (Non-proprietary)
  Isosorbide dinitrate 10 mg
  Isosorbide dinitrate 10mg tablets
  56 tablet [PO] £30.00 DT price = £13.41
  Isosorbide dinitrate 20 mg
  Isosorbide dinitrate 20mg tablets
  56 tablet [PO] £36.60 DT price = £14.38

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS

Tablet
- ISOSORBIDE DINITRATE (Non-proprietary)
  Isosorbide dinitrate 20 mg
  Isosorbide dinitrate 20mg modified-release tablets
  56 tablet [PO] no price available
  Isosorbide dinitrate 40 mg
  Isosorbide dinitrate 40mg modified-release tablets
  56 tablet [PO] no price available
  Isoket Retard (UCB Pharma Ltd)
  Isosorbide dinitrate 20 mg
  Isoket Retard 20 tablets
  56 tablet [PO] £2.58
  Isosorbide dinitrate 40 mg
  Isoket Retard 40 tablets
  56 tablet [PO] £6.36

Cardiovascular system
Isosorbide mononitrate

INDICATIONS AND DOSE

Prophylaxis of angina | Adjunct in congestive heart failure

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 20 mg 2–3 times a day, alternatively initially 40 mg twice daily, increased if necessary up to 120 mg daily in divided doses

Prophylaxis of angina (for patients who have not previously had a nitrate) | Adjunct in congestive heart failure (for patients who have not previously had a nitrate)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 10 mg twice daily, increased if necessary up to 120 mg daily in divided doses

MONOMIL® XL

Prophylaxis of angina

BY MOUTH

- Adult: Initially 0.5 tablet daily for 2–4 days, to minimise possibility of headache, then 1 tablet daily, increased if necessary to 2 tablets once daily, to be taken in the morning

ISOB® 60XL

Prophylaxis of angina

BY MOUTH

- Adult: Initially 0.5 tablet daily for 2–4 days, to be taken if headache occurs, then 1 tablet daily, increased if necessary to 2 tablets daily, dose to be taken in the morning

MONOSORB® XL60

Prophylaxis of angina

BY MOUTH

- Adult: Initially 0.5 tablet daily for the first 2–4 days, to minimise the possibility of headache, then 1 tablet daily, increased if necessary to 2 tablets daily, to be taken in the morning

IMDUR®

Prophylaxis of angina

BY MOUTH

- Adult: Initially 0.5 tablet daily, to be taken if headache occurs; 1 tablet daily, then increased if necessary to 2 tablets daily, dose to be taken in the morning

MONOMAX® XL

Prophylaxis of angina

BY MOUTH

- Adult: Initially 0.5 tablet daily for 2–4 days, to minimise possibility of headache, then 1 tablet daily, increased if necessary to 2 tablets daily, to be taken in the morning

ZEMON®

Prophylaxis of angina

BY MOUTH

- Adult: Initially 30 mg daily for 2–4 days, to minimise possibility of headache, then 40–60 mg daily, increased if necessary to 80–120 mg once daily, to be taken in the morning

ISOTARD®

Prophylaxis of angina

BY MOUTH

- Adult: 25–60 mg daily, if headaches occur with 60 mg tablet, half a 60 mg tablet may be given for 2–4 days, then increased if necessary to 50–120 mg daily, to be taken in the morning

MODISAL® XL

Prophylaxis of angina

BY MOUTH

- Adult: Initially 0.5 tablet once daily for 2–4 days, to minimise the possibility of headache; 1 tablet once daily, then increased if necessary to 2 tablets once daily, dose to be taken in the morning

CHEMYDUR® 60XL

Prophylaxis of angina

BY MOUTH

- Adult: 25–50 mg daily, then increased if necessary to 50–100 mg once daily, to be taken in the morning

MONOMAX® SR

Prophylaxis of angina

BY MOUTH

- Adult: 40–60 mg daily, increased if necessary to 120 mg daily, to be taken in the morning

PREGNANCY

Manufacturers advise avoid unless potential benefit outweighs risk.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

**DRUG ACTION** Dobutamine is a cardiac stimulant which acts on beta, receptors in cardiac muscle, and increases contractility with little effect on rate.

**INDICATIONS AND DOSE**

Inotropic support in infarction, cardiac surgery, cardiomyopathies, septic shock, cardiogenic shock, and during positive end expiratory pressure ventilation

**BY INTRAVENOUS INFUSION**

- Adult: Usual dose 2.5–10 micrograms/kg/minute, adjusted according to response, alternatively 0.5–40 micrograms/kg/minute

**Cardiac stress testing**

**BY INTRAVENOUS INFUSION**

- Adult: (consult product literature)

**CONTRA-INDICATIONS** Phaeochromocytoma

**CAUTIONS** Acute heart failure - acute myocardial infarction - arrhythmias - correct hypercapnia before starting and during treatment - correct hypovolaemia before starting and during treatment - correct hypoxia before starting and during treatment - correct metabolic acidosis before starting and during treatment - diabetes mellitus - elderly - extravasation may cause tissue necrosis - extreme caution or avoid in marked obstruction of cardiac ejection (such as idiopathic hypertrophic subaortic stenosis) - hyperthyroidism - ischaemic heart disease - occlusive vascular disease - severe hypotension - susceptibility to angle-closure glaucoma - tachycardia - tolerance may develop with continuous infusions longer than 72 hours

**INTERACTIONS** → Appendix 1 (sympathomimetics).

**SIDE-EFFECTS**

- Rare Psychosis

- Very rare Angle-closure glaucoma - AV block - bradycardia - cardiac arrest - coronary artery spasm - hypokalaemia - myocardial infarction - petechial bleeding

- Frequency not known Anxiety - arrhythmias - bronchospasm - cerebral haemorrhage - chest pain - dyspnoea - eosinophilia - fever - headache - hypertension (marked increase in systolic blood pressure indicates overdose) - hypotension - increased urinary urgency - myoclonic spasm - nausea - palpitation - paraesthesia - phlebitis - puritus of scalp - pulmonary oedema - rash - reduced platelet aggregation (on prolonged use) - tachycardia - tremor - vomiting

**PREGNANCY** No evidence of harm in animal studies— manufacturers advise use only if potential benefit outweighs risk.

**BREAST FEEDING** Manufacturers advise avoid—no information available.

**MONITORING REQUIREMENTS** Monitor serum-potassium concentration.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute to a concentration of 0.5–1 mg/mL and give via an infusion pump; give higher concentration (max. 5 mg/mL) through central venous catheter; incompatible with bicarbonate and other strong alkaline solutions. Dobutamine injection should be diluted before use or given undiluted with syringe pump. Dobutamine concentrate for intravenous infusion should be diluted before use.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

**EXCIPIENTS:** May contain Sulphites

- **DOBUTAMINE (Non-proprietary)**
  - Dobutamine (as Dobutamine hydrochloride) 5 mg per 1 mL Dobutamine 250mg/50ml solution for infusion vials | 1 vial (£0.195)
  - Dobutamine (as Dobutamine hydrochloride) 12.5 mg per 1 mL Dobutamine 250mg/20ml concentrate for solution for infusion ampoules | 5 ampoule (£0.06-£0.25)

**Fibrinolytic drugs**

The value of thrombolytic drugs for the treatment of myocardial infarction has been established. Streptokinase p. 195 and alteplase p. 194 have been shown to reduce mortality. Retepaase p. 195 and tenecteplase p. 195 are also licensed for acute myocardial infarction. Thrombolytic drugs are indicated for any patient with acute myocardial infarction for whom the benefit is likely to outweigh the risk of treatment. Trials have shown that the benefit is greatest
in those with ECG changes that include ST segment elevation (especially in those with anterior infarction) and in patients with bundle branch block. Patients should not be denied thrombolytic treatment on account of age alone because mortality in the elderly is high and the reduction in mortality is the same as in younger patients. Alteplase should be given within 6–12 hours of symptom onset, reteplase and streptokinase within 12 hours of symptom onset, but ideally all should be given within 1 hour; use after 12 hours requires specialist advice. Tenecteplase should be given as early as possible and usually within 6 hours of symptom onset.

Alteplase, streptokinase and urokinase p. 119 can be used for other thromboembolic disorders such as deep-vein thrombosis and pulmonary embolism. Alteplase is also used for acute ischaemic stroke.

Urokinase p. 119 is also licensed to restore the patency of occluded intravenous catheters and cannulas blocked with fibrin clots.

### Fibrinolytics

**Drug Action** Fibrinolytic drugs act as thrombolitics by activating plasminogen to form plasmin, which degrades fibrin and so breaks up thrombi.

**Contra-Indications** Active pulmonary disease with cavitation - acute pancreatitis - aneurysm - aortic dissection - bacterial endocarditis - bleeding diatheses - coagulation defects - coma - heavy vaginal bleeding - history of cerebrovascular disease (especially recent events or with any residual disability) - oesophageal varices - pericarditis - recent haemorrhage - recent surgery (including dental extraction) - recent symptoms of possible peptic ulceration - recent trauma - severe hypertension

**Caution** Conditions in which thrombolysis might give rise to embolic complications such as enlarged left atrium with atrial fibrillation (risk of dissolution of clot and subsequent embolisation) - elderly - external chest compression - hypertension - risk of bleeding (including that from venepuncture or invasive procedures)

**Interactions** Caution with recent or concomitant use of drugs that increase the risk of bleeding.

**Side-Effects** Allergic reactions - anaphylaxis - angina (when used in myocardial infarction) - back pain - bleeding - bleeding (usually limited to the site of injection, but can occur from other sites) - cerebral oedema (caused by reperfusion) - convulsions - fever - flushing - hypotension - intracerebral haemorrhage - nausea - pulmonary oedema (caused by reperfusion) - rash - recurrent ischaemia (when used in myocardial infarction) - reperfusion arrhythmias (when used in myocardial infarction) - urticaria - vomiting

**Side-Effects, Further Information**

**Bleeding** Serious bleeding calls for discontinuation of the thrombolytic and may require administration of coagulation factors and antifibrinolytic drugs (e.g. tranexamic acid). Rarely further embolism may occur (either due to clots that break away from the original thrombus or to cholesterol crystal emboli).

**Hypotension** Hypotension can usually be controlled by elevating the patient’s legs, or by reducing the rate of infusion or stopping it temporarily.

**Pregnancy** Thrombolytic drugs can possibly lead to premature separation of the placenta in the last 18 weeks of pregnancy. There is also a risk of maternal haemorrhage throughout pregnancy and post-partum, and also a theoretical risk of fetal haemorrhage throughout pregnancy.

**Hepatic Impairment** Avoid in severe hepatic impairment as there is an increased risk of bleeding.

---

### Alteplase

**(rt-PA; Tissue-type plasminogen activator)**

**Indications and Dose**

**Acute myocardial infarction, accelerated regimen**

- **Initially by intravenous injection**
  - Adult: Initially 10 mg, to be initiated within 6 hours of symptom onset, followed by (by intravenous infusion) 0.75 mg/kg, to be given over 30 minutes, then (by intravenous infusion) 0.5 mg/kg, to be given over 60 minutes, maximum total dose of 100 mg administered over 90 minutes
  - Adult: Initially 15 mg, to be initiated within 6 hours of symptom onset, followed by (by intravenous infusion) 50 mg, to be given over 30 minutes, then (by intravenous infusion) 35 mg, to be given over 60 minutes, maximum total dose of 100 mg administered over 90 minutes

**Acute myocardial infarction**

- **Initially by intravenous injection**
  - Adult: Initially 10 mg, to be initiated within 6–12 hours of symptom onset, followed by (by intravenous infusion) 50 mg, to be given over 60 minutes, then (by intravenous infusion) 10 mg for 4 infusions, each 10 mg infusion dose to be given over 30 minutes, total dose of 100 mg over 3 hours; maximum 1.5 mg/kg in patients less than 65 kg

**Pulmonary embolism**

- **Initially by intravenous injection**
  - Adult: Initially 10 mg, to be given over 1–2 minutes, followed by (by intravenous infusion) 90 mg, to be given over 2 hours, maximum 1.5 mg/kg in patients less than 65 kg

**Acute stroke (under specialist neurology physician only)**

- **By intravenous infusion**
  - Adult 18–79 years: Initially 900 micrograms/kg (max. per dose 90 mg), treatment must begin within 4.5 hours of symptom onset, to be given over 60 minutes, the initial 10% of dose to be administered by intravenous injection and the remainder by intravenous infusion

**Actilyse Cathflo**

**Thrombolytic treatment of occluded central venous access devices**

- **By intravenous injection**
  - Adult: (consult product literature)

**Contra-Indications**

- When used for acute ischaemic stroke: Convulsion accompanying stroke - history of stroke in patients with diabetes - hyperglycaemia - hypoglycaemia - severe stroke - stroke in last 3 months

**Interactions** Contra-indicated if concomitant treatment with oral anticoagulants.

**Side-Effects** Risk of cerebral bleeding increased in acute stroke

**Allergy and Cross-Sensitivity** Contra-indicated if history of hypersensitivity to gentamicin (residue from manufacturing process).

**Monitoring Requirements**

- When used for acute ischaemic stroke: Monitor for intracranial haemorrhage, and monitor blood pressure (antihypertensive recommended if systolic above 180 mmHg or diastolic above 105 mmHg).

**Directions for Administration** For intravenous infusion (Actilyse®), give intermittently or continuously in Sodium chloride 0.9%; dissolve in water for injections to a concentration of 1 mg/mL or 2 mg/mL and infuse intravenously; alternatively dilute the solution further in...
the infusion fluid to a concentration of not less than 200 microgram/mL; not to be infused in glucose solution.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - NICE technology appraisals (TAs)
    - Alteplase for the treatment of acute ischaemic stroke (September 2012) NICE TA264
    - Alteplase is recommended for the treatment of acute ischaemic stroke in adults in accordance with its licensed indication:
      - treatment is started as early as possible within 4.5 hours of onset of stroke symptoms, and
      - intracranial haemorrhage has been excluded by appropriate imaging techniques. [www.nice.org.uk/TA264](http://www.nice.org.uk/TA264)

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

  - **Powder and solvent for solution for injection**
    - **Actilyse** (Boehringer Ingelheim Ltd)
      - Alteplase 10 mg Actilyse 10mg powder and solvent for solution for injection vials | 1 vial £144.00
      - Alteplase 20 mg Actilyse 20mg powder and solvent for solution for injection vials | 1 vial £246.00
    - **Actilyse Cathflo** (Boehringer Ingelheim Ltd)
      - Alteplase 2 mg Actilyse Cathflo 2mg powder and solvent for solution for injection vials | 5 vial £225.00 (Hospital only)

  - **Powder and solvent for solution for infusion**
    - **Actilyse** (Boehringer Ingelheim Ltd)
      - Alteplase 50 mg Actilyse 50mg powder and solvent for solution for infusion vials | 1 vial £360.00

### Reteplase

- **INDICATIONS AND DOSE**
  - Acute myocardial infarction
    - Adult: 10 units, initiated within 12 hours of onset of symptoms, dose to be given over not more than 2 minutes, followed by 10 units after 30 minutes

- **BREAST FEEDING**
  Manufacturer advises avoid breastfeeding for 24 hours after dose (express and discard milk during this time).

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  - **Powder and solvent for solution for injection**
    - **Rapilysin** (Actavis UK Ltd)
      - Rapilysin 10 unit Rapilysin 10unit powder and solvent for solution for injection vials | 2 vial £566.00

### Streptokinase

- **INDICATIONS AND DOSE**
  - Acute myocardial infarction
    - Adult: 1 500 000 units, to be initiated within 12 hours of symptom onset, dose to be given over 60 minutes
    - Deep-vein thrombosis | Pulmonary embolism | Acute arterial thromboembolism | Central retinal venous or arterial thrombosis
    - **BY INTRAVENTOUS INFUSION**
      - Adult: 250 000 units, dose to be given over 30 minutes, then 100 000 units every 1 hour for up to 12–72 hours, duration is adjusted according to condition with monitoring of clotting parameters (consult product literature)

- **SIDE-EFFECTS**
  - Rare Guillain-Barré syndrome

- **ALLERGY AND CROSS-SENSITIVITY**
  Contra-indicated if previous allergic reaction to either streptokinase or anistreplase (no longer available). Prolonged persistence of antibodies to streptokinase and anistreplase (no longer available) can reduce the effectiveness of subsequent treatment; therefore, streptokinase should not be used again beyond 4 days of first administration of either streptokinase or anistreplase.

- **DIRECTIONS FOR ADMINISTRATION**
  - For intravenous infusion (Streptase®), give continuously or intermittently; reconstitute with sodium chloride 0.9%, then dilute further with Glucose 5% or Sodium Chloride 0.9% after reconstitution.

### Medicines

- **Tenecteplase**

  - **INDICATIONS AND DOSE**
    - Acute myocardial infarction
      - Adult: 30–50 mg (max. per dose 50 mg), dose to be given over 10 seconds and initiated within 6 hours of symptom onset, dose varies according to body weight—consult product literature

  - **BREAST FEEDING**
    Manufacturer advises avoid breastfeeding for 24 hours after dose (express and discard milk during this time).

  - **MEDICINAL FORMS**
    There can be variation in the licensing of different medicines containing the same drug.

    - **Powder and solvent for solution for injection**
      - **Metalyse** (Boehringer Ingelheim Ltd)
        - Tenecteplase 8000 unit Metalyse 8,000unit powder and solvent for solution for injection vials | 1 vial £502.25
        - Tenecteplase 10000 unit Metalyse 10,000unit powder and solvent for solution for injection vials | 1 vial £502.25

### 7.2 Cardiac arrest

Cardiopulmonary resuscitation

The algorithm for cardiopulmonary resuscitation (Life support algorithm) reflects the most recent recommendations of the Resuscitation Council (UK). These guidelines are available at [www.resus.org.uk](http://www.resus.org.uk).

Cardiac arrest can be associated with ventricular fibrillation, pulseless ventricular tachycardia, asystole, and pulseless electrical activity (electromechanical dissociation). Adrenaline/epinephrine p. 196 1 in 10000 (100 microgram/mL) is recommended by intravenous injection repeated every 3–5 minutes if necessary. Administration through a central line results in a faster response than peripheral administration, however placement of a central line must not interfere with chest

...
Cardiovascular system

**CARDIOVASCULAR SYSTEM**

**DRUG ACTION**

Adrenaline/epinephrine

- Acts on both alpha and beta receptors and increases both heart rate and contractility (beta, effects); it can cause peripheral vasodilation (a beta, effect) or vasoconstriction (an alpha effect).

**INDICATIONS AND DOSE**

**Cardiopulmonary resuscitation**

- **BY INTRAVENOUS INFUSION**
  - Adult: 1 mg every 3–5 minutes as required, a 1 in 10 000 (100 micrograms/mL) solution is recommended

**Acute hypotension**

- **BY CONTINUOUS INTRAVENOUS INFUSION**
  - Neonate: Initially 100 nanograms/kg/minute (up to 1.5 micrograms/kg/minute has been used), adjusted according to response
  - Child: Initially 100 nanograms/kg/minute (up to 1.5 micrograms/kg/minute has been used), adjusted according to response

**Emergency treatment of acute anaphylaxis (under expert supervision) Angioedema (if laryngeal oedema is present)**

- **BY INTRAMUSCULAR INJECTION**
  - Child 1 month–5 years: 150 micrograms, to be injected preferably into the anterolateral aspect of the middle third of the thigh, repeated if necessary, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function, suitable syringe to be used for measuring small volume; injected preferably into the anterolateral aspect of the middle third of the thigh
  - Child 6–11 years: 300 micrograms, to be injected preferably into the anterolateral aspect of the middle third of the thigh, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function
  - Child 12–17 years: 500 micrograms, to be injected preferably into the anterolateral aspect of the middle third of the thigh, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function, 300 micrograms (0.3 mL) to be administered if child small or prepubertal
  - Adult: 500 micrograms, to be injected preferably into the anterolateral aspect of the middle third of the thigh, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function

**Acute hypotension**

- Adult 1 mg every 3–5 minutes as required, a 1 in 10 000 (100 micrograms/mL) solution is recommended

**Emergency treatment of acute anaphylaxis**

- Adult: 2–10 micrograms/minute, adjusted according to response

**EMERADE® 150 MICROGRAMS**

**Acute anaphylaxis (for self-administration)**

- **BY INTRAMUSCULAR INJECTION**
  - Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required
  - Child (body-weight 15–30 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required, on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children

**EMERADE® 300 MICROGRAMS**

**Acute anaphylaxis (for self-administration)**

- **BY INTRAMUSCULAR INJECTION**
  - Child (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required
  - Adult (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required

**EMERADE® 500 MICROGRAMS**

**Acute anaphylaxis (for self-administration for patients at risk of severe anaphylaxis)**

- **BY INTRAMUSCULAR INJECTION**
  - Child 12–17 years: 500 micrograms, then 500 micrograms after 5–15 minutes as required
  - Adult: 500 micrograms, then 500 micrograms after 5–15 minutes as required

**EPIPEN® JR AUTO-INJECTOR 0.15MG**

**Acute anaphylaxis (for self-administration)**

- **BY INTRAMUSCULAR INJECTION**
  - Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required
  - Child (body-weight 15–30 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required, on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children

**EPIPEN® AUTO-INJECTOR 0.3MG**

**Acute anaphylaxis (for self-administration)**

- **BY INTRAMUSCULAR INJECTION**
  - Child (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required
  - Adult (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required

**JEXT® 150 MICROGRAMS**

**Acute anaphylaxis (for self-administration)**

- **BY INTRAMUSCULAR INJECTION**
  - Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required
  - Child (body-weight 15–30 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required, on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children
JEXT® 300 MICROGRAMS

Acute anaphylaxis (for self-administration)

BY INTRAVENOUS INJECTION

- Child (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required
- Adult (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required

Priapism associated with alprostadil, if aspiration and lavage of corpora are unsuccessful (alternative to phenylephrine or metaraminol).

BY INTRACAVERNOSAL INJECTION

- Adult: 10–20 micrograms every 5–10 minutes, using a 20 microgram/mL solution, Important: if suitable strength of adrenaline not available may be specially prepared by diluting 0.1 mL of the adrenaline 1 in 1000 (1 mg/mL) injection to 5 mL with sodium chloride 0.9%, continuously monitor blood pressure and pulse; maximum 100 micrograms per course

UNLICENSED USE

- With intravenous use Adrenaline 1 in 1000 (1mg/mL) solution is not licensed for intravenous administration. Auto-injector delivering 150-microgram dose of adrenaline not licensed for use in children body-weight under 15 kg.

Important safety information

SAFE PRACTICE

Intravenous route should be used with extreme care by specialists only.

- CAUTIONS Arteriosclerosis, arrhythmias, cerebrovascular disease, cor pulmonale, diabetes mellitus, elderly, hypercalcaemia, hyperreflexia, hypertension, hyperthyroidism, hypokalaemia, ischaemic heart disease, obstructive cardiomyopathy, occlusive vascular disease, organic brain damage, phaeochromocytoma, prostate disorders, psychosis, severe aniga, susceptibility to angle-closure glaucoma

CAUTIONS, FURTHER INFORMATION

Cautions listed are only for non-life-threatening situations.

- INTERACTIONS Appendix 1 (sympathomimetics)

Severe anaphylaxis in patients taking beta-blockers may not respond to adrenaline—consider bronchodilator therapy. Furthermore, adrenaline can cause severe hypertension and bradycardia in those taking non-cardioselective beta-blockers.

- SIDE-EFFECTS Angina, angle-closure glaucoma, anorexia, anxiety, arrhythmias, cold extremities, confusion, difficulty in micturition, dizziness, dry mouth, dyspnoea, headache, hyperglycaemia, hypersalivation, hypertension (risk of cerebral haemorrhage), hypokalaemia, insomnia, metabolic acidosis, mydriasis, myocardial infarction, nausea, pallor, palpitation, psychosis, pulmonary oedema (on excessive dosage or extreme sensitivity), restlessness, sweating, tachycardia, tissue necrosis at injection site, tissue necrosis of bowel, tissue necrosis of extremities, tissue necrosis of kidneys, tissue necrosis of liver, tremor, urinary retention, vomiting, weakness

- PREGNANCY May reduce placental perfusion and cause tachycardia, cardiac irregularities, and extrasystoles in fetus. Can delay second stage of labour. Manufacturers advise use only if benefit outweighs risk.

- BREAST FEEDING Present in milk but unlikely to be harmful as poor oral bioavailability.

- RENAL IMPAIRMENT Manufacturers advise use with caution in severe impairment.

- MONITORING REQUIREMENTS Monitor blood pressure and ECG.

DIRECTIONS FOR ADMINISTRATION

- With intravenous use in children Acute hypotension (same text as above) For continuous intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9% and give through a central venous catheter. Incompatible with bicarbonate and alkaline solutions. Neonatal intensive care, dilute 3 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 100 nanograms/kg/minute; infuse through a central venous catheter. Incompatible with bicarbonate and alkaline solutions. These infusions are usually made up with adrenaline 1 in 1000 (1 mg/mL) solutions.

- With intravenous use Administration through a central line results in a faster response than peripheral administration, however placement of a central line must not interfere with chest compressions; drugs administered peripherally must be followed by a flush of at least 20 mL. Sodium Chloride 0.9% injection to aid entry into the central circulation.

PRESCRIBING AND DISPENSING INFORMATION

It is important, in acute anaphylaxis where intramuscular injection might still succeed, time should not be wasted seeking intravenous access. Great vigilance is needed to ensure that the correct strength of adrenaline injection is used; anaphylactic shock kits need to make a very clear distinction between the 1 in 10 000 strength and the 1 in 1000 strength. Patients with severe allergy should be instructed in the self-administration of adrenaline by intramuscular injection.

Packs for self-administration need to be clearly labelled with instructions on how to administer adrenaline (intramuscularly, preferably at the midpoint of the outer thigh, through light clothing if necessary) so that in the case of rapid collapse someone else is able to give it. It is important to ensure individuals at risk and their carers understand that:

- two injection devices should be carried at all times to treat symptoms until medical assistance is available; if, after the first injection, the individual does not start to feel better, the second injection should be given 5 to 15 minutes after the first;
- an ambulance should be called after every administration, even if symptoms improve;
- the individual should lie down with their legs raised (unless they have breathing difficulties, in which case they should sit up) and should not be left alone.

Adrenaline for administration by intramuscular injection is available in ‘auto-injectors’ (e.g. Emerade®), EpiPen®, or Jext®), pre-assembled syringes fitted with a needle suitable for very rapid administration (if necessary by a bystander or a healthcare provider if it is the only preparation available); injection technique is device specific.

To ensure patients receive the auto-injector device that they have been trained to use, prescribers should specify the brand to be dispensed.

PATIENT AND CARER ADVICE

Individuals at considerable risk of anaphylaxis need to carry (or have available) adrenaline at all times and the patient, or their carers, need to be instructed in advance and how to inject it.

Medicines for Children leaflet: Adrenaline auto-injector for anaphylaxis www.medicinesforchildren.org.uk/adrenaline-for-anaphylaxis

EpiPen® AUTO-INJECTOR 0.15MG, 0.3MG

1.7 mL of the solution remains in the auto-injector device after use.

EMERADE® 500 MICROGRAMS

No solution remains in the auto-injector device after use.
EMERADE® 150 MICROGRAMS
0.35 mL of the solution remains in the auto-injector device after use.

EMERADE® 300 MICROGRAMS
0.2 mL of the solution remains in the auto-injector device after use.

JEXT® 300 MICROGRAMS
1.1 mL of the solution remains in the auto-injector device after use.

JEXT® 150 MICROGRAMS
1.25 mL of the solution remains in the auto-injector device after use.

Exceptions to legal category
POM restriction does not apply to the intramuscular administration of up to 1 mg of adrenaline injection 1 in 1000 (1 mg/mL) for the emergency treatment of anaphylaxis.

Medicinal forms
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection
Excipients: May contain Sulfites

Adrenaline (as Adrenaline acid tartrate) 100 microgram per 1 ml
Adrenaline (base) 1mg/10ml (1 in 10,000) dilute solution for injection ampoules | 1 ampoule (PSB) £43.53 | 10 ampoule (PSB) £60.30

Jext 300micrograms/0.3ml (1 in 1,000) solution for injection auto-injectors | 1 pre-filled disposable injection (PSB) £23.99

8 Oedema

Diuretics

Overview
Thiazides are used to relieve oedema due to chronic heart failure and, in lower doses, to reduce blood pressure.

Loop diuretics are used in pulmonary oedema due to left ventricular failure and in patients with chronic heart failure. Combination diuretic therapy may be effective in patients with oedema resistant to treatment with one diuretic. Vigorous diuresis, particularly with loop diuretics, may induce acute hypotension; rapid reduction of plasma volume should be avoided.

Thiazides and related diuretics

Thiazides and related compounds are moderately potent diuretics; they inhibit sodium reabsorption at the beginning of the distal convoluted tubule. They act within 1 to 2 hours of oral administration and most have a duration of action of 12 to 24 hours; they are usually administered early in the day so that the diuresis does not interfere with sleep.

In the management of hypertension a low dose of a thiazide produces a maximal or near-maximal blood pressure lowering effect, with very little biochemical disturbance. Higher doses cause more marked changes in plasma potassium, sodium, uric acid, glucose, and lipids, with little advantage in blood pressure control.

Chlortalidone p. 204 and indapamide p. 160 are the preferred diuretics in the management of hypertension. Thiazides also have a role in chronic heart failure.

Bendroflumethiazide p. 159 can be used for mild or moderate heart failure; it is licensed for the treatment of hypertension but is no longer considered the first-line diuretic for this indication, although patients with stable and controlled blood pressure currently taking bendroflumethiazide can continue treatment.

Chlortalidone, a thiazide-related compound, has a longer duration of action than the thiazides and may be given on alternate days to control oedema. It is also useful if acute retention is liable to be precipitated by a more rapid diuresis or if patients dislike the altered pattern of micturition caused by other diuretics. Chlortalidone can also be used under close supervision for the treatment of ascites due to cirrhosis in stable patients.

Xipamide p. 205 and indapamide are chemically related to chlortalidone. Indapamide is claimed to lower blood pressure with less metabolic disturbance, particularly less aggravation of diabetes mellitus.

Metolazone p. 205 is particularly effective when combined with a loop diuretic (even in renal failure); profound diuresis can occur and the patient should therefore be monitored carefully.

The thiazide diuretics benzthiazide, clopamide, cyclopenthiazide p. 204, hydrochlorothiazide, and hydroflumethiazide do not offer any significant advantage over other thiazides and related diuretics.

Loop diuretics

Loop diuretics are used in pulmonary oedema due to left ventricular failure; intravenous administration produces relief of breathlessness and reduces pre-load sooner than would be expected from the time of onset of diuresis. Loop diuretics are also used in patients with chronic heart failure. Diuretic-resistant oedema (except lymphoedema and
Oedema due to peripheral venous stasis or calcium-channel blockers can be treated with a loop diuretic combined with a thiazide or related diuretic (e.g. bendroflumethiazide or metolazone).

If necessary, a loop diuretic can be added to antihypertensive treatment to achieve better control of blood pressure in those with resistant hypertension, or in patients with impaired renal function or heart failure.

Loop diuretics can exacerbate diabetes (but hyperglycaemia is less likely than with thiazides) and gout. If there is an enlarged prostate, urinary retention can occur, although this is less likely if small doses and less potent diuretics are used initially.

Furosemide and bumetanide are similar in activity; both act within 1 hour of oral administration and diuresis is complete within 6 hours so that, if necessary, they can be given twice in one day without interfering with sleep. Following intravenous administration furosemide has a peak effect within 30 minutes. The diuresis associated with these drugs is dose related.

Torasemide p. 202 has properties similar to those of furosemide and bumetanide, and is indicated for oedema and for hypertension.

Potassium-sparing diuretics and aldosterone antagonists

Amiloride hydrochloride p. 203 and triamterene p. 203 on their own are weak diuretics. They cause retention of potassium and are therefore given with thiazide or loop diuretics as a more effective alternative to potassium supplements. See compound preparations with thiazides or loop diuretics.

Potassium supplements must not be given with potassium-sparing diuretics. Administration of a potassium-sparing diuretic to a patient receiving an ACE inhibitor or an angiotensin-II receptor antagonist can also cause severe hyperkalaemia.

Aldosterone antagonists

Spironolactone p. 168 potentiates thiazide or loop diuretics by antagonising aldosterone; it is a potassium-sparing diuretic. Spironolactone is of value in the treatment of oedema and ascites caused by cirrhosis of the liver; furosemide can be used as an adjunct. Low doses of spironolactone are beneficial in moderate to severe heart failure and when used in resistant hypertension [unlicensed indication].

Spironolactone is also used in primary hyperaldosteronism (Conn’s syndrome). It is given before surgery or if surgery is not appropriate, in the lowest effective dose for maintenance.

Eplerenone p. 167 is licensed for use as an adjunct in left ventricular dysfunction with evidence of heart failure after a myocardial infarction; it is also licensed as an adjunct in chronic mild heart failure with left ventricular systolic dysfunction.

Potassium supplements must not be given with aldosterone antagonists

Potassium-sparing diuretics with other diuretics

Although it is preferable to prescribe thiazides and potassium-sparing diuretics separately, the use of fixed combinations may be justified if compliance is a problem. Potassium-sparing diuretics are not usually necessary in the routine treatment of hypertension, unless hypokalaemia develops.

Other diuretics

Mannitol p. 202 is an osmotic diuretic that can be used to treat cerebral oedema and raised intraocular pressure. Mercurial diuretics are effective but are now almost never used because of their nephrotoxicity.

The carbonic anhydrase inhibitor acetazolamide p. 965 is a weak diuretic and is little used for its diuretic effect. It is used for prophylaxis against mountain sickness [unlicensed indication] but is not a substitute for acclimatisation.

Acetazolamide and eye drops of dorzolamide p. 966 and brinzolamide p. 965 inhibit the formation of aqueous humour and are used in glaucoma.

Diuretics with potassium

Many patients on diuretics do not need potassium supplements. For many of those who do, the amount of potassium in combined preparations may not be enough, and for this reason their use is to be discouraged.

Diuretics with potassium and potassium-sparing diuretics should not usually be given together. Diuretics and potassium supplements should be prescribed separately for children.

LOOP DIURETICS

Loop diuretics

- **DRUG ACTION** Loop diuretics inhibit reabsorption from the ascending limb of the loop of Henlé in the renal tubule and are powerful diuretics.

- **CONTRA-INDICATIONS** Anuria · comatose and precomatose states associated with liver cirrhosis · renal failure due to nephrotoxic or hepatotoxic drugs · severe hypokalaemia · severe hyponatraemia

- **CAUTIONS** Can exacerbate diabetes (but hyperglycaemia less likely than with thiazides) · can exacerbate gout · hypotension should be corrected before initiation of treatment · hypovolaemia should be corrected before initiation of treatment · urinary retention can occur in prostatic hyperplasia

**CAUTIONS, FURTHER INFORMATION**

**Elderly** Lower initial doses of diuretics should be used in the elderly because they are particularly susceptible to the side-effects. The dose should then be adjusted according to renal function. Diuretics should not be used continuously on a long-term basis to treat simple gravitational oedema (which will usually respond to increased movement, raising the legs, and support stockings).

**Potassium loss** Hypokalaemia can occur with both thiazide and loop diuretics. The risk of hypokalaemia depends on the duration of action as well as the potency and is thus greater with thiazides than with an equipotent dose of a loop diuretic. Hypokalaemia is dangerous in severe cardiovascular disease and in patients also being treated with cardiac glycosides. Often the use of potassium-sparing diuretics avoids the need to take potassium supplements.

In hepatic failure, hypokalaemia caused by diuretics can precipitate encephalopathy, particularly in alcoholic cirrhosis.

**Urinary retention** If there is an enlarged prostate, urinary retention can occur, although this is less likely if small doses and less potent diuretics are used initially; an adequate urinary output should be established before initiating treatment.

- **INTERACTIONS** → Appendix 1 (diuretics).

- **SIDE-EFFECTS**
  - Very rare Hyperuricaemia
  - Frequency not known Acute urinary retention · blood disorders · bone-marrow depression · deafness (usually with high doses and rapid intravenous administration, and in renal impairment) · electrolyte disturbances · hepatic encephalopathy · hyperuricaemia (less common than with thiazides) · hypersensitivity reactions ·
Co-amilofruse

**INDICATIONS AND DOSE**

**Oedema**

**BY MOUTH**

- Adult: 2.5/20–10/80 mg daily, dose to be taken in the morning

**Co-amilofruse**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet

- **CO-AMILOFRUSE (Non-proprietary)**
  - Amiloride hydrochloride 2.5 mg, Furosemide 20 mg
  - Amiloride hydrochloride 5 mg, Furosemide 40 mg
  - Amiloride hydrochloride 10 mg, Furosemide 80 mg

- Frumil (Sanofi)
  - Amiloride hydrochloride 2.5 mg, Furosemide 20 mg
  - Amiloride hydrochloride 5 mg, Furosemide 40 mg

**Dose equivalence and conversion**

A mixture of amiloride hydrochloride and furosemide (frusemide) in the mass proportions of 1 part amiloride hydrochloride to 8 parts furosemide (frusemide).

- **CONTRA-INDICATIONS**
  - Addison’s disease
  - anuria
  - comatose or precomatose states associated with liver cirrhosis
  - dehydration
  - hyperkalaemia
  - hypovolaemia
  - renal failure
  - severe hypokalaemia
  - severe hyponatraemia

- **CAUTIONS**
  - Correct hypovolaemia before using in oliguria
  - diabetes mellitus
  - elderly
  - gout
  - hepatorenal syndrome
  - hypoproteinaemia
  - hypotension
  - impaired micturition
  - prostatic enlargement

- **INTERACTIONS**
  - Appendix 1 (diuretics).

- **SIDE-EFFECTS**
  - Agranulocytosis
  - anaphylaxis
  - aplastic anaemia
  - blood disorders
  - bone marrow depression
  - confusion
  - deafness
  - diabetes mellitus
  - eosinophilia
  - exfoliative dermatitis
  - gastro-intestinal disturbances
  - gout
  - haemolytic anaemia
  - hepatic encephalopathy
  - hyperglycaemia
  - hypersensitivity reactions
  - hyperuricaemia
  - hypocalcaemia
  - hypomagnesaemia
  - hypoproteinaemia
  - increased in serum cholesterol and triglyceride concentrations
  - tinnitus
  - toxic epidermal necrolysis

- **PREGNANCY**
  - Not used to treat hypertension in pregnancy.

- **BREAST FEEDING**
  - No information regarding amiloride component available.
  - Amount of furosemide in milk too small to be harmful.
  - Frusemide may inhibit lactation.

- **HEPATIC IMPAIRMENT**
  - Increased risk of hypomagnesaemia in alcoholic cirrhosis.

- **RENAL IMPAIRMENT**
  - Risk of hyperkalaemia in renal impairment but may need higher doses. Monitor plasma-potassium concentration. Avoid if eGFR less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**
  - Monitor electrolytes.
Furosemide
(Frusemide)

INDICATIONS AND DOSE

**Oedema**

- **By mouth**
  - Adult: Initially 40 mg daily, dose to be taken in the morning, then maintenance 20–40 mg daily initially by intramuscular injection or by slow intravenous injection or by intravenous infusion

**Resistant oedema**

- **By mouth**
  - Adult: 80–120 mg daily initially by intramuscular injection or by slow intravenous injection or by intravenous infusion

**Resistant hypertension**

- **By mouth**
  - Adult: 40–80 mg daily initially by intramuscular injection or by slow intravenous injection or by intravenous infusion

- **By intramuscular injection or by intravenous infusion**
  - Adult: Initially 20–50 mg, then (by intramuscular injection or by intravenous injection or by intravenous infusion) increased in steps of 20 mg every 2 hours if required, doses greater than 50 mg given by intravenous infusion only; maximum 1.5 g per day

**CAUTIONS**

- Hepatorenal syndrome - hypoproteinaemia may reduce diuretic effect and increase risk of side-effects
- **SIDE-EFFECTS** Gout - intrahepatic cholestasis
- **PREGNANCY** Furosemide should not be used to treat gestational hypertension because of the maternal hypoproteinaemia associated with this condition.
- **BREAST FEEDING** Amount too small to be harmful. May inhibit lactation.
- **DIRECTIONS FOR ADMINISTRATION** Intravenous administration rate should not usually exceed 4 mg/minute however single doses of up to 80 mg may be administered more rapidly. A lower rate of infusion may be necessary in renal impairment. For intravenous infusion (Lasix®), give continuously in Sodium chloride 0.9%; infusion pH must be above 5.5 and rate should not exceed 4 mg/minute; glucose solutions are unsuitable.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, spray, oral solution

- **Tablet**
  - **Furosemide 20 mg** Furosemide 20mg tablets | 28 tablet | £1.13
  - **Furosemide 40 mg** Furosemide 40mg tablets | 28 tablet | £1.89

**Solution for injection**

**Furosemide with potassium chloride**

The properties listed below are those particular to the combination only. For the properties of the components please consider, furosemide above, potassium chloride p. 863.

**INDICATIONS AND DOSE**

**Oedema**

- **By mouth**
  - Adult: consult product literature

**DIRECTIONS FOR ADMINISTRATION** Furosemide with modified-release potassium chloride tablets should be swallowed whole with plenty of fluid during meals while sitting or standing.

**PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer furosemide with potassium chloride tablets.

**LESS SUITABLE FOR PRESCRIBING** Furosemide with potassium chloride tablets are less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Modified-release tablet**
  - Lasilactone®
  - Furosemide 40 mg, Potassium chloride 600 mg
  - Diumide-K Continus tablets | 30 tablet | £3.00

**Furosemide with spironolactone**

The properties listed below are those particular to the combination only. For the properties of the components please consider, furosemide above, spironolactone p. 168.

**INDICATIONS AND DOSE**

**Resistant oedema**

- **By mouth**
  - Adult: 20/50–80/200 mg daily

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Capsule**
  - Lasilactone®

**Furosemide 20 mg, Spironolactone 50 mg** Lasilactone 20mg/50mg capsules | 28 capsule | £1.97

**Furosemide with triamterene**

The properties listed below are those particular to the combination only. For the properties of the components please consider, furosemide above, triamterene p. 203.

- **Tablet**
  - **Furosemide 4 mg** Furosemide 4mg/5ml oral solution sugar free (sugar-free) | 150 ml | £14.49
  - **Furosemide 50 mg** Furosemide 50mg/5ml oral solution sugar free (sugar-free) | 150 ml | £20.21
INDICATIONS AND DOSE

Oedema

BY MOUTH

Adult: 0.5–2 tablets daily, dose to be taken in the morning.

CONTRA-INDICATIONS

Anuria - comatose or precomatose states associated with liver cirrhosis - dehydration - hyperkalaemia - hypovolaemia - renal failure - severe hypoproteinaemia - severe hyponatraemia

CAUTIONS

Diabetes mellitus - elderly - gout - hepatorenal syndrome - hypotension - impaired micturition - may cause blue fluorescence of urine - prostatic enlargement

INTERACTIONS

Appendix 1 (diuretics).

SIDE-EFFECTS

Rare

Agranulocytosis - anaphylaxis - aplastic anaemia - blood disorders - bone marrow depression (withdrawal treatment) - deafness (usually in renal impairment or in hypoproteinaemia) - eosinophilia - exfoliative dermatitis - haemolytic anaemia - hypersensitivity reactions - intrahepatic cholestasis - leucopenia - pancreatitis - paraesthesia - photosensitivity - purpura - rash - thrombocytopenia - tinnitus (usually in renal impairment or in hypoproteinaemia)

Frequency not known

Dry mouth - electrolyte disturbances - gastro-intestinal disturbances - gout - hyperglycaemia (less common than with thiazides) - hyperkalaemia - hyperuricaemia - hypocalcaemia - hypokalaemia - hypomagnesaemia - hyponatraemia - hypotension - metabolic alkalosis - temporary increase in plasma cholesterol and triglyceride concentration - triamterene found in kidney stones

BREAST FEEDING

Triamterene present in milk—manufacturer advises avoid. Furosemide may inhibit lactation.

HEPATIC IMPAIRMENT

Increased risk of hypomagnesaemia in alcoholic cirrhosis. Hypokalaemia may precipitate coma.

RENAL IMPAIRMENT

May need high doses. Monitor plasma-potassium concentration in renal impairment (high risk of hyperkalaemia). Avoid in severe impairment.

MONITORING REQUIREMENTS

Monitor electrolytes.

PATIENT AND CARER ADVICE

Urine may look slightly blue in some lights.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Table

CAUTIONARY AND ADVISORY LABELS 14

Frusene (Orion Pharma (UK) Ltd)

Furosemide 40 mg, Triamterene 50 mg

Furosemide 50mg/40mg tablets | 56 tablet PD | £4.34 DT price | £4.34

Torasemide

INDICATIONS AND DOSE

Oedema

BY MOUTH

Adult: 5 mg once daily, to be taken preferably in the morning, then increased if necessary to 20 mg once daily; maximum 40 mg per day

Hypertension

BY MOUTH

Adult: 2.5 mg daily, then increased if necessary to 5 mg once daily

SIDE-EFFECTS

Rare

Limb paraesthesia

• Frequency not known

Dry mouth

PREGNANCY

Manufacturer advises avoid—toxicity in animal studies.

BREAST FEEDING

Manufacturer advises avoid—no information available.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Table

TORASEMIDE (Non-proprietary)

OSMOTIC DIURETICS

Mannitol

INDICATIONS AND DOSE

Cerebral oedema

BY INTRAVENOUS INFUSION

Adult: 0.25–2 g/kg, repeated if necessary, to be administered over 30–60 minutes, dose may be repeated 1–2 times after 4–8 hours

Raised intra-ocular pressure

BY INTRAVENOUS INFUSION

Adult: 0.25–2 g/kg, repeated if necessary, to be administered over 30–60 minutes, dose may be repeated 1–2 times after 4–8 hours

CONTRA-INDICATIONS

Anuria - intracranial bleeding (except during craniotomy) - severe cardiac failure - severe dehydration - severe pulmonary oedema

CAUTIONS

Extravasation causes inflammation and thrombophlebitis

INTERACTIONS

Appendix 1 (mannitol).

SIDE-EFFECTS

Uncommon

Electrolyte imbalance - fluid imbalance - hypotension - thrombophlebitis

Rare

Very rare

Acute renal failure - congestive heart failure

PREGNANCY

Manufacturer advises avoid unless essential—no information available.

BREAST FEEDING

Manufacturer advises avoid unless essential—no information available.

RENAL IMPAIRMENT

Use with caution in severe impairment.

PRE-TREATMENT SCREENING

Assess cardiac function before treatment.

MONITORING REQUIREMENTS

Monitor fluid and electrolyte balance, serum osmolality, and cardiac, pulmonary and renal function.

DIRECTIONS FOR ADMINISTRATION

For mannitol 20%, an in-line filter is recommended (15-micron filters have been used).
**POTASSIUM-SPARING DIURETICS**

**Amiloride hydrochloride**

**INDICATIONS AND DOSE**

**Oedema (monotherapy)**

**BY MOUTH**

- Adult: Initially 10 mg daily, alternatively initially 5 mg twice daily, adjusted according to response; maximum 20 mg per day

Potassium conservation when used as an adjunct to thiazide or loop diuretics for hypertension or congestive heart failure

**BY MOUTH**

- Adult: Initially 5–10 mg daily

Potassium conservation when used as an adjunct to thiazide or loop diuretics for hepatic cirrhosis with ascites

**BY MOUTH**

- Adult: Initially 5 mg daily

**CONTRA-INDICATIONS**

- Addison’s disease - anuria - hyperkalaemia

**CAUTIONS**

- Diabetes mellitus - elderly

**INTERACTIONS**

→ Appendix 1 (diuretics).

**SIDE-EFFECTS**

**PREGNANCY**

Not to be used to treat gestational hypertension.

**BREAST FEEDING**

Manufacturer advises avoid—no information available.

**RENAL IMPAIRMENT**

Manufacturers advise avoid in severe impairment. Monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment).

**MONITORING REQUIREMENTS**

Monitor electrolytes.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**BY MOUTH**

- Adult: 1–2 tablets daily

**Triamterene**

**INDICATIONS AND DOSE**

**Oedema**

Potassium conservation with thiazide and loop diuretics

**BY MOUTH**

- Adult: Initially 150–250 mg daily in 2 divided doses, to be taken after breakfast and lunch, lower initial dose when given with other diuretics, then reduced to 150–250 mg once daily on alternate days in 2 divided doses, to be taken after breakfast and lunch, after one week of initial treatment

**CONTRA-INDICATIONS**

- Addison’s disease - anuria - hyperkalaemia

**CAUTIONS**

- Diabetes mellitus - elderly - gout - may cause blue fluorescence of urine

**INTERACTIONS**

→ Appendix 1 (triaterene).

**SIDE-EFFECTS**

- Common or very common Diarrhoea - hyperkalaemia - nausea - vomiting

- Uncommon Dry mouth - headache - hyperuricaemia - rash

- Rare Megaloblastic anaemia - pancytopenia - photosensitivity - serum sickness

- Very rare Renal failure (reversible on discontinuation) - triamterene found in kidney stones

- Frequency not known Jaundice - malaise - slight decrease in blood pressure

**PREGNANCY**

Not to be used to treat gestational hypertension.

Avoid unless essential.

**BREAST FEEDING** Present in milk—manufacturer advises avoid.

**HEPATIC IMPAIRMENT** Use with caution. Avoid in progressive impairment.

**RENAL IMPAIRMENT** Avoid in progressive impairment. Monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment).

**MONITORING REQUIREMENTS** Monitor electrolytes.
Chlortalidone with triamterene

The properties listed below are those particular to the combination only. For the properties of the components please consider, triamterene p. 203, chlortalidone below.

INDICATIONS AND DOSE
Hypertension | Oedema
BY MOUTH
Adult: 1–2 tablets daily, dose to be taken in the morning

Co-triamterzide

The properties listed below are those particular to the combination only. For the properties of the components please consider, triamterene p. 203, hydrochlorothiazide p. 160.

INDICATIONS AND DOSE
Hypertension | Oedema
BY MOUTH
Adult: 1 tablet daily, increased if necessary up to 4 tablets daily, dose to be taken after breakfast

Oedema
BY MOUTH
Adult: 1 tablet twice daily, to be taken after breakfast and after midday meal, increased if necessary to 3 tablets daily, two tablets to be taken after breakfast and one tablet after midday meal; maintenance 1 tablet daily, alternatively maintenance 2 tablets once daily on alternate days; maximum 4 tablets per day

Cyclosporine

The properties listed below are those particular to the drug only. For properties common to the class, see thiazides and related diuretics, p. 159.

INDICATIONS AND DOSE
Heart failure
BY MOUTH
Adult: 250–500 micrograms daily, taken in the morning, then increased if necessary to 1 mg daily, reduce to lowest effective dose for maintenance

Hypertension
BY MOUTH
Adult: Initially 250 micrograms daily, taken in the morning, then increased if necessary to 500 micrograms daily

Oedema
BY MOUTH
Adult: Up to 500 micrograms daily for a short period

SIDE-EFFECTS
Rare Depression

BREAST FEEDING
The amount present in milk is too small to be harmful. Large doses may suppress lactation.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.
Tablet
EXCIPIENTS: May contain Gluten
Navidrex
Cyclosporine 500 microgram Navidrex 500 microgram tablets | 28 tablet (PAC) £1.27

THIAZIDES AND RELATED DIURETICS

Chlortalidone
(Chlorthalidone)
The properties listed below are those particular to the drug only. For properties common to the class, see thiazides and related diuretics, p. 159.
Regulating blood lipids, optimising glycaemic control in diabetes, taking aspirin p. 104 in a dose of 75 mg daily, and possibly weight reduction in obesity. Exercise training can improve symptoms of intermittent claudication; revascularisation procedures may be appropriate.

Nafidrofuryl oxalate p. 206 can alleviate symptoms of intermittent claudication and improve pain-free walking distance in moderate disease. Patients taking nafidrofuryl oxalate p. 206 should be assessed for improvement after 3–6 months.

Cilostazol p. 206 is licensed for use in intermittent claudication to improve walking distance in patients without peripheral tissue necrosis who do not have pain at rest; use is restricted to second-line treatment where lifestyle modifications and other appropriate interventions have failed to improve symptoms. Cilostazol should be initiated by those experienced in the management of intermittent claudication. Patients receiving cilostazol should be assessed for improvement after 3 months; consider discontinuation of treatment if there is no clinically relevant improvement in walking distance.

Inositol nicotinate p. 206 and pentoxifylline p. 207 are not established as being effective for the treatment of intermittent claudication. Management of Raynaud’s syndrome includes avoidance of exposure to cold and stopping smoking. More severe symptoms may require vasodilator treatment, which is most often successful in primary Raynaud’s syndrome. Nifedipine p. 154 is useful for reducing the frequency and severity of vasospastic attacks. Alternatively, nafidrofuryl oxalate p. 206 may produce symptomatic improvement; inositol nicotinate p. 206 (a nicotinic acid derivative) may also be considered. Pentoxifylline, prazosin p. 674, and moxisylyte below are not established as being effective for the treatment of Raynaud’s syndrome.

 Vasodilator therapy is not established as being effective for chilblains.

### ALPHA-ADRENOCEPTOR BLOCKERS

**Moxisylyte**

(Thymoxamine)

**INDICATIONS AND DOSE**

**Primary Raynaud’s syndrome (short-term treatment)**

**BY MOUTH**

Adult: Initially 40 mg 4 times a day, increased if necessary to 80 mg 4 times a day, increase dose if poor initial response, discontinue after 2 weeks if no response.

**CONTRA-INDICATIONS**

Active liver disease

**CAUTIONS**

Diabetes mellitus

**SIDE-EFFECTS**

Cholestatic jaundice · diarrhoea · dizziness · flushing · headache · hepatic reactions · hepatitis · nausea

**PREGNANCY**

Manufacturer advises avoid.

**LESS SUITABLE FOR PRESCRIBING**

Less suitable for prescribing.

**PHOSPHODIESTERASE TYPE-3 INHIBITORS**

**Cilostazol**

**INDICATIONS AND DOSE**

Intermittent claudication in patients without rest pain and no peripheral tissue necrosis

**BY MOUTH**

- Adult: 100 mg twice daily, to be taken 30 minutes before food, cilostazol should be initiated by those experienced in the management of intermittent claudication, patients receiving cilostazol should be assessed for improvement after 3 months; consider discontinuation of treatment if there is no clinically relevant improvement in walking distance

**Dose adjustments due to interactions**

Reduce dose to 50 mg twice daily with concomitant use of potent inhibitors of cytochrome P450 enzymes CYP3A4 (e.g. clarithromycin, itraconazole, ketoconazole, protease inhibitors) or CYP2C19, or with erythromycin or omeprazole.

**CONTRA-INDICATIONS** Active peptic ulcer, congestive heart failure, coronary intervention in previous 6 months, haemorrhagic stroke in previous 6 months, history of severe tachyarrhythmia, myocardial infarction in previous 6 months, poorly controlled hypertension, predisposition to bleeding, proliferative diabetic retinopathy.
Cilostazol, naftidrofuryl oxalate, pentoxifylline and inositol

NATIONAL FUNDING/ACCESS DECISIONS

RENAL IMPAIRMENT

BREAST FEEDING

PREGNANCY

INTERACTIONS → Appendix 1 (cilostazol).

Caution with concomitant use of drugs that increase risk of bleeding. Contra-indicated with concomitant use of 2 or more antplatelets or antiagulants.

SIDE-EFFECTS

Common or very common Abdominal pain · angina · anorexia · arrhythmia · diarrhoea · dizziness · dyspepsia · ecchymosis · flatulence · headache · malaise · nausea · oedema · palpitation · pharyngitis · pruritus · rash · rhinitis · tachycardia · vomiting

Uncommon Abnormal dreams · anemia · anxiety · congestive heart failure · cough · diabetes mellitus · dyspnea · gastritis · haemorrhage · hyperglycaemia · insomnia · myalgia · myocardial infarction · pneumonia · postural hypotension

Rare Bleeding disorders · increased urinary frequency · renal impairment · thrombocythaemia

Frequency not known Agranulocytosis · aplastic anemia · conjunctivitis · hepatitis · hot flushes · hypertension · leucopenia · pancycopenia · pyrexia · Stevens-Johnson syndrome · thrombocytopenia · tinnitus · toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION

Blood Disorders A blood count should be performed and the drug stopped immediately if there is suspicion of a blood dyscrasia.

PREGNANCY Avoid—toxicity in animal studies.

BREAST FEEDING Present in milk in animal studies—manufacturer advises avoid.

HEPATIC IMPAIRMENT Avoid in moderate or severe liver disease.

RENAL IMPAIRMENT Avoid if eGFR less than 25 mL/minute/1.73 m².

PATIENT AND CARER ADVICE

Blood disorders Patients should be advised to report any unexplained bleeding, bruising, sore throat, or fever.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Cilostazol, naftidrofuryl oxalate, pentoxifylline and inositol nicotinate for the treatment of intermittent claudication in people with peripheral arterial disease (May 2011) NICE TA223 Cilostazol is not recommended for the treatment of intermittent claudication in patients with peripheral arterial disease; patients currently receiving this treatment should have the option to continue until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA223

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (October 2005) that cilostazol is not recommended for the treatment of intermittent claudication within NHS Scotland.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

  Fibrovein 3% solution for injection 5ml vials | 10 vial £158.50
Chapter 3
Respiratory system

Use and care of spacer devices

Patients should inhale from the spacer device as soon as possible after actuation because the drug aerosol is very short-lived; single-dose actuation is recommended. Tidal breathing is as effective as single breaths. The device should be cleaned once a month with mild detergent and then allowed to dry in air without rinsing; the mouthpiece should be wiped clean of detergent before use. Some manufacturers recommend more frequent cleaning, but this should be avoided since any electrostatic charge may affect drug delivery. Spacer devices should be replaced every 6–12 months.

Nebulisers

Solutions for nebulisation are available for use in severe acute asthma. They are administered over 5–10 minutes from a nebuliser usually driven by oxygen in hospital. Patients with a severe attack of asthma should preferably have oxygen during nebulisation since beta, agonists can increase arterial hypoxaemia. A nebuliser converts a solution of a drug into an aerosol for inhalation. It is used to deliver higher doses of drug to the airways than is usual with standard inhalers. The main indications for use of a nebuliser are to deliver:

- a beta, agonist or ipratropium bromide p. 217 to a patient with an acute exacerbation of asthma or of chronic obstructive pulmonary disease;
- a beta, agonist, corticosteroid, or ipratropium bromide on a regular basis to a patient with severe asthma or reversible airways obstruction when the patient is unable to use other inhalational devices;
- an antibiotic (such as colistimethate sodium p. 489) or a mucolytic to a patient with cystic fibrosis;
- budesonide p. 228 or adrenaline/epinephrine p. 196 to a child with severe croup;
- pentamidine isetionate p. 523 for the prophylaxis and treatment of pneumocystis pneumonia.

The use of nebulisers in chronic persistent asthma and chronic obstructive pulmonary disease should be considered only:

- after a review of the diagnosis;
- after review of therapy (see also Chronic Obstructive Pulmonary Disease p. 214) and the patient’s ability to use hand-held devices;
- after increased doses of inhaled therapy from hand-held inhalers (with a spacer if necessary) have been tried for 2 weeks;
- if the patient remains breathless, despite correctly using optimal therapy.

Before prescribing a nebuliser, a home trial should preferably be undertaken to monitor response for up to 2 weeks on standard treatment and up to 2 weeks on...

piped air or oxygen; in acute asthma the nebuliser should be
nebulised treatment. If prescribed, patients must:
• have clear instructions from a doctor, specialist nurse,
physiotherapist, or pharmacist on the use of the
nebuliser (including maintenance and cleaning) and on
peak-flow monitoring;
• be instructed not to treat acute attacks at home without
also seeking help;
• have regular follow up by a doctor, specialist nurse or
physiotherapist after about 1 month and annually
thereafter.
The proportion of a nebuliser solution that reaches the
lungs depends on the type of nebuliser and although it can be
as high as 30%, it is more frequently close to 10% and
sometimes below 10%. The remaining solution is left in the
nebuliser as residual volume or is deposited in the
mouthpiece and tubing. The extent to which the nebulised
solution is deposited in the airways or alveoli depends on
the droplet size, pattern of breath inhalation, and condition
of the lung. Droplets with a mass median diameter of
1–5 microns are deposited in the airways and are therefore
appropriate for asthma, whereas a particle size of
1–2 microns is needed for alveolar deposition of
pentamidine isetionate p. 523 to combat pneumocystis
infection. The type of nebuliser is therefore chosen
according to the deposition required and according to the
viscosity of the solution.

Jet nebulisers
Jet nebulisers are more widely used than ultrasonic
nebulisers. Most jet nebulisers require an optimum gas flow
rate of 6–8 litres/minute and in hospital can be driven by
piped air or oxygen; in acute asthma the nebuliser should be
driven by oxygen. Domiciliary oxygen cylinders do not
provide an adequate flow rate therefore an electrical
compressor is required for domiciliary use.
For patients at risk of hypercapnia, such as those with
chronic obstructive pulmonary disease, oxygen can be
dangerous and the nebuliser should be driven by air. If
oxygen is required, it should be given simultaneously by
nasal cannula.

Tubing
The Department of Health has reminded users of the need
to use the correct grade of tubing when connecting a
nebuliser to a medical gas supply or compressor.

Ultrasonic nebulisers
Ultrasonic nebulisers produce an aerosol by ultrasonic
vibration of the drug solution and therefore do not require a
gas flow; they are not suitable for the nebulisation of some
drugs, such as dornase alfa p. 256 and nebulised
suspensions.

Nebuliser diluent
Nebulisation may be carried out using an undiluted
nebuliser solution or it may require dilution beforehand.
The usual diluent is sterile sodium chloride 0.9%
(physiological saline).
In England and Wales nebulisers and compressors are not
available on the NHS (but they are free of VAT); some
nebulisers (but not compressors) are available on form
GP10A in Scotland (for details consult Scottish Drug Tariff).

Oral
The oral route is used when administration by inhalation is
not possible. Systemic side-effects occur more frequently
when a drug is given orally rather than by inhalation. Drugs
given by mouth for the treatment of asthma include beta,
agonists, corticosteroids, theophylline p. 238, and
leukotriene receptor antagonists.

Parenteral
Drugs such as beta, agonists, corticosteroids, and
aminophylline p. 237 can be given by injection in acute
severe asthma when administration by nebulisation is
inadequate or inappropriate. If the patient is being treated in
the community, urgent transfer to hospital should be
arranged.

NICE technology appraisals (TAs)

Inhaler devices for children under 5 years with chronic
asthma (August 2000) NICE TA10
A child’s needs and likelihood of good compliance should
govern the choice of inhaler and spacer device; only then
should cost be considered.
• corticosteroid and bronchodilator therapy should be
delivered by pressurised metered-dose inhaler and
spacer device, with a facemask if necessary;
• if this is not effective, and depending on the child’s
condition, nebulised therapy may be considered and, in
children over 3 years, a dry powder inhaler may also be
considered. www.nice.org.uk/TA10

Inhaler devices for children 5–15 years with chronic asthma
(March 2002) NICE TA38
A child’s needs, ability to develop and maintain effective
technique, and likelihood of good compliance should govern
the choice of inhaler and spacer device; only then should
cost be considered.
• corticosteroid therapy should be routinely delivered by
a pressurised metered-dose inhaler and spacer device;
• for other inhaled drugs, particularly bronchodilators, a
wider range of devices should be considered;
• children and their carers should be trained in the use of
the chosen device; suitability of the device should be
reviewed at least annually. Inhaler technique and
compliance should be monitored. www.nice.org.uk/TA38

1 Airways disease, obstructive

Asthma

Drugs used in the management of asthma include beta,agonists, antimuscarinic bronchodilators, theophylline p. 238, corticosteroids, sodium cromoglicate p. 234 and
decromomil sodium p. 234, leukotriene receptor antagonists,
and, in specialist centres, omalizumab p. 235.

Management of acute asthma

Important: Patients with severe or life-threatening acute
asthma may not be distressed and may not have all these
abnormalities; the presence of any should alert the doctor
Regard each emergency consultation as being for severe
acute asthma until shown otherwise.
See medical emergencies, for doses of drugs used for the
management of acute asthma.

Moderate acute asthma

• Able to talk
• Respiration (breaths/minute) < 25; child 2–5 years
≤ 40, 5–12 years ≤ 30
• Pulse (beats/minute) < 110; child 2–5 years ≤ 140,
5–12 years ≤ 125
• Arterial oxygen saturation ≥ 92%
• Peak flow > 50% of predicted or best; child 5–12 years
≥ 50%

Treat at home or in surgery and assess response to treatment

Treatment

• Inhaled short-acting beta, agonist via a large-volume
spacer or oxygen-driven nebuliser (if available); give
salbutamol 100 micrograms metered inhalation p. 222,
and repeat at 10–20 minute intervals if necessary or
give nebulised salbutamol or terbutaline sulphate p. 225,
and repeat at 20–30 minute intervals if necessary
• Prednisolone by mouth for at least 5 days; and for up to 3 days in children, or longer if necessary. If the child has been taking an oral corticosteroid for more than a few days, give prednisolone at the upper end of the dose range.

Monitor response for 15–30 minutes
If response is poor or a relapse occurs in 3–4 hours, send immediately to hospital for further assessment.

Severe acute asthma
• Cannot complete sentences in one breath; in children, too breathless to talk or feed
• Respiration (breaths/minute) ≥ 25; child 2–5 years > 40; 5–12 years > 30
• Pulse (beats/minute) ≥ 110; child 2–5 years > 140; 5–12 years > 125
• Arterial oxygen saturation ≥ 92%; child under 12 years < 92%
• Peak flow 33–50% of predicted or best; child 5–12 years 33–50%

Start treatment below and send immediately to hospital.

Treatment
• High-flow oxygen (if available)
• Inhaled short-acting beta, agonist via a large-volume spacer or oxygen-driven nebuliser (if available) as for moderate acute asthma
• Prednisolone p. 585 by mouth as for moderate acute asthma or intravenous hydrocortisone p. 583 (preferably as sodium succinate) every 4–6 hours until conversion to oral prednisolone is possible

Monitor response for 15–30 minutes
If response is poor:
• Inhaled ipratropium bromide p. 217 via oxygen-driven nebuliser (if available) every 4–6 hours in adults; or every 20–30 minutes for the first 2 hours, then every 4–6 hours as necessary in children.
• Refer those who fail to respond and require ventilatory support to an intensive care or high-dependency unit
• Consider intravenous beta, agonist, aminophylline p. 237, or magnesium sulfate p. 858 [unlicensed indication] only after consultation with senior medical staff.

Life-threatening acute asthma
• Silent chest, feeble respiratory effort, cyanosis
• Hypotension, bradycardia, arrhythmia, exhaustion, agitation (in children), or reduced level of consciousness
• Arterial oxygen saturation < 92%
• Peak flow < 33% of predicted or best; child 5–12 years < 33%

Start treatment below and send immediately to hospital; consult with senior medical staff and refer to intensive care

Treatment
• High-flow oxygen (if available)
• Short-acting beta, agonist via oxygen-driven nebuliser (if available); give salbutamol or terbutaline, and repeat at 20–30 minute intervals or as necessary; reserve intravenous beta, agonists for those in whom inhaled therapy cannot be used reliably
• Prednisolone by mouth as for moderate acute asthma or intravenous hydrocortisone p. 583 as for severe acute asthma
• Inhaled ipratropium bromide via oxygen-driven nebuliser (if available) as for severe acute asthma

Monitor response for 15–30 minutes
If response is poor:
• Consider intravenous aminophylline or magnesium sulfate [unlicensed indication] only after consultation with senior medical staff.

Management of severe acute asthma

Important
Regard each emergency consultation as being for severe acute asthma until shown otherwise. Failure to respond adequately at any time requires immediate transfer to hospital.

Severe acute asthma can be fatal and must be treated promptly. All patients with severe acute asthma should be given high-flow oxygen (if available) and an inhaled short-acting beta, agonist via a large-volume spacer or nebuliser; give salbutamol 100 micrograms/metered inhalation p. 222, each puff inhaled separately via a large volume spacer, and repeat at 10–20 minute intervals or as necessary. If there are life-threatening features, give salbutamol or terbutaline sulfate p. 225 via an oxygen-driven nebuliser every 20–30 minutes or as necessary. In all cases, a systemic corticosteroid should be given. For adults, give prednisolone by mouth for at least 5 days, or intravenous hydrocortisone (preferably as sodium succinate) every 6 hours until conversion to oral prednisolone is possible. For children, give prednisolone by mouth for up to 3 days, or longer if necessary, or intravenous hydrocortisone (preferably as sodium succinate) every 6 hours until conversion to oral prednisolone is possible. If the child has been taking an oral corticosteroid for more than a few days, then give prednisolone at the upper end of the dose range.

In severe or life-threatening asthma, also consider initial treatment with ipratropium bromide by nebuliser.

Most patients do not require and do not benefit from the addition of intravenous aminophylline or of intravenous beta, agonist; both cause more adverse effects than nebulised beta, agonists. Nevertheless, an occasional patient who has not been taking theophylline may benefit from aminophylline infusion. A single dose of magnesium sulfate [unlicensed indication] by intravenous infusion over 20 minutes can be used for patients with severe acute asthma, but evidence of benefit is limited.

Treatment of severe acute asthma is safer in hospital where resuscitation facilities are immediately available. Treatment should never be delayed for investigations, patients should never be sedated, and the possibility of a pneumothorax should be considered.

If the patient’s condition deteriorates despite pharmacological treatment, intermittent positive pressure ventilation may be needed.

Follow up in all cases
Episodes of acute asthma should be regarded as a failure of preventative therapy. A careful history should be taken to establish the reason for the exacerbation. Monitor symptoms and peak flow. Inhaler technique should be checked and regular treatment should be reviewed, see Management of chronic asthma below. Patients should be given a written asthma action plan aimed at preventing relapse, optimising treatment, and preventing delay in seeking assistance in future exacerbations. Follow-up within 48 hours should be arranged with the general practitioner or appropriate primary care health professional. Patients should also be reviewed by a respiratory specialist within one month of the exacerbation.

Advice on the management of acute asthma is based on the recommendations of the British Thoracic Society and Scottish Intercollegiate Guidelines Network (updated January 2012); updates available at www.brit-thoracic.org.uk.

Management of chronic asthma

Important: Start at step most appropriate to initial severity; before initiating a new drug consider whether diagnosis is correct, check compliance and inhaler technique, and eliminate trigger factors for acute exacerbations.
Advice on the management of chronic asthma is based on the recommendations of the British Thoracic Society and Scottish Intercollegiate Guidelines Network (updated January 2012); updates available at www.brit-thoracic.org.uk

Adult and child over 5 years

**Step 1: occasional relief bronchodilator**
- Inhaled short-acting beta₂ agonist as required (up to once daily).
- Move to step 2 if needed more than twice a week, or if night-time symptoms at least once a week, or if exacerbation in the last 2 years

**Step 2: regular inhaled preventer therapy**
- Inhaled short-acting beta₂ agonist as required
- Regular standard-dose inhaled corticosteroid (alternatives to inhaled corticosteroid are leukotriene receptor antagonists, theophylline, inhaled sodium cromoglicate, or inhaled nedocromil sodium, but are considerably less effective)

**Step 3: inhaled corticosteroid + long-acting inhaled beta₂ agonist**
- Inhaled short-acting beta₂ agonist as required
- Regular standard-dose inhaled corticosteroid
- Regular inhaled long-acting beta₂ agonist (salmeterol p. 222 or formoterol fumarate p. 220); if asthma not controlled increase dose of inhaled corticosteroid to upper end of standard dose range and
- Either stop long-acting beta₂ agonist if of no benefit or continue long-acting beta₂ agonist if of some benefit; if asthma still not controlled and long-acting beta₂ agonist stopped, add one of:
  - Leukotriene receptor antagonist
  - Modified-release oral theophylline
  - Modified-release oral beta₂ agonist (child under 12 years not recommended).

**Step 4: high-dose inhaled corticosteroid + regular bronchodilators**
- Inhaled short-acting beta₂ agonist as required
- Regular high-dose inhaled corticosteroid
- Inhaled long-acting beta₂ agonist
- In adults 6-week sequential therapeutic trial of one or more of:
  - Leukotriene receptor antagonist
  - Modified-release oral theophylline
  - Modified-release oral beta₂ agonist

**Step 5: regular corticosteroid tablets** (refer to a respiratory specialist)
- Inhaled short-acting beta₂ agonist as required
- Regular high-dose inhaled corticosteroid
- One or more long-acting bronchodilators (see step 4) plus
- Regular prednisolone p. 585 tablets (as single daily dose); in addition to regular prednisolone, continue high-dose inhaled corticosteroid in exceptional cases may exceed licensed doses; these patients should normally be referred to an asthma clinic

**Stepping down**
- Review treatment every 3 months; if control achieved, stepwise reduction may be possible; reduce dose of inhaled corticosteroid slowly (consider reduction every 3 months, decreasing dose by up to 50% each time)

**Child under 5 years**
Lung function measurements cannot be used to guide management of those under 5 years.

**Step 1: occasional relief bronchodilator**
- Short-acting beta₂ agonist as required (not more than once daily); preferably by inhalation (less effective and more side-effects when given by mouth)
- Move to step 2 if needed more than twice a week, or if night-time symptoms at least once a week, or if exacerbation in the last 2 years

**Step 2: regular preventer therapy**
- Inhaled short-acting beta₂ agonist as required plus
- Either regular standard-dose inhaled corticosteroid
- Or (if inhaled corticosteroid cannot be used) leukotriene receptor antagonist.

**Step 3: add-on therapy**
- Child under 2 years: Refer to respiratory paediatrician
- Child 2–5 years: Inhaled short-acting beta₂ agonist as required plus
- Regular inhaled corticosteroid in standard dose plus
- Leukotriene receptor antagonist

**Step 4: persistent poor control**
- Refer to respiratory paediatrician.

**Stepping down**
- Regularly review need for treatment.

**Standard-dose inhaled corticosteroids**

**Beclomethasone dipropionate or budesonide:**
- Adult and child over 12 years 100–400 micrograms twice daily
- Child under 12 years 100–200 micrograms twice daily

**Fluticasone propionate:**
- Adult and child over 12 years 50–200 micrograms twice daily
- Child 4–12 years 50–100 micrograms twice daily

**Mometasone furoate:**
- Adult and child over 12 years 400 micrograms as a single dose in the evening or in 2 divided doses
- Child under 12 years not recommended

Dose adjustments may be required for some inhaler devices, see individual preparations.

**High-dose inhaled corticosteroids**

**Beclomethasone dipropionate or budesonide:**
- Adult and child over 12 years 0.4–1 mg twice daily
- Child 5–12 years 200–400 micrograms twice daily

**Fluticasone propionate:**
- Adult and child over 12 years 200–500 micrograms twice daily
- Child 5–12 years 100–200 micrograms twice daily

**Mometasone furoate:**
- Adult and child over 12 years 400 micrograms twice daily
- Child under 12 years not recommended

Dose adjustments may be required for some inhaler devices, see individual preparations.

Failure to achieve control with these doses is unusual.

**Pregnancy and breast-feeding**
It is particularly important that asthma should be well controlled during pregnancy; when this is achieved asthma has no important effects on pregnancy, labour, or on the fetus. Drugs for asthma should preferably be administered by inhalation to minimise exposure of the fetus. Inhaled drugs, theophylline p. 238, and prednisolone can be taken as normal during pregnancy and breast-feeding. See individual leukotriene receptor antagonists for information on their use during pregnancy. Women planning to become pregnant should be counselled about the importance of taking their asthma medication regularly to maintain good control.

Severe acute exacerbations of asthma can have an adverse effect on pregnancy and should be treated promptly in hospital with conventional therapy, including nebulisation of a beta₂ agonist and oral or parenteral administration of a corticosteroid; prednisolone is the preferred corticosteroid for oral administration since very little of the drug reaches the fetus. Oxygen should be given immediately to maintain arterial oxygen saturation of 94–98% and prevent maternal and fetal hypoxia. An intravenous beta₂ agonist, aminophylline p. 237, or magnesium sulfate p. 858 can be used during pregnancy if necessary; parenteral beta₂ agonists can affect the myometrium.
Peak flow meters

When used in addition to symptom-based monitoring, peak flow monitoring has not been proven to improve asthma control in either adults or children, however measurement of peak flow may be of benefit in adult patients who are ‘poor perceivers’ and hence slow to detect deterioration in their asthma, and for those with more severe asthma.

When peak flow meters are used, patients must be given clear guidelines as to the action they should take if their peak flow falls below a certain level. Patients can be encouraged to adjust some of their own treatment (within specified limits) according to changes in peak flow rate.

Peak flow charts should be issued to patients where appropriate, and are available to purchase from:

- 3M Security Print and Systems Limited, Gorse Street, Chadderton, Oldham, OL9 9QH. Tel: 0845 610 1112
- GP practices can obtain supplies through their Area Team stores.
- NHS Hospitals can order supplies from www.nhsforms.co.uk or by emailing nhsforms@mmm.com.
- In Scotland, peak flow charts can be obtained by emailing stockorders.dppas@apsgroup.co.uk.

Bronchodilators

Adrenoceptor agonists (sympathomimetics)

Selective beta₂ agonists produce bronchodilation. A short-acting beta₂ agonist is used for immediate relief of asthma symptoms while some long-acting beta₂ agonists are added to an inhaled corticosteroid in patients requiring prophylactic treatment.

The selective beta₂ agonists (selective beta₂-adrenoceptor agonists, selective beta₂ stimulants) such as salbutamol p. 222 or terbutaline sulfate p. 225 are the safest and most effective short-acting beta₂ agonists for asthma. Less selective beta₂ agonists such as ephedrine hydrochloride p. 226 is less suitable and less safe for use as a bronchodilator than the selective beta₂ agonists, because it is more likely to cause arrhythmias and other side-effects; it should be avoided whenever possible.

Adrenaline/epinephrine p. 196 (which has both alpha- and beta-adrenoceptor agonist properties) is used in the emergency management of acute allergic and anaphylactic reactions, in angioedema, in cardiopulmonary resuscitation, and in the management of severe croup.

Short-acting beta₂ agonists

Mild to moderate symptoms of asthma respond rapidly to the inhalation of a selective short-acting beta₂ agonist such as salbutamol or terbutaline sulfate. If beta₂ agonist inhalation is needed more often than twice a week, or if night-time symptoms occur at least once a week, or if the patient has suffered an exacerbation in the last 2 years, then prophylactic treatment should be considered using a stepped approach.

A short-acting beta₂ agonist inhaled immediately before exertion reduces exercise-induced asthma; however, frequent exercise-induced asthma probably reflects poor overall control and calls for reassessment of asthma treatment.

Long-acting beta₂ agonists

Formoterol fumarate p. 220 (eformoterol) and salmeterol p. 222 are longer-acting beta₂ agonists which are administered by inhalation. They should be used for asthma only in patients who regularly use an inhaled corticosteroid. They have a role in the long-term management of chronic asthma and can be useful in nocturnal asthma.

Salmeterol should not be used for the relief of an asthma attack; it has a slower onset of action than salbutamol or terbutaline sulfate. Formoterol fumarate is licensed for short-term symptom relief and for the prevention of exercise-induced bronchospasm; its speed of onset of action is similar to that of salbutamol.

Combination inhalers that contain a long-acting beta₂ agonist and a corticosteroid ensure that long-acting beta₂ agonists are not used without concomitant corticosteroids, but reduce the flexibility to adjust the dose of each component.

Indacaterol p. 221 and olodaterol p. 222 are long-acting beta₂ agonists licensed for chronic obstructive pulmonary disease in adults; they are not indicated for the relief of acute bronchospasm.

Vilanterol is a long-acting beta₂ agonist available only in a combination inhaler with fluticasone furoate or with umclidinium p. 219.

Oral

Oral preparations of beta₂ agonists may be used by patients who cannot manage the inhaled route. They are sometimes used for children and the elderly, but inhaled beta₂ agonists are more effective and have fewer side-effects. The longer-acting oral preparations, including bambuterol hydrochloride p. 220, may be of value in nocturnal asthma but they have a limited role and inhaled long-acting beta₂ agonists are usually preferred.

Parenteral

Salbutamol or terbutaline sulfate can be given intravenously for severe or life-threatening acute asthma; patients should be carefully monitored and the dose adjusted according to response and heart rate. The regular use of beta₂ agonists by the subcutaneous route is not recommended since the evidence of benefit is uncertain and it may be difficult to withdraw such treatment once started. In adults, beta₂ agonists may also be given by intramuscular injection.

Children

Selective beta₂ agonists are useful even in children under the age of 18 months. They are most effective by the inhaled route; a pressurised metered-dose inhaler should be used with a spacer device in children under 5 years. A beta₂ agonist may also be given by mouth but administration by inhalation is preferred; a long-acting inhaled beta₂ agonist may be used where appropriate. In severe attacks nebulisation using a selective beta₂ agonist or ipratropium bromide is advisable.

Antimuscarinic bronchodilators

Ipratropium bromide p. 217 can provide short-term relief in chronic asthma, but short-acting beta₂ agonists act more quickly and are preferred. Ipratropium bromide by nebulisation can be added to other standard treatment in life-threatening asthma or if acute asthma fails to improve with standard therapy.

The aerosol inhalation of ipratropium bromide can be used for short-term relief in mild chronic obstructive pulmonary disease in patients who are not using a long-acting antimuscarinic drug. Its maximal effect occurs 30–60 minutes after use; its duration of action is 3 to 6 hours and bronchodilation can usually be maintained with treatment 3 times a day.

Acclidinium bromide p. 217, glycopyrronium bromide p. 217, tiotropium p. 218, and umeclidinium p. 219 are licensed for the maintenance treatment of adults with chronic obstructive pulmonary disease. They are not suitable for the relief of acute bronchospasm. Tiotropium p. 218 (via Respimat® device) is also licensed as an adjunct to inhaled corticosteroids and long-acting beta₂ agonists for the maintenance treatment of patients with asthma who have suffered one or more severe exacerbations in the last year.

Theophylline

Theophylline p. 238 is a xanthine used as a bronchodilator in asthma and stable chronic obstructive pulmonary disease; it
is not generally effective in exacerbations of chronic obstructive pulmonary disease. Theophylline may have an additive effect when used in conjunction with small doses of beta; agonists; the combination may increase the risk of side-effects, including hypokalaemia.

Theophylline is given by injection as aminophylline p. 227, a mixture of theophylline with ethylenediamine, which is 20 times more soluble than theophylline alone. Aminophylline injection is needed rarely for severe acute asthma.

Compound bronchodilator preparations
In general, patients are best treated with single-ingredient preparations, such as a selective beta, agonist or ipratropium bromide p. 217, so that the dose of each drug can be adjusted. This flexibility is lost with compound bronchodilator preparations. However, a combination product may be appropriate for patients stabilised on individual components in the same proportion.

Chronic obstructive pulmonary disease
Smoking cessation reduces the progressive decline in lung function in chronic obstructive pulmonary disease (COPD, chronic bronchitis, or emphysema). Infection can complicate chronic obstructive pulmonary disease and may be prevented by vaccination (pneumococcal vaccine p. 1089 and influenza vaccine p. 1085). A trial of a high-dose inhaled corticosteroid or an oral corticosteroid is recommended for patients with moderate or severe airflow obstruction if the diagnosis is in doubt.

Symptoms of chronic obstructive pulmonary disease may be alleviated by an inhaled short-acting beta, agonist or a short-acting antimuscarinic bronchodilator used as required.

When the airways obstruction is more severe, regular inhaled therapy should be used. It is important to check compliance and inhaler technique before initiating a new drug.

If the Forced Expiratory Volume in 1 second (FEV), is 50% of predicted or more, either a long-acting antimuscarinic bronchodilator or a long-acting beta, agonist should be used. Short-acting antimuscarinic bronchodilators should be discontinued when a long-acting antimuscarinic bronchodilator is started. A long-acting beta, agonist with a corticosteroid in a combination inhaler can be used for patients who remain symptomatic despite regular treatment with a long-acting beta, agonist.

If FEV, is less than 50% of predicted, either a long-acting antimuscarinic bronchodilator or a long-acting beta, agonist with a corticosteroid in a combination inhaler should be used.

In any patient who remains breathless or continues to have exacerbations, triple therapy with a long-acting beta, agonist and a corticosteroid in a combination inhaler plus a long-acting antimuscarinic bronchodilator should be used.

If an inhaled corticosteroid is not appropriate, a long-acting antimuscarinic bronchodilator can be used with a long-acting beta, agonist (see Use of inhaled therapies in chronic obstructive pulmonary disease algorithm, p. 215).

If symptoms persist or if the patient is unable to use an inhaler, oral modified-release aminophylline p. 237 or theophylline p. 238 can be used.

Indacaterol p. 221 is a long-acting beta, agonist licensed for the maintenance treatment of chronic obstructive pulmonary disease.

In patients with severe chronic obstructive pulmonary disease associated with chronic bronchitis and a history of frequent exacerbations, roflumilast p. 236 is licensed as an adjunct to existing bronchodilator treatment.

A mucolytic drug may be considered for a patient with a chronic productive cough.

Long-term oxygen therapy prolongs survival in patients with severe chronic obstructive pulmonary disease and hypoxaemia.

During an exacerbation of chronic obstructive pulmonary disease, bronchodilator therapy can be administered through a nebuliser if necessary and oxygen given if appropriate. Aminophylline can be given intravenously if response to nebulised bronchodilators is poor. A short course of oral corticosteroid, such as prednisolone for 7–14 days, should be given if increased breathlessness interferes with daily activities. Antibacterial treatment is required if sputum becomes more purulent than usual, or if there are other signs of infection.

Patients who have had an episode of hypercapnic respiratory failure should be given a 24% or 28% Venturi mask and an oxygen alert card endorsed with the oxygen saturations required during previous exacerbations. Patients and their carers should be instructed to show the card to emergency healthcare providers in the event of an exacerbation.

Oxygen alert card based on British Thoracic Society guideline for emergency oxygen use in adult patients (October 2008)

Oxygen alert card

Oxygen should be regarded as a drug. It is prescribed for hypoxaemic patients to increase alveolar oxygen tension and decrease the work of breathing. The concentration of oxygen required depends on the condition being treated; the administration of an inappropriate concentration of oxygen can have serious or even fatal consequences.

Oxygen is probably the most common drug used in medical emergencies. It should be prescribed initially to achieve a normal or near-normal oxygen saturation; in most acutely ill patients with a normal or low arterial carbon dioxide (PaCO₂), oxygen saturation should be 94–96% oxygen saturation. However, in some clinical situations such as cardiac arrest and carbon monoxide poisoning it is more appropriate to aim for the highest possible oxygen saturation until the patient is stable. A lower target of 88–92% oxygen saturation is indicated for patients at risk of hypercapnic respiratory failure.

High concentration oxygen therapy is safe in uncomplicated cases of conditions such as pneumonia, pulmonary thromboembolism, pulmonary fibrosis, shock, severe trauma, sepsis, or anaphylaxis. In such conditions low arterial oxygen (PaO₂) is usually associated with low or
normal arterial carbon dioxide ($P_{a}CO_2$), and therefore there is little risk of hypoventilation and carbon dioxide retention.

In acute severe asthma, the arterial carbon dioxide ($P_{a}CO_2$) is usually subnormal but as asthma deteriorates it may rise steeply (particularly in children). These patients usually require high concentrations of oxygen and if the arterial carbon dioxide ($P_{a}CO_2$) remains high despite other treatment, intermittent positive-pressure ventilation needs to be considered urgently.

Low concentration oxygen therapy (controlled oxygen therapy) is reserved for patients at risk of hypercapnic respiratory failure, which is more likely in those with:
- chronic obstructive pulmonary disease;
- advanced cystic fibrosis;
- severe non-cystic fibrosis bronchiectasis;
- severe kyphoscoliosis or severe ankylosing spondylitis;
- severe lung scarring caused by tuberculosis;
- musculoskeletal disorders with respiratory weakness, especially if on home ventilation;
- an overdose of opioids, benzodiazepines, or other drugs causing respiratory depression.

Until blood gases can be measured, initial oxygen should be given using a controlled concentration of 28% or less, titrated towards a target oxygen saturation of 88–92%. The aim is to provide the patient with enough oxygen to achieve an acceptable arterial oxygen tension without worsening carbon dioxide retention and respiratory acidosis. Patients may carry an oxygen alert card.

Domiciliary oxygen
Oxygen should only be prescribed for use in the home after careful evaluation in hospital by respiratory experts. Patients should be advised of the risks of continuing to smoke when receiving oxygen therapy, including the risk of fire. Smoking cessation therapy should be recommended before home oxygen prescription.

Air travel
Some patients with arterial hypoxaemia require supplementary oxygen for air travel. The patient’s requirement should be discussed with the airline before travel.
Long-term oxygen therapy

Long-term administration of oxygen (usually at least 15 hours daily) prolongs survival in some patients with chronic obstructive pulmonary disease. Assessment for long-term oxygen therapy requires measurement of arterial blood gas tensions. Measurements should be taken on 2 occasions at least 3 weeks apart to demonstrate clinical stability, and not sooner than 4 weeks after an acute exacerbation of the disease. Long-term oxygen therapy should be considered for patients with:

- chronic obstructive pulmonary disease with \( P_{O_2} < 7.3 \) kPa when breathing air during a period of clinical stability;
- chronic obstructive pulmonary disease with \( P_{O_2} \geq 7.3 \) kPa in the presence of secondary polycythæmia, nocturnal hypoxæmia, peripheral oedema, or evidence of pulmonary hypertension;
- severe chronic asthma with \( P_{O_2} < 7.3 \) kPa or persistent disabling breathlessness;
- interstitial lung disease with \( P_{O_2} < 8 \) kPa and in patients with \( P_{O_2} > 8 \) kPa with disabling dyspnoea;
- cystic fibrosis when \( P_{O_2} < 7.3 \) kPa or if \( P_{O_2} > 7.3 \) kPa in the presence of secondary polycythæmia, nocturnal hypoxæmia, pulmonary hypertension, or peripheral oedema;
- pulmonary hypertension, without parenchymal lung involvement when \( P_{O_2} < 8 \) kPa;
- neuromuscular or skeletal disorders, after specialist assessment;
- obstructive sleep apnoea despite continuous positive airways pressure therapy, after specialist assessment;
- pulmonary malignancy or other terminal disease with disabling dyspnoea;
- heart failure with daytime \( P_{O_2} < 7.3 \) kPa when breathing air or with nocturnal hypoxæmia;
- paediatric respiratory disease, after specialist assessment.

Increased respiratory depression is seldom a problem in patients with stable respiratory failure treated with low concentrations of oxygen although it may occur during exacerbations; patients and relatives should be warned to call for medical help if drowsiness or confusion occurs.

Short-burst oxygen therapy

Oxygen is occasionally prescribed for short-burst (intermittent) use for episodes of breathlessness not relieved by other treatment in patients with severe chronic obstructive pulmonary disease, interstitial lung disease, heart failure, and in palliative care. It is important, however, that the patient does not rely on oxygen instead of obtaining medical help or taking more specific treatment. Short-burst oxygen therapy can be used to improve exercise capacity and recovery; it should only be continued if there is proven improvement in breathlessness or exercise tolerance.

Ambulatory oxygen therapy

Ambulatory oxygen is prescribed for patients on long-term oxygen therapy who need to be away from home on a regular basis. Patients who are not on long-term oxygen therapy can be considered for ambulatory oxygen therapy if there is evidence of exercise-induced oxygen desaturation and of improvement in blood oxygen saturation and exercise capacity with oxygen. Ambulatory oxygen therapy is not recommended for patients with heart failure or those who smoke.

Oxygen therapy equipment

Under the NHS oxygen may be supplied as oxygen cylinders. Oxygen flow can be adjusted as the cylinders are equipped with an oxygen flow meter with ‘medium’ (2 litres/minute) and ‘high’ (4 litres/minute) settings.
ANTIMUSCARINICS

Glycopyrronium bromide

MEDICINAL FORMS
- Capsules with device
- Powder inhalation capsules
- Powder inhalation device

PATIENT AND CARER ADVICE
- Patients or carers should be given advice on how to administer glycopyrronium for inhalation.
- Manufacturer advises use only if potential benefit outweighs risk.

SIDE-EFFECTS
- Common or very common: Constipation, cough, diarrhoea, dry mouth, gastro-intestinal motility disorder, headache, rhinitis, sinusitis, nasopharyngitis, nausea, palpitation, paradoxical bronchospasm, pharyngitis, tachycardia, throat irritation, urinary retention
- Rare: Dental caries, dry skin
- Uncommon: Arrhythmia

INTERACTIONS
- Bladder outflow obstruction, prostatic hyperplasia, susceptibility to angle-closure glaucoma

CAUTIONS
- Hospitalisation with moderate or severe heart failure within last 12 months, myocardial infarction within last 6 months, newly diagnosed arrhythmia within last 3 months, unstable angina
- Use with caution if eGFR less than 30 mL/minute/1.73 m²
- Care needed to protect the patient’s eyes from nebulised drug or from drug powder.
- Severe or life-threatening acute asthma

INDICATIONS AND DOSE
- By inhalation of powder
- By nebulisation

IPRATROPNIUM BROMIDE

Glycopyrronium bromide (Glycopyrrrolate)

INDICATIONS AND DOSE
- Maintenance treatment of chronic obstructive pulmonary disease
- By inhalation of solution
- By inhalation of powder

CAUTIONS
- Cystic fibrosis

INTERACTIONS
- Beta-blockers, calcium channel blockers

INDICATIONS AND DOSE
- Reversible airways obstruction

PREGNANCY
- Manufacturer advises use only if potential benefit outweighs risk.

RENAI IMPAIRMENT
- Use with caution if eGFR less than 30 mL/minute/1.73 m²

PATIENT AND CARER ADVICE
- Patients or carers should be given advice on how to administer glycopyrronium for inhalation.
- There can be variation in the licensing of different medicines containing the same drug.

MEDICINAL FORMS
- Capsules with device
- Powder inhalation capsules
- Powder inhalation device

SIDE-EFFECTS
- Common or very common: Constipation, cough, diarrhoea, dry mouth, gastro-intestinal motility disorder, headache, rhinitis, sinusitis, nasopharyngitis, nausea, palpitation, paradoxical bronchospasm, pharyngitis, tachycardia, throat irritation, urinary retention
- Rare: Dental caries, dry skin
- Uncommon: Angina

CAUTIONS
- Hospitalisation with moderate or severe heart failure within last 12 months, myocardial infarction within last 6 months, newly diagnosed arrhythmia within last 3 months, unstable angina
- Use with caution if eGFR less than 30 mL/minute/1.73 m²
- Care needed to protect the patient’s eyes from nebulised drug or from drug powder.
- Severe or life-threatening acute asthma

INDICATIONS AND DOSE
- Reversible airways obstruction

PREGNANCY
- Manufacturer advises use only if potential benefit outweighs risk.

RENAI IMPAIRMENT
- Use with caution if eGFR less than 30 mL/minute/1.73 m²
218 Airways disease, obstructive

Ipratropium with salbutamol

The properties listed below are those particular to the combination only. For the properties of the components please consider, salbutamol p. 222, ipratropium bromide p. 217.

INDICATIONS AND DOSE
Bronchospasm in chronic obstructive pulmonary disease by inhalation of nebulised solution
- Adult: 0.5/2.5 mg 3–4 times a day

- CONTRAINDICATIONS
- Patients with known hypersensitivity to the components
- Do not use in patients with active oropharyngeal candidiasis

- PREGNANCY
- Breastfeeding

- MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Nebuliser liquid
- IPRATROPIUM BROMIDE (Non-proprietary) Ipratropium bromide 20 microgram per 1 ml, Salbutamol (as Salbutamol sulphate) 1 mg per 1 ml Ipratropium bromide 200 microgram per 1 ml, Salbutamol (as Salbutamol sulphate) 1 mg per 1 ml Ipratropium bromide 500 microgram per 1 ml, Salbutamol (as Salbutamol sulphate) 2.5 mg per 1 ml Ipratropium bromide 1 mg per 1 ml

- COMBIVENT (Boehringer Ingelheim Ltd) Ipratropium bromide 200 microgram per 1 ml, Salbutamol (as Salbutamol sulphate) 1 mg per 1 ml Combivent nebuliser liquid 2.5ml UDVs | 60 unit dose (POD) £24.10
- Brands may include Atrovent

- CAUTIONS
- Cardiac arrhythmia requiring intervention in the previous 12 months - hospitalisation for moderate to severe heart failure in the previous 12 months - life-threatening cardiac arrhythmia - myocardial infarction in the previous 6 months - unstable cardiac arrhythmia

- SIDE-EFFECTS
- Common or very common: Dizziness, epistaxis, oropharyngeal candidiasis, pruritus, taste disturbance
- Rare: Gingivitis, glossitis, insomnia, intestinal obstruction, paralytic ileus, sinusitis, stomatitis
- Frequency not known: Dehydration, joint swelling
- PREGNANCY
- Manufacturer advises use only if potential benefit outweighs risk

- BREAST FEEDING
- Manufacturer advises avoid—no information available.

- RENAL IMPAIRMENT
- Plasma-tiotropium concentration raised. Manufacturer advises use only if potential benefit outweighs risk if eGFR less than 50 mL/minute/1.73 m².

- PATIENT AND CARER ADVICE
- Counselling. Advise patients to report any worsening of cardiac symptoms during treatment.
- Patients or carers should be given advice on how to administer tiotropium powder inhalation and pressurised inhalation.

- NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (November 2007) that Spiriva Respimat® is restricted for use in chronic obstructive pulmonary disease in patients who have poor manual dexterity and difficulty using the Handihaler™ device.

- MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Pressurised inhalation
- SPIRIVA RESPIMAT® (Boehringer Ingelheim Ltd) Tiotropium bromide 25 microgram per 1 dose Tiotropium bromide 25 microgram per 1 dose solution for inhalation cartrige with device CFC free | 60 unit dose (POD) no price available DT price = £33.50

- SPIRIVA RESPIMAT® (Boehringer Ingelheim Ltd) Tiotropium bromide 25 microgram per 1 dose Tiotropium bromide 25 microgram per 1 dose solution for inhalation cartrige with device | 60 unit dose (POD) £33.50 DT price = £33.50
Inhalation powder

- Spiriva (Boehringer Ingelheim Ltd)
  Tiotropium (as Tiotropium bromide) 18 microgram Spiriva 18microgram inhalation powder capsules | 30 capsule [PMD] £33.50 DT price = £33.50
  Spiriva 18microgram inhalation powder capsules with HandiHaler | 30 capsule [PMD] £34.87 DT price = £34.87

Umeclidinium

INDICATIONS AND DOSE
Maintenance treatment of chronic obstructive pulmonary disease
BY INHALATION OF POWDER
- Adult: 55 micrograms once daily

Dose equivalence and conversion
Each 65 microgram inhalation of umeclidinium bromide delivers 55 micrograms of umeclidinium.

- CAUTIONS Cardiac disorders (particularly cardiac rhythm disorders)
- SIDE-EFFECTS
  Uncommon Arrhythmias - rash - sinusitis - urinary tract infection
  PREGNANCY Manufacturer advises use only if potential benefit outweighs risks.
  BREAST FEEDING Manufacturer advises avoid—no information available.
  HEPATIC IMPAIRMENT Use with caution in severe impairment.
  PATIENT AND CARER ADVICE Patient or carers should be given advice on how to administer umeclidinium inhalation powder.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.
  Inhalation powder
    Anoro Ellipta (GlaxoSmithKline UK Ltd)
    Umeclidinium bromide 65 microgram per 1 dose, Vilanterol (as Vilanterol trifenatate) 22 microgram per 1 dose Anoro Ellipta 55micrograms/dose / 22micrograms/dose dry powder inhaler | 30 dose [PMD] £32.50

BETA₂ AGONISTS (LONG-ACTING)

Selective beta₂ agonists

- CONTRA-INDICATIONS Severe pre-eclampsia
- CAUTIONS Arrhythmias - cardiovascular disease - diabetes (risk of hyperglycaemia and ketoacidosis, especially with intravenous use) - hypertension - hyperthyroidism - hypokalaemia - susceptibility to QT-interval prolongation
- MEDICINAL FORMS
  Hypokalaemia Potentially serious hypokalaemia may result from beta₂ agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, diuretics, and by hypoxia.
  INTERACTIONS Appendix 1 (sympathomimetics, beta₂.). Hypokalaemia may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, and diuretics.

- SIDE-EFFECTS Angioedema - arrhythmias - behavioural disturbances - collapse - fine tremor (particularly in the hands) - headache - hyperglycaemia (especially when given intravenously) - hypertension - ketoadidosis (especially when given intravenously) - muscle cramps - myocardial ischaemia - nervous tension - palpitation - paradoxical bronchospasm (occasionally severe) - peripheral vasodilation - rash - sleep disturbances - tachycardia - urticaria
- PREGNANCY Women planning to become pregnant should be counselled about the importance of taking their asthma medication regularly to maintain good control.

- MONITORING REQUIREMENTS
  In severe asthma, plasma-potassium concentration should be monitored (risk of hypokalaemia).
  In patients with diabetes, monitor blood glucose (risk of hyperglycaemia and ketoacidosis, especially when beta₂ agonist given intravenously).
  PATIENT AND CARER ADVICE When used by inhalation The dose, the frequency, and the maximum number of inhalations in 24 hours of the beta₂
Respiratory system

Formoterol fumarate

INDICATIONS AND DOSE
Reversible airways obstruction in patients requiring long-term regular bronchodilator therapy | Nocturnal asthma in patients requiring long-term regular bronchodilator therapy | Prophylaxis of exercise-induced bronchospasm in patients requiring long-term regular bronchodilator therapy | Chronic asthma in patients who regularly use an inhaled corticosteroid

BY INHALATION OF POWDER
- Child 6-11 years: 12 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age-groups; higher doses should be used rarely, and only when control is not maintained on the lower dose
- Child 12-17 years: 24 micrograms twice daily, a daily dose of 48 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age-groups; higher doses should be used rarely, and only when control is not maintained on the lower dose

Formoterol fumarate

(Eformoterol fumarate)

INDICATIONS AND DOSE
Reversible airways obstruction in patients requiring long-term regular bronchodilator therapy | Prophylaxis of exercise-induced bronchospasm in patients requiring long-term regular bronchodilator therapy | Chronic asthma in patients who regularly use an inhaled corticosteroid

BY INHALATION OF POWDER
- Child 6-11 years: 12 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age-groups; higher doses should be used rarely, and only when control is not maintained on the lower dose
- Child 12-17 years: 24 micrograms twice daily, a daily dose of 48 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age-groups; higher doses should be used rarely, and only when control is not maintained on the lower dose

BY INHALATION OF AEROSOL
- Child 12-17 years: 24 micrograms twice daily, a daily dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily

CHM ADVICE
To ensure safe use, the CHM has advised that for the management of chronic asthma, long-acting β₂ agonist (formoterol) should:
- be added only if regular use of standard-dose inhaled corticosteroids has failed to control asthma adequately;
- not be initiated in patients with rapidly deteriorating asthma;
- be introduced at a low dose and the effect properly monitored before considering dose increase;
- be discontinued in the absence of benefit;

CHRONIC OBSTRUCTIVE PULMONARY DISEASE

仞

Bambuterol hydrochloride

仞

DRUG ACTION
Bambuterol is a pro-drug of terbutaline.

INDICATIONS AND DOSE
- Asthma (patients who have previously tolerated β₂-agonists)
- Other conditions associated with reversible airways obstruction (patients who have previously tolerated β₂-agonists)

BY MOUTH
- Adult: 20 mg once daily, dose to be taken at bedtime
- Child 6–12 years: 6 micrograms, dose to be taken before exercise
- Child 12–17 years: 12 micrograms, dose to be taken before exercise

PREGNANCY
Manufacturer advises avoid—no information available.

BREAST FEEDING
Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT
Avoid in severe impairment.

RENAL IMPAIRMENT
Reduce initial dose by half if eGFR less than 50 mL/minute/1.73 m².

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet
- Bambec (AstraZeneca UK Ltd)
  - Bambuterol hydrochloride 10 mg: Bambec 10mg tablets | 28 tablet blister pack £14.46 DT price = £14.46
  - Bambuterol hydrochloride 20 mg: Bambec 20mg tablets | 28 tablet blister pack £15.77 DT price = £15.77

Formoterol fumarate

Bambuterol hydrochloride

仞

ению
Beclometasone with formoterol

The properties listed below are those particular to the combination only. For the properties of the components please consider, beclometasone dipropionate p. 227, formoterol fumarate p. 220.

**INDICATIONS AND DOSE**

**Asthma maintenance therapy**

**BY INHALATION OF AEROSOL OR BY INHALATION OF POWDER**

- Adult: 100/6–200/12 micrograms twice daily; maximum 400/24 micrograms per day

**Asthma, maintenance and reliever therapy**

**BY INHALATION OF AEROSOL**

- Adult: Maintenance 100/6 micrograms twice daily; 100/6 micrograms as required for relief of symptoms; maximum 800/48 micrograms per day

**Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 50% of predicted**

**BY INHALATION OF AEROSOL**

- Adult: 200/12 micrograms twice daily

**Dose equivalence and conversion**

For inhalation of aerosol, when switching patients from other beclometasone dipropionate and formoterol fumarate inhalers, Fostair® 100/6 can be prescribed for patients already using beclometasone dipropionate 250 micrograms in another CFC-free inhaler; the dose of Fostair® should be adjusted according to response. For inhalation of powder, when switching patients from other beclometasone dipropionate formulations with non-extrafine particle size distribution, the dose should be adjusted according to response. 1 puff is equivalent to 100 micrograms beclometasone dipropionate and 6 micrograms formoterol fumarate.

**PATIENT AND CARER ADVICE**

With high doses, a steroid card should be supplied. Patients or carers should be given advice on how to administer beclometasone with formoterol inhalation.

**INDICATIONS AND DOSE**

**Maintenance treatment of chronic obstructive pulmonary disease**

**BY INHALATION OF POWDER**

- Adult: 150 micrograms once daily, then increased to 300 micrograms once daily

**INDICATIONS AND DOSE**

**Maintenance treatment of chronic obstructive pulmonary disease**

**BY INHALATION OF POWDER**

- Adult: 150 micrograms once daily, then increased to 300 micrograms once daily

**SIDE-EFFECTS**

- Very rare QT-interval prolongation
- Very rare hypokalaemia

**PREGNANCY**

Inhaled drugs for asthma can be taken as normal during pregnancy.

**BREAST FEEDING**

Inhaled drugs for asthma can be taken as normal during breast-feeding.

**PATIENT AND CARER ADVICE**

Advise patients not to exceed prescribed dose, and to follow manufacturer's directions; if a previously effective dose of inhaled formoterol fails to provide adequate relief, a doctor's advice should be obtained as soon as possible. Patients should be advised to report any deterioration in symptoms following initiation of treatment with a long-acting beta₂ agonist. Patient or carer should be given advice on how to administer formoterol fumarate inhalers.

**MACHINES AND DEVICES**

For inhalation of aerosol, when switching patients from other beclometasone dipropionate formulations with non-extrafine particle size distribution, the dose should be adjusted according to response. 1 puff is equivalent to 100 micrograms beclometasone dipropionate and 6 micrograms formoterol fumarate.

**PATIENT AND CARER ADVICE**

With high doses, a steroid card should be supplied. Patients or carers should be given advice on how to administer beclometasone with formoterol inhalation.

**INDICATIONS AND DOSE**

**Maintenance treatment of chronic obstructive pulmonary disease**

**BY INHALATION OF POWDER**

- Adult: 150 micrograms once daily, then increased to 300 micrograms once daily

**SIDE-EFFECTS**

- Common or very common Cough · dizziness · nasopharyngitis · oropharyngeal pain · peripheral oedema · rhinorrhoea · sinusitis
- Uncommon Atrial fibrillation · chest pain · paraesthesia · pruritus
- PREGNANCY

Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**

Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

Use with caution in severe impairment—no information available.

**PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer indacaterol inhalation powder.

**MACHINES AND DEVICES**

For inhalation of aerosol, when switching patients from other beclometasone dipropionate formulations with non-extrafine particle size distribution, the dose should be adjusted according to response. 1 puff is equivalent to 100 micrograms beclometasone dipropionate and 6 micrograms formoterol fumarate.

**PATIENT AND CARER ADVICE**

With high doses, a steroid card should be supplied. Patients or carers should be given advice on how to administer beclometasone with formoterol inhalation.

**INDICATIONS AND DOSE**

**Maintenance treatment of chronic obstructive pulmonary disease**

**BY INHALATION OF POWDER**

- Adult: 150 micrograms once daily, then increased to 300 micrograms once daily

**SIDE-EFFECTS**

- Common or very common Cough · dizziness · nasopharyngitis · oropharyngeal pain · peripheral oedema · rhinorrhoea · sinusitis
- Uncommon Atrial fibrillation · chest pain · paraesthesia · pruritus
- PREGNANCY

Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**

Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

Use with caution in severe impairment—no information available.

**PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer indacaterol inhalation powder.
Respiratory system

**Olodaterol**

**INDICATIONS AND DOSE**

Maintenance treatment of chronic obstructive pulmonary disease

- **BY INHALATION**
  - Adult: 5 micrograms once daily

**Dose equivalence and conversion**

2 puffs is equivalent to 5 micrograms.

- **CAUTIONS**
  - Anerysm • convulsive disorders

- **SIDE-EFFECTS**
  - Uncommon Dizziness • nasopharyngitis
  - Rare Arthralgia • hypertension

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Use with caution in severe hepatic impairment—no information available.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer olodaterol solution for inhalation.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Pressurised inhalation**
    - Serevent Respimat (Boehringer Ingelheim Ltd) ▼
    - Olodaterol (as Olodaterol hydrochloride) 2.5 microgram per 1 dose Serevent Respimat 2.5 micrograms/dose solution for inhalation cartridge with device | 60 dose [PO] £26.35 DT price = £26.35

**Salmeterol**

**INDICATIONS AND DOSE**

Reversible airways obstruction in patients requiring long-term regular bronchodilator therapy | Nocturnal asthma in patients requiring long-term regular bronchodilator therapy | Prevention of exercise-induced bronchospasm in patients requiring long-term regular bronchodilator therapy | Chronic asthma only in patients who regularly use an inhaled corticosteroid (not for immediate relief of acute asthma)

- **BY INHALATION OF AEROSOL OR BY INHALATION OF POWDER**
  - Child 5–11 years: 50 micrograms twice daily
  - Child 12–17 years: 50 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 100 micrograms twice daily
  - Adult: 50 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 100 micrograms twice daily

**CHRONIC OBSTRUCTIVE PULMONARY DISEASE**

- **BY INHALATION OF AEROSOL OR BY INHALATION OF POWDER**
  - Adult: 50 micrograms twice daily

**PHARMACOKINETICS**

At recommended inhaled doses, the duration of action of salmeterol is about 12 hours.

- **UNLICENSED USE** Neovent® not licensed for use in children under 12 years.

**Important safety information**

**CHM ADVICE**

- To ensure safe use, the CHM has advised that for the management of chronic asthma, long-acting beta₂ agonist (salmeterol) should: be added only if regular use of standard-dose inhaled corticosteroids has failed to control asthma adequately; be not initiated in patients with rapidly deteriorating asthma; be introduced at a low dose and the effect properly monitored before considering dose increase; be discontinued in the absence of benefit; not be used for the relief of exercise-induced asthma symptoms unless regular inhaled corticosteroids are also used; be reviewed as clinically appropriate: stepping down therapy should be considered when good long-term asthma control has been achieved.

- **SIDE-EFFECTS**
  - Arthralgia • dizziness • nausea

- **PREGNANCY** Inhaled drugs for asthma can be taken as normal during pregnancy.

- **BREAST FEEDING** Inhaled drugs for asthma can be taken as normal during breast-feeding.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Salmeterol inhaler for asthma prevention (prophylaxis) [www.medicinesforchildren.org.uk/salmeterol-inhaler-for-asthma-prevention](http://www.medicinesforchildren.org.uk/salmeterol-inhaler-for-asthma-prevention)

Advise patients that salmeterol should not be used for relief of acute attacks, not to exceed prescribed dose, and to follow manufacturer’s directions; if a previously effective dose of inhaled salmeterol fails to provide adequate relief, a doctor’s advice should be obtained as soon as possible.

Patients should be advised to report any deterioration in symptoms following initiation of treatment with a long-acting beta, agonist.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Pressurised inhalation**
    - SALMETEROL (Non-proprietary)
      - Salmeterol (as Salmeterol xinafoate) 25 microgram per 1 dose Salmeterol 25 micrograms/dose inhaler CFC free | 120 dose [PO] £29.26 DT price = £29.26
    - Serevent Evohaler (GlaxoSmithKline UK Ltd)
      - Salmeterol (as Salmeterol xinafoate) 25 microgram per 1 dose Serevent 25 micrograms/dose Evohaler | 120 dose [PO] £29.26 DT price = £29.26
    - Brands may include Neovent; Vertine

**Inhalation powder**

- Serevent Accuhaler (GlaxoSmithKline UK Ltd)
  - Salmeterol (as Salmeterol xinafoate) 50 microgram per 1 dose Serevent 50 micrograms/dose Accuhaler | 60 dose [PO] £29.26 DT price = £29.26

**Salbutamol** (Albuterol)

**INDICATIONS AND DOSE**

Asthma | Other conditions associated with reversible airways obstruction

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 4 mg 3–4 times a day, maximum single dose 8 mg (but unlikely to provide much extra benefit or to be tolerated), inhalation route preferred over oral route, use elderly dose for sensitive patients
  - Elderly: Initially 2 mg 3–4 times a day, maximum single dose 6 mg (but unlikely to provide much extra benefit or to be tolerated), inhalation route preferred over oral route

- **BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION**
  - Adult: 500 micrograms every 4 hours if required
Uncomplicated premature labour (between 22 and 37 weeks of gestation) (specialist use only)

**BY INTRavenous INJECTION**
- Adult: Initially 10 micrograms/minute, rate increased gradually according to response at 10-minute intervals until contractions diminish then increase rate slowly until contractions cease (maximum rate 45 micrograms/minute), maintain rate for 1 hour after contractions have stopped, then gradually reduce by 50% every 6 hours, maximum duration 48 hours

**VENTOLIN ACCUHALER®**

**Acute bronchospasm**
- Adult: Initially 200 micrograms, up to 4 times daily for persistent symptoms

**Prophylaxis of allergen- or exercise-induced bronchospasm**
- **BY INHALATION OF POWDER**
  - Adult: 200 micrograms

**Moderate, severe, or life-threatening acute asthma**
- **BY INHALATION OF NEBULISED SOLUTION**
  - Child 1 month–4 years: 2.5 mg, then 2.5 mg every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
  - Child 5–11 years: 2.5–5 mg, then 2.5–5 mg every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
  - Child 12–17 years: 5 mg, then 5 mg every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
  - Adult: 5 mg, then 5 mg every 20–30 minutes or when required, give via oxygen-driven nebuliser if available

**Moderate and severe acute asthma**
- **BY INHALATION OF AEROSOL**
  - Child: 2–10 puffs, up to 4 times a day for persistent symptoms
  - Adult: 2–10 puffs, up to 4 times daily for persistent symptoms

**Exacerbation of reversible airways obstruction (including nocturnal asthma) Prophylaxis of allergen- or exercise-induced bronchospasm**
- **BY INHALATION OF AEROSOL**
  - Child: 100–200 micrograms, up to 4 times a day for persistent symptoms

**Chronic asthma**
- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child 3–11 years: 4 mg twice daily
  - Child 12–17 years: 8 mg twice daily
  - Adult: 8 mg twice daily

**SALBUTAMOL**

**Acute bronchospasm**
- **BY INHALATION OF POWDER**
  - Adult: Initially 200 micrograms, up to 4 times daily for persistent symptoms

**Prophylaxis of allergen- or exercise-induced bronchospasm**
- **BY INHALATION OF POWDER**
  - Adult: 200 micrograms

**Respiratory system**
significant risk factors for myocardial ischaemia - threatened miscarriage

- **CAUTIONS**
  - With intravenous use mild to moderate pre-eclampsia (when used for uncomplicated premature labour) - suspected cardiovascular disease (should be assessed by a cardiologist before initiating therapy for uncomplicated premature labour)

- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - Lactic acidosis (with high doses) - nausea
  - **SPECIFIC SIDE-EFFECTS**
    - When used for uncomplicated premature labour bronchospasm - muscle tension - pulmonary oedema - vomiting
  - **BREAST FEEDING**
    - Inhaled drugs for asthma can be taken as normal during breast-feeding.
  - **MONITORING REQUIREMENTS**
    - In uncomplicated premature labour it is important to monitor blood pressure, pulse rate (should not exceed 120 beats per minute), ECG (discontinue treatment if signs of myocardial ischaemia develop), blood glucose and lactate concentrations, and the patient's fluid and electrolyte status (avoid over-hydration—discontinue drug immediately and initiate diuretic therapy if pulmonary oedema occurs).
  - **DIRECTIONS FOR ADMINISTRATION**
    - When used by inhalation For nebulisation, dilute nebuliser solution with a suitable volume of sterile Sodium Chloride 0.9% solution according to nebuliser type and duration of administration; salbutamol and ipratropium bromide solutions are compatible and can be mixed for nebulisation.
  - When used by continuous intravenous infusion For bronchodilatation, dilute to a concentration of 200 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%.
  - For premature labour, dilute with Glucose 5% to a concentration of 200 micrograms/mL for use in a syringe pump or for other infusion methods (preferably via controlled infusion device), dilute to a concentration of 20 micrograms/mL; close attention to patient's fluid and electrolyte status essential.

- **PATIENT AND CARER ADVICE**
  - For inhalation by aerosol or dry powder, advise patients and carers not to exceed prescribed dose and to follow manufacturer's directions; if a previously effective dose of inhaled salbutamol fails to provide at least 3 hours relief, a doctor's advice should be obtained as soon as possible.
  - For inhalation by nebuliser, the dose given by nebuliser is substantially higher than that given by inhaler. Patients should therefore be warned that it is dangerous to exceed the prescribed dose and they should seek medical advice if they fail to respond to the usual dose of the respiratory solution.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - *Salbutamol (as Salbutamol sulphate) 2 mg* Salbutamol 2mg tablets | 28 tablet [PST] £113.09 DT price = £104.95

Also available in combination with *ipratropium*, p. 218
Terbutaline sulfate

**INDICATIONS AND DOSE**

**Asthma**  | Other conditions associated with reversible airways obstruction

**BY MOUTH**
- Adult: Initially 2.5 mg 3 times a day for 1–2 weeks, then increased to up to 5 mg 3 times a day, use by inhalation preferred over by mouth

**BY SUBCUTANEOUS INJECTION OR BY SLOW INTRAVENOUS INJECTION**
- Adult: 250–500 micrograms up to 4 times a day, reserve intravenous beta, agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect

**BY CONTINUOUS INTRAVENOUS INFUSION**
- Adult: 90–300 micrograms/hour for 8–10 hours, to be administered as a solution containing 3–5 micrograms/mL, high doses require close monitoring, reserve intravenous beta, agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect

**BY INHALATION OF POWDER**
- Adult: 500 micrograms up to 4 times a day, for persistent symptoms

**BY INHALATION OF NEBULISED SOLUTION**
- Adult: 5–10 mg 2–4 times a day, additional doses may be necessary in severe acute asthma

**Acute asthma**

**BY SUBCUTANEOUS INJECTION OR BY SLOW INTRAVENOUS INJECTION**
- Child 2–14 years: 10 micrograms/kg up to 4 times a day (max. per dose 300 micrograms), reserve intravenous beta, agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
- Child 15–17 years: 250–500 micrograms up to 4 times a day, reserve intravenous beta, agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect

**BY CONTINUOUS INTRAVENOUS INFUSION**
- Adult: Loading dose 2–4 micrograms/kg, then 1–10 micrograms/kg/hour, dose to be adjusted according to response and heart rate, close monitoring is required for doses above 10 micrograms/kg/hour, reserve intravenous beta, agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect

**Moderate, severe, or life-threatening acute asthma**

**BY INHALATION OF NEBULISED SOLUTION**
- Child 1 month–4 years: Initially 5 mg, then 5 mg every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
- Child 5–11 years: Initially 5–10 mg, then 5–10 mg every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
- Child 12–17 years: Initially 10 mg, then 10 mg every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
- Adult: Initially 10 mg, then 10 mg every 20–30 minutes or when required, give via oxygen-driven nebuliser if available

**Exacerbation of reversible airways obstruction (including nocturnal asthma)**

**Prevention of exercise-induced bronchospasm**

**BY INHALATION OF POWDER**
- Child 5–17 years: 500 micrograms up to 4 times a day, for occasional use only

**BY MOUTH**
- Child 1 month–6 years: 75 micrograms/kg 3 times a day (max. per dose 2.5 mg)

**UNLICENSED USE**
- Tablets not licensed for use in children under 7 years. Injection not licensed for use in children under 2 years.

**CONTRA-INDICATIONS**
- When used for uncomplicated premature labour
  - abruptio placenta
  - antepartum haemorrhage
  - cord compression
  - eclampsia
  - history of cardiac disease
  - intra-uterine fetal death
  - intra-uterine infection
  - placenta praevia
  - pulmonary hypertension
  - severe pre-eclampsia
  - significant risk factors for myocardial ischaemia
  - threatened miscarriage

**CAUTIONS**
- Mild to moderate pre-eclampsia (when used for uncomplicated premature labour)
- Suspected cardiovascular disease (should be assessed by a cardiologist before initiating therapy for uncomplicated premature labour)

**SIDE-EFFECTS**

- **GENERAL SIDE-EFFECTS**
  - Nausea

**SPECIFIC SIDE-EFFECTS**

**Pharmacokinetics**
- At recommended inhaled doses, the duration of action of terbutaline is about 3 to 5 hours.

**Respiratory system**

- Child 7–14 years: 2.5 mg 2–3 times a day
- Child 15–17 years: Initially 2.5 mg 3 times a day, then increased if necessary to 5 mg 3 times a day

**Uncomplicated premature labour (between 22 and 37 weeks of gestation)** (specialist supervision in hospital)

**BY INTRAVENOUS INFUSION**
- Adult: Initially 5 micrograms/minute for 20 minutes, then increased in steps of 2.5 micrograms/minute every 20 minutes until contractions have ceased (more than 10 micrograms/minute should seldom be given—20 micrograms/minute should not be exceeded), continue for 1 hour, then reduced in steps of 2.5 micrograms/minute every 20 minutes to lowest dose that maintains suppression (maximum total duration 48 hours)

**Pharmacokinetics**
- When used for uncomplicated premature labour
  - Suspected cardiovascular disease (should be assessed by a cardiologist before initiating therapy for uncomplicated premature labour)

**DIRECTIONS FOR ADMINISTRATION**
- When used by inhalation
  - For nebulisation, dilute nebuliser solution with sterile Sodium Chloride 0.9% solution according to nebuliser type and duration of administration; terbutaline and ipratropium bromide solutions are compatible and may be mixed for nebulisation.

**With intravenous use in children**

- For continuous intravenous infusion, dilute to a concentration of 5 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; if fluid-restricted, dilute to a concentration of 100 micrograms/mL.

- In uncomplicated premature labour
  - For bronchodilation by continuous intravenous infusion, dilute 1.5–2.5 mg with 500 mL glucose 5% or sodium chloride 0.9% and give over 8–10 hours. For premature labour by continuous intravenous infusion, dilute in glucose 5% and give via controlled infusion device preferably a syringe pump; if
Respiratory system

Asthma and irreversible airways disease.

Corticosteroids are used for the management of reversible airways disease (and hence reduce oedema and secretion of mucus into the airway).

**Patient and carer advice**

For inhalation by dry powder, advise patients and carers not to exceed prescribed dose and to follow manufacturer’s directions; if a previously effective dose of inhaled terbutaline fails to provide at least 3 hours relief, a doctor’s advice should be obtained as soon as possible.

For inhalation by nebuliser, the dose given by nebuliser is substantially higher than that given by inhaler. Patients should therefore be warned that it is dangerous to exceed the prescribed dose and they should seek medical advice if they fail to respond to the usual dose of the respirator solution.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

- **Tablet**
  - Bricanyl (AstraZeneca UK Ltd)
  - Terbutaline sulfate 5 mg Bricanyl 5mg tablets | 100 tablet (PSM)
  - £4.91 DT price = £4.91

- **Oral solution**
  - Bricanyl (AstraZeneca UK Ltd)
  - Terbutaline sulfate 300 microgram per 1 ml Bricanyl 1.5mg/5ml syrup (sugar-free) | 100 ml (PSM) £2.80 DT price = £2.80

- **Solution for injection**
  - Bricanyl (AstraZeneca UK Ltd)
  - Terbutaline sulfate 500 microgram per 1 ml Bricanyl 2.5mg/5ml solution for injection ampoules | 10 ampoule (PSM) £16.74
  - Bricanyl 500micrograms/1ml solution for injection ampoules | 5 ampoule (PSM) £2.16

- **Inhalation powder**
  - Bricanyl Turbuhaler (AstraZeneca UK Ltd)
  - Terbutaline sulfate 500 microgram per 1 dose Bricanyl 500micrograms/dose Turbuhaler | 100 dose (PSM) £6.92 DT price = £6.92

- **Nebuliser liquid**
  - TERBUTALINE SULFATE (Non-proprietary)
  - Terbutaline sulfate 2.5 mg per 1 ml Terbutaline 5mg/2ml nebuliser liquid unit dose vials | 20 unit dose (PSM) £4.08 DT price = £4.08
  - Bricanyl Respules (AstraZeneca UK Ltd)
  - Terbutaline sulfate 2.5 mg per 1 ml Bricanyl 5mg/2ml Respules | 20 unit dose (PSM) £5.82 DT price = £5.82

**Corticosteroids**

Current and previous smoking reduces the effectiveness of inhaled corticosteroids and higher doses may be necessary. Corticosteroid inhalers must be used regularly for maximum benefit; alleviation of symptoms usually occurs 3 to 7 days after initiation. Beclometasone dipropionate p. 227, budesonide p. 228, fluticasone p. 230, and mometasone furoate p. 222 appear to be equally effective. Preparations that combine a corticosteroid with a long-acting beta₂ agonist may be helpful for patients stabilised on the individual components in the same proportion.

In adults using an inhaled corticosteroid and a long-acting beta₂ agonist for the prophylaxis of asthma, but who are poorly controlled, Symbicort® or Duo吸入Spiromax® (both containing budesonide with formoterol p. 229) can be used as relievers (instead of a short-acting beta₂ agonist), in addition to their regular use for the prophylaxis of asthma. Symbicort® can also be used in this way in adults using an inhaled corticosteroid with a dose greater than beclometasone dipropionate 400 micrograms daily, but who are poorly controlled (standard doses of other inhaled corticosteroids can be used). When starting this treatment, the total regular daily dose of inhaled corticosteroid should not be reduced. Patients must be carefully instructed on the appropriate dose and management of exacerbations before initiating this therapy. Patients using budesonide with formoterol as a reliever once a day or more should have their treatment reviewed regularly. The use of Symbicort® for both reliever and maintenance therapy is also used by some specialists in children 12–18 years [unlicensed].

Fostair® can also be used in adults as a reliever (instead of a short-acting beta₂ agonist) in addition to its regular use for the prophylaxis of asthma. It may be particularly useful for patients with poorly controlled asthma requiring reliever therapy, or for those who have had previous exacerbations of asthma which needed medical intervention. Patients requiring frequent daily use of Fostair® as a reliever should have their maintenance treatment reviewed. This approach has not been investigated with combination inhalers containing other corticosteroids and long-acting beta₂ agonists.

High doses of inhaled corticosteroid can be prescribed for patients who respond only partially to standard doses with a long-acting beta₂ agonist or another long-acting bronchodilator. High doses should be continued only if there is clear benefit over the lower dose. The recommended maximum dose of an inhaled corticosteroid should not generally be exceeded. However, if a higher dose is required, then it should be initiated and supervised by a specialist.

The use of high doses of inhaled corticosteroid can minimise the requirement for an oral corticosteroid.

**Oral corticosteroids**

Systemic corticosteroid therapy may be necessary during episodes of stress, such as severe infection, or if the asthma is worsening, when higher doses are needed and access of inhaled drug to small airways may be reduced; patients may need a reserve supply of corticosteroid tablets.

In chronic asthma, when the response to other drugs has been inadequate, longer term administration of an oral corticosteroid may be necessary; in such cases high doses of an inhaled corticosteroid should be continued to minimise oral corticosteroid requirements. Patients taking long-term oral corticosteroids for asthma can often be transferred to an inhaled corticosteroid but the transfer must be slow, with gradual reduction in the dose of the oral corticosteroid, and at a time when the asthma is well controlled.

An acute attack of asthma should be treated with a short course of an oral corticosteroid starting with a high dose. Patients whose asthma has deteriorated rapidly usually respond quickly to corticosteroids. The dose can usually be stopped abruptly; tapering is not needed provided that the patient receives an inhaled corticosteroid in an adequate dose (apart from those on maintenance oral corticosteroid

Airways disease, use of corticosteroids

Corticosteroids are used for the management of reversible and irreversible airways disease.

**Asthma**

**Inhaled corticosteroids**

An inhaled corticosteroid used for 3–4 weeks may help to distinguish asthma from chronic obstructive pulmonary disease; clear improvement over 3–4 weeks suggests asthma.

Corticosteroids are effective in asthma; they reduce airway inflammation (and hence reduce oedema and secretion of mucus into the airway).

An inhaled corticosteroid is used regularly for prophylaxis of asthma when patients require a beta₂ agonist more than twice a week, or if symptoms disturb sleep at least once a week, or if the patient has suffered an exacerbation in the last 2 years requiring a systemic corticosteroid. **Regular use** of inhaled corticosteroids reduces the risk of exacerbation of asthma.
treatment or where oral corticosteroids are required for 3 or more weeks). In patients who have needed several courses of oral corticosteroids and in whom the possibility of a period on maintenance corticosteroids is being considered, it may be useful to taper the corticosteroid dose gradually to identify a threshold dose for asthma control. This should only be done after other standard options for controlling asthma have been tried.

An oral corticosteroid should normally be taken as a single dose in the morning to reduce the disturbance to circadian cortisol secretion. Dosage should always be titrated to the lowest dose that controls symptoms. Regular peak-flow measurements help to optimise the dose.

Parenteral corticosteroids

Hydrocortisone p. 583 injection has a role in the emergency treatment of acute severe asthma.

Chronic obstructive pulmonary disease

Inhaled corticosteroids

In chronic obstructive pulmonary disease inhaled corticosteroid therapy may reduce exacerbations when given in combination with an inhaled long-acting beta<sub>2</sub> agonist.

Oral corticosteroids

During an acute exacerbation of chronic obstructive pulmonary disease, prednisolone p. 585 should be given; treatment can be stopped abruptly. Prolonged treatment with oral prednisolone p. 585 is of no benefit and maintenance treatment is not normally recommended.

Corticosteroids (inhaled)

- **INTERACTIONS**
  - Appendix 1 (corticosteroids).
  
  Interactions do not generally apply to corticosteroids used for inhalation unless specified.

- **SIDE-EFFECTS**
  - Very rare Paradoxical bronchospasm
  - Frequency not known Adrenal crisis (with prolonged high doses) - adrenal suppression (with prolonged high doses) - aggression (particularly in children) - anxiety - behavioural changes (particularly in children) - bruising - candidiasis of the mouth - candidiasis of the throat - cutaneous - coma (with prolonged high doses) - Cushing’s syndrome (with moon face, striae and acne) - depression - dysphonia - glaucoma (with prolonged high doses) - hoarseness - hyperactivity (particularly in children) - hyperglycaemia (usually only with high doses) - irritability (particularly in children) - lower respiratory tract infections in older patients with chronic obstructive pulmonary disease (with high doses) - pneumonia in older patients with chronic obstructive pulmonary disease (with high doses) - reduced mineral bone density (with long-term treatment of high doses) - side-effects applicable to systemic corticosteroids may also apply if absorption occurs following inhaled use - sleep disturbances - throat irritation

SIDE-EFFECTS, FURTHER INFORMATION

Candidiasis The risk of oral candidiasis can be reduced by using a spacer device with the corticosteroid inhaler; rinsing the mouth with water after inhalation of a dose may also be helpful. An anti-fungal oral suspension or oral gel can be used to treat oral candidiasis without discontinuing corticosteroid therapy.

Paradoxical bronchospasm The potential for paradoxical bronchospasm (calling for discontinuation and alternative therapy) should be borne in mind—mild bronchospasm may be prevented by inhalation of a short-acting beta<sub>2</sub> agonist beforehand (or by transfer from an aerosol inhalation to a dry powder inhalation).

- **PREGNANCY** Inhaled drugs for asthma can be taken as normal during pregnancy.

Beclometasone dipropionate

Beclometasone dipropionate

**INDICATIONS AND DOSE**

**Prophylaxis of asthma**

**By inhalation of powder**

- Child 5–11 years: 100–200 micrograms twice daily, dose to be adjusted as necessary
- Child 12–17 years: 200–400 micrograms twice daily; increased if necessary up to 800 micrograms twice daily, dose to be adjusted as necessary
- Adult: 200–400 micrograms twice daily; increased if necessary up to 800 micrograms twice daily, dose to be adjusted as necessary

**Asmabec clickhaler<sup>®</sup>**

**Prophylaxis of asthma**

**By inhalation of powder**

- Child 6–11 years: 100–200 micrograms twice daily, dose to be adjusted as necessary
- Child 12–17 years: 100–400 micrograms twice daily (max. 1 mg twice daily), dose to be adjusted as necessary
- Adult: 100–400 micrograms twice daily (max. 1 mg twice daily), dose to be adjusted as necessary

**Clenil modulite<sup>®</sup>**

**Prophylaxis of asthma**

**By inhalation of powder**

- Child 2–11 years: 100–200 micrograms twice daily
- Child 12–17 years: 200–400 micrograms twice daily, adjusted according to response; increased if necessary up to 1 mg twice daily
- Adult: 200–400 micrograms twice daily, adjusted according to response; increased if necessary up to 1 mg twice daily

**Qvar preparations<sup>®</sup>**

**Prophylaxis of asthma**

**By inhalation of powder**

- Child 12–17 years: 50–200 micrograms twice daily; increased if necessary up to 400 micrograms twice daily
- Adult: 50–200 micrograms twice daily; increased if necessary up to 400 micrograms twice daily

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Inhaled corticosteroids for the treatment of chronic asthma in adults and children over 12 years (March 2008) NICE TA138

For adults and children over 12 years with chronic asthma in whom treatment with an inhaled corticosteroid is considered appropriate, the least costly product that is suitable for an individual (taking into consideration NICE TAs 38 and 10), within its marketing authorisation is recommended.

For adults and children over 12 years with chronic asthma in whom treatment with an inhaled corticosteroid and a long-acting beta<sub>2</sub> agonist is considered appropriate, the following apply:

- the use of a combination inhaler within its marketing authorisation is recommended as an option;
- the decision to use a combination inhaler or two agents in separate inhalers should be made on an individual basis, taking into consideration therapeutic need, and the likelihood of treatment adherence;
- if a combination inhaler is chosen, then the least costly inhaler that is suitable for the individual is recommended. www.nice.org.uk/TA138

**SIDE-EFFECTS**

- Breast feeding Inhaled corticosteroids for asthma can be taken as normal during breast-feeding.

- **RESPIRATORY SYSTEM**
### Preparing and dispensing information

The MHRA has advised (July 2008) that beclomethasone dipropionate CFC-free inhalers should be prescribed by brand name.

**Qvar® preparations**

When switching a patient with well-controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered-dose of Qvar® should be prescribed for 200–250 micrograms of beclomethasone dipropionate or budesonide and for 100 micrograms of fluticasone propionate.

When switching a patient with poorly controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered-dose of Qvar® should be prescribed for 100 micrograms of beclomethasone dipropionate, budesonide, or fluticasone propionate; the dose of Qvar® should be adjusted according to response.

**Patient and carer advice**

Steroid card should be issued with high doses of inhaled beclomethasone dipropionate.

**Profession specific information**

Dental practitioners’ formulary

Clenil Modulite® 50 micrograms/metered inhalation may be prescribed.

### Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

**Inhalation powder**

- **BECLOMETHASONE DIPROPIONATE (Non-proprietary)**
  - Beclomethasone dipropionate 200 microgram per 1 dose Easyhaler Beclomethasone 200 micrograms/dose dry powder inhaler | 200 dose (PO) £14.93
  - Brands may include Asmabec Clickhaler; Pulvinal (beclomethasone)

### Budesonide

#### Indications and dose

**Prophylaxis of asthma**

- **By inhalation of powder**
  - Child 6–11 years: 100–400 micrograms twice daily, dose to be adjusted as necessary
  - Child 12–17 years: 100–800 micrograms twice daily, dose to be adjusted as necessary
  - Adult: 100–800 micrograms twice daily, dose to be adjusted as necessary

- **By inhalation of nebulised suspension**
  - Child 6 months–11 years: 125–500 micrograms twice daily, adjusted according to response; maximum 2 mg per day
  - Child 12–17 years: Initially 0.25–1 mg twice daily, adjusted according to response, doses higher than recommended max. may be used in severe disease; maximum 2 mg per day
  - Adult: Initially 0.25–1 mg twice daily, adjusted according to response, doses higher than recommended max. may be used in severe disease; maximum 2 mg per day

**Prophylaxis of mild to moderate asthma (in patients stabilised on twice daily dose)**

- **By inhalation of powder**
  - Child 6–11 years: 200–400 micrograms once daily, dose to be given in the evening
  - Child 12–17 years: 200–400 micrograms once daily (max. per dose 800 micrograms), dose to be given in the evening
  - Adult: 200–400 micrograms once daily (max. per dose 800 micrograms), dose to be given in the evening

### Pressurised inhalation

**Cautionary and advisory labels 5, 10**

- **BECLOMETHASONE DIPROPIONATE (Non-proprietary)**
  - Beclomethasone dipropionate 50 microgram per 1 dose Beclomethasone 50 micrograms/dose inhaler CFC free | 200 dose (PO) no price available

Also available in combination with formoterol, p. 229
Budesonide with formoterol

The properties listed below are those particular to the combination only. For the properties of the components please consider, budesonide p. 228, formoterol fumarate p. 220.

INDICATIONS AND DOSE
SYMBICORT 100/6 TURBOHALER®
Asthma, maintenance therapy
BY INHALATION OF POWDER
- Child 6-17 years: Initially 1–2 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained
- Adult: Initially 1–2 puffs twice daily, increased if necessary up to 4 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained

Asthma, maintenance and reliever therapy
BY INHALATION OF POWDER
- Adult: Maintenance 2 puffs daily in 1–2 divided doses; 1 puff as required for relief of symptoms, increased if necessary up to 6 puffs as required; max. 8 per day; up to 12 puffs daily can be used for a limited time but medical assessment should be considered

SYMBICORT 200/6 TURBOHALER®
Asthma maintenance therapy
BY INHALATION OF POWDER
- Child 12-17 years: Initially 1–2 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained
- Adult: Initially 1–2 puffs twice daily, increased if necessary up to 4 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained

Asthma, maintenance and reliever therapy
BY INHALATION OF POWDER
- Adult: Maintenance 2 puffs daily in 1–2 divided doses, increased if necessary to 2 puffs twice daily; 1 puff as required for relief of symptoms, increased if necessary up to 6 puffs as required; max. 8 puffs per day; up to 12 puffs daily can be used for a limited time but medical assessment should be considered

Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 50% of predicted
BY INHALATION OF POWDER
- Adult: 2 puffs twice daily

SYMBICORT 400/12 TURBOHALER®
Asthma, maintenance therapy
BY INHALATION OF POWDER
- Child 12-17 years: Initially 1 puff twice daily; reduced to 1 puff daily, dose reduced only if control is maintained
- Adult: Initially 1 puff twice daily, increased if necessary up to 2 puffs twice daily; reduced to 1 puff daily, dose reduced only if control is maintained

Chronic obstructive pulmonary disease with forced expiratory volume in 1 second < 50% of predicted
BY INHALATION OF POWDER
- Adult: 1 puff twice daily

PULMICORT® RESPULES
Prophylaxis of asthma
BY INHALATION OF NEBULISED SUSPENSION
- Child 3 months-11 years: Initially 0.5–1 mg twice daily, reduced to 250–500 micrograms twice daily
- Child 12-17 years: Initially 1–2 mg twice daily, reduced to 0.5–1 mg twice daily
- Adult: Initially 1–2 mg twice daily, reduced to 0.5–1 mg twice daily

BUDELIN NOVOLIZER®
Prophylaxis of asthma
BY INHALATION OF POWDER
- Adult: 200–800 micrograms twice daily, dose is adjusted as necessary
Alternative in mild to moderate asthma, for patients previously stabilised on a twice daily dose
BY INHALATION OF POWDER
- Adult: 200–400 micrograms once daily (max. per dose 800 micrograms), to be taken in the evening

PULMICORT® TURBOHALER
Prophylaxis of asthma
BY INHALATION OF POWDER
- Adult: 100–800 micrograms twice daily, dose to be adjusted as necessary
Alternative in mild to moderate asthma, for patients previously stabilised on a twice daily dose
BY INHALATION OF POWDER
- Adult: 200–400 micrograms once daily (max. per dose 800 micrograms), to be taken in the evening

Potency
Dose adjustments may be required for some inhaler devices, see under individual preparations.

DIRECTIONS FOR ADMINISTRATION
Budesonide nebuliser suspension is not suitable for use in ultrasonic nebulisers.

PATIENT AND CARER ADVICE
With high doses, a steroid card should be supplied. Patients or carers should be given advice on how to administer budesonide dry powder inhaler and nebuliser suspension.

Medicines for Children leaflet: Budesonide inhaler for asthma prevention (prophylaxis)
www.medicinesforchildren.org.uk/budesonide-inhaler-asthma-prevention-prophylaxis

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Mometasone furoate inhaler for asthma prevention (prophylaxis) www.medicinesforchildren.org.uk/mometasone-furoate-inhaler-for-asthma-prevention-prophylaxis

Patients or carers should be given advice on how to administer mometasone by inhaler. With high doses, a steroid card should be supplied.
LEUKOTRIENE RECEPTOR ANTAGONISTS

Leukotriene receptor antagonist

The leukotriene receptor antagonists, montelukast below and zafirlukast below, block the effects of cysteinyl leukotrienes in the airways. They are effective in asthma when used alone or with an inhaled corticosteroid.

Montelukast below has not been shown to be more effective than a standard dose of inhaled corticosteroid, but the two drugs appear to have an additive effect. The leukotriene receptor antagonists may be of benefit in exercise-induced asthma and in those with concomitant rhinitis, but they are less effective in those with severe asthma who are also receiving high doses of other drugs.

Montelukast

**INDICATIONS AND DOSE**

**Prophylaxis of asthma**

**BY MOUTH**

- Child 6 months–5 years: 4 mg once daily, dose to be taken in the evening
- Child 6–14 years: 5 mg once daily, dose to be taken in the evening
- Child 15–17 years: 10 mg once daily, dose to be taken in the evening
- Adult: 10 mg once daily, dose to be taken in the evening

**Symptomatic relief of seasonal allergic rhinitis in patients with asthma.**

**BY MOUTH**

- Child 15–17 years: 10 mg once daily, dose to be taken in the evening
- Adult: 10 mg once daily, dose to be taken in the evening

**INTERACTIONS**  → Appendix 1 (leukotriene receptor antagonists).

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain • headache • hyperkinesia (in young children) • thirst
- **Uncommon** Abnormal dreams • aggressive behaviour • agitation • anxiety • arthralgia • bruising • depression • dizziness • drowsiness • dry mouth • dyspepsia • epistaxis • hostility • hypoaesthesia • irritability • malaise • muscle cramps • myalgia • oedema • paraesthesia • psychomotor hyperactivity • restlessness • seizures • sleep disturbances • sleep-walking
- **Rare** Disturbance in attention • increased bleeding tendency • memory impairment • palpitation • tremor
- **Very rare** Churg–Strauss syndrome • disorientation • erythema multiforme • erythema nodosum • hallucinations • hepatic disorders • hepatic eosinophilic infiltration • suicidal behaviour • suicidal thoughts

**SIDE-EFFECTS, FURTHER INFORMATION**

Churg–Strauss syndrome has occurred very rarely in association with the use of montelukast; in many of the reported cases the reaction followed the reduction or withdrawal of oral corticosteroid therapy. Prescribers should be alert to the development of eosinophilia, vasculitic rash, worsening pulmonary symptoms, cardiac complications, or peripheral neuropathy.

**PREGNANCY**

Manufacturer advises avoid unless essential.

**BREAST FEEDING**

Manufacturer advises avoid unless essential.

**DIRECTIONS FOR ADMINISTRATION**

Granules may be swallowed or mixed with cold, soft food (not liquid) and taken immediately.

**PRESCRIBING AND DISPENSING INFORMATION**

Flavours of chewable tablet formulations may include cherry.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Montelukast for asthma www.medicinesforchildren.org.uk/montelukast-for-asthma Patients or carers should be given advice on how to administer montelukast granules.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (June 2007) that Singulair® chewable tablets are restricted for use as an alternative to low-dose inhaled corticosteroids for children 2–14 years with mild persistent asthma who have not recently had serious asthma attacks that required oral corticosteroid use and who are not capable of using inhaled corticosteroids; Singulair® chewable tablets should be initiated by a specialist in paediatric asthma.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Zafirlukast

**INDICATIONS AND DOSE**

**Prophylaxis of asthma**

**BY MOUTH**

- Child 12–17 years: 20 mg twice daily
- Adult: 20 mg twice daily

**CAUTIONS**

Elderly

**INTERACTIONS** → Appendix 1 (leukotriene receptor antagonists).
Respiratory system

usualy 3 could probably be given for in practice, it is difficult to predict who will benefit; they may be of value in asthma with an allergic basis, but, nedocromil sodium below is not completely understood.

The mode of action of sodium cromoglicate below and nedocromil sodium below is not completely understood.

Cromoglicate and related therapy

The mode of action of sodium cromoglicate below and nedocromil sodium below is not completely understood. They may be of value in asthma with an allergic basis, but, in practice, it is difficult to predict who will benefit; they could probably be given for 4 to 6 weeks to assess response. Dose frequency is adjusted according to response but is usually 3 to 4 times a day initially; this may subsequently be reduced.

In general, prophylaxis with sodium cromoglicate is less effective than prophylaxis with corticosteroid inhalations. There is evidence of efficacy of nedocromil sodium in children aged 5–12 years. Sodium cromoglicate and nedocromil sodium are of no value in the treatment of acute attacks of asthma.

Sodium cromoglicate can prevent exercise-induced asthma. However, exercise-induced asthma may reflect poor overall control and the patient should be reassessed.

Sodium cromoglicate below and nedocromil sodium below may also have a role in allergic conjunctivitis; sodium cromoglicate is used also in allergic rhinitis and allergy-related diarrhoea.

Nedocromil sodium

INDICATIONS AND DOSE

Prophylaxis of asthma

BY INHALATION OF AEROSOL

Child 5–17 years: Initially 4 mg 4 times a day, when control achieved may be possible to reduce to twice daily

Adult: Initially 4 mg 4 times a day, when control achieved may be possible to reduce to twice daily

Dose equivalence and conversion

2 puffs = 4 mg.
MONOCLONAL ANTIBODIES

Omalizumab

INDICATIONS AND DOSE

Prophylaxis of severe persistent allergic asthma

BY SUBCUTANEOUS INJECTION

• Adult: Dose according to immunoglobulin E concentration and body-weight (consult product literature)

Add-on therapy for chronic spontaneous urticaria in patients who have had an inadequate response to H1 antihistamine treatment

BY SUBCUTANEOUS INJECTION

• Adult: 300 mg every 4 weeks

● CAUTIONS

• Autoimmune disease - susceptibility to helminth infection—discontinue if infection does not respond to antihelmintic

● SIDE-EFFECTS

• Common or very common Abdominal pain - arthralgia - headache - injection-site reactions - pyrexia - sinusitis - upper respiratory tract infection

• Rare Angioedema - antibody formation - laryngoedema - parasitic infection

• Frequency not known Alopecia - arterial thromboembolic events - Churg-Strauss syndrome - joint swelling - myalgia - serum sickness (including fever and lymphadenopathy) - thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION

Churg-Strauss syndrome Churg-Strauss syndrome has occurred rarely in patients given omalizumab; the reaction is usually associated with the reduction of oral corticosteroid therapy. Churg-Strauss syndrome can present as eosinophilia, vasculitic rash, cardiac complications, worsening pulmonary symptoms, or peripheral neuropathy. Hypersensitivity reactions Hypersensitivity reactions can also occur immediately following treatment with omalizumab or sometimes more than 24 hours after the first injection.

● PREGNANCY

Manufacturer advises avoid unless essential—crosses the placenta.

● BREAST FEEDING

Manufacturer advises avoid—present in milk in animal studies.

NICE technology appraisals (TAs)

• Omalizumab for previously treated chronic spontaneous urticaria (June 2015) NICE TA339

Omalizumab is an option as add-on therapy for the treatment of severe chronic spontaneous urticaria in patients 12 years and over, only if:

• the severity of the condition is assessed objectively, for example, using a weekly urticaria activity score of 28 or more,

• the patient’s condition has not responded to standard treatment with H1-antihistamines and leukotriene receptor antagonists,

• omalizumab is stopped at or before the fourth dose if the condition has not responded,
Omalizumab is recommended as an option for treating severe persistent confirmed allergic IgE-mediated asthma as an add-on to optimised standard therapy in patients aged 6 years and over:

- who need continuous or frequent treatment with oral corticosteroids (defined as 4 or more courses in the previous year), and
- only if the manufacturer makes omalizumab available with the discount agreed in the patient access scheme.

Optimised standard therapy is defined as a full trial of and, if tolerated, documented compliance with inhaled high-dose corticosteroids, long-acting beta agonists, leukotriene receptor antagonists, theophyllines, oral corticosteroids, and smoking cessation if clinically appropriate.

Patients currently receiving omalizumab whose disease does not meet the criteria should be able to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA278

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (December 2014) that omalizumab (Xolair®) is accepted for restricted use within NHS Scotland for the treatment of chronic spontaneous urticaria in patients aged 12 years and over, who have had an inadequate response to combination therapy with H1-antihistamines, leukotriene receptor antagonists and H2-antihistamines, used according to current treatment guidelines.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- Xolair (Novartis Pharmaceuticals UK Ltd)
  - Omalizumab 150 mg per 1 ml Xolair 150mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £256.15
  - Xolair 75mg/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £128.07

**PHOSPHODIESTERASE TYPE-4 INHIBITORS**
Roflumilast

**DRUG ACTION**
Roflumilast is a phosphodiesterase type–4 inhibitor with anti-inflammatory properties.

**INDICATIONS AND DOSE**
Adjunct to bronchodilators for the maintenance treatment of patients with severe chronic obstructive pulmonary disease associated with chronic bronchitis and a history of frequent exacerbations

**BY MOUTH**
- Adult: 500 micrograms once daily

**CONTRA-INDICATIONS**
Cancer (except basal cell carcinoma) • concomitant treatment with immunosuppressive drugs (except short-term systemic corticosteroids) • history of depression associated with suicidal ideation or behaviour • moderate to severe cardiac failure • severe acute infective disease • severe immunological disease

**CAUTIONS**
History of psychiatric illness (discontinue if new or worsening psychiatric symptoms occur) • latent infection (such as tuberculosis, viral hepatitis, herpes infection)

**INTERACTIONS**
Caution with concomitant use of drugs likely to cause psychiatric events (discontinue if new or worsening psychiatric symptoms occur).
Appendix 1 (roflumilast).

**SIDE-EFFECTS**
- Common or very common Abdominal pain • decreased appetite • diarrhoea • headache • insomnia • nausea • weight loss
- Uncommon Anxiety • back pain • dizziness • dyspepsia • gastritis • gastro-oesophageal reflux • malaise • muscle spasm • myalgia • palpitation • rash • tremor • vertigo • vomiting
- Rare Constipation • depression • gynaecomastia • haematochæzia • nervousness • raised creatine kinase • respiratory tract infections • suicidal behaviour • suicidal ideation • taste disturbances • urticaria

- **CONCEPTION AND CONTRACEPTION** Women of child-bearing age should use effective contraception.

- **PREGNANCY** Manufacturer advises avoidance — toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoidance — present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Caution in mild impairment. Avoid in moderate to severe impairment.

- **MONITORING REQUIREMENTS** Monitor body-weight.

- **PATIENT AND CARER ADVICE** Patients should be given a patient card before starting treatment and advised to record body-weight at regular intervals.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **NICE technology appraisals (TAs)**
  - Roflumilast for the management of severe chronic obstructive pulmonary disease (January 2012) NICE TA244
  Roflumilast is recommended only in the context of research as part of a clinical trial for adults with severe chronic obstructive pulmonary disease associated with chronic bronchitis with a history of frequent exacerbations as an add-on to bronchodilator treatment. Patients receiving roflumilast should have the option to continue treatment until they and their clinicians consider it appropriate to stop. www.nice.org.uk/TA244

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- Daxas (Takeda UK Ltd)
  - Roflumilast 500 microgram Daxas 500microgram tablets | 30 tablet | £37.71
  - By mouth
  - Adult: 15–60 mg 3 times a day

**Ephedrine hydrochloride**

**INDICATIONS AND DOSE**
Reversible airflow obstruction

**BY MOUTH**
- Adult: 15–60 mg 3 times a day

**Neuropathic oedema**

**BY MOUTH**
- Adult: 30–60 mg 3 times a day
Ephedrine hydrochloride (Non-proprietary)  
Solution for injection

- **Ephedrine hydrochloride 3 mg per 1 ml**  
  Ephedrine 30mg/1ml solution for injection ampoules | 10 ampoules [£3.10]

- **Ephedrine hydrochloride 15 mg**  
  Ephedrine hydrochloride 15mg tablets | 28 tablet [£5.86-£6.38] DT price = £5.86

- **Ephedrine hydrochloride 30 mg**  
  Ephedrine hydrochloride 30mg tablets | 28 tablet [£4.87-£5.43] DT price = £4.87

**INDICATIONS AND DOSE**

**Severe acute asthma**

**By intravenous infusion**
- Child 1 month-11 years: 1 mg/kg/hour, adjusted according to plasma-theophylline concentration
- Child 12-17 years: 500–700 micrograms/kg/hour, adjusted according to plasma-theophylline concentration
- Adult: 500–700 micrograms/kg/hour, adjusted according to plasma-theophylline concentration

**By slow intravenous injection**
- Adult: 250–500 mg (max. per dose 5 mg/kg), to be followed by intravenous infusion

**Severe acute exacerbation of chronic obstructive pulmonary disease**

**By intravenous infusion**
- Adult: 500–700 micrograms/kg/hour, adjusted according to plasma-theophylline concentration
- Elderly: 300 micrograms/kg/hour, adjusted according to plasma-theophylline concentration

**Severe acute exacerbation of chronic obstructive pulmonary disease in patients not previously treated with theophylline**

**By slow intravenous injection**
- Adult: 5 mg/kg (max. per dose 500 mg), to be followed by intravenous infusion

**Chronic asthma**

**By mouth using modified-release medicines**
- Child (body-weight 40 kg and above): Initially 225 mg twice daily for 1 week, then increased if necessary to 450 mg twice daily, adjusted according to plasma-theophylline concentration

**By mouth using modified-release medicines**
- Adult (body-weight 40 kg and above): Initially 225 mg twice daily for 1 week, then increased if necessary to 450 mg twice daily, adjusted according to plasma-theophylline concentration

**PHYLLOCONTIN CONTINUS® FORTE**

**Reversible airways obstruction**

**By mouth using modified-release medicines**
- Adult: Initially 350 mg twice daily for 1 week, then increased if necessary to 700 mg twice daily, increase dose according to plasma-theophylline concentration

**Dose adjustments due to interactions**

Dose adjustment may be necessary if smoking started or stopped during treatment.

**Doses at extremes of body-weight**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal weight for height.

**PHARMACOKINETICS**

Aminophylline is a stable mixture or combination of theophylline and ethylenediamine; the ethylenediamine confers greater solubility in water. Theophylline is metabolised in the liver. The plasma-theophylline concentration is increased in heart failure, hepatic impairment, and in viral infections. The plasma-theophylline concentration is decreased in smokers, and by alcohol consumption. Differences in **continued**
If aminophylline is given intravenously, a blood sample should usually be taken 1123 hours after starting oral treatment. For specific details on the management of poisoning, see Appendix 1 (aminophylline).

**SIDE-EFFECTS, FURTHER INFORMATION**

**Hypokalaemia** Potentially serious hypokalaemia may result from beta, agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, and diuretics, and by hypoxia. Plasma-potassium concentration should therefore be monitored in severe asthma.

**Overdose** Theophylline and related drugs are often prescribed as modified-release formulations and toxicity can therefore be delayed. They cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly. For specific details on the management of poisoning, see Theophylline, under Emergency treatment of poisoning p. 1123.

**ALLERGY AND CROSS-SENSITIVITY** Allergy to ethylenediamine can cause urticaria, erythema, and exfoliative dermatitis.

**PREGNANCY** Neonatal irritability and apnoea have been reported. Theophylline can be taken as normal during pregnancy as it is particularly important that asthma should be well controlled during pregnancy.

**BREAST FEEDING** Present in milk—irritability in infant reported; modified-release preparations preferable. Theophylline can be taken as normal during breast-feeding.

**HEPATIC IMPAIRMENT** Reduce dose.

**MONITORING REQUIREMENTS**

- Aminophylline is monitored therapeutically in terms of plasma-theophylline concentrations. Measurement of plasma-theophylline concentration may be helpful and is essential if a loading dose of intravenous aminophylline is to be given to children who are already taking theophylline, because serious side-effects such as convulsions and arrhythmias can occasionally precede other symptoms of toxicity. In most individuals, a plasma-theophylline concentration of 10–20 mg/litre (55–110 micromol/litre) is required for satisfactory bronchodilation, although a lower plasma-theophylline concentration of 5–15 mg/litre may be effective. Adverse effects can occur within the range 10–20 mg/litre and both the frequency and severity increase at concentrations above 20 mg/litre.
- If aminophylline is given intravenously, a blood sample should be taken 4–6 hours after starting treatment.
- Plasma-theophylline concentration is measured 5 days after starting oral treatment and at least 3 days after any dose adjustment. A blood sample should usually be taken 4–6 hours after an oral dose of a modified-release preparation (sampling times may vary—consult local guidelines).

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use in children For intravenous infusion, dilute to a concentration of 1 mg/mL with Glucose 5% or Sodium Chloride 0.9%.
- With intravenous use in adults For intravenous infusion, give continuously in Glucose 5% or Sodium Chloride 0.9%. For intravenous injection, give very slowly over at least 20 minutes (with close monitoring).
- With intramuscular use Aminophylline is too irritant for intramuscular use.

**PRESCRIBING AND DISPENSING INFORMATION**

Patients taking oral theophylline or aminophylline should not normally receive a loading dose of intravenous aminophylline. Consider intravenous aminophylline for treatment of severe and life-threatening acute asthma only after consultation with senior medical staff.

Modified release: The rate of absorption from modified-release preparations can vary between brands. If a prescription for a modified-release oral aminophylline preparation does not specify a brand name, the pharmacist should contact the prescriber and agree the brand to be dispensed. Additionally, it is essential that a patient discharged from hospital should be maintained on the brand on which that patient was stabilised as an in-patient. Phyllocontin Continus® Forte tablets are for smokers and other patients where theophylline half-life is shorter.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion, suppository.

## Theophylline

### INDICATIONS AND DOSE

**NUELIN SA® 175MG TABLETS**

**Chronic asthma**

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child 6–11 years: 125–250 mg every 12 hours
  - Child 12–17 years: 250–500 mg every 12 hours

**Reversible airways obstruction | Chronic asthma**

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: 250–500 mg every 12 hours
UNIPHPhyllIN Continus®

Chronic asthma

BY MOUTH USING MODIFIED-RELEASE MEDICINES

▶ Child 2–11 years: 9 mg/kg every 12 hours (max. per dose 200 mg), dose may be increased in some children with chronic asthma to 10–16 mg/kg every 12 hours (max. per dose 400 mg), may be appropriate to give larger evening or morning dose to achieve optimum therapeutic effect when symptoms most severe; in patients whose night or daytime symptoms persist despite other therapy, who are not currently receiving theophylline, total daily requirement may be added as single evening or morning dose

▶ Child 12–17 years: 200 mg every 12 hours, adjusted according to response to 400 mg every 12 hours, may be appropriate to give larger evening or morning dose to achieve optimum therapeutic effect when symptoms most severe; in patients whose night or daytime symptoms persist despite other therapy, who are not currently receiving theophylline, total daily requirement may be added as single evening or morning dose

Reversible airways obstruction | Chronic asthma

BY MOUTH USING MODIFIED-RELEASE MEDICINES

▶ Adult: 200 mg every 12 hours, adjusted according to response to 400 mg every 12 hours, may be appropriate to give larger evening or morning dose to achieve optimum therapeutic effect when symptoms most severe; in patients whose night or daytime symptoms persist despite other therapy, who are not currently receiving theophylline, total daily requirement may be added as single evening or morning dose

SLO-PHyllIN®

Chronic asthma

BY MOUTH USING MODIFIED-RELEASE MEDICINES

▶ Adult: 200–500 mg every 12 hours

PHARMACOKINETICS

Theophylline is metabolised in the liver. The plasma-theophylline concentration is increased in heart failure, hepatic impairment, and in viral infections. The plasma-theophylline concentration is decreased in smokers, and by alcohol consumption. Differences in the half-life of theophylline are important because the toxic dose is close to the therapeutic dose.

• CAUTIONS Cardiac arrhythmias or other cardiac disease • elderly (increased plasma-theophylline concentration) • epilepsy • fever • hypertension • hyperthyroidism • peptic ulcer - risk of hypokalaemia

• INTERACTIONS → Appendix 1 (theophylline).

• SIDE-EFFECTS Arrhythmias • CNS stimulation • convulsions • diarrhoea • gastric irritation • headache • insomnia • nausea • palpitation • tachycardia • vomiting

• SIDE-EFFECTS, FURTHER INFORMATION

Hypokalaemia Potentially serious hypokalaemia may result from beta, agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, and diuretics, and by hypoxia. Plasma-potassium concentration should therefore be monitored in severe asthma.

• Overdose Theophylline in overdose can cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemeses, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly. For details on the management of poisoning, see Theophylline, under Emergency treatment of poisoning p. 1123.

• PREGNANCY Neonatal irritability and apnoea have been reported. Theophylline can be taken as normal during pregnancy as it is particularly important that asthma should be well controlled during pregnancy.

• BREAST FEEDING Present in milk—irritability in infant reported; modified-release preparations preferable. Theophylline can be taken as normal during breast-feeding.

• HEPATIC IMPAIRMENT Reduce dose.

• MONITORING REQUIREMENTS

▶ In most individuals, a plasma-theophylline concentration of 10–20 mg/litre (55–110 micromol/litre) is required for satisfactory bronchodilatation, although a lower plasma-theophylline concentration of 5–15 mg/litre may be effective. Adverse effects can occur within the range 10–20 mg/litre and both the frequency and severity increase at concentrations above 20 mg/litre.

▶ Plasma-theophylline concentration is measured 5 days after starting oral treatment and at least 3 days after any dose adjustment. A blood sample should usually be taken 4–6 hours after an oral dose of a modified-release preparation (sampling times may vary—consult local guidelines).

• DIRECTIONS FOR ADMINISTRATION

SLO-PHYLLIN® Swallow whole with fluid or swallow enclosed granules with soft food (e.g. yoghurt). Contents of the capsule (enteric-coated granules) may be sprinkled on to a spoonful of soft food (e.g. yoghurt) and swallowed without chewing.

• PRESCRIBING AND DISPENSING INFORMATION The rate of absorption from modified-release preparations can vary between brands. If a prescription for a modified-release oral theophylline preparation does not specify a brand name, the pharmacist should contact the prescriber and agree the brand to be dispensed. Additionally, it is essential that a patient discharged from hospital should be maintained on the brand on which that patient was stabilised as an in-patient.

• PATIENT AND CARER ADVICE

SLO-PHyllIN® Patient or carer should be given advice on how to administer theophylline modified release capsules.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Allergic conditions 241

2 Allergic conditions

Antihistamines, allergen immunotherapy and allergic emergencies

Antihistamines

All antihistamines are of potential value in the treatment of nasal allergies, particularly seasonal allergic rhinitis (hayfever), and they may be of some value in vasomotor rhinitis. They reduce rhinorrhea and sneezing but are usually less effective for nasal congestion. Antihistamines are used topically in the eye, in the nose, and on the skin.

Oral antihistamines are also of some value in preventing urticaria and are used to treat urticarial rashes, pruritus, and insect bites and stings; they are also used in drug allergies. Injections of chlorphenamine maleate p. 245 or promethazine hydrochloride p. 251 are used as an adjunct to adrenaline/epinephrine p. 136 in the emergency treatment of anaphylaxis and angioedema. Antihistamines (including cinnarizine p. 342, cyclizine p. 343, and promethazine teoclolate p. 252) may also have a role in nausea and vomiting. Buclizine is included as an anti-emetic in a preparation for migraine. Antihistamines may also have a role in occasional insomnia.

All older antihistamines cause sedation but alimemazine tartrate p. 243 and promethazine may be more sedating whereas chlorphenamine maleate and cyclizine may be less so. This sedating activity is sometimes used to manage the pruritus associated with some allergies. There is little evidence that any one of the older, ‘sedating’ antihistamines is superior to another and patients vary widely in their response.

Non-sedating antihistamines such as acrivastine p. 243, bilastine p. 244, cetirizine hydrochloride p. 244, desloratadine p. 247 (an active metabolite of loratadine p. 250), fexofenadine hydrochloride p. 247 (an active metabolite of terfenadine), levocetirizine hydrochloride p. 249 (an isomer of cetirizine hydrochloride), loratadine, and mizolastine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

Allergic immunotherapy

Immunotherapy using allergen vaccines containing house dust mite, animal dander (cat or dog), or extracts of grass and tree pollen can reduce symptoms of asthma and allergic rhinoconjunctivitis. A vaccine containing extracts of wasp and bee venom is used to reduce the risk of severe anaphylaxis and systemic reactions in individuals with hypersensitivity to wasp and bee stings. An oral preparation of grass pollen extract (Grazax®) is also licensed for disease-modifying treatment of grass pollen-induced rhinitis and conjunctivitis. Those requiring immunotherapy must be referred to a hospital specialist for accurate diagnosis, assessment, and treatment.

Omalizumab p. 235 is a monoclonal antibody that binds to immunoglobulin E (IgE). It is used as additional therapy in individuals with proven IgE-mediated sensitivity to inhaled allergens, whose severe persistent allergic asthma cannot be controlled adequately with high dose inhaled corticosteroid together with a long-acting beta, agonist. Omalizumab should be initiated by physicians in specialist centres experienced in the treatment of severe persistent asthma. Omalizumab is also indicated as add-on therapy for the treatment of chronic spontaneous urticaria in patients who have had an inadequate response to H1 antihistamine treatment.
Allergic emergencies

Anaphylaxis

Anaphylaxis is a severe, life-threatening, generalised or systemic hypersensitivity reaction. It is characterised by the rapid onset of respiratory and/or circulatory problems and is usually associated with skin and mucosal changes; prompt treatment is required. Patients with pre-existing asthma, especially poorly controlled asthma, are at particular risk of life-threatening reactions. Insect stings are a recognised risk (in particular wasp and bee stings). Latex and certain foods, including eggs, fish, cow’s milk protein, peanuts, sesame, shellfish, soy, and tree nuts may also precipitate anaphylaxis. Medicinal products particularly associated with anaphylaxis include blood products, vaccines, hyposensitising (allergen) preparations, antibacterials, aspirin and other NSAIDs, and neuromuscular blocking drugs. In the case of drugs, anaphylaxis is more likely after parenteral administration; resuscitation facilities must always be available for injections associated with special risk. Anaphylactic reactions may also be associated with additives and excipients in foods and medicines. Refined arachis (peanut) oil, which may be present in some medicinal products, is unlikely to cause an allergic reaction—nevertheless it is wise to check the full formula of preparations which may contain allergens.

Treatment of anaphylaxis

Adrenaline/epinephrine p. 196 provides physiological reversal of the immediate symptoms associated with hypersensitivity reactions such as anaphylaxis and angioedema.

First-line treatment includes:

- securing the airway, restoration of blood pressure (laying the patient flat and raising the legs, or in the recovery position if unconscious or nauseous and at risk of vomiting);
- administering adrenaline/epinephrine (by intramuscular injection in a dose of 500 micrograms (a dose of 300 micrograms may be appropriate for immediate self-administration); the dose should be repeated if necessary at 5-minute intervals according to blood pressure, pulse, and respiratory function. Patients receiving beta-blockers require special consideration;
- administering high-flow oxygen and intravenous fluids is also of primary importance;
- administering an antihistamine, such as chlorphenamine maleate, by slow intravenous injection or intramuscular injection is a useful adjunctive treatment, given after adrenaline.
- Administering an intravenous corticosteroid such as hydrocortisone p. 583 (preferably as sodium succinate) is of secondary value in the initial management of anaphylaxis because the onset of action is delayed for several hours, but should be given to prevent further deterioration in severely affected patients.

Continuing respiratory deterioration requires further treatment with bronchodilators including inhaled or intravenous salbutamol p. 222, inhaled ipratropium bromide p. 217, intravenous aminophylline p. 237, or intravenous magnesium sulfate p. 858 [unlicensed indication] (as for acute severe asthma); in addition to oxygen, assisted respiration and possibly emergency tracheotomy may be necessary.

When a patient is so ill that there is doubt about the adequacy of the circulation, the initial injection of adrenaline/epinephrine may need to be given as a dilute solution by the intravenous route.

Cardiopulmonary arrest may follow an anaphylactic reaction; resuscitation should be started immediately.

On discharge, patients should be considered for further treatment with an oral antihistamine and an oral corticosteroid for up to 3 days to reduce the risk of further reaction. Patients should be instructed to return to hospital if symptoms recur and to contact their general practitioner for follow-up.

Patients who are suspected of having had an anaphylactic reaction should be referred to a specialist for specific allergy diagnosis. Avoidance of the allergen is the principal treatment; if appropriate, an adrenaline/epinephrine auto-injector should be given for self-administration or a replacement supplied.

Intramuscular adrenaline (epinephrine)

The intramuscular route is the first choice route for the administration of adrenaline/epinephrine in the management of anaphylaxis. Adrenaline/epinephrine is best given as an intramuscular injection into the anterolateral aspect of the middle third of the thigh; it has a rapid onset of action after intramuscular administration and in the shocked patient its absorption from the intramuscular site is faster and more reliable than from the subcutaneous site.

Patients with severe allergy should be instructed in the self-administration of adrenaline/epinephrine by intramuscular injection.

Prompt injection of adrenaline/epinephrine is of paramount importance. The adrenaline/epinephrine doses recommended for the emergency treatment of anaphylaxis by appropriately trained healthcare professionals are based on the revised recommendations of the Working Group of the Resuscitation Council (UK).

Dose of intramuscular injection of adrenaline (epinephrine) for the emergency treatment of anaphylaxis by healthcare professionals

<table>
<thead>
<tr>
<th>Age</th>
<th>Dose</th>
<th>Volume of adrenaline 1 in 1000 (1 mg/mL)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Child under 6 years</td>
<td>150 micrograms</td>
<td>0.15 mL¹</td>
</tr>
<tr>
<td>Child 6-11 years</td>
<td>300 micrograms</td>
<td>0.3 mL</td>
</tr>
<tr>
<td>Child 12-17 years</td>
<td>500 micrograms</td>
<td>0.5 mL²</td>
</tr>
<tr>
<td>Adult</td>
<td>500 micrograms</td>
<td>0.5 mL</td>
</tr>
</tbody>
</table>

These doses may be repeated several times if necessary at 5-minute intervals according to blood pressure, pulse, and respiratory function.

1. Use suitable syringe for measuring small volume
2. 300 micrograms (0.3 mL) if child is small or prepubertal

Intravenous adrenaline (epinephrine)

Intravenous adrenaline/epinephrine p. 196 should be given only by those experienced in its use, in a setting where patients can be carefully monitored.

When the patient is severely ill and there is real doubt about the adequacy of the circulation and absorption after intramuscular injection, adrenaline/epinephrine can be given by slow intravenous injection repeated according to response; if multiple doses are required, adrenaline/epinephrine should be given as a slow intravenous infusion stopping when a response has been obtained.

It is important that, where intramuscular injection might still succeed, time should not be wasted seeking intravenous access.

The intravenous route is also used for cardiac resuscitation.

Angioedema

Angioedema is dangerous if laryngeal oedema is present. In this circumstance adrenaline/epinephrine injection and oxygen should be given as described under Anaphylaxis; antihistamines and corticosteroids should also be given. Tracheal intubation may be necessary.
Hereditary angioedema
The treatment of hereditary angioedema should be under specialist supervision. Unlike allergic angioedema, adrenaline/epinephrine, corticosteroids, and antihistamines should not be used for the treatment of acute attacks, including attacks involving laryngeal oedema, as they are ineffective and may delay appropriate treatment—intubation may be necessary. The administration of C1-esterase inhibitor p. 255, an endogenous complement blocker derived from human plasma, (in fresh frozen plasma or in partially purified form) can terminate acute attacks of hereditary angioedema; it can also be used for short-term prophylaxis before dental, medical or surgical procedures. Conestat alfa p. 255 and icatibant p. 255 are licensed for the treatment of acute attacks of hereditary angioedema in adults with C1-esterase inhibitor deficiency.

Tranexamic acid p. 95 and danazol p. 636 [unlicensed indication] are used for short-term and long-term prophylaxis of hereditary angioedema. Short-term prophylaxis with tranexamic acid or danazol is started several days before planned procedures (e.g. dental work) and continued for 2–5 days afterwards. Danazol should be avoided in children because of its androgenic effects.

**ANTIHISTAMINES**

Acrivastine

**INDICATIONS AND DOSE**

Symptomatic relief of allergy such as hay fever, chronic idiopathic urticaria

**BY MOUTH**

- Child 12-17 years: 8 mg 3 times a day
- Adult: 8 mg 3 times a day

- CONTRA-INDICATIONS Avoid in Acute porphyrias p. 864 (some antihistamines are thought to be safe) - elderly

- CAUTIONS Epilepsy

- INTERACTIONS → Appendix 1 (antihistamines). Sedative antihistamine interactions apply to a lesser extent to the non-sedating antihistamines.

- SIDE-EFFECTS

  - Uncommon Antimuscarinic effects - gastro-intestinal disturbances - headache - psychomotor impairment
  - Rare Anaphylaxis - angioedema - angle-closure glaucoma (in adults) - arrhythmias - blood disorders - bronchospasm - confusion - convulsions - depression - dizziness - extrapyramidal effects - hypersensitivity reactions - hypotension - liver dysfunction - palpitation - photosensitivity reactions - rashes - sleep disturbances - tremor
  - Frequency not known Blurred vision - drowsiness - dry mouth - urinary retention

**SIDE-EFFECTS, FURTHER INFORMATION**

Non-sedating antihistamines such as acrivastine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent. If drowsiness occurs, it may diminish after a few days of treatment. Children and the elderly are more susceptible to side-effects.

- ALLERGY AND CROSS-SENSITIVITY Contraindicated if history of hypersensitivity to triprolidine.

- PREGNANCY Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

- BREAST FEEDING Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

- RENAL IMPAIRMENT Avoid in severe impairment.

- PATIENT AND CARER ADVICE Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); excess alcohol should be avoided.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- Benadryl Allergy Relief (McNeil Products Ltd)
  - Acrivastine 8 mg Benadryl Allergy Relief 8mg capsules I
  - 12 capsule £2.91 DT price = £2.91 | 24 capsule P £4.95

Alimemazine tartrate

(Trimethazine tartrate)

**INDICATIONS AND DOSE**

Urticaria | Pruritus

**BY MOUTH**

- Child 2-4 years: 2.5 mg 3–4 times a day
- Child 5-11 years: 5 mg 3–4 times a day
- Child 12-17 years: 10 mg 2–3 times a day, in severe cases up to maximum daily dose has been used; maximum 100 mg per day
- Adult: 10 mg 2–3 times a day, in severe cases up to maximum daily dose has been used; maximum 100 mg per day
- Elderly: 10 mg 1–2 times a day

- CONTRA-INDICATIONS Epilepsy - hepatic dysfunction - history of narrow angle glaucoma - hypothyroidism - many antihistamines should be avoided in Acute porphyrias p. 864 but alimemazine is thought to be safe - myasthenia gravis - parkinson’s disease - phaeochromocytoma - prostatic hypertrophy - renal dysfunction

- CAUTIONS Cardiovascular diseases (due to tachycardia-inducing and hypotensive effects of phenothiazines) - elderly - exposure to sunlight should be avoided during treatment with high doses - pyloroduodenal obstruction - urinary retention - volume depleted patients who are more susceptible to orthostatic hypotension

- INTERACTIONS → Appendix 1 (antihistamines).

- SIDE-EFFECTS

  - Rare Anaphylaxis - angioedema - bronchospasm - hypersensitivity reactions
  - Frequency not known Acute dystonia - agitation - agranulocytosis - akathisia - akinesia - angle-closure glaucoma - anti-muscarinic effects - arrhythmias (may be predisposed by hypokalaemia and cardiac disease) - blurred vision - contact sensitisation - convulsions - drowsiness - dry mouth - dyskinesia - gastro-intestinal disturbances - headache - hyperprolactinaemia - hypotension - insomnia - jaundice - leukopenia (on prolonged high dose) - nasal stuffiness - neuroleptic malignant syndrome - ocular changes - pallor (in children) - paradoxical excitement - parkinsonism - photosensitivity - postural hypotension (in elderly) - postural hypotension (in volume depletion) - rashes - respiratory depression - rigidity - tardive dyskinesia (usually after prolonged high doses) - tremor - urinary retention

**SIDE-EFFECTS, FURTHER INFORMATION**

Patients on high dosage may develop photosensitivity and should avoid exposure to direct sunlight. Children and the elderly are more susceptible to side-effects. Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days.
of treatment and is considerably less of a problem with the
newer antihistamines.

- **PREGNANCY** Most manufacturers of antihistamines advise
avoiding their use during pregnancy; however, there is no
evidence of teratogenicity. Use in the latter part of the
third trimester may cause adverse effects in neonates
such as irritability, paradoxical excitability, and tremor.

- **BREAST FEEDING** Most antihistamines are present in
breast milk in varying amounts; although not known to be
harmful, most manufacturers advise avoiding their use in
mothers who are breast-feeding.

- **HEPATIC IMPAIRMENT** Avoid in severe liver disease—
increased risk of coma.

- **RENAL IMPAIRMENT** Avoid.

- **PATIENT AND CARER ADVICE** Although drowsiness is rare,
nevertheless patients should be advised that it can occur
and may affect performance of skilled tasks (e.g. cycling
or driving); alcohol should be avoided.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines
containing the same drug. Forms available from special-order
manufacturers include: oral solution

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS 2**
- **ALIMEMAZINE TARTRATE (Non-proprietary)**
  - **Alimemazine tartrate 10 mg** Alimemazine 10mg tablets | 25 tablet [P</n>]
  - **no price available** | 28 tablet [P</n>]
  - **£17.95 DT price = £6.27**

**Oral solution**

- **CAUTIONARY AND ADVISORY LABELS 2**
- **ALIMEMAZINE TARTRATE (Non-proprietary)**
  - **Alimemazine tartrate 1.5 mg per 1 ml** Alimemazine 7.5mg/5ml
  - **oral solution | 100 ml [P</n>]
  - **£28.00 DT price = £14.36**
  - **Alimemazine tartrate 6 mg per 1 ml** Alimemazine 30mg/5ml oral
  - **solution | 100 ml [P</n>]
  - **£72.75 DT price = £41.88**

**Bilastine**

**INDICATIONS AND DOSE**

Symptomatic relief of allergic rhinoconjunctivitis and
urticaria

**BY MOUTH**

- **Child 2-17 years**: 20 mg once daily
- **Adult**: 20 mg once daily

**CONTRA-INDICATIONS** Avoid in Acute porphyrias p. 864
(some antihistamines are thought to be safe)

**CAUTIONS** Epilepsy

**INTERACTIONS** → Appendix 1 (antihistamines).
Sedative antihistamine interactions apply to a lesser
extent to the non-sedating antihistamines.

**SIDE-EFFECTS**

- **Common or very common** Headache • malaise

- **Uncommon** Abdominal pain • anxiety • diarrhoea •
dizziness • dyspnoea • gastritis • increased appetite •
insomnia • oral herpes • prolongation of the QT interval •
pyrexia • thirst • tinnitus • vertigo • weight gain

**SIDE-EFFECTS, FURTHER INFORMATION**

Children and the elderly are more susceptible to side-
effects. Non-sedating antihistamines such as bilastine cause less
sedation and psychomotor impairment than the older
antihistamines because they penetrate the blood brain
barrier only to a slight extent.

- **PREGNANCY** Avoid—limited information available. Most
manufacturers of antihistamines advise avoiding their use
during pregnancy; however, there is no evidence of
teratogenicity.
Chlorphenamine maleate

**INDICATIONS AND DOSE**

Symptomatic relief of allergy such as hay fever, urticaria, food allergy, drug reactions. Relief of itch associated with chickenpox

**BY MOUTH**

- **Child 12-23 months:** 1 mg twice daily
- **Child 2-5 years:** 1 mg every 4–6 hours; maximum 6 mg per day
- **Child 6-11 years:** 2 mg every 4–6 hours; maximum 12 mg per day
- **Child 12-17 years:** 4 mg every 4–6 hours; maximum 24 mg per day
- **Adult:** 4 mg every 4–6 hours; maximum 24 mg per day
- **Elderly:** 4 mg every 4–6 hours; maximum 12 mg per day

**BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION**

- **Child 1-5 months:** 250 micrograms/kg (max. per dose 2.5 mg), repeated if necessary; maximum 4 doses per day
- **Child 6 months-5 years:** 2.5 mg, repeated if necessary; maximum 4 doses per day
- **Child 6-11 years:** 5 mg, repeated if necessary; maximum 4 doses per day

**PROFESSION SPECIFIC INFORMATION**

**Dental practitioners’ formulary**

Cetirizine Tablets 10 mg may be prescribed. Cetirizine Oral Solution 5 mg/5 mL may be prescribed.

**SIDE-EFFECTS**

- Rare: Anaphylaxis - angioedema - angle-closure glaucoma in adults)
- Very common: arrhythmias - bronchospasm - confusion - convulsions - depression - dizziness - extrapyramidal effects - hypersensitivity reactions - hypotension - liver dysfunction - palpitation - photosensitivity reactions - sleep disturbances - tremor
- Frequency not known: Antimuscarinic effects - blood disorders - exfoliative dermatitis - rashes - tinnitus

**SPECIFIC SIDE-EFFECTS**

- **With intramuscular use:** CNS stimulation - irritant effects - transient hypotension
- **With intravenous use:** CNS stimulation - irritant effects - transient hypotension

**SIDE-EFFECTS, FURTHER INFORMATION**

Children and the elderly are more susceptible to side-effects.

Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

**PREGNANCY**

Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

**BREAST FEEDING**

Most antihistamines are present in breast milk in varying amounts; although not known to be

---

**RENAL IMPAIRMENT**

- **In adults** Use half normal dose if eGFR 30–50 mL/minute/1.73 m². Use half normal dose and reduce dose frequency to alternate days if eGFR 10–30 mL/minute/1.73 m². Avoid if eGFR less than 10 mL/minute/1.73 m².
- **In children** Use half normal dose if estimated glomerular filtration rate 30–50 mL/minute/1.73 m². Use half normal dose and reduce dose frequency to alternate days if estimated glomerular filtration rate 10–30 mL/minute/1.73 m². Avoid if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

**PATIENT AND CARER ADVICE**

Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

Medicines for Children leaflet: Cetirizine hydrochloride for hay fever www.medicinesforchildren.org.uk/cetirizine-hay-fever-0

**INTERACTIONS**

- Emergency treatment of anaphylactic reactions
  - By intramuscular injection or by intravenous injection
    - **Child 1-5 months:** 250 micrograms/kg (max. per dose 2.5 mg), repeated if necessary; maximum 4 doses per day
    - **Child 6 months-5 years:** 2.5 mg, repeated if necessary; maximum 4 doses per day
    - **Child 6-11 years:** 5 mg, repeated if necessary; maximum 4 doses per day
    - **Child 12-17 years:** 10 mg, repeated if necessary; maximum 4 doses per day
    - **Adult:** 10 mg, repeated if necessary; maximum 4 doses per day

**LICENSED USE**

- Tablets not licensed for use in children under 6 years.

**CONTRA-INDICATIONS**

Many antihistamines should be avoided in Acute porphyrias (p. 864) but chlorphenamine is thought to be safe

**CAUTIONS**

- Epilepsy - prostatic hypertrophy - pyloroduodenal obstruction - susceptibility to angle-closure glaucoma - urinary retention

**SIDE-EFFECTS**

- **GENERAL SIDE-EFFECTS**
  - Common or very common: Blurred vision - dry mouth - gastro-intestinal disturbances - headache - psychomotor impairment - urinary retention
  - Rare: Anaphylaxis - angioedema - angle-closure glaucoma in adults)

**FURTHER INFORMATION**

Children under 6 years should not be given over-the-counter cough and cold medicines containing chlorphenamine.
harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

- **HEPATIC IMPAIRMENT** Avoid in severe liver disease—increased risk of coma.

- **DIRECTIONS FOR ADMINISTRATION**
  - In children For intravenous injection, give over 1 minute; if small dose required, dilute with Sodium Chloride 0.9%.

- **PATIENT AND CARER ADVICE** Drowsiness may affect performance of skilled tasks (e.g., cycling or driving); sedating effects enhanced by alcohol.

  - **CAUTIONS**

- **PREGNANCY** Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.
Hydroxyzine hydrochloride

INDICATIONS AND DOSE

Pruritus

**BY MOUTH**

- Child 1-5 years: Initially 5–15 mg once daily, dose to be taken at night, increased if necessary to 50 mg daily in 3–4 divided doses
- Child 6-11 years: Initially 15–25 mg once daily, dose to be taken at night, increased if necessary to 50–100 mg daily in 3–4 divided doses
- Child 12-17 years: Initially 25 mg once daily, dose to be taken at night, increased if necessary to 100 mg daily in 3–4 divided doses
- Adult: Initially 25 mg daily, dose to be taken at night; increased if necessary to 25 mg 3–4 times a day

**Important safety information**

**HYDROXYZINE: RISK OF QT-INTERVAL PROLONGATION AND TORSADE DE POINTES (APRIL 2015)**

Following concerns of heart rhythm abnormalities, the safety and efficacy of hydroxyzine has been reviewed by the European Medicines Agency. The review concludes that hydroxyzine is associated with a small risk of QT-interval prolongation and Torsade de Pointes; these events are most likely to occur in patients who have risk factors for QT prolongation, e.g. concomitant use of drugs that prolong the QT interval, cardiovascular disease, family history of sudden cardiac death, significant electrolyte imbalance (low plasma-potassium or plasma-magnesium concentrations), or significant bradycardia.

To minimise the risk of such adverse effects, the following dose restrictions have been made and new cautions and contra-indications added:

- Hydroxyzine is contra-indicated in patients with prolonged QT-interval or who have risk factors for QT-interval prolongation;
- Avoid use in the elderly due to increased susceptibility to the side-effects of hydroxyzine;
- Consider the risks of QT-interval prolongation and Torsade de Pointes before prescribing to patients taking drugs that lower heart rate or plasma-potassium concentration;
- In adults, the maximum daily dose is 100 mg;
- In the elderly, the maximum daily dose is 50 mg (if use of hydroxyzine cannot be avoided);
- In children with body-weight up to 40 kg, the maximum daily dose is 2 mg/kg;
- The lowest effective dose for the shortest period of time should be prescribed.

**CONTRA-INDICATIONS**

- Avoid in Acute porphyrias p. 864 (some antihistamines are thought to be safe)

**CAUTIONS**

- Epilepsy • prostatic hypertrophy • pyloroduodenal obstruction • susceptibility to angle-closure glaucoma • susceptibility to QT interval prolongation • urinary retention

**INTERACTIONS**

- β-blockers and tricyclic antidepressants may increase the potential for cardiac toxicity
- Drowsiness may be enhanced by alcohol
- Alcohol should be avoided.

**SIDE-EFFECTS**

- Rare Anaphylaxis • angioedema • angle-closure glaucoma • arrhythmias • blood disorders • bronchospasm • confusion • convulsions • depression • dizziness • extrapyramidal effects • hypersensitivity reactions • hypotension • liver dysfunction • palpitation • photosensitivity reactions • rashes • sleep disturbances - tremor
- Frequency not known Antimuscarinic effects - blurred vision - drowsiness - dry mouth - gastro-intestinal disturbances - headache - psychomotor impairment - urinary retention

SIDE-EFFECTS, FURTHER INFORMATION

Children and the elderly are more susceptible to side-effects.

Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

**PREGNANCY**

- Most manufacturers of antihistamines advise avoiding their use during pregnancy; toxicity in animal studies with higher doses. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

**BREAST FEEDING**

- Manufacturer advises avoid. Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

**HEPATIC IMPAIRMENT**

- Reduce daily dose by one-third. Avoid in severe liver disease—increased risk of coma.

**RENAL IMPAIRMENT**

- Reduce daily dose by half.

**PATIENT AND CARER ADVICE**

- Drowsiness may affect performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**Tablet**

Ketotifen

INDICATIONS AND DOSE

Allergic rhinitis

BY MOUTH

- Child 3-17 years: 1 mg twice daily
- Adult: 1 mg twice daily, increased if necessary to 2 mg twice daily, to be taken with food

Allergic rhinitis in readily sedated patients

BY MOUTH

- Adult: Initially 0.5–1 mg once daily, dose to be taken at night

- CONTRA-INDICATIONS Avoid in Acute porphyrias p. 864 (some antihistamines are thought to be safe).
- CAUTIONS Epilepsy - prostatic hypertrophy - pyloroduodenal obstruction - susceptibility to angle-closure glaucoma - urinary retention
- INTERACTIONS → Appendix 1 (antihistamines).

SIDE-EFFECTS

- Common or very common Excitation (in adults) - irritability - nervousness
- Uncommon Cystitis
- Rare Weight gain
- Very rare Stevens-Johnson syndrome

FREQUENCY NOT KNOWN

SIDE-EFFECTS, FURTHER INFORMATION

Children and the elderly are more susceptible to side effects.

Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

PREGNANCY

Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

BREAST FEEDING

Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

HEPATIC IMPAIRMENT

Avoid in severe liver disease—increased risk of coma.

PATIENT AND CARER ADVICE

Drowsiness may affect performance of skilled tasks (e.g. driving or cycling); sedating effects enhanced by alcohol.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Zaditen** (CD Pharma AB)
  - Ketotifen (as Ketotifen fumarate) 1 mg Zaditen 1mg tablets | 60 tablet (cost £7.53)

Levocetirizine hydrochloride

INDICATIONS AND DOSE

Symptomatic relief of allergy such as hay fever, urticaria

BY MOUTH

- Child 6-17 years: 5 mg once daily
- Adult: 5 mg once daily

PHARMACOKINETICS

Levocetirizine is an isomer of cetirizine.

- CONTRA-INDICATIONS Avoid in Acute porphyrias p. 864 (some antihistamines are thought to be safe).
- CAUTIONS Epilepsy

INTERACTIONS → Appendix 1 (antihistamines).

SIDE-EFFECTS

- Uncommon Antimuscarinic effects - blurred vision - dry mouth - gastro-intestinal disturbances - headache - psychomotor impairment - urinary retention
- Rare Anaphylaxis - angioedema - angle-closure glaucoma (in adults) - arrhythmias - blood disorders - bronchospasm - confusion - convulsions - depression - dizziness - extrapyramidal effects - hypersensitivity reactions - hypotension - liver dysfunction - palpitation - photosensitivity reactions - rashes - sleep disturbances - tremor

- Very rare Weight gain

FREQUENCY NOT KNOWN

- Drowsiness

SIDE-EFFECTS, FURTHER INFORMATION

Children and the elderly are more susceptible to side effects. Non-sedating antihistamines such as levocetirizine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent. If drowsiness occurs, it may diminish after a few days of treatment.

PREGNANCY

Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

BREAST FEEDING

Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

RENAI IMPAIRMENT

- In adults 5 mg on alternate days if eGFR 30–50 mL/minute/1.73 m². 5 mg every 3 days if eGFR 10–30 mL/minute/1.73 m². Avoid if eGFR less than 10 mL/minute/1.73 m².
- In children Reduce dose frequency to alternate days if estimated glomerular filtration rate 30–50 mL/minute/1.73 m². Reduce dose frequency to every 3 days if estimated glomerular filtration rate 10–30 mL/minute/1.73 m². Avoid if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

PATIENT AND CARER ADVICE

Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.
### Tablet
- **LEVOCETIRIZINE HYDROCHLORIDE (Non-proprietary)**
  - Levocetirizine dihydrochloride 5 mg: 30 tablet (PO) £4.39 DT price = £3.95
  - Xyzal (UCB Pharma Ltd)
- Levocetirizine dihydrochloride 5 mg: 30 tablet (PO) £4.39 DT price = £3.95

### Oral solution
- Xyzal (UCB Pharma Ltd)
- Levocetirizine dihydrochloride 500 microgram per 1 ml: 100 ml (sugar-free) £6.00 DT price = £6.00

### Loratadine

#### INDICATIONS AND DOSE
Symptomatic relief of allergy such as hay fever, chronic idiopathic urticaria

**BY MOUTH**
- Child 2-11 years (body-weight up to 30 kg): 5 mg once daily
- Child 2-11 years (body-weight 30 kg and above): 10 mg once daily
- Child 12-17 years: 10 mg once daily
- Adult: 10 mg once daily

#### CAUTIONS
- Acute porphyria p. 864
- Epilepsy

#### INTERACTIONS
- Appendix 1 (antihistamines).
- Sedative antihistamine interactions apply to a lesser extent to the non-sedating antihistamines.

#### SIDE-EFFECTS
- **Uncommon**
  - Antimuscarinic effects - blurred vision, dry mouth, gastrointestinal disturbances - Headache - psychomotor impairment - urinary retention
- **Rare**

#### Frequency not known
- Drowsiness

#### SIDE-EFFECTS, FURTHER INFORMATION
Children and elderly are more susceptible to side-effects. Non-sedating antihistamines such as loratadine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

If drowsiness occurs, it may diminish after a few days of treatment.

#### PREGNANCY
Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

#### BREAST FEEDING
Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

#### HEPATIC IMPAIRMENT
Reduce dose frequency to alternate days in severe impairment.

#### PATIENT AND CARER ADVICE
Although drowsiness is rare, nevertheless patients and their carers should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

#### PROFESSION SPECIFIC INFORMATION
Dental practitioners’ formulary Loratadine 10 mg tablets may be prescribed. Loratadine syrup 5 mg/5 ml may be prescribed.

### Medicinal Forms

#### Table
- **LORATADINE (Non-proprietary)**
  - Loratadine 10 mg: 7 tablet (OS) £1.75
  - 30 tablet (PO) £8.20 DT price = £1.11
  - Claritin (Loratadine) (Bayer Plc)
  - Loratadine 10 mg: 7 tablet (OS) £1.75
  - 30 tablet (OS) £4.97 DT price = £1.11
  - 60 tablet (PO) £8.85

#### Oral lyophilisate
- Claritin (Loratadine) (Bayer Plc)
- Loratadine 10 mg: 10 tablet (sugar-free) £3.24

### Mizolastine

#### INDICATIONS AND DOSE
Symptomatic relief of allergy such as hay fever, urticaria

**BY MOUTH**
- Child 12-17 years: 10 mg once daily
- Adult: 10 mg once daily

#### CONTRA-INDICATIONS
Avoid in Acute porphyria p. 864 (some antihistamines are thought to be safe).

- Cardiac disease - hypokalaemia - susceptibility to QT-interval prolongation

#### CAUTIONS
- Epilepsy

#### INTERACTIONS
- Appendix 1 (antihistamines).
- Sedative antihistamine interactions apply to a lesser extent to the non-sedating antihistamines.

#### SIDE-EFFECTS
- **Common or very common**
  - Anxiety - asthenia - weight gain
- **Uncommon**
  - Antimuscarinic effects - arthralgia - blurred vision - dry mouth - gastrointestinal disturbances - headache - myalgia - psychomotor impairment - urinary retention
- **Rare**

#### Frequency not known
- Drowsiness

#### SIDE-EFFECTS, FURTHER INFORMATION
Children and elderly are more susceptible to side-effects. Non-sedating antihistamines such as mizolastine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

If drowsiness occurs, it may diminish after a few days of treatment.

#### PREGNANCY
Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

#### BREAST FEEDING
Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

#### HEPATIC IMPAIRMENT
Manufacturer advises avoid in significant impairment.

#### PATIENT AND CARER ADVICE
Although drowsiness is rare, nevertheless patients and their carers should be advised...
that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

*Modified-release tablet*

**CAUTIONARY AND ADVISORY LABELS**

- Promethazine (Sanofi)
- Mizollen 10 mg (Mizollen 10mg modified-release tablets | 30 tablet [PO] £6.92 DT price + £6.92

**Promethazine hydrochloride**

**INDICATIONS AND DOSE**
Symptomatic relief of allergy such as hay fever and urticaria | Insomnia associated with urticaria and pruritus

**BY MOUTH**
- Child 2-4 years: 5 mg twice daily, alternatively 5–15 mg once daily, dose to be taken at night
- Child 5–9 years: 5–10 mg twice daily, alternatively 10–25 mg once daily, dose to be taken at night
- Child 10–17 years: 10–20 mg 2–3 times a day, alternatively 25 mg once daily, dose to be taken at night, increased if necessary to 25 mg twice daily
- Adult: 10–20 mg 2–3 times a day

**BY DEEP INTRAMUSCULAR INJECTION**
- Child 10–17 years: 20–50 mg (max. per dose 100 mg)

**Emergency treatment of anaphylactic reactions**

**BY SLOW INTRAVENOUS INJECTION**
- Adult: 25–50 mg to be administered as a solution containing 2.5 mg/mL in water for injections; maximum 100 mg per course

**Sedation (short-term use)**

**BY MOUTH**
- Child 2–4 years: 15–20 mg
- Child 5–9 years: 20–25 mg
- Child 10–17 years: 25–50 mg
- Adult: 25–50 mg

**BY DEEP INTRAMUSCULAR INJECTION**
- Adult: 25–50 mg

**Nausea | Vomiting | Vertigo | Labyrinthine disorders | Motion sickness**

**BY MOUTH**
- Child 2–4 years: 5 mg, to be taken at bedtime on night before travel, repeat following morning if necessary
- Child 5–9 years: 10 mg, to be taken at bedtime on night before travel, repeat following morning if necessary
- Child 10–17 years: 20–25 mg, to be taken at bedtime on night before travel, repeat following morning if necessary
- Adult: 20–25 mg, to be taken at bedtime on night before travel, repeat following morning if necessary

**SPECIFIC CAUTIONS**
- With intravenous use: avoid extravasation with intravenous injection

**INTERACTIONS**
- Appendix 1 (antihistamines).

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
- Rare: Anaphylaxis | Angioedema | Angle-closure glaucoma | Arthralgias | Asthma | Blood disorders | Bronchospasm | Confusion | Convulsions | Depression | Dizziness | Extrapyramidal effects | Hypersensitivity reactions | Hypotension | Liver dysfunction | Palpitation | Photosensitivity reactions | Rash | Sleep disturbances | Tremor

- Frequency not known: Antimuscarinic effects | Blurred vision | Drowsiness | Dry mouth | Gastro-intestinal disturbances | Headache | Psychomotor impairment | Restlessness | Urinary retention

**SPECIFIC SIDE-EFFECTS**
- With intramuscular use: injection pain

**SIDE-EFFECTS, FURTHER INFORMATION**

Children and elderly are more susceptible to side-effects. Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

**PREGNANCY**
Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

**BREAST FEEDING**
Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

**HEPATIC IMPAIRMENT**
Avoid in severe liver disease—increased risk of coma.

**RENAL IMPAIRMENT**
Use with caution.

**PATIENT AND CARER ADVICE**
Drowsiness may affect the performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

**PROFESSION SPECIFIC INFORMATION**

**Dental practitioners’ formulary**
Promethazine Hydrochloride Tablets 10 mg or 25 mg may be prescribed. Promethazine Hydrochloride Oral Solution (elixir) 5 mg/5 mL may be prescribed.

**LESS SUITABLE FOR PRESCRIBING**
Promethazine is less suitable for prescribing for sedation.

**EXCEPTIONS TO LEGAL CATEGORY**
Prescription only medicine restriction does not apply to promethazine hydrochloride injection where administration is for saving life in emergency.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension.

VACCINES (ALLERGEN-TYPE)

**Bee venom extract**

INDICATIONS AND DOSE

Hypersensitivity to bee venom

BY SUBCUTANEOUS INJECTION

- Adult: (consult product literature)

**Important safety information**

**DESENSITISING VACCINES**

In view of concerns about the safety of desensitising vaccines, it is recommended that they are used by specialists and only for the following indications:

- Seasonal allergic hay fever (caused by pollen) that has not responded to anti-allergic drugs.

- Hypersensitivity to wasp and bee venoms. Desensitising vaccines should generally be avoided or used with particular care in patients with asthma.

**CONTRA-INDICATIONS**

Consult product literature

- **CAUTIONS**

- **INTERACTIONS** → Appendix 1 (antihistamines).

**SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- Rare Anaphylaxis, angioedema, angle-closure glaucoma, arrhythmias, blood disorders, bronchospasm, confusion, convulsions, depression, dizziness, extrapyramidal effects, hypersensitivity reactions, hypotension, liver dysfunction, palpitation, photosensitivity reactions, rashes, sleep disturbances, tremor

- Frequency not known Antimuscarinic effects, blurred vision, drowsiness, dry mouth, gastro-intestinal disturbances, headache, psychomotor impairment, restlessness, urinary retention

**SPECIFIC SIDE-EFFECTS**

- With intramuscular use injection pain

**Important safety information**

MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009)

OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN

Children under 6 years should not be given over-the-counter cough and cold medicines containing promethazine.

- **CAUTIONS** Acute porphyrias p. 864, asthma, bronchiectasis, bronchitis, epilepsy, prostatic hypertrophy, pyloroduodenal obstruction. Reye’s syndrome, severe coronary artery disease, susceptibility to angle-closure glaucoma, urinary retention

- **INTERACTIONS** → Appendix 1 (antihistamines).

**SIDE-EFFECTS**

- **Phenergan** (Sanofi) Promethazine hydrochloride 25 mg per 1 ml Phenergan 25mg/1ml solution for injection ampoules | 10 ampoule £6.74

  - **INDICATIONS AND DOSE**

    - **Grass pollen extract**

      Treatment of seasonal allergic hay fever due to grass pollen in patients who have failed to respond to anti-allergy drugs

      **BY SUBCUTANEOUS INJECTION**

        - Adult: (consult product literature)

      Treatment of seasonal allergic hay fever due to grass pollen in patients who have failed to respond to anti-allergy drugs (initiated under specialist supervision)

      **BY MOUTH**

        - Adult: 1 tablet daily, treatment to be started at least 4 months before start of pollen season and continue for up to 3 years

      **Important safety information**

      **DESENSITISING VACCINES**

      In view of concerns about the safety of desensitising vaccines, it is recommended that they are used by specialists and only for the following indications:

      - seasonal allergic hay fever (caused by pollen) that has not responded to anti-allergic drugs;
      - hypersensitivity to wasp and bee venoms.

      Desensitising vaccines should generally be avoided or used with particular care in patients with asthma.

  - **CONTRA-INDICATIONS** Consult product literature

  - **CAUTIONS** Consult product literature

  - **INTERACTIONS** Desensitising vaccines should be avoided in patients taking beta-blockers (adrenaline may be ineffective in case of a hypersensitivity reaction), or ACE inhibitors (risk of severe anaphylactoid reactions).

  - **SIDE-EFFECTS**

    **SIDE-EFFECTS, FURTHER INFORMATION** Consult product literature.

    **Hypersensitivity reactions** Hypersensitivity reactions to immunotherapy can be life-threatening; bronchospasm usually develops within 1 hour and anaphylaxis within 30 minutes of injection. Therefore, cardiopulmonary resuscitation must be immediately available and patients need to be monitored for at least 1 hour after injection. If symptoms or signs of hypersensitivity develop (e.g. rash, urticaria, bronchospasm, faintness), even when mild, the patient should be observed until these have resolved completely.

    - **PREGNANCY** Should be avoided in pregnant women—consult product literature.

    - **MONITORING REQUIREMENTS** The first dose of grass pollen extract should be (Grazax®) should be taken under medical supervision and the patient should be monitored for 20–30 minutes.

    - **DIRECTIONS FOR ADMINISTRATION** Oral lyophilisates should be placed under the tongue and allowed to disperse. Advise patient not to swallow for 1 minute, or eat or drink for 5 minutes after taking the tablet. The first should be taken under medical supervision and the patient should be monitored for 20–30 minutes.

    - **PRESCRIBING AND DISPENSING INFORMATION** Each set of allergen extracts usually contains vials for the administration of graded amounts of allergen to patients undergoing hyposensitisation. Maintenance sets containing vials at the highest strength are also available. Product literature must be consulted for details of allergens, vial strengths, and administration.

    - **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer oral lyophilisates.

  - **MEDICATION FORMS**

PRESCRIBING AND DISPENSING INFORMATION

Flavours of oral liquid formulations may include cherry, raspberry, cinnamon, or rum.

INDICATIONS AND DOSE

Symptomatic treatment of acute exacerbations of chronic bronchitis

BY MOUTH

Adult: 300 mg twice daily for up to 10 days

CAUTIONS

History of peptic ulceration (may disrupt the gastric mucosal barrier)

INDICATIONS AND DOSE

Management of cystic fibrosis patients with a forced vital capacity (FVC) of greater than 40% of predicted to improve pulmonary function

BY INHALATION OF NEBULISED SOLUTION

Adult: 2500 units once daily, administered by jet nebuliser, patients over 21 years may benefit from twice daily dosage

Dose equivalence and conversion

Dornase alfa 1000 units is equivalent to 1 mg

SIDE-EFFECTS

Rare

Chest pain · conjunctivitis · dyspepsia · dysphonia · dysphonia · laryngitis · pharyngitis · pyrexia · rash · rhinitis · urticaria

PREGNANCY

No evidence of teratogenicity; manufacturer advises use only if potential benefit outweighs risk.

BREAST FEEDING

Amount probably too small to be harmful—manufacturer advises caution.

DIRECTIONS FOR ADMINISTRATION

Dornase alfa is administered by inhalation using a jet nebuliser, usually once daily at least 1 hour before physiotherapy; however, alternate-day therapy may be as effective as daily treatment. For use undiluted with jet nebulisers only; ultrasonic nebulisers are unsuitable.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

3.1 Cystic fibrosis

Mucolytics for cystic fibrosis

Mucolytics are prescribed to facilitate expectoration by reducing sputum viscosity. In some patients with chronic obstructive pulmonary disease and a chronic productive cough, mucolytics can reduce exacerbations; mucolytic therapy should be stopped if there is no benefit after a 4-week trial. Steam inhalation with postural drainage is effective in bronchiectasis and in some cases of chronic bronchitis.

Dornase alfa below is used to reduce sputum viscosity in patients with cystic fibrosis.

Nebulised hypertonic sodium chloride (3–7%) is used to mobilise lower respiratory tract secretions in mucus consolidation (e.g. cystic fibrosis). Nebulised hypertonic sodium chloride solution (3%) is used for mild to moderate acute viral bronchiolitis in infants.

Mannitol, administered by inhalation, improves mucus clearance and is licensed for the treatment of cystic fibrosis as an add-on therapy to standard care.

Dornase alfa

(Phosphorylated glycosylated recombinant human deoxyribonuclease 1 (rhDNase))

DRUG ACTION

Dornase alfa is a genetically engineered version of a naturally occurring human enzyme which cleaves extracellular deoxyribonucleic acid (DNA).

INDICATIONS AND DOSE

Management of cystic fibrosis patients with a forced vital capacity (FVC) of greater than 40% of predicted to improve pulmonary function

BY INHALATION OF NEBULISED SOLUTION

Adult: 2500 units once daily, administered by jet nebuliser, patients over 21 years may benefit from twice daily dosage

Dose equivalence and conversion

Dornase alfa 1000 units is equivalent to 1 mg

SIDE-EFFECTS

Rare

Chest pain · conjunctivitis · dyspepsia · dysphonia · dysphonia · laryngitis · pharyngitis · pyrexia · rash · rhinitis · urticaria

PREGNANCY

No evidence of teratogenicity; manufacturer advises use only if potential benefit outweighs risk.

BREAST FEEDING

Respiratory system
**Ivacaftor**

**INDICATIONS AND DOSE**
Treatment of cystic fibrosis in patients who have a G551D mutation in the cystic fibrosis transmembrane conductance regulator (CFTR) gene (under expert supervision)

**BY MOUTH**
- *Adults:* 150 mg every 12 hours

**Dose adjustments due to interactions**
Reduce dose to 150 mg twice a week with concomitant use of itraconazole, ketoconazole, posaconazole, voriconazole, telithromycin, and clarithromycin. Reduce dose to 150 mg once daily with concomitant use of fluconazole and erythromycin.

- **CONTRA-INDICATIONS** Organ transplantation (no information available)
- **INTERACTIONS** → Appendix 1 (ivacaftor). Avoid grapefruit and Seville oranges.
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain, diarrhoea, dizziness, ear discomfort, headache, nasal congestion, nasopharyngitis, ophthalmic pain, pharyngolaryngeal pain, rash, rhinitis, tinnitus, upper respiratory tract infection
  - **Uncommon** Gynaecomastia, vestibular disorder
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **HEPATIC IMPAIRMENT** Max. 150 mg once daily in moderate impairment; in severe impairment, manufacturer recommends use only if potential benefit outweighs risk—starting dose 150 mg on alternate days, dosing interval adjusted according to clinical response and tolerability.
- **RENAL IMPAIRMENT** Caution in severe impairment.
- **PRE-TREATMENT SCREENING** If the patient’s genotype is unknown, a validated genotyping method should be performed to confirm the presence of the G551D mutation in at least one allele of the CFTR gene before starting treatment.
- **MONITORING REQUIREMENTS** Test liver function before treatment, every 3 months during the first year of treatment, then annually thereafter.
- **DIRECTIONS FOR ADMINISTRATION** Tablets should be taken with fat-containing food.
- **PRESCRIBING AND DISPENSING INFORMATION** Ivacaftor should be prescribed by a physician experienced in the treatment of cystic fibrosis.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer ivacaftor tablets.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Mannitol**

**INDICATIONS AND DOSE**
Treatment of cystic fibrosis as an add-on therapy to standard care

**BY INHALATION OF POWDER**
- *Adult:* Maintenance 400 mg twice daily, an initiation dose assessment must be carried out under medical supervision, for details of the initiation dose regimen, consult product literature

- **CONTRA-INDICATIONS** Bronchial hyperresponsiveness to inhaled mannitol, impaired lung function (forced expiratory volume in 1 second < 50% of predicted), non-CF bronchiectasis
- **CAUTIONS** Asthma, haemoptysis
- **INTERACTIONS** → Appendix 1 (mannitol).
- **SIDE-EFFECTS**
  - **Common or very common** Cough, haemoptysis, headache, pharyngolaryngeal pain, throat irritation, vomiting, wheezing
  - **Uncommon** Acne, arthralgia, bronchospasm, dizziness, dysphonia, dysphonia, ear pain, eructation, flatulence, gastro-oesophageal reflux disease, glossodynia, hyperventilation, influenza-like illness, malaise, nausea, oral candidiasis, pharyngitis, pruritis, pyrexia, rash, rhinorrhoea, stomatitis, transient insomnia
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Manufacturer advises avoid.
- **PRE-TREATMENT SCREENING** Patients must be assessed for bronchial hyperresponsiveness to inhaled mannitol before starting the therapeutic dose regimen; an initiation dose assessment must be carried out under medical supervision—for details of the initiation dose regimen, consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** The dose should be administered 5–15 minutes after a bronchodilator and before physiotherapy; the second daily dose should be taken 2–3 hours before bedtime.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer mannitol inhalation powder.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - Mannitol dry powder for inhalation for treating cystic fibrosis (November 2012) NICE TA266

Mannitol dry powder for inhalation is recommended as an option for treating cystic fibrosis in adults:
- who cannot use dornase alfa (rhDNase) because of inability, intolerance or inadequate response to dornase alfa (rhDNase), and
- whose lung function is rapidly declining (forced expiratory volume in 1 second decline greater than 2% annually), and
- for whom other osmotic agents are not considered appropriate. www.nice.org.uk/TA266

**Scottish Medicines Consortium (SMC) Decisions**
The Scottish Medicines Consortium, has advised (November 2013) that mannitol (Bronchitol®) is accepted for restricted use within NHS Scotland for the treatment of cystic fibrosis in adults aged 18 years and over as an add-on therapy to best standard of care. Mannitol is restricted to patients who are not currently using dornase alfa due to lack of response, intolerance, or ineligibility and have rapidly declining lung function and in whom other osmotic agents are considered unsuitable.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order
respiratory system is particularly useful in children. being harmless and inexpensive; drowsiness which may reflect their main mode of action. preparations on sale to the public; all tend to cause suppressant component of many compound cough effects.

methadone hydrochloride linctus should be avoided because contraindicated because they induce sputum retention and pholcodine p. 259 are not generally recommended in children and should be avoided in children under 6 years.

mhra/chm advice (march 2008 and february 2009)
over-the-counter cough and cold medicines for children children under 6 years should not be given over-the-counter cough and cold medicines containing the following ingredients:
- brompheniramine, chlorphenamine maleate, diphenhydramine, doxylamine, promethazine, or tripolidine (antihistamines);
- dextromethorphan or pholcodine (cough suppressants);
- guaifenesin or ippecacuanha (expectorants);
- phenylephrine hydrochloride, pseudoephedrine hydrochloride, ephedrine hydrochloride, oxytetracycline, or xylometazoline hydrochloride (decongestants).

over-the-counter cough and cold medicines can be considered for children aged 6–12 years after basic principles of best care have been tried, but treatment should be restricted to five days or less. children should not be given more than 1 cough or cold preparation at a time because different brands may contain the same active ingredient; care should be taken to give the correct dose.

drugs used for cough and congestion not listed below; codeine phosphate, p. 360 · methadone hydrochloride, p. 436 · morphine hydrochloride, p. 367

4 cough and congestion

aromatic inhalations, cough preparations and systemic nasal decongestants

aromatic inhalations in adults
inhalations containing volatile substances such as eucalyptus oil are traditionally used and although the vapour may contain little of the additive it encourages deliberate inspiration of warm moist air which is often comforting in bronchitis; boiling water should not be used owing to the risk of scalding. inhalations are also used for the relief of nasal obstruction in acute rhinitis or sinusitis. eucalyptus with menthol p. 259 inhalation is used to relieve sinusitis affecting the maxillar antrum.

cough preparations in adults

cough suppressants

cough may be a symptom of an underlying disorder, such as asthma, gastro-oesophageal reflux disease, or rhinitis, which should be addressed before prescribing cough suppressants. cough may be a side-effect of another drug, such as an ace inhibitor, or it can be associated with smoking or environmental pollutants. cough can also have a significant habit component. when there is no identifiable cause, cough suppressants may be useful, for example if sleep is disturbed. they may cause sputum retention and this may be harmful in patients with chronic bronchitis and bronchiectasis. codeine phosphate p. 360 may be effective but it is constipating and can cause dependence;
dextromethorphan and pholcodine p. 259 have fewer side-effects.

sedating antihistamines are used as the cough suppressant component of many compound cough preparations on sale to the public; all tend to cause drowsiness which may reflect their main mode of action.

palliative care
diamorphine hydrochloride p. 361 and methadone hydrochloride p. 436 have been used to control distressing cough in terminal lung cancer although morphine p. 367 is now preferred. in other circumstances they are contraindicated because they induce sputum retention and ventilatory failure as well as causing opioid dependence. methadone hydrochloride linctus should be avoided because it has a long duration of action and tends to accumulate.

demulcent and expectorant cough preparations

demulcent cough preparations contain soothing substances such as syrup or glycerol and some patients believe that such preparations relieve a dry irritating cough. preparations such as simple linctus have the advantage of being harmless and inexpensive; paediatric simple linctus is particularly useful in children.

epectorants are claimed to promote expulsion of bronchial secretions, but there is no evidence that any drug can specifically facilitate expectoration.

compound preparations are on sale to the public for the treatment of cough and colds but should not be used in children under 6 years; the rationale for some is dubious. care should be taken to give the correct dose and to not use more than one preparation at a time.

systemic nasal decongestants

nasal decongestants for administration by mouth may not be as effective as preparations for local application but they do not give rise to rebound nasal congestion on withdrawal. pseudoephedrine hydrochloride p. 982 is available over the counter; it has few sympathomimetic effects.

aromatic inhalations in children

the use of strong aromatic decongestants (applied as rubs or to pillows) is not advised for infants under the age of 3 months. carers of young infants in whom nasal obstruction with mucus is a problem can readily be taught appropriate techniques of suction aspiration but sodium chloride 0.9% given as nasal drops is preferred; administration before feeds may ease feeding difficulties caused by nasal congestion.

cough preparations in children

the use of over-the-counter cough suppressants containing codeine phosphate p. 360 should be avoided in children under 12 years and in children of any age known to be cyp2d6 ultra-rapid metabolisers. cough suppressants containing similar opioid analgesics such as dextromethorphan and pholcodine p. 259 are not generally recommended in children and should be avoided in children under 6 years.

mhra/chm advice (march 2008 and february 2009)
over-the-counter cough and cold medicines for children children under 6 years should not be given over-the-counter cough and cold medicines containing the following ingredients:
- brompheniramine, chlorphenamine maleate, diphenhydramine, doxylamine, promethazine, or tripolidine (antihistamines);
- dextromethorphan or pholcodine (cough suppressants);
- guaifenesin or ippecacuanha (expectorants);
- phenylephrine hydrochloride, pseudoephedrine hydrochloride, ephedrine hydrochloride, oxytetracycline, or xylometazoline hydrochloride (decongestants).

over-the-counter cough and cold medicines can be considered for children aged 6–12 years after basic principles of best care have been tried, but treatment should be restricted to five days or less. children should not be given more than 1 cough or cold preparation at a time because different brands may contain the same active ingredient; care should be taken to give the correct dose.

drugs used for cough and congestion not listed below; codeine phosphate, p. 360 · methadone hydrochloride, p. 436 · morphine hydrochloride, p. 367

citric acid
(formulated as simple linctus)

indications and dose

cough
by mouth
- adult: 5 ml 3–4 times a day, this dose is for simple linctus, bp (2.5%)
\textbf{Prescribing and dispensing information} Flavours of oral liquid formulations may include anise. When prepared extemporaneously, the BP states Simple Linctus, BP consists of citric acid monohydrate 2.5%, in a suitable vehicle with an anise flavour.

\textbf{Medicinal forms}
There can be variation in the licensing of different medicines containing the same drug.

\textbf{Oral solution}
- **Citric acid (Non-proprietary)**
  - Citric acid monohydrate 6.25 mg per 1 ml Simple linctus
  - 200 ml GSK £0.93 DT price = £0.92
  - 2000 ml GSK £3.20

\section*{Menthol and Derivatives}

\textbf{Eucalyptus with menthol}

\textbf{Indications and dose}

\textit{Aromatic inhalation for relief of nasal congestion}

\textbf{By inhalation}
- Adult: Add one teaspoonful to a pint of hot, not boiling, water and inhale the vapour

\textbf{Prescribing and dispensing information}
When prepared extemporaneously, the BP states Benzoin Tincture, BP consists of benzoin tincture. There can be variation in the licensing of different medicines containing the same drug.

\textbf{Inhalation vapour}
- **Eucalyptus with menthol (Non-proprietary)**
  - Eucalyptus oil 100 microlitre per 1 ml, Menthol 20 mg per 1 ml
  - light 70 mg per 1 ml, Menthol 20 mg per 1 ml

\subsection*{Opioids}

\textbf{Pholcodine}

\textbf{Indications and dose}

\textit{Dry cough}

\textbf{By mouth using linctus}
- Child: 6-11 years: 2–5 mg 3–4 times a day
- Child: 12-17 years: 5–10 mg 3–4 times a day
- Adult: 5–10 mg 3–4 times a day

\textbf{Prescribing and dispensing information}
When prepared extemporaneously, the BP states Pholcodine Linctus, BP consists of pholcodine 400 microgram per 1 ml in a suitable flavoured vehicle, containing citric acid monohydrate 1% and Pholcodine Linctus, Strong, BP consists of pholcodine 10 mg/5 ml in a suitable flavoured vehicle, containing citric acid monohydrate 2%.

\textbf{Medicinal forms}
There can be variation in the licensing of different medicines containing the same drug.

\textbf{Oral solution}
- **Pholcodine (Non-proprietary)**
  - Pholcodine 1 mg per 1 ml Pholcodine 5mg/5ml linctus | 200 ml £1.28 DT price = £1.25 Schedule 5 (CD Inv)
  - Pholcodine Sng/5ml linctus sugar free (sugar-free) | 200 ml £2.75 DT price = £1.27 Schedule 5 (CD Inv) (sugar-free) | 2000 ml £11.70 Schedule 5 (CD Inv)
  - Pholcodine 2 mg per 1 ml Pholcodine 10mg/5ml linctus strong sugar free (sugar-free) | 2000 ml £10.19 DT price = £10.19 Schedule 5 (CD Inv)
  - Pholcodine 10mg/5ml linctus strong | 200 ml £1.61 Schedule 5 (CD Inv)
  - Galenphol (Thornton & Ross Ltd)
    - Pholcodine 400 microgram per 1 ml Galenphol Paediatric 2mg/5ml linctus (sugar-free) | 2000 ml £4.50 DT price = £4.50 Schedule 5 (CD Inv)
    - Pholcodine 1 mg per 1 ml Galenphol 5mg/5ml linctus (sugar-free) | 2000 ml £8.50 Schedule 5 (CD Inv)
    - Pholcodine 2 mg per 1 ml Galenphol Strong 10mg/5ml linctus (sugar-free) | 2000 ml £9.88 DT price = £9.19 Schedule 5 (CD Inv)
  - Brands may include Covonia Dry Cough, Pavacol-D

\section*{Resins}

\textbf{Benzoin tincture}

\textbf{(Friars’ Balsam)}

\textbf{Indications and dose}

\textit{Aromatic inhalation for relief of nasal congestion}

\textbf{By inhalation}
- Child: Add 5 mL to a pint of hot, not boiling, water and inhale the vapour; repeat after 4 hours if necessary
- Adult: Add 5 mL to a pint of hot, not boiling, water and inhale the vapour; repeat after 4 hours if necessary

\textbf{Side-effects}
Allergic contact dermatitis

\textbf{Prescribing and dispensing information}
Tincture, balsamic acids approx. 4.5%. When prepared extemporaneously, the BP states Benzoin Tincture, Compound, BP consists of balsamic acids approx. 4.5%. Not recommended (applied as a rub or to pillows) for infants under 3 months.
Idiopathic pulmonary fibrosis

ANTIFIBROTICS

Pirfenidone

- **DRUG ACTION** The exact mechanism of action of pirfenidone is not yet understood, but it is believed to slow down the progression of idiopathic pulmonary fibrosis by exerting both antifibrotic and anti-inflammatory properties.

**INDICATIONS AND DOSE**

Treatment of mild to moderate idiopathic pulmonary fibrosis (initiated under specialist supervision)

- **BY MOUTH**
  - Adult: Initially 267 mg 3 times a day for 7 days, then increased to 534 mg 3 times a day for 7 days, then increased to 801 mg 3 times a day
  - **Dose adjustments due to interactions**
    - Caution with concomitant use with ciprofloxacin—reduce dose of pirfenidone to 534 mg three times daily with high-dose ciprofloxacin (750 mg twice daily).
    - Caution with concomitant use of drugs known to cause photosensitivity—if photosensitivity reaction or rash occurs, dose adjustment or treatment interruption may be required (consult product literature).

- **CONTRA-INDICATIONS** Cigarette smoking

- **CAUTIONS**
  - **CAUTIONS, FURTHER INFORMATION**
    - **Photosensitivity** Avoid exposure to direct sunlight—if photosensitivity reaction or rash occurs, dose adjustment or treatment interruption may be required (consult product literature).
  - **Treatment interruption** If treatment is interrupted for less than 14 consecutive days, the dose can be resumed at the previous daily dose without titration.
  - **INTERACTIONS** → Appendix 1 (pirfenidone).

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal discomfort - anorexia - arthralgia - constipation - diarrhoea - dizziness - dry skin - dysgeusia - dyspepsia - erythema - flatulence - gastritis - gastro-oesophageal reflux disease - headache - hot flush - insomnia - malaise - myalgia - nausea - non-cardiac chest pain - photosensitivity reaction - pruritus - raised hepatic enzymes - rash - somnolence - upper respiratory tract infection - urinary tract infection - vomiting - weight loss
  - **Rare** Raised bilirubin in combination with raised hepatic transaminases

**SIDE-EFFECTS, FURTHER INFORMATION**

Gastrointestinal side-effects may require dose reduction or treatment interruption—consult product literature.

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Use with caution in mild to moderate hepatic impairment, particularly if concomitant use of CYP1A2 inhibitors. Avoid use in severe hepatic impairment.

- **RENAL IMPAIRMENT** Avoid use if eGFR less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**
  - Monitor for weight loss.
  - Test liver function before treatment, then at monthly intervals for the next 6 months, and then every 3 months thereafter; review if abnormal liver function tests—dose reduction, treatment interruption or discontinuation may be required (consult product literature).

- **PATIENT AND CARER ADVICE** Dizziness or malaise may affect performance of skilled tasks (e.g. driving).

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - Pirfenidone for treating idiopathic pulmonary fibrosis (April 2013) NICE TA282
      - Pirfenidone is recommended as an option for treating idiopathic pulmonary fibrosis only if:
        - the patient has a forced vital capacity (FVC) between 50% and 80% predicted, and
        - the manufacturer provides pirfenidone with the discount agreed in the patient access scheme.Treatment should be discontinued if there is evidence of disease progression, defined as a decline in predicted FVC of 10% or more within any 12 month period.
      - Patients currently receiving pirfenidone that is not within NHS Scotland for the treatment of mild to moderate idiopathic pulmonary fibrosis. Pirfenidone is restricted for use in patients with a predicted forced vital capacity less than or equal to 80%, and only whilst pirfenidone is available at the price agreed in the patient access scheme.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Liquid**
  - **CAUTIONARY AND ADVISORY LABELS**
    - 15
      - BENZIIN TINCTURE (Non-proprietary)
        - Balsamic acids 16.5 mg per 1 ml Benzin tincture | 500 ml (£12.62–£22.78 DT price = £12.62)
  - **RENAL IMPAIRMENT**
    - **BREAST FEEDING**
      - Manufacturer advises avoid—no information available.

6 Respiratory depression, respiratory distress syndrome and apnoea

Respiratory stimulants

Respiratory stimulants (analeptic drugs) have a limited place in the treatment of ventilatory failure in patients with chronic obstructive pulmonary disease. They are effective only when given by intravenous injection or infusion and have a short duration of action. Their use has largely been replaced by ventilatory support including nasal intermittent positive pressure ventilation. However, occasionally when
ventilatory support is contra-indicated and in patients with hypercapnic respiratory failure who are becoming drowsy or comatose, respiratory stimulants in the short term may arouse patients sufficiently to co-operate and clear their secretions. Respiratory stimulants can also be harmful in respiratory failure since they stimulate non-respiratory as well as respiratory muscles. They should only be given under expert supervision in hospital and must be combined with active physiotherapy. There is at present no oral respiratory stimulant available for long-term use in chronic respiratory failure.

**RESPIRATORY STIMULANTS**

**Doxapram hydrochloride**

**INDICATIONS AND DOSE**

**Postoperative respiratory depression**

**INITIALLY BY INTRAVENOUS INJECTION**

▶ Adult: Initially 1–1.5 mg/kg, to be administered over at least 30 seconds, repeated if necessary after intervals of one hour, alternatively (by intravenous infusion) 2–3 mg/minute, adjusted according to response

**Acute respiratory failure**

**BY INTRAVENOUS INFUSION**

▶ Adult: 1.5–4 mg/minute, adjusted according to response, to be given concurrently with oxygen and whenever possible monitor with frequent measurement of blood gas tensions

**CONTRA-INDICATIONS** Cerebral oedema · cerebrovascular accident · coronary artery disease · epilepsy and other convulsive disorders · hyperthyroidism · physical obstruction of respiratory tract · severe hypertension · status asthmaticus

**CAUTIONS** Give with beta₂ agonist in bronchoconstriction · give with oxygen in severe irreversible airways obstruction or severely decreased lung compliance (because of increased work load of breathing) · hypertension · impaired cardiac reserve · phaeochromocytoma

**INTERACTIONS** → Appendix 1 (doxapram).

**SIDE-EFFECTS** Arrhythmias · bradycardia · bronchospasm · chest pain · confusion · convulsions · cough · dizziness · dyspnoea · extrasystoles · flushing · hallucination · headache · hyperactivity · hypertension · incontinence · laryngospasm · muscle spasms · nausea · perineal warmth · pyrexia · tachycardia · urinary retention · vomiting

**PREGNANCY** No evidence of harm, but manufacturer advises avoid unless benefit outweighs risk.

**HEPATIC IMPAIRMENT** Use with caution.

**MONITORING REQUIREMENTS** Frequent arterial blood gas and pH measurements are necessary during treatment to ensure correct dosage.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

▶ **DOXAPRAM HYDROCHLORIDE** (Non-proprietary)

Doxapram hydrochloride 20 mg per 1 ml Doxapram 100mg/5ml solution for injection ampoules | 5 ampoule [PMS] £30.00–£110.00

**Infusion**

▶ **DOXAPRAM HYDROCHLORIDE** (Non-proprietary)

Doxapram hydrochloride 2 mg per 1 ml Doxapram 1g/500ml infusion bags | 1 bag [PMS] no price available
Chapter 4

Nervous system

1 Dementia

Dementia

Acetylcholinesterase inhibiting drugs are used in the treatment of Alzheimer’s disease, specifically for mild to moderate disease. Rivastigmine p. 264 is also licensed for mild to moderate dementia associated with Parkinson’s disease. The evidence to support the use of these drugs relates to their cognitive enhancement.

Treatment with drugs for dementia should be initiated and supervised only by a specialist experienced in the management of dementia.

Benefit is assessed by repeating the cognitive assessment at around 3 months. Such assessment cannot demonstrate how the disease may have progressed in the absence of treatment but it can give a good guide to response. Up to half the patients given these drugs will show a slower rate of deterioration occurs during this short period, consideration should be given to restarting therapy.

ANTICHOLINESTERASES

Donepezil hydrochloride

- **DRUG ACTION** Donepezil is a reversible inhibitor of acetylcholinesterase.

- **INDICATIONS AND DOSE**
  - **Mild to moderate dementia in Alzheimer’s disease**
  - **BY MOUTH**
    - Adult: Initially 5 mg once daily for one month, then increased if necessary up to 10 mg daily, doses to be given at bedtime

- **CAUTIONS** Asthma · chronic obstructive pulmonary disease · sick sinus syndrome · supraventricular conduction abnormalities · susceptibility to peptic ulcers

- **INTERACTIONS** → Appendix 1 (parasympathomimetics). Caution with concomitant antipsychotic treatment—increased risk of neuroleptic malignant syndrome.

- **SIDE-EFFECTS**
  - Common or very common Abnormal dreams · aggression · agitation · anorexia · diarrhoea · dizziness · fatigue · hallucinations · headache · insomnia · muscle cramps · nausea · pruritus · rash · syncope · urinary incontinence · vomiting
  - Uncommon Bradycardia · duodenal ulcers · gastric ulcers · gastro-intestinal haemorrhage · seizures
  - Rare AV block · extrapyramidal symptoms · hepatitis · potential for bladder outflow obstruction · sino-atrial block
  - Very rare Neuroleptic malignant syndrome

- **SIDE-EFFECTS, FURTHER INFORMATION**
Acetylcholinesterase inhibitors can cause unwanted dose-related cholinergic effects and should be started at a low dose and the dose increased according to response and tolerability.

- **HEPATIC IMPAIRMENT** Caution in mild to moderate impairment. No information available for severe impairment.

- **DIRECTIONS FOR ADMINISTRATION** Donepezil orodispersible tablet should be placed on the tongue, allowed to disperse, and swallowed.

- **PATIENT AND CARER ADVICE** Patient or carers should be given advise on how to administer donepezil hydrochloride orodispersible tablets.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - Donepezil, galantamine, rivastigmine, and memantine for the treatment of Alzheimer’s disease (March 2011) NICE TA217
    - These drugs can be used for the treatment of mild to moderate Alzheimer’s disease. Treatment should only be prescribed under the following conditions:
      - Alzheimer’s disease must be diagnosed and treatment initiated by a specialist; treatment can be continued by general practitioners under a shared-care protocol;
      - the carer’s view of the condition should be sought before and during treatment;
● treatment should continue only if it is considered to have a worthwhile effect on cognitive, global, functional, or behavioural symptoms.
Healthcare professionals should not rely solely on assessment scales to determine the severity of Alzheimer’s disease when the patient has learning or other disabilities, or other communication difficulties. www.nice.org.uk/TA217

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet
▷ Donepezil hydrochloride (Non-proprietary)
Donepezil hydrochloride 5 mg | 28 tablet | £59.85 DT price = £1.31
Donepezil hydrochloride 10 mg | 28 tablet | £83.89 DT price = £1.65

Aricept
Donepezil hydrochloride 5 mg | 28 tablet | £59.85 DT price = £1.31
Donepezil hydrochloride 10 mg | 28 tablet | £83.89 DT price = £1.65

Orodispersible tablet
▷ Donepezil hydrochloride (Non-proprietary)
Donepezil hydrochloride 5 mg | 28 tablet | £59.85 DT price = £1.31
Donepezil hydrochloride 10 mg | 28 tablet | £83.89 DT price = £1.65

Aricept Evess
Donepezil hydrochloride 5 mg | 28 tablet | £83.89 DT price = £1.65

Donepezil hydrochloride 10 mg | 28 tablet | £83.89 DT price = £1.65

Oral solution
▷ Donepezil hydrochloride (Non-proprietary)
Donepezil hydrochloride 1 mg per 1 ml | 150 ml | £37.50 DT price = £1.57

Galantamine
● DRUG ACTION
Galantamine is a reversible inhibitor of acetylcholinesterase and it also has nicotinic receptor agonist properties.

INDICATIONS AND DOSE
Mild to moderate dementia in Alzheimer’s disease
By mouth using Immediate-release medicines
Adult: Initially 4 mg twice daily for 4 weeks, increased to 8 mg twice daily for 4 weeks; maintenance 8–12 mg twice daily
Mild to moderate dementia in Alzheimer’s disease
By mouth using Modified-release capsules
Adult: Initially 8 mg once daily for 4 weeks, increased to 16 mg once daily for 4 weeks; maintenance 16–24 mg daily

CAUTIONS
Asthma - avoid in gastrointestinal obstruction • avoid in urinary retention • avoid whilst recovering from bladder surgery • avoid whilst recovering from gastrointestinal surgery • cardiac disease • chronic obstructive pulmonary disease • congestive heart failure • electrolyte disturbances • history of seizures • pulmonary infection • sick sinus syndrome • supraventricular conduction abnormalities • susceptibility to peptic ulcers • unstable angina

INTERACTIONS
Appendix 1 (parasympathomimetics).

SIDE-EFFECTS
Common or very common Abdominal pain • anorexia • bradycardia • depression • diarrhoea • dizziness • drowsiness • dyspepsia • hallucination • headache • hypertension • malaise • muscle spasm • nausea • sweating • syncope • tremor • vomiting • weight loss
Uncommon Arrhythmias • blurring vision • dehydration • first-degree AV block • flushing • hypotension • muscular weakness • palpitation • paraesthesia • seizures • taste disturbance • tinnitus
Rare Exacerbation of Parkinson’s disease • hepatitis

Nervous system
Dementia 263
Rivastigmine

● **DRUG ACTION** Rivastigmine is a reversible non-competitive inhibitor of acetylcholinesterases.

**INDICATIONS AND DOSE**

**Mild to moderate dementia in Alzheimer’s disease**

**BY MOUTH**

> Adult: Initially 1.5 mg twice daily, increased in steps of 1.5 mg twice daily; dose to be increased at intervals of at least 2 weeks according to response and tolerability; usual dose 3–6 mg twice daily (max. per dose 6 mg twice daily), if treatment interrupted for more than several days, titrate from 1.5 mg twice daily

**BY TRANSDERMAL APPLICATION USING PATCHES**

> Adult: Apply 4.6 mg/24 hours daily for at least 4 weeks, increased if tolerated to 9.5 mg/24 hours daily for a further 6 months, then increased if necessary to 13.3 mg/24 hours daily, increase to 13.3 mg/24 hours patch if well tolerated and cognitive deterioration or functional decline demonstrated; use caution in patients with body-weight less than 50 kg, if treatment interrupted for more than 3 days, titrate from 4.6 mg/24 hours patch

**Mild to moderate dementia in Parkinson’s disease**

**BY MOUTH**

> Adult: Initially 1.5 mg twice daily, increased in steps of 1.5 mg twice daily, dose to be increased at intervals of at least 2 weeks according to response and tolerability; usual dose 3–6 mg twice daily (max. per dose 6 mg twice daily), if treatment interrupted for more than several days, titrate from 1.5 mg twice daily.

**Dose equivalence and conversion**

When switching from oral to transdermal therapy, patients taking 3–6 mg by mouth daily should initially switch to 4.6 mg/24 hours patch, then titrate as above. Patients taking 9 mg by mouth daily should switch to 9.5 mg/24 hours patch if oral dose stable and well tolerated; if oral dose not stable or well tolerated, patients should switch to 4.6 mg/24 hours patch, then titrate as above. Patients taking 12 mg by mouth daily should switch to 9.5 mg/24 hours patch. The first patch should be applied on the day following the last oral dose.

**CAUTIONS** Bladder outflow obstruction - conduction abnormalities - duodenal ulcers - gastric ulcers - history of asthma - history of chronic obstructive pulmonary disease - history of seizures - risk of fatal overdose with patch administration errors - sick sinus syndrome - susceptibility to ulcers

**INTERACTIONS** → Appendix 1 (parasympathomimetics).

**SIDE-EFFECTS**

> **Common or very common** Abdominal pain - agitation - anorexia - anxiety - bradycardia - confusion - diarrhoea - dizziness - drowsiness - dyspepsia - extrapyramidal symptoms - headache - increased salivation - insomnia - malaise - nausea - sweating - tremor - urinary incontinence - vomiting - weight loss - worsening of Parkinson’s disease

> **Uncommon** Atrial fibrillation - AV block - depression - syncpe

> **Rare** Angina - duodenal ulceration - gastric ulceration - rash - seizures

> **Very rare** Gastro-intestinal haemorrhage - hallucinations - hypertension - pancreatitis - tachycardia

**SIDE-EFFECTS, FURTHER INFORMATION**

Transdermal administration less likely to cause gastro-intestinal disturbance.

Treatment should be interrupted if gastro-intestinal side-effects occur and withheld until their resolution—titrate dose if necessary. Acetylcholinesterase inhibitors can cause unwanted dose-related cholinergic effects and should be started at a low dose and the dose increased according to response and tolerability.

**Hepatic Impairment** Titrate according to individual tolerability in mild to moderate impairment. Use with caution in severe impairment—no information available.

**Renal Impairment** Titrate according to individual tolerability.

**Monitoring Requirements** Monitor body-weight.

**DIRECTIONS FOR ADMINISTRATION**

> With transdermal use Apply patches to clean, dry, non-hairy, non-irritated skin on back, upper arm, or chest, removing after 24 hours and sitting a replacement patch on a different area (avoid using the same area for 14 days).

**PATIENT AND CARER ADVICE**

**EXELON® TRANSDERMAL PATCHES.** Adhere patients and carers of patch administration instructions, particularly to remove the previous day’s patch before applying the new patch—consult product literature.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

> Donepezil, galantamine, rivastigmine, and memantine for the treatment of Alzheimer’s disease (March 2011) NICE TA217

See Donepezil, p. 262. www.nice.org.uk/TA217

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (October 2007) that Exelon® patches should be restricted for use in patients with moderately severe Alzheimer’s disease under the conditions of the NICE guidance (September 2007) and when a transdermal patch is an appropriate choice of formulation.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

### NMDA RECEPTOR ANTAGONISTS

#### Memantine hydrochloride

**DRUG ACTION** Memantine is a glutamate receptor antagonist.

### INDICATIONS AND DOSE

**Moderate to severe dementia in Alzheimer’s disease**

**BY MOUTH**

- Adult: Initially 5 mg once daily, increased in steps of 5 mg at weekly intervals; maximum 20 mg per day

### CAUTIONS

- History of convulsions
- INTERACTIONS → Appendix 1 (memantine).

### SIDE-EFFECTS

- Common or very common Constipation, dizziness, drowsiness, dyspnoea, headache, hypertension
- Uncommon Abnormal gait, confusion, fatigue, hallucinations, heart failure, thrombosis, vomiting
- Very rare Seizures
- Frequency not known Depression, pancreatitis, psychosis, suicidal ideation
- HEPATIC IMPAIRMENT Avoid in severe impairment—no information available.

### RENAL IMPAIRMENT

Reduce dose to 10 mg daily if eGFR 30–49 mL/minute/1.73 m²; if well tolerated after at least 7 days can be increased in steps to 20 mg daily; reduce dose to 10 mg daily if eGFR 5–29 mL/minute/1.73 m². Avoid if eGFR less than 5 mL/minute/1.73 m².

### DIRECTIONS FOR ADMINISTRATION

Oral solution should be dosed onto a spoon or into a glass of water.

### NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Transdermal patch**

| RIVASTIGMINE (Non-proprietary) | Rivastigmine 4.6 mg per 24 hour | Transdermal patch | 30 patch (PBM) £77.97 DT price = £7.97 |
|--------------------------------|-------------------------------|-----------------|---------------------------------|-----------------|
| Rivastigmine 9.5 mg per 24 hour | Rivastigmine 9.5mg/24hours transdermal patches | 30 patch (PBM) £31.69 DT price = £3.16 |
| Exelon (Novartis Pharmaceuticals UK Ltd) | Rivastigmine 4.6 mg per 24 hour | Exelon 4.6mg/24hours transdermal patches | 30 patch (PBM) £31.69 DT price = £31.69 |
| Rivastigmine 9.5 mg per 24 hour | Exelon 9.5mg/24hours transdermal patches | 30 patch (PBM) £77.97 DT price = £7.97 |
| Rivastigmine 13.3 mg per 24 hour | Exelon 13.3mg/24hours transdermal patches | 30 patch (PBM) £77.97 DT price = £7.97 |

Brands may include Alzest, Eluden, Prometax, Rivatev, Somnition, Vokez,

**Ebixa** (Lundbeck Ltd)

- Memantine hydrochloride 5 mg | Ebixa 5mg tablets | 7 tablet (PBM) no price available
- Memantine hydrochloride 10 mg | Ebixa 10mg tablets | 7 tablet (PBM) no price available | 28 tablet (PBM) £34.50 DT price = £1.86 | 56 tablet (PBM) £69.01 | 112 tablet (PBM) £138.01
- Memantine hydrochloride 15 mg | Ebixa 15mg tablets | 7 tablet (PBM) no price available
- Memantine hydrochloride 20 mg | Ebixa 20mg tablets | 7 tablet (PBM) no price available | 28 tablet (PBM) £69.01 DT price = £2.63

- Ebixa (Lundbeck Ltd) Ebixa tablets treatment initiation pack | 28 tablet (PBM) £43.13 |

Brands may include Marixa, Nondatine

### Oral solution

**MEMANTINE HYDROCHLORIDE (Non-proprietary)**

- Memantine hydrochloride 10 mg/ml oral solution sugar free (sugar-free) | 50 ml (PBM) £55.00–£62.36 DT price = £62.24 (sugar-free) | 100 ml (PBM) £110.00–£124.72
- Ebixa (Lundbeck Ltd) Memantine hydrochloride 10 mg per 1 ml | Ebixa 5mg/0.5ml pump actuation oral solution (sugar-free) | 50 ml (PBM) £61.61 DT price = £62.24 (sugar-free) | 100 ml (PBM) £123.23

---

# 2 Mental health disorders

## 2.1 Anxiety

### Drugs used for Anxiety not listed below;

- Duloxetine, p. 288
- Escitalopram, p. 285
- Moclobemide, p. 283
- Oxprenolol hydrochloride, p. 145
- Paroxetine, p. 287
- Perixazine, p. 308
- Perphenazine, p. 308
- Pregabalin, p. 400
- Trazadone hydrochloride, p. 291
- Trifluoperazine, p. 310
- Venlafaxine, p. 289

---

### CARBAMATES

#### Meprobamate

**INDICATIONS AND DOSE**

Short-term use in anxiety—not recommended

**BY MOUTH**

- Adult: 400 mg 3–4 times a day
- Elderly: Up to 200 mg 3–4 times a day

### Important safety information

The European Medicines Agency has recommended (January 2012) the suspension of all marketing authorisations for meprobamate because the risks, particularly of serious CNS side-effects, outweigh the benefits.

### CONTRA-INDICATIONS

Acute porphyrias p. 864 - acute pulmonary insufficiency - respiratory depression

### CAUTIONS

Abrupt withdrawal (may precipitate convulsions) - avoid prolonged use - debilitated - elderly - epilepsy (may induce seizures) - history of alcohol abuse - history of drug abuse - marked personality disorder - muscle weakness - respiratory disease

### INTERACTIONS → Appendix 1 (anxiolytics and hypnotics).

### SIDE-EFFECTS

- Common or very common Amnesia - ataxia (especially in the elderly) - confusion (especially in the elderly) - dependence - drowsiness - lightheadedness - marked personality disorder - muscle weakness - paradoxical increase in aggression
- Uncommon Changes in libido - dizziness - dysarthria - gastro-intestinal disturbances - gynaecomastia - headache - hypotension - incontinence - salivation changes -
slurred speech, tremor, urinary retention, vertigo, visual disturbances

- **Rare** Agranulocytosis, apnoea, blood disorders, jaundice, rashes, respiratory depression, skin reactions
- **Frequency not known** CNS effects, paradoxical excitement, paraesthesia, weakness

- **PREGNANCY** Avoid if possible.
- **BREAST FEEDING** Avoid. Concentration in milk may exceed maternal plasma concentrations fourfold and may cause drowsiness in infant.
- **HEPATIC IMPAIRMENT** Can precipitate coma.
- **RENAL IMPAIRMENT** Increased cerebral sensitivity. Start with small doses in severe impairment.
- **PATIENT AND CARER ADVICE** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.
- **LESS SUITABLE FOR PRESCRIBING** Meprobamate is less suitable for prescribing.

**HYPNOTICS AND SEDATIVES (BENZODIAZEPINE)**

### Benzodiazepines

- **CONTRA-INDICATIONS** Acute pulmonary insufficiency, marked neuromuscular respiratory weakness, sleep apnoea syndrome, unstable myasthenia gravis
- **CAUTIONS** Avoid prolonged use (and abrupt withdrawal thereafter), debilitated patients (reduce dose), elderly (reduce dose), history of alcohol dependence or abuse, history of drug dependence or abuse, myasthenia gravis, respiratory disease

**CAUTIONS, FURTHER INFORMATION**

- **Paradoxical effects** A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

- **INTERACTIONS** → Appendix 1 (anxiolytics and hypnotics).

**SIDE-EFFECTS**

- **Overdose** Benzodiazepines taken alone cause drowsiness, ataxia, dysarthria, nystagmus, and occasionally respiratory depression, and coma. For details on the management of poisoning, see Benzodiazepines, under Emergency treatment of poisoning p. 1123.
- **PREGNANCY** Risk of neonatal withdrawal symptoms when used during pregnancy. Avoid regular use and use only if there is a clear indication such as seizure control. High doses administered during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression.
- **RENAL IMPAIRMENT** Increased cerebral sensitivity to benzodiazepines.
- **PATIENT AND CARER ADVICE** Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including benzodiazepines, see Drugs and driving under Guidance on prescribing p. 1.

### Alprazolam

**INDICATIONS AND DOSE**

**Short-term use in anxiety**

**BY MOUTH**

- **Adult** 250–500 micrograms 3 times a day, increased if necessary up to 3 mg daily, for debilitated patients, use elderly dose
- **Elderly** 250 micrograms 2–3 times a day, increased if necessary up to 3 mg daily

- **CONTRA-INDICATIONS** Chronic psychosis, hyperkinesia, not for use alone to treat depression (or anxiety associated with depression), obsessional states, phobic states, respiratory depression
- **CAUTIONS** Muscle weakness, organic brain changes, personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence

- **SIDE-EFFECTS**
  - **Common or very common** Amnesia, ataxia (especially in the elderly), confusion (especially in the elderly), dependence, drowsiness the next day, lightheadedness the next day, muscle weakness, paradoxical increase in aggression
  - **Uncommon** Changes in libido, dizziness, dysarthria, gastro-intestinal disturbances, gynaecomastia, headache, hypotension, incontinence, salivation changes, slurred speech, tremor, urinary retention, vertigo, visual disturbances
  - **Rare** Apnoea, blood disorders, jaundice, respiratory depression, skin reactions
- **BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.
- **HEPATIC IMPAIRMENT** Can precipitate coma. If treatment is necessary, benzodiazepines with shorter half-lives (such as temazepam or oxazepam) are safer. Start with smaller initial doses or reduce dose. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Start with small doses in severe impairment.
- **PATIENT AND CARER ADVICE** May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NHS restrictions** Alprazolam tablets are not prescribable under the NHS.

**MEDICINAL FORMS**

- **Tablet**
  - **CAUTIONARY AND ADVISORY LABELS 2**
  - **Xanax (Pfizer Ltd)** Meprobamate 400 mg Meprobamate 400 mg tablets | 84 tablet | £197.63–£200.54 DT price | £200.54 Schedule 3 (CD No Register)

**Chlordiazepoxide hydrochloride**

**INDICATIONS AND DOSE**

**Short-term use in anxiety**

**BY MOUTH**
- Adult: 10 mg 3 times a day, increased if necessary to 60–100 mg daily in divided doses, for debilitated patients, use elderly dose
- Elderly: 5 mg 3 times a day, increased if necessary to 30–50 mg daily in divided doses

**Treatment of alcohol withdrawal in moderate dependence**

**BY MOUTH**
- Adult: 10–30 mg 4 times a day, dose to be gradually reduced over 5–7 days, consult local protocols for titration regimens

**Treatment of alcohol withdrawal in severe dependence**

**BY MOUTH**
- Adult: 10–50 mg 4 times a day and 10–40 mg as required for the first 2 days, dose to be gradually reduced over 7–10 days, consult local protocols for titration regimens; maximum 250 mg per day

**SIDE-EFFECTS**

- **Common or very common**
  - Amnesia
  - Ataxia
  - Confusion
  - Drowsiness
  - Impaired concentration
  - Impaired reaction time
  - Insomnia
  - Nervousness
  - Paradoxical increase in agitation
  - Respiratory depression
  - Sedation

- **Uncommon**
  - Sedative effects
  - Somnolence

- **Rare**
  - Blood disorders
  - Dizziness
  - Headache
  - Impaired sexual function
  - Tachycardia

**Capsule**

**Contraindications**

**Caution**

**Advisory labels**

**Price**

**NHS restrictions**

**Diazepam**

**INDICATIONS AND DOSE**

**Muscle spasm of varied aetiology**

**BY MOUTH**
- Adult: 2–15 mg daily in divided doses, then increased if necessary to 60 mg daily, adjusted according to response, dose only increased in spastic conditions

**Acute muscle spasm**

**BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION**
- Adult: 10 mg, then 10 mg after 4 hours if required, intravenous injection to be administered into a large vein at a rate of no more than 5 mg/minute

**Tetanus**

**BY INTRAVENOUS INJECTION**
- Child: 100–300 micrograms/kg every 1–4 hours
- Adult: 100–300 micrograms/kg every 1–4 hours

**BY INTRAVENOUS INFUSION OR BY NASODUODENAL TUBE**
- Child: 3–10 mg/kg, adjusted according to response, to be given over 24 hours
- Adult: 3–10 mg/kg, adjusted according to response, to be given over 24 hours

**Muscle spasm in cerebral spasticity or in postoperative skeletal muscle spasm**

**BY MOUTH**
- Child 1-11 months: Initially 250 micrograms/kg twice daily
- Child 1-4 years: Initially 2.5 mg twice daily
- Child 5-11 years: Initially 5 mg twice daily
- Child 12-17 years: Initially 10 mg twice daily; maximum 40 mg per day

**Anxiety**

**BY MOUTH**
- Adult: 2 mg 3 times a day, then increased if necessary to 15–30 mg daily in divided doses, for debilitated patients, use elderly dose
- Elderly: 1 mg 3 times a day, then increased if necessary to 7.5–15 mg daily in divided doses

**Insomnia associated with anxiety**

**BY MOUTH**
- Adult: 5–15 mg daily, to be taken at bedtime

**Severe acute anxiety / Control of acute panic attacks / Acute alcohol withdrawal**

**INITIALLY BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION**
- Adult: 10 mg, then (by intramuscular injection or by intravenous injection) 10 mg after at least 4 hours if required, intravenous injection to be administered into a large vein, at a rate of not more than 5 mg/minute

**continued**
Acute anxiety and agitation

**BY RECTUM**
- Adult: 500 micrograms/kg, then 500 micrograms/kg after 12 hours as required
- Elderly: 250 micrograms/kg, then 250 micrograms/kg after 12 hours as required

**Acute drug-induced dystonic reactions**

**BY INTRAVENOUS INJECTION**
- Adult: 5–10 mg, then 5–10 mg after at least 10 minutes as required, to be administered into a large vein, at a rate of not more than 5 mg/minute

**Premedication**

**BY MOUTH**
- Adult: 2.5–5 mg, to be given 1–2 hours before procedure

**BY INTRAVENOUS INJECTION**
- Adult: 100–200 micrograms/kg, to be administered into a large vein at a rate of not more than 5 mg/minute, immediately before procedure

**Status epilepticus**

**BY INTRAVENOUS INJECTION**
- Adult: 10–20 mg, to be administered into a large vein over 2–4 minutes, immediately before procedure

**Dyspnoea associated with anxiety in palliative care**

**BY MOUTH**
- Adult: 5–10 mg daily

**Pain of muscle spasm in palliative care**

**BY MOUTH**
- Adult: 5–10 mg daily

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
- Rare
  - Changes in libido (in adults), dizziness, dysarthria, gastro-intestinal disturbances, gynaecomastia
  - Muscle weakness, ataxia (especially in the elderly)
  - Muscle weakness, ataxia (especially in the elderly)
  - Changes in libido (in children), dizziness

**Specific side-effects**

- Changes in libido
- Dizziness
- Gynaecomastia
- Paradoxical increase in aggression
- Increased risk of seizures
- Increased risk of depression
- Increased risk of psychosis
- Increased risk of irritability

**Important safety information**

**ANAESTHESIA**

- Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

**CONTRA-INDICATIONS**

- Avoid injections containing benzyl alcohol in neonates
- Chronic psychosis (in adults)
- CNS depression
- Committed airway
- Hyperventilation
- Not for use alone to treat depression (or anxiety associated with depression) (in adults)
- Obsessional states
- Phobic states
- Respiratory depression

**CAUTIONS**

**GENERAL CAUTIONS**

- Muscle weakness
- Organic brain changes
- Parenteral administration (close observation required until full recovery from sedation)
- Personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence

**SPECIFIC CAUTIONS**

- With intravenous use, high risk of venous thrombophlebitis with intravenous use (reduced by using an emulsion formulation)

**CAUTIONS, FURTHER INFORMATION**

- Special precautions for intravenous injection: When given intravenously for reversing respiratory depression with mechanical ventilation must be immediately available.

**SPECIFIC SIDE-EFFECTS**

- Life-threatening acute drug-induced dystonic reactions
- Intravenous injection
- Child: 100 micrograms/kg, repeated if necessary
- Child: 5–10 mg, repeated if necessary, to be given over 3–5 minutes
change is made to antiepileptic treatment. Status epilepticus should be treated according to the standard protocol.

Epilepsy and Pregnancy Register All pregnant women with epilepsy, whether taking medication or not, should be encouraged to notify the UK Epilepsy and Pregnancy Register (Tel: 0800 389 1246).

- **BREAST FEEDING** Present in milk, and should be avoided if possible during breast-feeding.

- **HEPATIC IMPAIRMENT** Can precipitate coma. If treatment is necessary, benzodiazepines with shorter half lives are safer, such as temazepam or oxazepam. Start with smaller initial doses or reduce dose. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Start with small doses in severe impairment.

- **DIRECTIONS FOR ADMINISTRATION**
  - With intramuscular use Diazepam is absorbed by plasctics of infusion bags and giving sets.
  - With intravenous use Emulsion formulation preferred for intravenous injection.
  - With intravenous use in children For continuous intravenous infusion of diazepam emulsion, dilute to a concentration of max. 400 micrograms/mL with Glucose 5% or 10%; max. 6 hours between addition and completion of infusion. For continuous intravenous infusion of diazepam solution, dilute to a concentration of max. 50 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%.
  - With intravenous use in adults For intravenous infusion (solution) (Diazepam, Wockhardt), give continuously in Glucose 5% or Sodium chloride 0.9%. Dilute to a concentration of not more than 10 mg in 200 mL.
  - With intravenous use in adults For intravenous infusion (emulsion) (Diazemuls®), give continuously in Glucose 5% or 10%. May be diluted to a max. concentration of 200 mg in 500 mL; max. 6 hours between addition and completion of administration. May be given via drip tubing in Glucose 5% or 10% or Sodium chloride 0.9%.
  - With intramuscular use or intravenous use in adults Solution for injection should not be diluted, except for intravenous infusion.
  - With intramuscular use in adults Only use intramuscular route when oral and intravenous routes not possible.

- **PATIENT AND CARER ADVICE** May impair judgement and increase reaction time, and so affect ability to drive or perform skilled tasks; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair performance on the following day.

  Medicines for Children leaflet: Diazepam (rectal) for stopping seizures www.medicinesforchildren.org.uk/diazepam-rectal-stopping-seizures-0

  Medicines for Children leaflet: Diazepam for muscle spasm www.medicinesforchildren.org.uk/diazepam-for-muscle-spasm

  Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned of the risks of undertaking skilled tasks (e.g. driving) afterwards. For intravenous benzodiazepines the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home afterwards. The dangers of taking alcohol should be emphasised.

- **PROFESSION SPECIFIC INFORMATION**

  Dental practitioners’ formulary Diazepam Tablets may be prescribed. Diazepam Oral Solution 2 mg/5 mL may be prescribed.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: suppository, oral suspension, oral solution

---

### Tablet

**CAUTIONARY AND ADVISORY LABELS 2, 19**

- **DIAZEPAM (Non-proprietary)**
  - Diazepam 2 mg | 2 tablet | £3.80 DT price = £1.07 Schedule 4 (CD Benz) | 1000 tablet | £135.71 Schedule 4 (CD Benz)
  - Diazepam 5 mg | 2 tablet | £6.80 DT price = £1.09 Schedule 4 (CD Benz) | 1000 tablet | £242.85 Schedule 4 (CD Benz)
  - Diazepam 10 mg | 10 tablet | £9.80 DT price = £1.23 Schedule 4 (CD Benz) | 500 tablet | £175.00 Schedule 4 (CD Benz)

**Solution for injection**

**EXCIPENTS**: May contain Benzyl alcohol, ethanol, propylene glycol

- Diazemuls (Actavis UK Ltd)
  - Diazepam 5 mg per 1 ml | Diazemuls 10mg/2ml emulsion for injection ampoules | 10 ampoule | £9.05 Schedule 4 (CD Benz)

### Enema

**CAUTIONARY AND ADVISORY LABELS 2, 19**

- **DIAZEPAM (Non-proprietary)**
  - Diazepam 2 mg per 1 ml | Diazepam 5mg RecTubes | 5 tube | £5.85 DT price = £5.85 Schedule 4 (CD Benz)
  - Diazepam 2.5mg/1.25ml rectal solution tube | 5 tube | no price available Schedule 4 (CD Benz)
  - Diazepam 2.5mg RecTubes | 5 tube | £5.65 Schedule 4 (CD Benz)
  - Diazepam 5mg/2.5ml rectal solution tube | 5 tube | £6.30 DT price = £5.85 Schedule 4 (CD Benz)
  - Diazepam 4 mg per 1 ml | Diazepam 10mg RecTubes | 5 tube | £7.35 DT price = £7.35 Schedule 4 (CD Benz)
  - Diazepam 10mg/2.5ml rectal solution tube | 5 tube | £8.00 DT price = £7.35 Schedule 4 (CD Benz)
  - Stesolid (Actavis UK Ltd)
  - Diazepam 2 mg per 1 ml | Stesolid 5mg rectal tube | 5 tube | £6.89 DT price = £5.85 Schedule 4 (CD Benz)
  - Diazepam 4 mg per 1 ml | Stesolid 10mg rectal tube | 5 tube | £8.78 DT price = £7.35 Schedule 4 (CD Benz)

### SEROTONIN RECEPTOR AGONISTS

#### Buspirone hydrochloride

**INDICATIONS AND DOSE**

**Anxiety (short-term use)**

**BY MOUTH**

- Adult: 5 mg 2–3 times a day, increased if necessary up to 45 mg daily, dose to be increased at intervals of 2–3 days; usual dose 15–30 mg daily in divided doses

- **CONTRA-INDICATIONS** Acute porphyrias p. 864 - epilepsy

- **CAUTIONS** Does not alleviate symptoms of benzodiazepine withdrawal

**CAUTIONS, FURTHER INFORMATION**

A patient taking a benzodiazepine still needs to have the benzodiazepine withdrawn gradually; it is advisable to do this before starting buspirone.

- **INTERACTIONS** > Appendix 1 (anxiolytics and hypnotics).

- **SIDE-EFFECTS**
  - Common or very common Dizziness - excitement - headache - nausea - nervousness
  - Rare Chest pain - confusion - drowsiness - dry mouth - fatigue - palpitation - seizures - sweating - tachycardia

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.
2.2 Attention deficit hyperactivity disorder

Attention deficit hyperactivity disorder

Central nervous system stimulants include the amphetamines (dexamphetamine sulfate below and lisdexamfetamine mesilate p. 271) and related drugs (e.g. methylphenidate hydrochloride p. 273). They have very few indications and in particular, should not be used to treat depression, obesity, senility, debility, or for relief of fatigue. CNS stimulants should be prescribed for children with severe and persistent symptoms of attention deficit hyperactivity disorder (ADHD), when the diagnosis has been confirmed by a specialist; children with moderate symptoms of ADHD can be treated with CNS stimulants when psychological interventions have been unsuccessful or are unavailable. Prescribing of CNS stimulants may be continued by general practitioners, under a shared-care arrangement. Treatment of ADHD often needs to be continued into adolescence, and may need to be continued into adulthood.

Drug treatment of ADHD should be part of a comprehensive treatment programme. The choice of medication should take into consideration co-morbid conditions (such as tic disorders, Tourette syndrome, and epilepsy), the adverse effect profile, potential for drug misuse, tolerance and dependance; and preferences of the patient and carers. Methylphenidate hydrochloride and atomoxetine are used for the management of ADHD; dexamphetamine sulfate and lisdexamfetamine mesilate are an alternative in children who do not respond to these drugs.

The need to continue drug treatment for ADHD should be reviewed at least annually. This may involve suspending treatment.

CNS STIMULANTS (AMPHETAMINE ISOMERS)

Dexamphetamine sulfate (Dexamphetamine sulfate)

INDICATIONS AND DOSE

Narcolepsy

BY MOUTH

• Adult: Initially 10 mg daily in divided doses, increased in steps of 10 mg every 1 week, maintenance dose to

be given in 2–4 divided doses; maximum 60 mg per day

• Elderly: Initially 5 mg daily in divided doses, increased in steps of 5 mg every 1 week, maintenance dose to be

given in 2–4 divided doses; maximum 60 mg per day

Refractory attention deficit hyperactivity disorder (initiated under specialist supervision)

BY MOUTH

• Child 6-17 years: Initially 2.5 mg 2–3 times a day, increased in steps of 5 mg daily if required, dose to be increased at weekly intervals, increased if necessary up to 1 mg/kg daily, maintenance dose to be given in 2–4 divided doses, up to 20 mg daily (40 mg daily has been required in some children)

• Adult: Initially 5 mg twice daily, dose is increased at weekly intervals according to response, maintenance dose to be given in 2–4 divided doses; maximum 60 mg per day
**Lisdexamfetamine mesilate**

**DRUG ACTION** Lisdexamfetamine is a prodrug of dexamfetamine.

**INDICATIONS AND DOSE**

**Attention deficit hyperactivity disorder refractory to methylphenidate (initiated by a specialist)**

**BY MOUTH**

- **Child 6-17 years:** Initially 30 mg once daily, increased in steps of 20 mg every week if required, dose to be taken in the morning, discontinue if response insufficient after 1 month; maximum 70 mg per day
- **Adult:** Initially 30 mg once daily, increased in steps of 20 mg every week if required, dose to be taken in the morning, discontinue if response insufficient after 1 month; maximum 70 mg per day

**UNLICENSED USE**

Not licensed for use in adults for attention deficit hyperactivity disorder.

**MONITORING REQUIREMENTS**

- Monitor growth in children.
- Monitor for aggressive behaviour or hostility during initial treatment.
- Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.

**TREATMENT CESSION** Avoid abrupt withdrawal.

**DIRECTIONS FOR ADMINISTRATION**

- With oral use in children Tablets can be halved.

**PRESCRIBING AND DISPENSING INFORMATION**

Data on safety and efficacy of long-term use not complete.

**PATIENT AND CARER ADVICE**

- **Drugs and Driving** Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

- **Monitoring requirements** following each dose adjustment, and at least every 6 months thereafter.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Methylenidate, atomoxetine and dexamfetamine for attention deficit hyperactivity disorder (ADHD) (March 2006) NICE TA98

Dexamfetamine is recommended, within its licensed indications, as an option for the management of ADHD in children and adolescents. www.nice.org.uk/TA98

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, modified-release capsule

**Tablet**

- **DEXAMFETAMINE SULFATE (Non-proprietary)**
  - Dexamfetamine sulfate 5 mg Dexamfetamine 5mg tablets | 28 tablet | £24.75 GT price + £24.75 Schedule 2 (CD)

**Oral solution**

- **DEXAMFETAMINE SULFATE (Non-proprietary)**
  - Dexamfetamine sulfate 1 mg per 1 ml Dexamfetamine 5mg/5ml oral solution sugar free (sugar-free) | 500 ml | £109.04 Schedule 2 (CD)

**CONTRA-INDICATIONS** Advanced arteriosclerosis - agitated states - hyperexcitability - hyperthyroidism - moderate hypertension - severe hypertension - symptomatic cardiovascular disease

**CAUTIONS** Anorexia - bipolar disorder - history of alcohol abuse - history of cardiac abnormalities - history of cardiovascular disease - history of drug abuse - may lower seizure threshold (discontinue if seizures occur) - psychosis - susceptibility to angle-closure glaucoma - tics - Tourette syndrome

**CAUTIONS, FURTHER INFORMATION**

- **Tics and Tourette syndrome** Discontinue use if tics occur.

**Growth restriction in children** Monitor height and weight as growth restriction may occur during prolonged therapy (drug-free periods may allow catch-up in growth but withdraw slowly to avoid inducing depression or renewed hyperactivity).

**INTERACTIONS** → Appendix 1 (sympathomimetics).

**SIDE-EFFECTS**

- **Common or very common** Abdominal cramps - aggression - decreased appetite - diarrhea - dizziness - drowsiness - dry mouth - dysphoria - growth restriction in children - headache - lable mood - malaise - mydriasis - nausea - pyrexia - sleep disturbances - tics - vomiting - weight loss

- **Uncommon** Anorexia - anxiety - depression - dermatillomania - dysphoria - hallucination - hypertension - logorrhoea - mania - palpitation - paranoia - rash - restlessness - sexual dysfunction - sweating - tachycardia - tremor - visual disturbances

- **Very rare** Angle-closure glaucoma

- **Frequency not known** Cardiomyopathy - choreoathetoid movements (in predisposed individuals) - dyskinesia (in predisposed individuals) - euphoria - seizures - Tourette syndrome (in predisposed individuals)

**Overdose** Amphetamines cause wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. See Stimulants under Emergency treatment of poisoning, p. 1123.

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING** Manufacturer advises avoid—present in human milk.

**RENAL IMPAIRMENT** Max. dose 50 mg daily in severe impairment.

**MONITORING REQUIREMENTS**

- Monitor for aggressive behaviour or hostility during initial treatment.

- **Monitor growth in children.**

- **Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.**

**TREATMENT CESSION** Avoid abrupt withdrawal.

**DIRECTIONS FOR ADMINISTRATION** Swallow whole or mix contents of capsule in yoghurt or a glass of water or orange juice; contents should be dispersed completely and consumed immediately.

**PATIENT AND CARER ADVICE**

Patients and carers should be counselled on the administration of capsules.

**Drugs and Driving** Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.
For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including amphetamines, see Drugs and driving under Guidance on prescribing p. 1.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

**CAUTIONARY AND ADVISORY LABELS 3, 25**

- **Lisdexamfetamine dimesylate (Non-proprietary)**

  - Lisdexamfetamine dimesylate 30 mg Elvanse Adult 30mg capsules | 28 capsule (P) £58.24 GT price + £58.24 Schedule 2 (CD)

**CNS STIMULANTS (NORADRENALINE REUPTAKE INHIBITORS)**

**Atomoxetine**

**INDICATIONS AND DOSE**

Attention deficit hyperactivity disorder (initiated by a specialist)

**BY MOUTH**

- Child 6-17 years (body-weight 70 kg and above): Initially 40 mg daily for 7 days, dose is increased according to response; maintenance 80 mg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening; high daily doses to be given under the direction of a specialist; maximum 120 mg per day
- Child 6-17 years (body-weight up to 70 kg): Initially 500 micrograms/kg daily for 7 days, dose is increased according to response; maintenance 1.2 mg/kg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening; high daily doses to be given under the direction of a specialist; maximum 1.8 mg/kg per day; maximum 120 mg per day
- Adult (body-weight up to 70 kg): Initially 500 micrograms/kg daily for 7 days, dose is increased according to response; maintenance 1.2 mg/kg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given under the direction of a specialist; maximum 1.8 mg/kg per day; maximum 120 mg per day
- Adult (body-weight 70 kg and above): Initially 40 mg daily for 7 days, dose is increased according to response; maintenance 80–100 mg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given under the direction of a specialist; maximum 120 mg per day

**UNLICENSED USE**

- In children Doses above 100 mg daily not licensed.
- In adults Dose maximum of 120 mg not licensed.

Atomoxetine doses in BNF may differ from those in product literature.

**CONTRA-INDICATIONS** Phaeochromocytoma - severe cardiovascular disease - severe cerebrovascular disease

**SIDE-EFFECTS**

- **Common or very common**: Abdominal pain - anorexia - anxiety - constipation - depression - dermatitis - dizziness - drowsiness - dry mouth - dyspepsia - flatulence - flushing - headache - chills - increased blood pressure - irritability - lethargy - malaise - mydriasis - nausea - palpitation - paraesthesia - prostatitis - rash - sexual dysfunction - sleep disturbances - sweating - tachycardia - taste disturbances - tremor - urinary dysfunction - vomiting
- **Uncommon**: Aggression - cold extremities - emotional lability - hostility - hypoaesthesia - menstrual disturbances - muscle spasms - pruritus - psychosis - QT-interval prolongation - suicidal ideation - syncope - tics
- **Rare**: Raynaud’s phenomenon - seizures
- **Very rare**: Angle-closure glaucoma - hepatic disorders

**PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.

**BREAST FEEDING** Avoid-present in milk in animal studies.

**HEPATIC IMPAIRMENT** Halve dose in moderate impairment. Quarter dose in severe impairment.

**MONITORING REQUIREMENTS**

- Monitor for appearance or worsening of anxiety, depression or tics.
- Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Atomoxetine for attention deficit hyperactivity disorder (ADHD) www.medicinesforchildren.org.uk/atomoxetine-attention-deficit-hyperactivity-disorder-adhd

Suicidal ideation Following reports of suicidal thoughts and behaviour, patients and their carers should be informed about the risk and told to report clinical worsening, suicidal thoughts or behaviour, irritability, agitation, or depression. Hepatic impairment Following rare reports of hepatic disorders, patients and carers should be advised of the risk and be told how to recognise symptoms; prompt medical attention should be sought in case of abdominal pain, unexplained nausea, malaise, darkening of the urine, or jaundice.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Methylinide, atomoxetine and dexamfetamine for attention deficit hyperactivity disorder (ADHD) (March 2006) NICE TA98

Atomoxetine is recommended, within its licensed indications, as an option for the management of ADHD in children and adolescents. www.nice.org.uk/TA98

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**Capsule**

CAUTIONARY AND ADVISORY LABELS 3

- **Strattera** (Eli Lilly and Company Ltd)
  - Atomoxetine (as Atomoxetine hydrochloride) 10 mg Strattera 10mg capsules | 7 capsule (P) £15.62 | 28 capsule (P) £62.46 GT price = £62.46
  - Atomoxetine (as Atomoxetine hydrochloride) 18 mg Strattera 18mg capsules | 7 capsule (P) £15.62 | 28 capsule (P) £62.46 GT price = £62.46

**CONTRA-INDICATIONS** Phaeochromocytoma - severe cardiovascular disease - severe cerebrovascular disease

**INTERACTIONS** → Appendix 1 (atomoxetine).

Avoid concomitant use of drugs that prolong QT interval.

**CAUTIONS** QT-interval prolongation - aggressive behaviour - cardiovascular disease - cerebrovascular disease - emotional lability - history of seizures - hostility - hypertension - mania - psychosis - structural cardiac abnormalities - susceptibility to angle-closure glaucoma - tachycardia

**DRUG AND DRIVING**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension
Attention deficit hyperactivity disorder

**Methylenidate hydrochloride**

**INDICATIONS AND DOSE**

Attention deficit hyperactivity disorder (initiated under specialist supervision)

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 6–17 years: Initially 5 mg 1–2 times a day, increased in steps of 5–10 mg daily if required, at weekly intervals, increased if necessary up to 60 mg daily in 2–3 divided doses, increased if necessary up to 2.1 mg/kg daily in 2–3 divided doses, the licensed maximum dose is 60 mg daily in 2–3 doses, higher dose under the direction of a specialist, discontinue if no response after 1 month, if effect wears off in evening (with rebound hyperactivity) a dose at bedtime may be appropriate (establish need with trial bedtime dose). Treatment may be started using a modified-release preparation; maximum 90 mg per day.
  - Adult: Initially 5 mg 2–3 times a day, dose is increased if necessary at weekly intervals according to response, increased if necessary up to 100 mg daily in 2–3 divided doses, if effect wears off in evening (with rebound hyperactivity) a dose at bedtime may be appropriate (establish need with trial bedtime dose). Treatment may be started using a modified-release preparation.

**Narcolepsy**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 10–60 mg daily in divided doses; usual dose 20–30 mg daily in divided doses, dose to be taken before meals.

**CONCERTA® XL**

Attention deficit hyperactivity disorder

- **BY MOUTH**
  - Adult: Initially 18 mg once daily, dose to be taken in the morning; adjusted at weekly intervals according to response; maximum 108 mg per day.

Dose equivalence and conversion

Total daily dose of 15 mg of standard-release formulation is considered equivalent to Concerta® XL 18 mg once daily.

**MEDIKINET® XL**

Attention deficit hyperactivity disorder

- **BY MOUTH**
  - Child 6–17 years: Initially 10 mg once daily, dose to be taken in the morning with breakfast; adjusted at weekly intervals according to response; increased if necessary up to 2.1 mg/kg daily, licensed max. dose is 60 mg daily, to be increased to higher dose only under direction of specialist; discontinue if no response after 1 month; maximum 90 mg per day.
  - Adult: Initially 10 mg once daily, dose to be taken in the morning with breakfast; adjusted at weekly intervals according to response; maximum 100 mg per day.

**UNLICENSED USE**

Not licensed for use in children under 6 years; doses over 60 mg daily not licensed; doses of Concerta XL over 54 mg daily not licensed.

**CONTRA-INDICATIONS**

Anorexia nervosa, arrhythmias, cardiomyopathy, cardiovascular disease, cerebrovascular disorders, heart failure, hyperthyroidism, phaeochromocytoma, psychosis, severe depression, severe hypertension, structural cardiac abnormalities, suicidal ideation, uncontrolled bipolar disorder, vasculitis.

**CAUTIONS**

Agitation, alcohol dependence, anxiety, drug dependence, epilepsy (discontinue if increased seizure frequency), family history of Tourette syndrome, susceptibility to angle-closure glaucoma, tics.

**CONCERTA® XL** Dysphagia (dose form not appropriate) - restricted gastro-intestinal lumen (dose form not appropriate).

**INTERACTIONS**

- Appendix 1 (sympathomimetics).

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain, aggression, alopecia, anorexia, arrhythmias, arthralgia, asthenia, changes in blood pressure, cough, depression, diarrhoea, dizziness, drowsiness, dry mouth, dyspepsia, fever, growth restriction, headache, insomnia, irritability, movement disorders, nasopharyngitis, nausea, nervousness, palpititation, pruritus, rash, reduced weight gain, tachycardia, tics, vomiting.

- **Uncommon** Abnormal dreams, confusion, constipation, dysthymia, epistaxis, haematuria, muscle cramps, suicidal ideation, urinary frequency.

- **Rare** Angina, sweating, visual disturbances.

- **Very rare** Angle-closure glaucoma, blood disorders, cerebral arteritis, dependence, erythema multiforme, exfoliative dermatitis, hepatic dysfunction, leucopenia, myocardial infarction, neuroleptic malignant syndrome, psychosis, seizures, thrombocytopenia, tolerance, Tourette syndrome.

- **Frequency not known** Bradycardia, convulsions, supraventricular tachycardia.

**PREGNANCY**

Limited experience—avoid unless potential benefit outweighs risk.

**BREAST FEEDING**

Limited information available—avoid.

**MONITORING REQUIREMENTS**

- Monitor for psychiatric disorders.

- Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.

**TREATMENT CESSATION**

Avoid abrupt withdrawal.

**DIRECTIONS FOR ADMINISTRATION**

**MEDIKINET® XL**

Contents of capsule can be sprinkled on a tablespoon of apple sauce or yoghurt (then swallowed immediately without chewing).
274 Mental health disorders

EQUASYM® XL
Contents of capsule can be sprinkled on a tablespoon of apple sauce (then swallowed immediately without chewing).

- PRESCRIBING AND DISPENSING INFORMATION
  Different versions of modified-release preparations may not have the same clinical effect. To avoid confusion between these different formulations of methylphenidate, prescribers should specify the brand to be dispensed.

CONCERTA® XL
Consists of an immediate-release component (22% of the dose) and a modified-release component (78% of the dose).

EQUASYM® XL
Consists of an immediate-release component (30% of the dose) and a modified-release component (70% of the dose).

MEDIKINET® XL
Consists of an immediate-release component (50% of the dose) and a modified-release component (50% of the dose).

- PATIENT AND CARER ADVICE
  Drugs and Driving
  Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

2015 legislation regarding driving whilst taking certain drugs, may also apply to methylphenidate, see Drugs and driving under Guidance on prescribing p. 1.

CONCERTA® XL
Tablet membrane may pass through gastro-intestinal tract unchanged.

- NATIONAL FUNDING/ACCESS DECISIONS
  NICe technology appraisals (TAs)
  - Methylphenidate, atomoxetine and dexamfetamine for attention deficit hyperactivity disorder (ADHD) (March 2006) NICE TA98
    Methylphenidate is recommended, within its licensed indications, as an option for the management of ADHD in children and adolescents. www.nice.org.uk/TA98

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: modified-release tablet, oral suspension, oral solution

Tablet
  - METHYLPHENIDATE HYDROCHLORIDE (Non-proprietary)
    Methylphenidate hydrochloride 5 mg Methylphenidate 5mg tablets | 30 tablet (P) £3.03 DT price + £3.03 Schedule 2 (CD)
    Methylphenidate hydrochloride 10 mg Methylphenidate 10mg tablets | 30 tablet (P) £5.49 DT price + £5.49 Schedule 2 (CD)
    Methylphenidate hydrochloride 20 mg Methylphenidate 20mg tablets | 30 tablet (P) £10.92 DT price + £10.92 Schedule 2 (CD)
  - Ritalin® (Novartis Pharmaceuticals UK Ltd)
    Methylphenidate hydrochloride 10 mg Ritalin® 10mg tablets | 30 tablet (P) £5.57 DT price + £5.49 Schedule 2 (CD)
  - Brands may include Medikinet; Tranquilyn

Modified-release tablet
  CAUTIONARY AND ADVISORY LABELS 25
  - Concerta® (Janssen-Cilag Ltd)
    Methylphenidate hydrochloride 18 mg Concerta XL 18mg tablets | 30 tablet (P) £31.19 DT price + £31.19 Schedule 2 (CD)
    Methylphenidate hydrochloride 27 mg Concerta XL 27mg tablets | 30 tablet (P) £36.81 DT price + £36.81 Schedule 2 (CD)
    Methylphenidate hydrochloride 36 mg Concerta XL 36mg tablets | 30 tablet (P) £42.45 DT price + £42.45 Schedule 2 (CD)

   - Brands may include Matoride XL; Xenidate XL

2.3 Bipolar disorder and mania

Drugs used for mania and hypomania

Antimanic drugs are used to control acute attacks and to prevent recurrence of episodes of mania or hypomania. Long-term treatment of bipolar disorder should continue for at least two years from the last manic episode and up to five years if the patient has risk factors for relapse.

An antidepressant drug may also be required for the treatment of co-existing depression, but should be avoided in patients with rapid-cycling bipolar disorder, a recent history of hypomania, or with rapid mood fluctuations.

Benzodiazepines

Use of benzodiazepines (such as lorazepam p. 412) may be helpful in the initial stages of treatment for behavioural disturbance or agitation; they should not be used for long periods because of the risk of dependence.

Antipsychotic drugs

Antipsychotic drugs (normally olanzapine p. 315, quetiapine p. 318, or risperidone p. 319) are useful in acute episodes of mania and hypomania; if the response to antipsychotic drugs is inadequate, lithium or valproate may be added. An antipsychotic drug may be used concomitantly with lithium or valproate in the initial treatment of severe acute mania.

Olanzapine p. 315 can be used for the long-term management of bipolar disorder in patients whose manic episode responded to olanzapine p. 315 therapy. It can be given either as monotherapy, or in combination with lithium or valproate if the patient has frequent relapses or continuing functional impairment.

Asenapine p. 276, a second-generation antipsychotic, is licensed for the treatment of moderate to severe manic episodes associated with bipolar disorder.

When discontinuing antipsychotics, the dose should be reduced gradually over at least 4 weeks if the patient is continuing with other antimanic drugs; if the patient is not continuing with other antimanic drugs or if there is a history of manic relapse, a withdrawal period of up to 3 months should be considered.
**Bipolar disorder and mania**

**Carbamazepine**

Carbamazepine p. 387 may be used under specialist supervision for the prophylaxis of bipolar disorder (manic-depressive disorder) in patients unresponsive to a combination of other prophylactic drugs; it is used in patients with rapid-cycling manic-depressive illness (4 or more affective episodes per year). The dose of carbamazepine p. 387 should not normally be increased if an acute episode of mania occurs.

**Valproate**

Valproic acid (as the semisodium salt) and sodium valproate p. 403 are used for the treatment of manic episodes associated with bipolar disorder. Valproate (valproic acid below and sodium valproate) is also used for the prophylaxis of bipolar disorder; however, it should not normally be prescribed for women of childbearing potential. In patients with frequent relapse or continuing functional impairment, consider switching therapy to lithium or olanzapine p. 394, or adding lithium or olanzapine to valproate. If a patient taking valproate experiences an acute episode of mania that is not ameliorated by increasing the valproate dose, consider concomitant therapy with olanzapine, quetiapine p. 318, or risperidone p. 319.

**Lithium**

Lithium salts are used in the prophylaxis and treatment of mania, hypomania and depression in bipolar disorder (manic-depressive disorder), and in the prophylaxis and treatment of recurrent unipolar depression. Lithium is also used as concomitant therapy with antidepressant medication in patients who have had an incomplete response to treatment for acute bipolar depression and to augment other antidepressants in patients with treatment-resistant depression [unlicensed indication]. It is also licensed for the treatment of aggressive or self-harming behaviour.

The decision to use prophylactic lithium requires specialist advice, and must be based on careful consideration of the likelihood of recurrence in the individual patient, and the benefit of treatment weighed against the risks. The full prophylactic effect of lithium may not occur for six to twelve months after the initiation of therapy. Olanzapine p. 315 or valproate (given alone or as adjunctive therapy with lithium) are alternative prophylactic treatments in patients who experience frequent relapses or continued functional impairment.

Drugs used for Bipolar disorder and mania not listed below: Carbamazepine, p. 387 · Chlorpromazine hydrochloride, p. 304 · Haloperidol, p. 306 · Lamotrigine, p. 394 · Olanzapine, p. 315 · Paliperidone, p. 317 · Perphenazine, p. 308 · Prochlorperazine, p. 309 · Quetiapine, p. 318 · Sodium valproate, p. 403 · Zuclopenthixol acetate, p. 311

**Valproic acid**

**INDICATIONS AND DOSE**

**Treatment of manic episodes associated with bipolar disorder**

**BY MOUTH**

- Adult: Initially 750 mg daily in 2–3 divided doses, then increased to 1–2 g daily, adjusted according to response, doses greater than 45 mg/kg daily require careful monitoring

**Migraine prophylaxis**

**BY MOUTH**

- Adult: Initially 250 mg twice daily, then increased if necessary to 1 g daily in divided doses

**CONVULEX®**

**Epilepsy**

**BY MOUTH**

- Child: Total daily dose to be given in 2–4 divided doses (consult product literature)
- Adult: Total daily dose to be given in 2–4 divided doses (consult product literature)

**Dose equivalence and conversion**

Semisodium valproate comprises equimolar amounts of sodium valproate and valproic acid. Convulex® has a 1:1 dose relationship with products containing sodium valproate, but nevertheless care is needed if switching or making changes.

---

**Unlicensed use** Not licensed for migraine prophylaxis.

**Contra-indications** Acute porphyrias p. 864 · family history of severe hepatic dysfunction

**Cautions** Systemic lupus erythematosus

**Caution, further information**

**Liver toxicity** Liver dysfunction (including fatal hepatic failure) has occurred in association with valproate (especially in children under 3 years and in those with metabolic or degenerative disorders, organic brain disease or severe seizure disorders associated with mental retardation) usually in first 6 months and usually involving multiple antiepileptic therapy. Raised liver enzymes during valproate treatment are usually transient but patients should be reassessed clinically and liver function (including prothrombin time) monitored until return to normal—discontinue if abnormally prolonged prothrombin time (particularly in association with other relevant abnormalities).

Consider vitamin D supplementation in patients that are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

**Interactions** → Appendix 1 (valproic acid).

**Side-effects**

- **Common or very common** Diarrhoea · gastric irritation · hyperammonaemia · nausea · thrombocytopenia · transient hair loss (regrowth may be curly) · weight gain
- **Uncommon** Aggression · ataxia · behavioural disturbances · hyperactivity · increased alertness · tremor · vasculitis
- **Rare** Anaemia · blood disorders · confusion · drowsiness · hallucinations · hearing loss · hepatic dysfunction · lethargy · leucopenia · pancytopenia · rash · stupor
- **Very rare** Acne · coma · dementia · encephalopathy · enuresis · extrapyramidal symptoms · Fanconi’s syndrome · gynaecomastia · hirsutism · hyponatraemia · increase in bleeding time · pancreatitis · peripheral oedema · reduced bone mineral density · Stevens-Johnson syndrome · suicidal ideation · toxic epidermal necrolysis
- **Frequency not known** Drug rash with eosinophilia and systemic symptoms (DRESS) syndrome · hypersensitivity reactions · male infertility · menstrual disturbances · syndrome of inappropriate secretion of antidiuretic hormone

**SIDE-EFFECTS, FURTHER INFORMATION**

**Hepatic dysfunction** Withdraw treatment immediately if persistent vomiting and abdominal pain, anorexia, jaundice, oedema, malaise, drowsiness, or loss of seizure control.

**Conception and contraception** Valproate is associated with teratogenic risks and should not be used in women of child-bearing potential unless there is no safer alternative—this should be fully considered and discussed before prescribing for women of child-bearing age.
276 Mental health disorders

Effective contraception advised in women of child-bearing potential.

**PREGNANCY** Valproate is associated with the highest risk of major and minor congenital malformations (in particular neural tube defects), and long-term neurodevelopmental effects. Valproate should not be used during pregnancy or in women of child-bearing potential unless there is no safer alternative and only after a careful discussion of the risks. If valproate is to be used during pregnancy, the lowest effective dose should be prescribed in divided doses to avoid peaks in plasma-valproate concentrations; doses greater than 1 g daily are associated with an increased risk of teratogenicity. Specialist prenatal monitoring should be instigated when valproate has been taken in pregnancy. Neonatal bleeding (related to hypofibrinogenemia) and neonatal hepatotoxicity also reported. The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**BREAST FEEDING** Amount too small to be harmful.

**HEPATIC IMPAIRMENT** Avoid if possible—hepatotoxicity and hepatic failure may occasionally occur (usually in first 6 months). Avoid in active liver disease.

**RENAL IMPAIRMENT** Reduce dose.

**MONITORING REQUIREMENTS**
- Monitor closely if dose greater than 45 mg/kg daily.
- Monitor liver function before therapy and during first 6 months especially in patients most at risk.
- Measure full blood count and ensure no undue potential for bleeding before starting and before surgery.

**EFFECT ON LABORATORY TESTS** False-positive urine tests for ketones.

**TREATMENT CESSATION** If treatment with valproate is stopped, reduce the dose gradually over at least 4 weeks.

**PRESCRIBING AND DISPENSING INFORMATION**
- Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic oral valproic acid product.
- **Pregnancy** Use only if potential benefit outweighs risk—risk to embryo/fetus.
- **Breast feeding** Avoid—no information available.
- **Hepatic impairment** Use with caution in moderate impairment. Avoid in severe impairment.
- **Renal impairment** Use with caution in moderate impairment. Avoid in severe impairment.
- **Pregnancy** Use only if potential benefit outweighs risk—risk to embryo/fetus.
- **Breast feeding** Avoid—no information available.
- **Hepatic impairment** Use with caution in moderate impairment. Avoid in severe impairment.
- **Renal impairment** Use with caution in moderate impairment. Avoid in severe impairment.

**SIDE EFFECTS**
- Convulsions, sedation, hyperreflexia, tremor, ataxia, dysgeusia, fatigue, headache, dizziness, constipation, diarrhoea, nausea and vomiting.
- Changes in body weight and carbohydrate intolerance.
- Increased appetite, anorexia, anovulation.
-Transaminase elevation, jaundice, hepatitis and pancreatitis.
- Increased uric acid, gout, hyperkalaemia.
- Hypocalcaemia, hypomagnesaemia.
- Photosensitivity.
- Hypothyroidism.

**CAUTIONS**
- Dementia with Lewy Bodies
- **Side effects** Anxiety, dysphagia, glossodynia, hyperkalaemia, rhabdomyolysis, speech disturbance, taste disturbance, tongue swelling, transient oral hypoesthesia, transient paraesthesia.
- **Pregnancy** Use only if potential benefit outweighs risk—risk to embryo/fetus.
- **Breast feeding** Avoid—no information available.
- **Hepatic impairment** Use with caution in moderate impairment. Avoid in severe impairment.
- **Renal impairment** Use with caution in moderate impairment. Avoid in severe impairment.
- **Pregnancy** Use only if potential benefit outweighs risk—risk to embryo/fetus.
- **Breast feeding** Avoid—no information available.
- **Hepatic impairment** Use with caution in moderate impairment. Avoid in severe impairment.
- **Renal impairment** Use with caution in moderate impairment. Avoid in severe impairment.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Sublingual tablet**
- Sycrest (Lundbeck Ltd)
  - Asenapine (as Asenapine maleate) 5 mg Sycrest 5mg sublingual tablets (sugar-free) | 60 tablet (DT price = £102.60 DT price = £102.60)
  - Asenapine (as Asenapine maleate) 10 mg Sycrest 10mg sublingual tablets (sugar-free) | 60 tablet (DT price = £102.60 DT price = £102.60)

**LITHIUM SALTS**

**Lithium salts**

**Contra-indications**
- Addison’s disease.
- Hypertension.
- Diuretic therapy.
- Depressed mood.
- Reduced renal function.
- Hepatic insufficiency.
- Acute dehydration.
- Hypothyroidism.
- Myasthenia gravis.
- Pseudocholinesterase deficiency.
- Hypokalaemia.

**Caution** Avoid abrupt withdrawal—cardiac disease—concurrent ECT (may lower seizure threshold)—diuretic treatment (risk of toxicity)—elderly (reduce dose).
The need for continued therapy should be assessed regularly and patients should be maintained on lithium after 3–5 years only if benefit persists.

- **INTERACTIONS** → Appendix 1 (lithium).
  - Caution with concomitant use of drugs and any therapy that may lower seizure threshold.
  - Caution with concomitant use of drugs that prolong the QT interval.
  - Lithium toxicity is made worse by sodium depletion, therefore concurrent use of diuretics (particularly thiazides) is hazardous and should be avoided.

- **SIDE-EFFECTS**
  - Very rare: Nystagmus
  - Frequency not known: Acneiform eruptions, alopecia, arthralgia, AV block, benign intracranial hypertension, bradycardia, cardiomyopathy, cognitive impairment, dry mouth, dysgeusia, ECG changes, electrolyte imbalance, encephalopathy, euthyroid goitre, extrapyramidal side-effects, fine tremor, gastritis, gastrointestinal disturbances, hallucinations, hyperparathyroidism, hypersalivation, hyperthyroidism, hypothyroidism, kidney changes, leucocytosis, malaise, memory loss, myalgia, myasthenia gravis, nephrogenic diabetes insipidus, nephrotic syndrome, oedema, other skin disorders, parathyroid adenoma, peripheral neuropathy, polydipsia, psoriasis, spina bifida, speech disorder, thyroid changes, vertigo, weight changes

- **Overdose** Signs of intoxication require withdrawal of treatment and include increasing gastro-intestinal disturbances (vomiting, diarrhoea), visual disturbances, polypigmentation, muscle weakness, fine tremor increasing to coarse tremor, CNS disturbances (confusion and drowsiness increasing to lack of coordination, restlessness, stupor); abnormal reflexes, myoclonus, incontinence, hypernatraemia. With severe overdosage (serum-lithium concentration above 2 mmol/litre) seizures, cardiac arrhythmias (including sino-atrial block, bradycardia and first-degree heart block), blood pressure changes, circulatory failure, renal failure, coma and sudden death reported.

For details on the management of poisoning, see Lithium, under Emergency treatment of poisoning p. 1123.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment for women of child bearing potential.

- **PREGNANCY** Avoid if possible, particularly in the first trimester (risk of teratogenicity, including cardiac abnormalities).
  - Dose requirements increased during the second and third trimesters (but on delivery return abruptly to normal).
  - Close monitoring of serum-lithium concentration advised in pregnancy (risk of toxicity in neonate).

- **BREASTFEEDING** Present in milk and risk of toxicity in infant—avoid.

- **RENAL IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.
  - In renal impairment monitor serum-lithium concentration closely and adjust dose accordingly.

- **MONITORING REQUIREMENTS**
  - Serum concentrations: Lithium salts have a narrow therapeutic/toxic ratio and should therefore not be prescribed unless facilities for monitoring serum-lithium concentrations are available.
  - Samples should be taken 12 hours after the dose to achieve a serum-lithium concentration of 0.4–1 mmol/litre (lower end of the range for maintenance therapy and elderly patients).
  - A target serum-lithium concentration of 0.8–1 mmol/litre is recommended for acute episodes of mania, and for patients who have previously relapsed or have sub-syndromal symptoms. It is important to determine the optimum range for each individual patient.
  - Routine serum-lithium monitoring should be performed weekly after initiation and after each dose change until concentrations are stable, then every 3 months thereafter. Additional serum-lithium measurements should be made if a patient develops significant intercurrent disease or if there is a significant change in a patient’s sodium or fluid intake.
  - Renal function should be monitored at baseline and every 6 months thereafter (more often if there is evidence of deterioration or if the patient has other risk factors, such as starting ACE inhibitors, NSAIDs, or diuretics).
  - Assess cardiac and thyroid function before initiating, and thereafter every 6 months on stabilised regimens.

- **TREATMENT CESSATION** While there is no clear evidence of withdrawal or rebound psychosis, abrupt discontinuation of lithium increases the risk of relapse. If lithium is to be discontinued, the dose should be reduced gradually over a period of at least 4 weeks (preferably over a period of up to 3 months). Patients and their carers should be warned of the risk of relapse if lithium is discontinued abruptly. If lithium is stopped or is to be discontinued abruptly, consider changing therapy to an atypical antipsychotic or valproate.

- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks: May impair performance of skilled tasks (e.g. driving, operating machinery).
  - Lithium treatment packs: A lithium treatment pack should be given to patients on initiation of treatment with lithium.
  - The pack consists of a patient information booklet, lithium alert card, and a record book for tracking serum-lithium concentration. Packs may be purchased from 3M: 0845 610 1112 nhsforms@mmm.uk.com
  - Patients should be advised to report signs and symptoms of lithium toxicity, hypothyroidism, renal dysfunction (including polyuria and polydipsia), and benign intracranial hypertension (persistent headache and visual disturbance).
  - Maintain adequate fluid intake and avoid dietary changes which reduce or increase sodium intake.

### Lithium carbonate

#### INDICATIONS AND DOSE

<table>
<thead>
<tr>
<th>Treatment and prophylaxis of mania</th>

- Adult (body-weight up to 49 kg): Initially 200–400 mg daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

- Adult (body-weight 50 kg and above): Initially 0.4–1.2 g once daily, alternatively initially 0.4–1.2 g daily in 2 divided doses, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

Dose equivalence and conversion

Preparations vary widely in bioavailability: changing the preparation requires the same precautions as initiation of treatment.
Lithium citrate

INDICATIONS AND DOSE
Treatment and prophylaxis of mania | Treatment and prophylaxis of bipolar disorder | Treatment and prophylaxis of recurrent depression | Treatment and prophylaxis of aggressive or self-harming behaviour

BY MOUTH

- Adult (body-weight up to 49 kg): Initially 509 mg twice daily; dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

- Adult (body-weight 50 kg and above): Initially 1,018–3,054 g daily in 2 divided doses; dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

- Elderly: Initially 509 mg twice daily; dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter.

2.4 Depression

Antidepressant drugs

Antidepressant drugs are effective for treating moderate to severe depression associated with psychomotor and physiological changes such as loss of appetite and sleep...
disturbance; improvement in sleep is usually the first benefit of therapy. Ideally, patients with moderate to severe depression should be treated with psychological therapy in addition to drug therapy. Antidepressant drugs are also effective for dysthymia (lower grade chronic depression (typically of at least 2 years duration)). Antidepressant drugs should not be used routinely in mild depression, and psychological therapy should be considered initially; however, a trial of antidepressant therapy may be considered in cases refractory to psychological treatments or in those associated with psychosocial or medical problems. Drug treatment of mild depression may also be considered in patients with a history of moderate or severe depression.

Choice
The major classes of antidepressant drugs include the tricyclic and related antidepressants, the selective serotonin re-uptake inhibitors (SSRIs), and the monoamine oxidase inhibitors (MAOIs). A number of antidepressant drugs cannot be accommodated easily into this classification. There is little to choose between the different classes of antidepressant drugs in terms of efficacy, so choice should be based on the individual patient’s requirements, including the presence of concomitant disease, existing therapy, suicide risk, and previous response to antidepressant therapy. Since there may be an interval of 2 weeks before the antidepressant action takes place, electroconvulsive treatment may be required in severe depression when delay is hazardous or intolerable. During the first few weeks of treatment, there is an increased potential for agitation, anxiety, and suicidal ideation.

SSRIs are better tolerated and are safer in overdose than other classes of antidepressants and should be considered first-line for treating depression. In patients with unstable angina or who have had a recent myocardial infarction, sertraline p. 288 has been shown to be safe. Tricyclic antidepressants have similar efficacy to SSRIs but are more likely to be discontinued because of side-effects; toxicity in overdose is also a problem. SSRIs are less sedating and have fewer antimuscarinic and cardiotoxic effects than tricyclic antidepressants. MAOIs have dangerous interactions with some foods and drugs, and should be reserved for use by specialists. Failure to respond to a second antidepressant may require the addition of another agent (such as lithium, aripiprazole p. 293, quetiapine p. 291, venlafaxine p. 289, or mirtazapine p. 283). Other second-line choices include lofepramine p. 297, moclobemide p. 282, and reboxetine p. 284. Other tricyclic antidepressants and venlafaxine p. 289 should be considered for more severe forms of depression; irreversible MAOIs should only be prescribed by specialists. Failure to respond to a second antidepressant may require the addition of another antidepressant of a different class, or use of an augmenting agent (such as lithium, aripiprazole p. 312 [unlicensed], olanzapine p. 315 [unlicensed], quetiapine p. 318, or risperidone p. 319 [unlicensed]), but such adjunctive treatment should be initiated only by doctors with special experience of these combinations. Electroconvulsive therapy may be initiated in severe refractory depression.

Management
Patients should be reviewed every 1–2 weeks at the start of antidepressant treatment. Treatment should be continued for at least 4 weeks (6 weeks in the elderly) before considering whether to switch antidepressant due to lack of efficacy. In cases of partial response, continue for a further 2–4 weeks (elderly patients may take longer to respond). Following remission, antidepressant treatment should be continued at the same dose for at least 6 months (about 12 months in the elderly), or for at least 12 months in patients receiving treatment for generalised anxiety disorder (as the likelihood of relapse is high). Patients with a history of recurrent depression should receive maintenance treatment for at least 2 years.

Hyponatraemia and Antidepressant Therapy
Hyponatraemia (usually in the elderly and possibly due to inappropriate secretion of antidiuretic hormone) has been associated with all types of antidepressants; however, it has been reported more frequently with SSRIs than with other antidepressants. Hyponatraemia should be considered in all patients who develop drowsiness, confusion, or convulsions while taking an antidepressant.

Suicidal Behaviour and Antidepressant Therapy
The use of antidepressants has been linked with suicidal thoughts and behaviour; children, young adults, and patients with a history of suicidal behaviour are particularly at risk. Where necessary patients should be monitored for suicidal behaviour, self-harm, or hostility, particularly at the beginning of treatment or if the dose is changed.

Serotonin syndrome
Serotonin syndrome or serotonin toxicity is a relatively uncommon adverse drug reaction caused by excessive central and peripheral serotonergic activity. Onset of symptoms, which range from mild to life-threatening, can occur within hours or days following the initiation, dose escalation, or overdose of a serotonergic drug, the addition of a new serotonergic drug, or the replacement of one serotonergic drug by another without allowing a long enough washout period in-between, particularly when the first drug is an irreversible MAOI or a drug with a long half-life. Severe toxicity, which is a medical emergency, usually occurs with a combination of serotonergic drugs, one of which is generally an MAOI. The characteristic symptoms of serotonin syndrome fall into 3 main areas, although features from each group may not be seen in all patients—neuromuscular hyperactivity (such as tremor, hyperreflexia, clonus, myoclonus, rigidity), autonomic dysfunction (tachycardia, blood pressure changes, hyperthermia, diaphoresis, shivering, diarrhoea), and altered mental state (agitation, confusion, mania).

Treatment consists of withdrawal of the serotonergic medication and supportive care; specialist advice should be sought.

Failure to respond
Failure to respond to initial treatment with an SSRI may require an increase in the dose, or switching to a different SSRI or mirtazapine p. 291. Other second-line choices include lofepramine p. 297, moclobemide p. 282, and reboxetine p. 284. Other tricyclic antidepressants and venlafaxine p. 289 should be considered for more severe forms of depression; irreversible MAOIs should only be prescribed by specialists. Failure to respond to a second antidepressant may require the addition of another antidepressant of a different class, or use of an augmenting agent (such as lithium, aripiprazole p. 312 [unlicensed], olanzapine p. 315 [unlicensed], quetiapine p. 318, or risperidone p. 319 [unlicensed]), but such adjunctive treatment should be initiated only by doctors with special experience of these combinations. Electroconvulsive therapy may be initiated in severe refractory depression.

Anxiety disorders and obsessive-compulsive disorder
Management of acute anxiety generally involves the use of a benzodiazepine or buspirone hydrochloride p. 269. For chronic anxiety (of longer than 4 weeks’ duration) it may be appropriate to use an antidepressant. Combined therapy with a benzodiazepine may be required until the antidepressant takes effect. Patients with generalised anxiety disorder, a form of chronic anxiety, should be offered...
psychological treatment before initiating an antidepressant. If drug treatment is needed, an SSRI such as escitalopram p. 285, paroxetine p. 287, or sertraline p. 288 [unlicensed], can be used. Duloxetine p. 288 and venlafaxine p. 289 (serotonin and noradrenaline reuptake inhibitors) are also recommended for the treatment of generalised anxiety disorder, if the patient cannot tolerate SSRIs or serotonin and noradrenaline reuptake inhibitors (or if treatment has failed to control symptoms), pregabalin p. 400 can be considered.

Panic disorder, obsessive-compulsive disorder, post-traumatic stress disorder, and phobic states such as social anxiety disorder are treated with SSRIs. Clomipramine hydrochloride p. 294 or imipramine hydrochloride p. 296 can be used second-line in panic disorder [unlicensed]; clomipramine hydrochloride p. 294 can also be used second-line for obsessive-compulsive disorder. Moclobemide p. 283 is licensed for the treatment of social anxiety disorder.

Tricyclic and related antidepressant drugs

Choice
Tricyclic and related antidepressants block the re-uptake of both serotonin and noradrenaline, although to different extents. For example, clomipramine hydrochloride p. 294 is more selective for serotoninergic transmission, and imipramine hydrochloride p. 296 is more selective for noradrenergic transmission. Tricyclic and related antidepressant drugs can be roughly divided into those with additional sedative properties and those that are less sedating. Agitated and anxious patients tend to respond best to the sedative compounds, whereas withdrawn and apathetic patients will often obtain most benefit from the less sedating ones. Those with sedative properties include amitriptyline hydrochloride p. 292, clomipramine hydrochloride p. 294, dosulepin hydrochloride p. 295, doxepin p. 296, mianserin hydrochloride p. 290, trazodone hydrochloride p. 291, and trimipramine p. 299. Those with less sedative properties include imipramine hydrochloride p. 296, lofepramine p. 297, and nortriptyline p. 298.

Tricyclic and related antidepressants also have varying degrees of antimuscarinic side-effects and cardiotoxicity in overdose, which may be important in individual patients. Lofepramine has a lower incidence of side-effects and is less dangerous in overdose but is infrequently associated with hepatic toxicity. Imipramine hydrochloride is also well established, but has more marked antimuscarinic side-effects than other tricyclic and related antidepressants. Amitriptyline hydrochloride and dosulepin hydrochloride are effective but they are particularly dangerous in overdose and are not recommended for the treatment of depression; dosulepin hydrochloride should be initiated by a specialist.

Dosage
About 10 to 20% of patients fail to respond to tricyclic and related antidepressant drugs and inadequate dosage may account for some of these failures. It is important to use doses that are sufficiently high for effective treatment but not so high as to cause toxic effects. Low doses should be used for initial treatment in the elderly. In most patients the long half-life of tricyclic antidepressant drugs allows once-daily administration, usually at night; the use of modified-release preparations is therefore unnecessary. Some tricyclic antidepressants are used in the management of panic and other anxiety disorders. Some tricyclic antidepressants may also have a role in some forms of neuralgia and in nocturnal enuresis in children.

Children and adolescents
Studies have shown that tricyclic antidepressants are not effective for treating depression in children.

Monoamine-oxidase inhibitors

Monoamine-oxidase inhibitors are used much less frequently than tricyclic and related antidepressants, or SSRIs and related antidepressants because of the dangers of dietary and drug interactions and the fact that it is easier to prescribe MAOIs when tricyclic antidepressants have been unsuccessful than vice versa.

Tranylcypromine p. 283 has a greater stimulant action than phenelzine p. 283 or isocarboxazid p. 282 and is more likely to cause a hypertensive crisis. Isocarboxazid and phenelzine are more likely to cause hepatotoxicity than tranylcypromine.

Moclobemide p. 283 should be reserved as a second line treatment.

Phobic patients and depressed patients with atypical, hypochondriacal, or hysterical features are said to respond best to MAOIs. However, MAOIs should be tried in any patients who are refractory to treatment with other antidepressants as there is occasionally a dramatic response. Response to treatment may be delayed for 3 weeks or more and may take an additional 1 or 2 weeks to become maximal.

Other antidepressant drugs

The thioxanthene flupentixol p. 305 (Fluanxol®) has antidepressant properties when given by mouth in low doses. Flupentixol is also used for the treatment of psychoses.

MELATONIN RECEPTOR AGONISTS

Agomelatine

DRUG ACTION A melatonin receptor agonist and a selective serotonin-receptor antagonist; it does not affect the uptake of serotonin, noradrenaline, or dopamine.

INDICATIONS AND DOSE

Major depression
BY MOUTH
• Adult. 25 mg daily, dose to be taken at bedtime, dose to be increased if necessary after 2 weeks, increased if necessary to 50 mg daily, dose to be taken at bedtime

Dose adjustments due to interactions
Caution—dose adjustment may be necessary if smoking started or stopped during treatment.

CONTRA-INDICATIONS
Dementia • patients over 75 years of age

CAUTIONS
Bipolar disorder • diabetes • excessive alcohol consumption • hypomania • mania • non-alcoholic fatty liver disease • obesity

INTERACTIONS → Appendix 1 (agomelatine).
Caution with concomitant use of drugs associated with hepatic injury.

SIDE-EFFECTS
• Common or very common Abdominal pain • agitation • anxiety • back pain • constipation • diarrhea • dizziness • drowsiness • fatigue • headache • increased serum transaminases • nausea • sleep disturbances • sweating • vomiting
• Uncommon Blurred vision • eczema • paraesthesia • restless legs syndrome • tinnitus
• Rare Hepatic failure • hepatic injury • hepatitis • rash • weight changes
• Frequency not known Pruritus • suicidal behaviour

Drugs used for Depression not listed below; Flupentixol, p. 305 • Lithium carbonate, p. 277 • Lithium citrate, p. 279 • Quetiapine, p. 318
SIDE-EFFECTS, FURTHER INFORMATION

Suicidal behaviour The use of antidepressants has been linked with suicidal thoughts and behaviour; children, young adults, and patients with a history of suicidal behaviour are particularly at risk. Where necessary patients should be monitored for suicidal behaviour, self-harm, or hostility, particularly at the beginning of treatment or if the dose is changed.

PREGNANCY Manufacturer advises avoid.

BREAST FEEDING Avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT Avoid. Do not start if serum transaminases exceed 3 times the upper limit of reference range.

RENAL IMPAIRMENT Caution in moderate to severe impairment.

MONITORING REQUIREMENTS Test liver function before treatment and after 3, 6, 12 and 24 weeks of treatment, and then regularly thereafter when clinically indicated (restart monitoring schedule if dose increased); discontinue if serum transaminases exceed 3 times the upper limit of reference range or symptoms of liver disorder.

PATIENT AND CARER ADVICE Hepatotoxicity Patients should be told how to recognise signs of liver disorder, and advised to seek immediate medical attention if symptoms such as dark urine, light coloured stools, jaundice, bruising, fatigue, abdominal pain, or pruritus develop. Patients should be given a booklet with more information on the risk of hepatic side-effects.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet
- Valdoxan (Servier Laboratories Ltd)
  Agomelatine 25 mg Valdoxan 25mg tablets | 28 tablet (POM) £30.00
  DT price = £30.00

MONOAMINE-OXIDASE A AND B INHIBITORS (IRREVERSIBLE)

Monoamine-oxidase inhibitors

DRUG ACTION MAOIs inhibit monoamine oxidase, thereby causing an accumulation of amine neurotransmitters.

CONTRA-INDICATIONS Cerebrovascular disease - not indicated in manic phase - phaeochromocytoma

CAUTIONS Acute porphyria - avoid in agitated patients - blood disorders - cardiovascular disease - concurrent electroconvulsive therapy - diabetes mellitus - elderly (great caution) - epilepsy - severe hypertensive reactions to certain drugs and foods - surgery

INTERACTIONS ▶ Appendix 1 (MAOIs). The metabolism of some amine drugs such as indirect-acting sympathomimetics (present in many cough and decongestant preparations) is inhibited and their pressor action may be potentiated; the pressor effect of tyramine (in some foods, such as mature cheese, pickled herring, broad bean pods, and Bovril®, Oxo®, Marmite® or any similar meat or yeast extract or fermented soya bean extract) may also be dangerously potentiated. These interactions may cause a dangerous rise in blood pressure. An early warning symptom may be a throbbing headache. The danger of interaction persists for up to 2 weeks after treatment with MAOIs is discontinued.

Some psychiatrists use selected tricyclics in conjunction with MAOIs but this is hazardous, indeed potentially lethal, except in experienced hands and there is no evidence that the combination is more effective than when either constituent is used alone.

SIDE-EFFECTS
- Common or very common Dizziness - postural hypotension (especially in elderly)
- Rare Fatal progressive hepatocellular necrosis
- Frequency not known jaundice - hypotoniemia - paraesthesia - peripheral neuritis - peripheral neuropathy (may be due to pyridoxine deficiency)

SIDE-EFFECTS, FURTHER INFORMATION

Risk of postural hypotension and hypertensive responses Discontinue use if palpitations or frequent headaches occur.

PREGNANCY Increased risk of neonatal malformations — manufacturer advises avoid unless there are compelling reasons.

HEPATIC IMPAIRMENT MAOIs may cause idiosyncratic hepatotoxicity if used in patients with hepatic impairment.

MONITORING REQUIREMENTS Monitor blood pressure (risk of postural hypotension and hypertensive responses).

TREATMENT CESSATION If possible avoid abrupt withdrawal. MAOIs are associated with withdrawal symptoms on cessation of therapy. Symptoms include agitation, irritability, ataxia, movement disorders, insomnia, drowsiness, vivid dreams, cognitive impairment, and slowed speech. Withdrawal symptoms occasionally experienced when discontinuing MAOIs include hallucinations and paranoid delusions. If possible MAOIs should be withdrawn slowly.

Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

PATIENT AND CARER ADVICE Drowsiness may affect performance of skilled tasks (e.g. driving). Patients should be advised to eat only fresh foods and avoid food that is suspected of being stale or offal; game should be avoided. The danger of interaction persists for up to 2 weeks after treatment with MAOIs is discontinued. Patients should also be advised to avoid alcoholic drinks or de-alcoholised (low alcohol) drinks.

Isocarboxazid

INDICATIONS AND DOSE
Depressive illness
BY MOUTH
- Adult: Initially 30 mg daily until improvement occurs, initial dose may be given in single or divided doses, dose may be increased if necessary after 4 weeks up to 60 mg daily for 4–6 weeks, dose to be increased under
close supervision only, then reduced to 10–20 mg daily, usual maintenance dose, but up to 40 mg may be required  
- Elderly: 5–10 mg daily

**MEDICINAL FORMS**  
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension  
Tablet  
CAUTIONARY AND ADVISORY LABELS 3, 10  
- ISOCARBOXAZID (Non-proprietary)  
Isocarboxazid 10 mg Isocarboxazid 10mg tablets | 56 tablet £39.95

**Phenelzine**

**INDICATIONS AND DOSE**  
Depressive illness  
BY MOUTH  
- Adult: Initially 15 mg 3 times a day; response is usually seen within first week; dose may be increased if necessary after 2 weeks if response is not evident, increased if necessary to 15 mg 4 times a day, doses up to 30 mg three times a day may be used in hospital patients, then reduced to 15 mg once daily on alternate days, response may not become apparent for up to 4 weeks, once satisfactory response has been achieved, reduce dose gradually to lowest suitable maintenance dose (15 mg on alternate days may be adequate)

**SIDE-EFFECTS**  
- Common or very common: Insomnia  
- Uncommon: Hyperpyrexia, lupus erythematosus-like syndrome, speech disturbances  
- Very rare: Angle-closure glaucoma, hypertensive crises with throbbing headache, liver damage (less frequent than with phenelzine)

**Benign hypertension**

- Frequency not known: Blood dyscrasias

**SIDE-EFFECTS, FURTHER INFORMATION**  
Hypertensive crisis and throbbing headache requiring discontinuation of treatment is more frequent than with other MAOIs.

**BREAST FEEDING**  
Present in milk in animal studies.

**HEPATIC IMPAIRMENT**  
Avoid if history of hepatic disease or if abnormal liver function tests.

**LEADING SUITABLE FOR PRESCRIBING**  
Less suitable for prescribing.

**MEDICINAL FORMS**  
There can be variation in the licensing of different medicines containing the same drug.  
Tablet  
CAUTIONARY AND ADVISORY LABELS 3, 10  
- TRANYLCYPROMINE (Non-proprietary)  
Tranylcypromine (as Tranylcypromine sulfate) 10 mg Tranylcypromine 10mg tablets | 28 tablet £243.98–£252.30 07 price = £248.14

**MONOAMINE-OXIDASE INHIBITORS**  
(Reversible)

**Moclobemide**

**DRUG ACTION**  
Moclobemide is reported to act by reversible inhibition of monoamine oxidase type A (it is therefore termed a RIMA).

**INDICATIONS AND DOSE**  
Depressive illness  
BY MOUTH  
- Adult: Initially 300 mg daily in divided doses, adjusted according to response; usual dose 150–600 mg daily, dose to be taken after food  
Social anxiety disorder  
BY MOUTH  
- Adult: Initially 300 mg daily for 3 days, then increased to 600 mg daily in 2 divided doses continued for 8–12 weeks to assess efficacy

**CONTRA-INDICATIONS**  
Acute confusional states  
- Phaeochromocytoma

**CAUTIONS**  
Avoid in agitated or excited patients (or give with sedative for up to 2–3 weeks)  
- May provoke manic episodes in bipolar disorders  
- Thyrotoxicosis

**INTERACTIONS**  
Appendix 1 (moclobemide).  
The risk of drug interactions is claimed to be less than with the traditional (irreversible) MAOIs, but patients still need to avoid sympathomimetics such as ephedrine and pseudoephedrine. In addition, moclobemide should not be given with another antidepressant. Owing to its short duration of action no treatment-free period is required after it has been stopped but it should not be started until at least a week after a tricyclic or related antidepressant or an SSRI or related antidepressant has been stopped (at least 5 weeks in the case of fluoxetine), or for at least a week after an MAOI has been stopped.

**SIDE-EFFECTS**  
- Rare: Galactorrhoea, hyponatraemia, raised liver enzymes  
- Frequency not known: Agitation, confusional states, dizziness, dry mouth, gastrointestinal disorders, headache, oedema, paraesthesia, restlessness, skin reactions, sleep disturbances, visual disturbances
Raynaud’s syndrome • suicidal behaviour • testicular pain • vomiting
• PREGNANCY Use only if potential benefit outweighs risk—limited information available.
• BREAST FEEDING Small amount present in milk—use only if potential benefit outweighs risk.
• HEPATIC IMPAIRMENT Initial dose 2 mg twice daily, increased according to tolerance.
• RENAL IMPAIRMENT Initial dose 2 mg twice daily, increased according to tolerance.
• TREATMENT CESSATION Caution—avoid abrupt withdrawal.
• PATIENT AND CARER ADVICE Counselling advised.

SELECTIVE SEROTONIN RE- UPTAKE INHIBITORS

Selective serotonin re-uptake inhibitors

• DRUG ACTION Selectively inhibit the re-uptake of serotonin (5-hydroxytryptamine, 5-HT).
• CONTRA-INDICATIONS Poorly controlled epilepsy • SSRIs should not be used if the patient enters a manic phase.
• CAUTIONS Cardiac disease • concurrent electroconvulsive therapy • diabetes mellitus • epilepsy (discontinue if convulsions develop) • history of bleeding disorders (especially gastro-intestinal bleeding) • history of mania • susceptibility to angle-closure glaucoma
• INTERACTIONS → Appendix 1 (antidepressants, SSRI).
Caution with other drugs that increase the risk of bleeding.

• SIDE-EFFECTS
• Common or very common Abdominal pain (dose-related) • constipation (dose-related) • diarrhea (dose-related) • dyspepsia (dose-related) • gastro-intestinal effects (dose-related) • nausea (dose-related) • vomiting (dose-related)
• Uncommon Serotonin syndrome
• Rare Angle-closure glaucoma
• Frequency not known Anaphylaxis • angioedema • anorexia with weight loss • anxiety • arthralgia • asthenia • bleeding disorders • convulsions • dizziness • drowsiness • dry mouth • dyskinesias • ecchymoses • galactorrhoea • hallucinations • headache • hypersensitivity reactions • hypomania • hyponatraemia • increased appetite • insomnia • mania • movement disorders • myalgia • nervousness • photosensitivity • purpura • rash • sexual dysfunction • suicidal behaviour • sweating • tremor • urinary retention • urticaria • visual disturbances • weight gain

SIDE-EFFECTS, FURTHER INFORMATION

Hypersensitivity reactions If hypersensitivity reactions (including rash) occur, consider discontinuation—may be sign of impending serious systemic reaction, possibly associated with vasculitis.

Overdose Symptoms of poisoning by selective serotonin re-uptake inhibitors include nausea, vomiting, agitation, tremor, nystagmus, drowsiness, and sinus tachycardia; convulsions may occur. Rarely, severe poisoning results in the serotonin syndrome, with marked neuropsychiatric effects, neuromuscular hyperactivity, and autonomic instability; hyperthermia, rhabdomyolysis, renal failure, and coagulopathies may develop.
For details on the management of poisoning, see Selective serotonin re-uptake inhibitors, under Emergency treatment of poisoning p. 1123.

- **PREGNANCY** Manufacturers advise avoid during pregnancy unless the potential benefit outweighs the risk. There is a small increased risk of congenital heart defects when taken during early pregnancy. If used during the third trimester there is a risk of neonatal withdrawal symptoms, and persistent pulmonary hypertension in the newborn has been reported.

- **TREATMENT CESSATION** Gastro-intestinal disturbances, headache, anxiety, dizziness, paraesthesia, electric shock sensation in the head, neck, and spine, tinnitus, sleep disturbances, fatigue, influenza-like symptoms, and sweating are the most common features of abrupt withdrawal of an SSRI or marked reduction of the dose; palpitation and visual disturbances can occur less commonly. The dose should be tapered over at least a few weeks to avoid these effects. For some patients, it may be necessary to withdraw treatment over a longer period; consider obtaining specialist advice if symptoms persist. Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).

- **PATIENT AND CARER ADVICE** May also impair performance of skilled tasks (e.g. driving, operating machinery).

### Citalopram

**INDICATIONS AND DOSE**

**Depressive illness**
- **BY MOUTH USING TABLETS**
  - Adult: 20 mg once daily, increased in steps of 20 mg daily if required, dose to be increased at intervals of 3–4 weeks; maximum 40 mg per day
  - Elderly: 10–20 mg once daily; maximum 20 mg per day
- **BY MOUTH USING ORAL DROPS**
  - Adult: 16 mg once daily, increased in steps of 16 mg daily if required, dose to be increased at intervals of 3–4 weeks; maximum 32 mg per day
  - Elderly: 8–16 mg daily; maximum 16 mg per day

**Panic disorder**
- **BY MOUTH USING TABLETS**
  - Adult: Initially 10 mg daily, increased in steps of 10 mg daily if required, dose to be increased gradually; usual dose 20–30 mg daily; maximum 40 mg per day
  - Elderly: Initially 10 mg daily, increased in steps of 10 mg daily if required, dose to be increased gradually; maximum 20 mg per day
- **BY MOUTH USING ORAL DROPS**
  - Adult: Initially 8 mg once daily, increased in steps of 8 mg if required, dose to be increased gradually; usual dose 16–24 mg daily; maximum 32 mg per day
  - Elderly: Initially 8 mg once daily, increased in steps of 8 mg if required, dose to be increased gradually; maximum 16 mg per day

**Dose equivalence and conversion**
- 4 oral drops (8 mg) is equivalent in therapeutic effect to 10 mg tablet.

**CONTRA-INDICATIONS** QT-interval prolongation

**CAUTIONS** Susceptibility to QT-interval prolongation

**INTERACTIONS** Avoid concomitant administration of drugs that prolong QT interval.

**SIDE-EFFECTS** abnormal dreams · aggression · amnesia · bradycardia · confusion · coughing · euphoria · haemorrhage · hepatitis · hypokalaemia · impaired concentration · increased salivation · malaise · micturition disorders · migraine · mydriasis · oedema · palpitation paradoxical increased anxiety during initial treatment of panic disorder (reduce dose) · paraesthesia · polyuria · postural hypotension · pruritus · QT-interval prolongation · rhinitis · tachycardia · tinnitus · taste disturbance · yawning

**BREAST FEEDING** Present in milk—use with caution.

**HEPATIC IMPAIRMENT** Use doses at lower end of range; for tablets up to maximum 20 mg; for oral solution up to maximum 16 mg.

**RENAL IMPAIRMENT** No information available for eGFR less than 20 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION** Cipramil® oral drops should be mixed with water, orange juice, or apple juice before taking.

**PATIENT AND CARER ADVICE** Patients should be advised of the effects of citalopram on driving. Counselling on administration of oral drops is advised.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**
- **CITALOPRAM (Non-proprietary)**
  - Citalopram (as Citalopram hydrobromide) 10 mg
    - 10mg tablets | 28 tablet (P) £8.90 DT price = £1.05
    - Citalopram (as Citalopram hydrobromide) 20 mg
      - 20mg tablets | 28 tablet (P) £15.99 DT price = £1.09
  - Citalopram (as Citalopram hydrobromide) 40 mg
    - 40mg tablets | 28 tablet (P) £27.00 DT price = £1.28
- **Cipramil®** (Lundbeck Ltd)
  - Citalopram (as Citalopram hydrobromide) 20 mg
    - Cipramil 20mg tablets | 28 tablet (P) £8.95 DT price = £1.09

**Oral drops**
- **EXCipients:** May contain Alcohol
- **CITALOPRAM (Non-proprietary)**
  - Citalopram (as Citalopram hydrochloride) 40 mg per 1 ml
    - 40mg/ml oral drops sugar free (sugar-free) | 15 ml (P) £20.16 DT price = £1.56
  - Cipramil® (Lundbeck Ltd)
    - Citalopram (as Citalopram hydrochloride) 40 mg per 1 ml
      - Cipramil 40mg/ml drops (sugar-free) | 15 ml (P) £10.08 DT price = £0.56

### Escitalopram

- **DRUG ACTION** Escitalopram is the active enantiomer of citalopram.

**INDICATIONS AND DOSE**

**Depressive illness | Generalised anxiety disorder | Obsessive-compulsive disorder**
- **BY MOUTH**
  - Adult: 10 mg once daily; increased if necessary up to 20 mg daily
  - Elderly: Initially 5 mg once daily; maximum 10 mg per day

**Panic disorder**
- **BY MOUTH**
  - Adult: Initially 5 mg once daily for 7 days, then increased to 10 mg daily; maximum 20 mg per day
  - Elderly: Initially 2.5 mg once daily; maximum 10 mg per day

continued →
Fluoxetine

**INDICATIONS AND DOSE**

**Major depression**

- **BY MOUTH**
  - Adult: Initially 20 mg daily, dose is increased after 3–4 weeks if necessary, and at appropriate intervals thereafter, daily dose may be administered as a single or divided dose; maximum 60 mg per day
  - Elderly: Initially 20 mg daily, dose is increased after 3–4 weeks if necessary, and at appropriate intervals thereafter, daily dose may be administered as a single or divided dose, usual maximum dose is 40 mg but doses up to 60 mg can be used

**Bulimia nervosa**

- **BY MOUTH**
  - Adult: 60 mg daily, daily dose may be administered as a single or divided dose
  - Elderly: Up to 40 mg daily, daily dose may be administered as a single or divided dose, usual maximum dose is 40 mg but doses up to 60 mg can be used

**Obsessive compulsive disorder**

- **BY MOUTH**
  - Adult: 20 mg daily, increased if necessary up to 60 mg daily, daily dose may be administered as a single or divided dose, dose to be increased gradually, review treatment if inadequate response after 10 weeks; maximum 60 mg per day
  - Elderly: 20 mg daily, increased if necessary up to 40 mg daily, daily dose may be administered as a single or divided dose, dose to be increased gradually, review treatment if inadequate response after 10 weeks, usual maximum dose is 40 mg but doses up to 60 mg can be used

**PHARMACOKINETICS**

Consider the long half-life of fluoxetine when adjusting dosage (or in overdosage).

- **SIDE-EFFECTS**
  - Alopaeicia, changes in blood sugar, chills, confusion, diarrhoea, dysphagia, dyspnoea, euphoria, flushing, haemorrhage, hepatitis, hypotension, impaired concentration, malaise, neuroleptic malignant syndrome-like event, palpitation, pharyngitis, priapism, pulmonary fibrosis, pulmonary inflammation, sleep disturbances, taste disturbance, toxic epidermal necrolysis, urinary frequency, vasodilatation, yawning

- **BREAST FEEDING**
  - Present in milk—avoid.

- **HEPATIC IMPAIRMENT**
  - Reduction of dose required.

- **RENAL IMPAIRMENT**
  - Further reduction of dose required.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **ESCITALOPRAM (Non-proprietary)**
  - Escitalopram (as Escitalopram oxalate) 5 mg Escitalopram 5mg tablets | 28 tablet | £1.26–£8.97 DT price = £1.26
  - Escitalopram (as Escitalopram oxalate) 10 mg Escitalopram 10mg tablets | 28 tablet | £1.53–£14.16 DT price = £1.53
  - Escitalopram (as Escitalopram oxalate) 20 mg Escitalopram 20mg tablets | 28 tablet | £2.07–£23.94 DT price = £2.07
  - Cipralex (Lundbeck Ltd) Escitalopram (as Escitalopram oxalate) 5 mg Cipralex 5mg tablets | 28 tablet | £8.97 DT price = £1.26
  - Escitalopram (as Escitalopram oxalate) 10 mg Cipralex 10mg tablets | 28 tablet | £14.91 DT price = £1.53
  - Escitalopram (as Escitalopram oxalate) 20 mg Cipralex 20mg tablets | 28 tablet | £25.20 DT price = £2.07

**Oral drops**

- Cipralex (Lundbeck Ltd) Escitalopram (as Escitalopram oxalate) 20 mg per 1 ml Cipralex 20mg/ml oral drops (sugar-free) | 15 ml | £20.16

**Fluoxetine**

**INDICATIONS AND DOSE**

**Major depression**

- **BY MOUTH**
  - Adult: Initially 20 mg once daily for 2–4 weeks of treatment; usual dose 5–20 mg daily

- **CONTRA-INDICATIONS**
  - QT-interval prolongation

- **CAUTIONS**
  - Susceptibility to QT-interval prolongation

- **INTERACTIONS**
  - Avoid concomitant administration of drugs that prolong QT interval.

- **SIDE-EFFECTS**
  - **Common or very common**
    - Abnormal dreams, fatigue, paraesthesia, pyrexia, restlessness, sinusitis, yawning
  - **Uncommon**
    - Alopecia, bruxism, confusion, epistaxis, menstrual disturbances, mydriasis, oedema, pruritus, syncope, tachycardia, taste disturbance, tinnitus
  - **Rare**
    - Aggression, bradycardia, depersonalisation
  - **Frequency not known**
    - Hepatitis, paradoxical increased anxiety during initial treatment of panic disorder (reduce dose), postural hypotension, QT interval prolongation, thrombocytopenia

- **BREAST FEEDING**
  - Present in breast milk; avoid.

- **HEPATIC IMPAIRMENT**
  - Initial dose 5 mg daily for 2 weeks, thereafter increased to max. 10 mg daily according to response; particular caution in severe impairment.

- **RENAL IMPAIRMENT**
  - Caution if eGFR less than 30 mL/minute/1.73m².

- **DIRECTIONS FOR ADMINISTRATION**
  - Oral drops can be mixed with water, orange juice, or apple juice before swallowing.
  - Counselling on administration of oral drops advised.

- **SIDE-EFFECTS**
  - Alopecia, changes in blood sugar, chills, confusion, diarrhoea, dysphagia, dyspnoea, euphoria, flushing, haemorrhage, hepatitis, hypotension, impaired concentration, malaise, neuroleptic malignant syndrome-like event, palpitation, pharyngitis, priapism, pulmonary fibrosis, pulmonary inflammation, sleep disturbances, taste disturbance, toxic epidermal necrolysis, urinary frequency, vasodilatation, yawning

- **BREAST FEEDING**
  - Present in milk—avoid.

- **HEPATIC IMPAIRMENT**
  - Reduce dose or increase dose interval.

- **DIRECTIONS FOR ADMINISTRATION**
  - Dispersible tablets can be dispersed in water for administration or swallowed whole with plenty of water.

- **PATIENT AND CARER ADVICE**
  - Patients should be counselled about the effects on driving.
  - Patients and carers should be counselled on the administration of dispersible tablets.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**
  - **ESCITALOPRAM (Non-proprietary)**
    - Escitalopram (as Escitalopram oxalate) 5 mg Escitalopram 5mg tablets | 28 tablet | £1.26–£8.97 DT price = £1.26
    - Escitalopram (as Escitalopram oxalate) 10 mg Escitalopram 10mg tablets | 28 tablet | £1.53–£14.16 DT price = £1.53
    - Escitalopram (as Escitalopram oxalate) 20 mg Escitalopram 20mg tablets | 28 tablet | £2.07–£23.94 DT price = £2.07
  - Cipralex (Lundbeck Ltd) Escitalopram (as Escitalopram oxalate) 5 mg Cipralex 5mg tablets | 28 tablet | £8.97 DT price = £1.26
  - Escitalopram (as Escitalopram oxalate) 10 mg Cipralex 10mg tablets | 28 tablet | £14.91 DT price = £1.53
  - Escitalopram (as Escitalopram oxalate) 20 mg Cipralex 20mg tablets | 28 tablet | £25.20 DT price = £2.07

- **Oral drops**
  - Cipralex (Lundbeck Ltd) Escitalopram (as Escitalopram oxalate) 20 mg per 1 ml Cipralex 20mg/ml oral drops (sugar-free) | 15 ml | £20.16
Paroxetine (as Paroxetine hydrochloride) 4 mg per 1 ml  Prozac 20mg/5ml liquid | 70 ml [POM] £11.12 DT price = £3.69
Brands may include Prozep

Fluvoxamine maleate

INDICATIONS AND DOSE
Depressive illness
BY MOUTH
- Adult: Initially 50–100 mg daily, dose to be taken in the evening, dose to be increased gradually, then increased if necessary up to 300 mg daily, doses over 150 mg daily are given in divided doses; maintenance 100 mg daily

Obsessive-compulsive disorder
BY MOUTH
- Adult: Initially 50 mg daily, dose to be taken in the evening, dose is increased gradually if necessary after several weeks, doses over 150 mg daily are given in divided doses, then increased if necessary up to 300 mg daily; maintenance 100–300 mg daily, if no improvement in obsessive-compulsive disorder within 10 weeks, treatment should be reconsidered

SIDE-EFFECTS
- Common or very common Malaise · palpitation · tachycardia
- Uncommon Ataxia · confusion · postural hypotension
- Rare Abnormal liver function, usually symptomatic (discontinue treatment)
- Frequency not known Neuroleptic malignant syndrome-like event · paraesthesia · taste disturbance

BREAST FEEDING
Present in milk—avoid.

HEPATIC IMPAIRMENT
Reduce dose if eGFR less than 30 mL/minute/1.73 m².

PATIENT AND CARER ADVICE
Patients should be counselled about the effects on driving.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension
Tablet
- FLUOXETINE MALEATE (Non-proprietary)
  - Fluvoxamine maleate 100 mg Fluvoxamine 100mg tablets | 30 tablet [POM] £24.95 DT price = £0.83
  - Faverin (BGP Products Ltd) Fluvoxamine maleate 50 mg Faverin 50mg tablets | 30 tablet [POM] £5.95 DT price = £0.19
  - Faverin (BGP Products Ltd) Fluvoxamine maleate 100 mg Faverin 100mg tablets | 30 tablet [POM] £11.95 DT price = £0.39

Paroxetine (as Paroxetine hydrochloride) 10 mg Paroxetine 10mg tablets | 28 tablet [POM] £14.21–£18.12 DT price = £1.747
Paroxetine (as Paroxetine hydrochloride) 20 mg Paroxetine 20mg tablets | 30 tablet [POM] £3.25 DT price = £0.11
Paroxetine (as Paroxetine hydrochloride) 30 mg Paroxetine 30mg tablets | 30 tablet [POM] £13.36 DT price = £0.45
Seroxat (GlaxoSmithKline UK Ltd) Paroxetine (as Paroxetine hydrochloride) 10 mg Seroxat 10mg tablets | 28 tablet [POM] £14.21 DT price = £0.1747
Seroxat (GlaxoSmithKline UK Ltd) Paroxetine (as Paroxetine hydrochloride) 20 mg Seroxat 20mg tablets | 30 tablet [POM] £15.23 DT price = £0.51
Seroxat (GlaxoSmithKline UK Ltd) Paroxetine (as Paroxetine hydrochloride) 30 mg Seroxat 30mg tablets | 30 tablet [POM] £26.74 DT price = £0.89

Obsessive-compulsive disorder
BY MOUTH
- Adult: Initially 20 mg daily, dose to be taken in the morning, increased in steps of 10 mg, dose to be increased gradually, to 40 mg daily, no evidence of greater efficacy at higher doses; maximum 60 mg per day
- Elderly: Initially 20 mg daily, dose to be taken in the morning, increased in steps of 10 mg, dose to be increased gradually; maximum 40 mg per day

Panic disorder
BY MOUTH
- Adult: Initially 10 mg daily, dose to be taken in the morning, increased in steps of 10 mg, dose to be increased gradually, increased to 40 mg daily, no evidence of greater efficacy at higher doses; maximum 60 mg per day
- Elderly: Initially 10 mg daily, dose to be taken in the morning, increased in steps of 10 mg, dose to be increased gradually; maximum 40 mg per day

CAUTIONS
Achlorhydria · high gastric pH

CAUTIONS, FURTHER INFORMATION
Achlorhydria or high gastric pH Causes reduced absorption of the oral suspension.

SIDE-EFFECTS
- Common or very common Abnormal dreams · raised cholesterol · yawning
- Uncommon Arrhythmias · confusion · urinary incontinence
- Rare Depersonalisation · neuroleptic malignant syndrome-like event · panic attacks · paradoxical increased anxiety during initial treatment of panic disorder (reduce dose) · restless legs syndrome
- Very rare Acute glaucoma · hepatic disorders · hepatitis · peripheral oedema · priapism
- Frequency not known Extrapyramidal reactions · orofacial dystonias · tinnitus · withdrawal reactions

PREGNANCY
Increased risk of congenital malformations, especially if used in the first trimester.

BREAST FEEDING
Present in milk but amount too small to be harmful.

HEPATIC IMPAIRMENT
Reduce dose.

PATIENT AND CARER ADVICE
Patients should be counselled about the effect on driving.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension
Tablet
CAUTIONARY AND ADVISORY LABELS 21
- PAROXETINE (Non-proprietary)

Nervous system
Sertraline

**INDICATIONS AND DOSE**

**Depressive illness**
- **BY MOUTH**
  - Adult: Initially 50 mg daily, then increased in steps of 50 mg at least every 1 week if required; maintenance 50 mg daily; maximum 200 mg per day

**Obsessive-compulsive disorder**
- **BY MOUTH**
  - Adult: Initially 50 mg daily, then increased in steps of 50 mg at least every 1 week if required; maximum 200 mg per day

**Panic disorder / Post-traumatic stress disorder / Social anxiety disorder**
- **BY MOUTH**
  - Adult: Initially 25 mg daily for 1 week, then increased to 50 mg daily, then increased in steps of 50 mg at least every 1 week if required, increase only if response is partial and if drug is tolerated; maximum 200 mg per day

**SIDE-EFFECTS**
- Aggression, anemia, bronchospasm, hepatitis, hypercholesterolaemia, hyperprolactinaemia, hypertension, hypoglycaemia, hypothyroidism, jaundice, leucopenia, liver failure, menstrual irregularities, palpitation, pancreatitis, parahypersensitivity, postural hypotension, stomatitis, tachycardia, tinnitus, urinary incontinence

**BREAST FEEDING**
- Not known to be harmful but consider discontinuing breast-feeding.

**HEPATIC IMPAIRMENT**
- Reduce dose or increase dose interval in mild or moderate impairment. Avoid in severe impairment.

**RENAI IMPAIRMENT**
- Use with caution.

**PATIENT AND CARER ADVICE**
- Patients should be counselled on the effects on driving.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**
- **SERTRALINE (Non-proprietary)**
  - Sertraline (as Sertraline hydrochloride) 50 mg Sertraline 50mg tablets | 28 tablet | £19.25 OT price = £1.46
  - Sertraline (as Sertraline hydrochloride) 100 mg Sertraline 100mg tablets | 28 tablet | £25.09 OT price = £1.66
- **Lustral (Pfizer Ltd)**
  - Sertraline (as Sertraline hydrochloride) 50 mg Lustral 50mg tablets | 28 tablet | £17.82 OT price = £1.46
  - Sertraline (as Sertraline hydrochloride) 100 mg Lustral 100mg tablets | 28 tablet | £29.16 OT price = £1.66

**SEROTONIN AND NORADRENALINE RE-UPTAKE INHIBITORS**

**Duloxetine**
- **DRUG ACTION**
  - Inhibits the re-uptake of serotonin and noradrenaline.

**INDICATIONS AND DOSE**

**Major depressive disorder**
- **BY MOUTH**
  - Adult: 60 mg once daily

**Generalised anxiety disorder**
- **BY MOUTH**
  - Adult: Initially 30 mg once daily, increased if necessary to 60 mg once daily; maximum 120 mg per day

**Diabetic neuropathy**
- **BY MOUTH**
  - Adult: 60 mg once daily, discontinue if inadequate response after 2 months; review treatment at least every 3 months, maximum dose to be given in divided doses; maximum 120 mg per day

**Moderate to severe stress urinary incontinence**
- **BY MOUTH**
  - Adult (female): 40 mg twice daily, patient should be assessed for benefit and tolerability after 2–4 weeks, alternatively initially 20 mg twice daily for 2 weeks, this can minimise side effects, then increased to 40 mg twice daily, the patient should be assessed for benefit and tolerability after 2–4 weeks.

**CAUTIONS**
- Bleeding disorders - cardiac disease - elderly - history of mania - history of seizures - hypertension (avoid if uncontrolled) - raised intra-ocular pressure - susceptibility to angle-closure glaucoma

**INTERACTIONS**
- Appendix 1 (duloxetine). Caution with concomitant use of drugs that increase risk of bleeding.

**SIDE-EFFECTS**
- **Common or very common**

- **Uncommon**

- **Rare**
  - Mania

- **Very rare**
  - Angle-closure glaucoma

- **Frequency not known**
  - Anaphylaxis - angioedema - chest pain - hallucinations - hypersensitivity reactions - hyponatraemia - rash - seizures - Stevens-Johnson syndrome - suicidal behaviour - supraventricular arrhythmia - urticaria

**PREGNANCY**
- Toxicity in animal studies—avoid in patients with stress urinary incontinence; in other conditions use only if potential benefit outweighs risk. Risk of neonatal withdrawal symptoms if used near term.

**BREAST FEEDING**
- Present in milk—manufacturer advises avoid.

**HEPATIC IMPAIRMENT**
- Manufacturer advises avoid.

**RENAI IMPAIRMENT**
- Avoid if eGFR less than 30 ml/minute/1.73 m².

**TREATMENT CESSATION**
- Nausea, vomiting, headache, anxiety, dizziness, paraesthesia, sleep disturbances, and tremor are the most common features of abrupt withdrawal or marked reduction of the dose; dose should be reduced over at least 1–2 weeks.
Venlafaxine

- **DRUG ACTION** A serotonin and noradrenaline re-uptake inhibitor.

**INDICATIONS AND DOSE**

**Major depression**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- **Adults:** Initially 75 mg daily in 2 divided doses, then increased if necessary up to 375 mg daily, dose to be increased if necessary at intervals of at least 2 weeks, faster dose titration may be necessary in some patients; maximum 375 mg per day

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- **Adults:** Initially 75 mg once daily, increased if necessary up to 375 mg once daily, dose to be increased if necessary at intervals of at least 2 weeks, faster dose titration may be necessary in some patients; maximum 375 mg per day

**Generalised anxiety disorder**

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- **Adults:** 75 mg once daily, increased if necessary up to 225 mg once daily, dose to be increased at intervals of at least 2 weeks; maximum 225 mg per day

**Social anxiety disorder**

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- **Adults:** 75 mg once daily, there is no evidence of greater efficacy at higher doses, increased if necessary up to 225 mg once daily, dose to be increased if necessary at intervals of at least 2 weeks; maximum 225 mg per day

**CONTRA-INDICATIONS** Conditions associated with high risk of cardiac arrhythmia - uncontrolled hypertension

**CAUTIONS** Diabetes - heart disease (monitor blood pressure) - history of bleeding disorders - history of epilepsy - history or family history of mania - susceptibility to angle-closure glaucoma

**INTERACTIONS** Appendix 1 (venlafaxine). Concomitant use of drugs that increase risk of bleeding.

**SIDE-EFFECTS**

- **Common or very common** Abnormal dreams - anorexia - anxiety - anxiety (on withdrawal) - asthenia - changes in serum cholesterol - chills - confusion - constipation - difficulty with micturition - dizziness - dizziness (on withdrawal) - dry mouth - gastro-intestinal disturbances (on withdrawal) - headache - headache (on withdrawal) - hyperton - hypertension - hypotonia - insomnia - menstrual disturbances - mydriasis - nausea - nervousness - palpititation - paraesthesia (on withdrawal) - sensory disturbances - sexual dysfunction - sleep disturbances (on withdrawal) - sweating - sweating (on withdrawal) - tremor - tremor (on withdrawal) - vasodilatation - visual disturbances - vomiting - weight changes - yawning

- **Rare** Akathisia - extrapyramidal symptoms - hypomania - mania - seizures - urinary incontinence

- **Very rare** Angle-closure glaucoma

- **Frequency not known** Aggression - blood dyscrasias - delirium - hepatitis - hyperprolactinaemia - hypotension - neuroleptic malignant syndrome - pancreatitis - pruritus - QT interval prolongation - rhabdomyolysis - Stevens-Johnson syndrome - suicidal behaviour - syndrome of inappropriate anti-diuretic hormone secretion - urticaria - vertigo

**PREGNANCY** Avoid unless potential benefit outweighs risk—toxicity in animal studies. Risk of withdrawal effects in neonate.

**BREAST FEEDING** Present in milk—avoid.

**HEPATIC IMPAIRMENT** Consider reducing dose by 50% in mild or moderate impairment; use with caution and reduce dose by at least 50% in severe impairment.

**RENAL IMPAIRMENT** Use with caution. Use half normal dose (immediate-release tablets may be given once daily) if eGFR less than 30 mL/minute/1.73 m².

**TREATMENT CESSATION** Associated with a higher risk of withdrawal effects compared with other antidepressants. Gastro-intestinal disturbances, headache, anxiety, dizziness, paraesthesia, tremor, sleep disturbances, and sweating are most common features of withdrawal if treatment stopped abruptly or if dose reduced markedly; dose should be reduced over several weeks.

**PATIENT AND CARER ADVICE** May affect performance of skilled tasks (e.g. driving).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, powder

**Tablet**

**TETRACYCLIC ANTIDEPRESSANTS**

**Mianserin hydrochloride**

**INDICATIONS AND DOSE**

Depressive illness (particularly where sedation is required)

- **By Mouth**
  - **Adult:** Initially 30–40 mg daily in divided doses, alternatively initially 30–40 mg once daily, dose to be taken at bedtime, increase dose gradually as necessary; usual dose 30–90 mg
  - **Elderly:** Initially 30 mg daily in divided doses, alternatively initially 30 mg once daily, dose to be taken at bedtime, increase dose gradually as necessary; usual dose 30–90 mg

- **CONTRA-INDICATIONS**
  - Acute porphyrias p. 864
  - arrhythmias - during the manic phase of bipolar disorder
  - heart block - immediate recovery period after myocardial infarction

- **CAUTIONS**
  - Cardiovascular disease - chronic constipation - diabetes - epilepsy - history of bipolar disorder - history of psychosis - hyperthyroidism - risk of arrhythmias - increased intra-ocular pressure - patients with a significant risk of suicide - phaeochromocytoma (risk of arrhythmias) - prostatic hypertrophy - susceptibility to angle-closure glaucoma - urinary retention

- **CAUTIONS, FURTHER INFORMATION**
  - Treatment should be stopped if the patient enters a manic phase.
  - Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with careful monitoring, particularly for psychiatric and cardiac side-effects.

- **INTERACTIONS**
  - Antidepressants, tricyclic (related).

- **SIDE-EFFECTS**
  - Common or very common: Agitation - anxiety - arrhythmia - blurred vision - confusion - dizziness - dry mouth - ECG changes - heart block - irritability - paraesthesia - postural hypotension - sleep disturbances - sudden death of patients with cardiac disease - tachycardia

- **Rare:** Dysarthria - extrapyramidal symptoms - paralytic ileus - tremor - urinary retention

- **Very rare:** Constipation - neuroleptic malignant syndrome - precipitation of angle-closure glaucoma

- **Frequency not known**
  - Alopecia - anorexia - arthralgia - arthritis - blood dyscrasias - breast enlargement - changes in blood sugar - chillis (on withdrawal) - convulsions - delusions - galactorrhoea - gynaecomastia - haematological reactions - hallucinations - headache (on withdrawal) - hepatic reactions - hypomania - hypotension - increased appetite - influenza-like symptoms (on withdrawal)
  - Insomnia (on withdrawal) - jaundice - mania - movement disorders (on withdrawal) - myalgia (on withdrawal)

**SIDE-EFFECTS, FURTHER INFORMATION**

The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

**Overdose**

Emergency treatment of poisoning

The tricyclic-related antidepressant drugs may be associated with a lower risk of cardiotoxicity in overdosage. Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning, p. 1123.

- **PREGNANCY**
  - Avoid.

- **BREAST FEEDING**
  - The amount secreted into breast milk is too small to be harmful.

- **HEPATIC IMPAIRMENT**
  - Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.

- **RENAI IMPAIRMENT**
  - Caution in renal impairment.

- **MONITORING REQUIREMENTS**
  - A full blood count is recommended every 4 weeks during the first 3 months of treatment; clinical monitoring should continue subsequently and treatment should be stopped and a full blood count obtained if fever, sore throat, stomatitis, or other signs of infection develop.

- **TREATMENT CESSATION**
  - Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.

- **PATIENT AND CARER ADVICE**
  - Drowsiness may affect the performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.
Mirtazapine

**DRUG ACTION** Mirtazapine is a presynaptic alpha2-adrenoceptor antagonist which increases central noradrenergic and serotonergic neurotransmission.

**INDICATIONS AND DOSE**

**Major depression**

**BY MOUTH**

- Adult: Initially 15–30 mg daily for 2–4 weeks, dose to be taken at bedtime, then adjusted according to response to up to 45 mg once daily; increased if necessary up to 45 mg daily in 2 divided doses.

**CAUTIONS** Cardiac disorders - diabetes mellitus - elderly - history of bipolar depression - history of seizures - history of urinary retention - hypotension - psychoses (may aggravate psychotic symptoms) - susceptibility to angle-closure glaucoma

**INTERACTIONS** Appendix 1 (mirtazapine).

**SIDE-EFFECTS**

- **Common or very common** Abnormal dreams - agitation (on withdrawal) - anxiety - anxiety (on withdrawal) - arthralgia - confusion - dizziness - dizziness (on withdrawal) - drowsiness - dry mouth - fatigue - headache (on withdrawal) - increased appetite - insomnia - myalgia - nausea (on withdrawal) - oedema - postural hypotension - tremor - vomiting (on withdrawal) - weight gain

- **Uncommon** Hallucinations - mania - movement disorders - syncope

- **Rare** Aggression - myoclonus - pancreatitis

- **Frequency not known** Angle-closure glaucoma - blood disorders - convulsions - dysarthria - hypersalivation - hyponatraemia - inappropriate secretion of antidiuretic hormone - sedation during initial treatment - Stevens-Johnson syndrome - suicidal behaviour - toxic epidermal necrolysis

**PREGNANCY** Use with caution—limited experience; monitor neonate for withdrawal effects.

**BREAST FEEDING** Present in milk; use only if potential benefit outweighs risk.

**HEPATIC IMPAIRMENT** Use with caution. Discontinue if jaundice occurs.

**RENAL IMPAIRMENT** Clearance reduced by 30% if eGFR less than 40 mL/minute/1.73 m²; clearance reduced by 50% if eGFR less than 10 mL/minute/1.73 m².

**TREATMENT CESSATION** Nausea, vomiting, dizziness, agitation, anxiety, and headache are most common features of withdrawal if treatment stopped abruptly or if dose reduced markedly; dose should be reduced over several weeks.

**DIRECTIONS FOR ADMINISTRATION** Orodispensible tablet (Zispin SolTab) should be placed on the tongue, allowed to disperse and swallowed.

**PATIENT AND CARER ADVICE** Counselling on administration of orodispensible tablet advised. Blood Disorders Patients should be advised to report any fever, sore throat, stomatitis or other signs of infection during treatment. Blood count should be performed and the drug stopped immediately if blood dyscrasia suspected.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, capsule, tablet.

**Tablet**

- **MANSERIN HYDROCHLORIDE (Non-proprietary)**
  - Mianserin hydrochloride 10 mg: 28 tablet £18.00 DT price = £8.25
  - Mianserin hydrochloride 30 mg: 28 tablet £25.00 DT price = £18.34

**INTERACTIONS**

- **Major depression**
  - **BY MOUTH**
    - Adult: Initially 15–30 mg daily for 2–4 weeks, dose to be taken at bedtime, then adjusted according to response to up to 45 mg once daily; increased if necessary up to 45 mg daily in 2 divided doses.

**INDICATIONS AND DOSE**

**Depression**

**BY MOUTH**

- **Adult:**
  - Initially 15 mg daily in divided doses, dose to be taken after food, alternatively initially 150 mg once daily, dose to be taken at bedtime, increased if necessary to 300 mg daily; increased if necessary to 600 mg daily in divided doses, higher dose for use in hospital patients only
  - Elderly: Initially 100 mg daily in divided doses, dose to be taken after food, alternatively initially 100 mg once daily, dose to be taken at bedtime, increased if necessary to 300 mg daily; increased if necessary to 600 mg daily in divided doses, higher dose for use in hospital patients only

**CAUTIONS**

- **Cardiovascular disease**
- **Diabetes mellitus**
- **History of seizures**
- **Psychosis** (may aggravate psychotic symptoms)

**SIDE-EFFECTS**

- **Frequency not known** Agitation, anxiety, and headache are most common features of withdrawal if treatment stopped abruptly or if dose reduced markedly; dose should be reduced over several weeks.

**DIRECTIONS FOR ADMINISTRATION** Orodispensible tablet (Zispin SolTab) should be placed on the tongue, allowed to disperse and swallowed.

**CONTRA-INDICATIONS** Acute porphyrias p. 864 - arrhythmias - during the manic phase of bipolar disorder - heart block - immediate recovery period after myocardial infarction

**CAUTIONS**

- **Cardiovascular disease**
- **Diabetes mellitus**
- **Epilepsy**
- **History of bipolar disorder**
- **History of psychosis**
- **Hypothyroidism (risk of arrhythmias)**
- **Increased intra-ocular pressure**
- **Patients with a significant risk of suicide**
- **Phaeochromocytoma (risk of arrhythmias)**
- **Prostatic hypertrophy**
- **Susceptibility to angle-closure glaucoma**
- **Urinary retention**

**TRIAZOLOPYRIDINES**

**Trazodone hydrochloride**

**INDICATIONS AND DOSE**

**Depressive illness (particularly where sedation is required)**

**BY MOUTH**

- Adult: Initially 150 mg daily in divided doses, dose to be taken after food, alternatively initially 150 mg once daily, dose to be taken at bedtime, increased if necessary to 300 mg daily; increased if necessary to 600 mg daily in divided doses, higher dose for use in hospital patients only

**CAUTIONS**

- **Cardiovascular disease**
- **Chronic constipation**
- **Diabetes mellitus**
- **Epilepsy**
- **History of bipolar disorder**
- **History of psychosis**
- **Hyperthyroidism** (risk of arrhythmias)
- **Increased intra-ocular pressure**
- **Patients with a significant risk of suicide**
- **Phaeochromocytoma (risk of arrhythmias)**
- **Prostatic hypertrophy**
- **Susceptibility to angle-closure glaucoma**
- **Urinary retention**
## Nervous system

### Treatment Cessation
- Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

### Interactions
- Antidepressants, tricyclic (related).

### Side-effects

- **Rare** Extrapyramidal symptoms - paralytic ileus
- **Very rare** precipitation of angle-closure glaucoma
- **Frequency not known** agitation - alopecia - anorexia - anxiety - arrhythmia - arthralgia - blurred vision - breast enlargement - changes in blood sugar - chills (on withdrawal) - confusion - constipation - convulsions - delusions - dizziness - drowsiness - dry mouth - dysarthria - dyspepsia - dyspnoea - ECG changes - galactorrhoea - gynaecomastia - haematological reactions - hallucinations - headache (on withdrawal) - heart block - hepatic reactions - hypersalivation - hypertension - hypomania - hypotension - increased appetite - influenza-like symptoms (on withdrawal) - insomnia (on withdrawal) - irritability - mania - movement disorders (on withdrawal) - myalgia - myalgia (on withdrawal) - nausea - nausea (on withdrawal) - palpitation - paraesthesia - photosensitivity - postural hypotension - priapism (discontinue immediately) - pruritus - rash - sexual dysfunction - sleep disturbances - sudden death of patients with cardiac disease - sweating - sweating (on withdrawal) - tachycardia - taste disturbance - tinnitus - tremor - urinary retention - urticaria - vivid dreams (on withdrawal) - vomiting - weight gain - weight loss

### Side-effects, Further Information

The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

### Overdose

Emergency treatment of poisoning The tricyclic-related antidepressant drugs may be associated with a lower risk of cardiotoxicity in overdose. Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypoventilation, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning, p. 1123.

### Pregnancy

- Avoid during first trimester—limited information available. Monitor infant for signs of withdrawal if used until delivery.

### Breast Feeding

- The amount secreted into breast milk is too small to be harmful.

### Hepatic Impairment

- Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.

### Renal Impairment

- Use with caution in severe impairment.

### Treatment Cessation

Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

### Prescribing and Dispensing Information

Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdose.

### Patient and Carer Advice

Drowsiness may affect the performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension.

### TRICYCLIC ANTIDEPRESSANTS

#### Amitriptyline hydrochloride

**Indications and Dose**

Abdominal pain or discomfort (in patients who have not responded to laxatives, loperamide, or antispasmodics)

**By Mouth**

- Adult: Initially 5–10 mg daily, to be taken at night; increased in steps of 10 mg at least every 2 weeks as required; maximum 50 mg per day.

Depressive illness (but not recommended)

**By Mouth**

- Adult: Initially 75 mg daily in divided doses, alternatively initially 75 mg once daily, dose to be taken at bedtime, increased if necessary to 150–200 mg daily, dose to be increased gradually.

Neuropathic pain

**By Mouth**

- Adult: Initially 30–75 mg daily in divided doses, alternatively initially 30–75 mg once daily, dose to be taken at bedtime, increased if necessary to 150–200 mg daily, dose to be increased gradually.

Migraine prophylaxis

**By Mouth**

- Adult: Initially 10 mg once daily, then increased if necessary to 75 mg once daily, dose to be taken at night, dose to be increased gradually, higher doses to be given on specialist advice.

**Unlicensed Use**

licensed for use in abdominal pain or discomfort in patients who have not responded to laxatives, loperamide, or antispasmodics.

- **CONTRA-INDICATIONS** Acute porphyrias p. 864 - arrhythmias - during manic phase of bipolar disorder - heart block - immediate recovery period after myocardial infarction

- **CAUTIONS** Cardiovascular disease - chronic constipation - diabetes - epilepsy - history of bipolar disorder - history of psychosis - hyperthyroidism (risk of arrhythmias) - increased intra-ocular pressure - patients with a significant risk of suicide - phaeochromocytoma (risk of arrhythmias) - prostatic hypertrophy - susceptibility to angle-closure glaucoma - urinary retention

**SIDE-EFFECTS, FURTHER INFORMATION**

Treatment should be stopped if the patient enters a manic phase. Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

- **INTERACTIONS** → Appendix 1 (Antidepressants, tricyclic).

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain - fatigue - hypertension - mydriasis - oedema - palpitation - restlessness - stomatitis
  - **Rare** Dysarthria - extrapyramidal symptoms - paralytic ileus - tremor
  - **Very rare** Neuroleptic malignant syndrome - precipitation of angle-closure glaucoma
  - **Frequency not known** Agitation - alopecia - anorexia - anxiety - arrhythmia - blurred vision - breast enlargement - changes in blood sugar - chills (on withdrawal) - confusion - constipation - convulsions - delusions - dizziness - drowsiness - dry mouth - ECG changes - galactorrhoea - gynaecomastia - haematological reactions - hallucinations - headache (on withdrawal) - heart block - hepatic reactions - hypomania - hypotension (on withdrawal) - increased appetite - increased intra-ocular pressure - influenza-like symptoms (on withdrawal) - Insomnia (on withdrawal) - irritability - mania - movement disorders (on withdrawal) - myalgia (on withdrawal) - nausea - nausea (on withdrawal) - paraesthesia - photosensitivity - postural hypotension - pruritus - rash - sexual dysfunction - sleep disturbances - sudden death of patients with cardiac disease - suicidal behaviour - sweating - sweating (on withdrawal) - tachycardia - taste disturbance - tinnitus - urinary retention - urticaria - vivid dreams (on withdrawal) - vomiting - weight gain - weight loss

**SIDE-EFFECTS, FURTHER INFORMATION**

The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

**Overdose** Overdosage with amitriptyline is associated with a relatively high rate of fatality. Symptoms of overdosage may include dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning, see Tricyclic and related antidepressants, under Emergency treatment of poisoning p. 1123.

- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.

**HEPATIC IMPAIRMENT** Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.

**TREATMENT CESSION** Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

- **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.

**PATIENT AND CARER ADVICE** Drowsiness may affect the performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS**

  - **AMITRIPTYLINE HYDROCHLORIDE (Non-proprietary)**
    - Amitriptyline hydrochloride 10 mg | 28 tablet | £1.12 DT price = £1.05
    - Amitriptyline hydrochloride 25 mg | 28 tablet | £1.40 DT price = £1.10

      - Amitriptyline hydrochloride 5mg/1ml oral solution sugar free (sugar-free) | 150 ml | £18.00 DT price = £18.00
      - Amitriptyline hydrochloride 10mg/1ml oral solution sugar free (sugar-free) | 150 ml | £19.20 DT price = £19.20

**Amitriptyline with perphenazine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, amitriptyline hydrochloride p. 292, perphenazine p. 308.

**INDICATIONS AND DOSE**

**Depression with anxiety**

**BY MOUTH**

- Adult: 1 tablet 3 times a day, an additional tablet may be taken at bedtime when required

**LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS**

  - **Triptafen (AMCo)**
    - Amitriptyline hydrochloride 25 mg, Perphenazine 2 mg | 100 tablet | £33.13
Clomipramine hydrochloride

INDICATIONS AND DOSE

Depressive illness

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 10 mg daily, then increased if necessary to 30–150 mg daily in divided doses; dose to be increased gradually, alternatively increased if necessary to 30–150 mg once daily, dose to be taken at bedtime; maximum 250 mg per day
- Elderly: Initially 10 mg daily, then increased to 30–75 mg daily, dose to be increased carefully over approximately 10 days

Phobic and obsessional states

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 25 mg daily, then increased to 100–150 mg daily, dose to be increased gradually over 2 weeks; maximum 250 mg per day
- Elderly: Initially 10 mg daily, then increased to 100–150 mg daily, dose to be increased gradually over 2 weeks; maximum 250 mg per day

Adjunctive treatment of cataplexy associated with narcolepsy

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 10 mg daily, dose to be gradually increased until satisfactory response; increased if necessary to 10–75 mg daily

ANAFRANIL SR®

Depressive illness

BY MOUTH
- Adult: Initially 10 mg once daily, then increased if necessary to 30–150 mg once daily, to be taken at bedtime, doses to be titrated using clomipramine capsules, dose to be increased gradually; maximum 250 mg per day
- Elderly: Initially 10 mg once daily, then increased to 30–75 mg once daily, dose to be increased carefully over approximately 10 days, doses to be titrated using clomipramine capsules

Phobic and obsessional states

BY MOUTH
- Adult: Initially 25 mg once daily, then increased to 100–150 mg once daily, dose to be increased gradually over 2 weeks, doses to be titrated using clomipramine capsules; maximum 250 mg per day
- Elderly: Initially 10 mg once daily, then increased to 100–150 mg once daily, dose to be increased gradually over 2 weeks, doses to be titrated using clomipramine capsules; maximum 250 mg per day

Adjunctive treatment of cataplexy associated with narcolepsy

BY MOUTH
- Adult: Initially 10 mg once daily, dose to be gradually increased until satisfactory response; usual dose 10–75 mg once daily, doses to be titrated using clomipramine capsules

CONTRA-INDICATIONS
- Acute porphyrias p. 864.
- arrhythmias during the manic phase of bipolar disorder
- heart block
- immediate recovery period after myocardial infarction

CAUTIONS
- Cardiovascular disease
- chronic constipation
- diabetes
- epilepsy
- history of bipolar disorder
- history of psychosis
- hyperthyroidism (risk of arrhythmias)
- increased intra-ocular pressure - patients with a significant risk of suicide
- phaeochromocytoma (risk of arrhythmias)
- prostatic hypertrophy
- susceptibility to angle-closure glaucoma
- urinary retention

INTERACTIONS
- Appendix 1 (antidepressants, tricyclic).

SIDE-EFFECTS
- Common or very common: Abdominal pain, diarrhea, fatigue, flushing, hypertension, impaired memory, muscle hypertonia, muscle weakness, mydriasis, myoclonus, restlessness, yawning.
- Rare: Dysarthria, extrapyramidal symptoms, paralytic ileus, tremor.
- Very rare: Allergic alveolitis, neuroleptic malignant syndrome, precipitation of angle-closure glaucoma.

FREQUENCY NOT KNOWN
- Agitation, alopecia, anorexia, anxiety, arrhythmias, blurred vision, breast enlargement, changes in blood sugar, chills (on withdrawal), confusion, constipation, convulsions, delusions, dizziness, dry mouth, ECG changes, galactorrhoea, gynaecomastia, haematological reactions, hallucinations, headache (on withdrawal), heart block, hepatic reactions, hypomania, hypotension, increased appetite, influenza-like symptoms (on withdrawal), insomnia (on withdrawal), irritability, mania, movement disorders (on withdrawal), myalgia (on withdrawal), nausea, numbness (on withdrawal), paraesthesia, photosensitivity, postural hypotension, pruritus, rash, sexual dysfunction, sleep disturbances, sudden death of patients with cardiac disease, suicidal behaviour, sweating, sweating (on withdrawal), tachycardia, taste disturbance, tinnitus, urinary retention, urticaria, vivid dreams (on withdrawal), vomiting, weight gain, weight loss.

SIDE-EFFECTS, FURTHER INFORMATION

The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

OVERDOSE
- Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning, p. 1123.

PREGNANCY
- Neonatal withdrawal symptoms reported if used during third trimester.

HEPATIC IMPAIRMENT
- Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.

TREATMENT CESSATION
- Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 6 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

PRESCRIBING AND DISPENSING INFORMATION
- Limited quantities of tricyclic antidepressants should be
prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.

- **PATIENT AND CARER ADVICE** Drowsiness may affect the performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

- **LESS SUITABLE FOR PRESCRIBING** Anafranil SR® Anafranil SR® is less suitable for prescribing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**Dosulepin hydrochloride** (Dothiepin hydrochloride)

### INDICATIONS AND DOSE

**Depressive illness (particularly where sedation is required) (initiated by a specialist)**

**BY MOUTH**

- **Adult:** Initially 75 mg daily in divided doses, alternatively initially 75 mg once daily, dose to be taken at bedtime, increased if necessary to 150 mg daily, doses to be increased gradually; up to 225 mg daily in some circumstances (e.g. hospital use)
- **Elderly:** Initially 50–75 mg daily in divided doses, alternatively initially 50–75 mg once daily, dose to be taken at bedtime, increased if necessary to 75–150 mg daily, doses to be increased gradually; up to 225 mg daily in some circumstances (e.g. hospital use)

- **CONTRA-INDICATIONS** Acute porphyrias p. 864 - arrhythmias - during the manic phase of bipolar disorder - heart block - immediate recovery period after myocardial infarction

- **CAUTIONS** Cardiovascular disease - chronic constipation - diabetes - epilepsy - history of bipolar disorder - history of psychosis - hyperthyroidism (risk of arrhythmias) - increased intra-ocular pressure - patients with a significant risk of suicide - phaeochromocytoma (risk of arrhythmias) - prostatic hypertrophy - susceptibility to angle-closure glaucoma - urinary retention

- **CAUTIONS, FURTHER INFORMATION**
  - Treatment should be stopped if the patient enters a manic phase.
  - Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.
  - **INTERACTIONS** → Appendix 1 (antidepressants, tricyclic).

- **SIDE-EFFECTS**
  - Rare: Dysarthria - extrapyramidal symptoms - paralytic ileus - tremor
  - Very rare: Neuroleptic malignant syndrome - precipitation of angle-closure glaucoma

- **Frequency not known** Agitation - alopecia - anorexia - anxiety - arrhythmias - dizziness - dry mouth - ECG changes - galactorrhea - gynaecomastia - haematological reactions - hallucinations - headache (on withdrawal) - heart block - hepatic reactions - hypomania - hypotension - increased appetite - increased intraocular pressure - influenza-like symptoms (on withdrawal) - insomnia (on withdrawal) - irritable mania - movement disorders (on withdrawal) - myalgia (on withdrawal) - nausea - nausea (on withdrawal) - paradoxism - photosensitivity - postural hypotension - pruritus - rash - sexual dysfunction - sleep disturbances - sudden death of patients with cardiac disease - suicidal behaviour - sweating - sweating (on withdrawal) - tachycardia - taste disturbance - tinnitus - urinary retention - urticaria - vivid dreams (on withdrawal) - vomiting - weight gain - weight loss

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

- **Overdose** Overdosage with dosulepin is associated with a relatively high rate of fatality. Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor planter responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning, p. 1123.

- **PREGNANCY** Use only if potential benefit outweighs risk.

- **BREAST FEEDING** The amount secreted into breast milk is too small to be harmful.

- **HEPATIC IMPAIRMENT** Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.

- **TREATMENT CESSATION Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge. (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

- **PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage. A maximum prescription equivalent to 2 weeks’ supply of 75 mg daily should be considered in patients with increased risk factors for suicide at initiation of treatment, during any dose adjustment, and until improvement occurs.

- **PATIENT AND CARER ADVICE** Drowsiness may affect the performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

- **LESS SUITABLE FOR PRESCRIBING** Dosulepin hydrochloride is less suitable for prescribing.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension
Doxepin (as Doxepin hydrochloride) 25 mg
Doxepin 25mg capsules | 28 capsule | £84.00 DT price = £84.00

Doxepin (as Doxepin hydrochloride) 50 mg
Doxepin 50mg capsules | 28 capsule | £84.00 DT price = £84.00

Imipramine hydrochloride

INDICATIONS AND DOSE
Depressive Illness

BY MOUTH

Adult: Initially up to 75 mg daily in divided doses, then increased to 150–200 mg daily, up to 150 mg may be given as a single dose at bedtime, dose to be increased gradually

Elderly: Initially 10 mg daily, increased to 30–50 mg daily, dose to be increased gradually

- suicidal behaviour
- sweating
- sweating (on withdrawal)
- tachycardia
- taste disturbance
- tinnitus
- urinary retention
- urticaria
- vivid dreams (on withdrawal)
- vomiting
- weight gain
- weight loss

SIDE-EFFECTS, FURTHER INFORMATION
The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

Overdose Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning, p. 1123.

PREGNANCY Use with caution—limited information available.

BREAST FEEDING The amount secreted into breast milk is too small to be harmful. Accumulation of metabolite may cause sedation and respiratory depression in neonate.

HEPATIC IMPAIRMENT Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.

RENAL IMPAIRMENT Use with caution.

TREATMENT CESSATION Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

PRESCRIBING AND DISPENSING INFORMATION Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.

PATIENT AND CARER ADVICE Drowsiness may affect performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, capsule
Depressive illness in hospital patients

BY MOUTH

▶ Adult: Initially up to 75 mg daily in divided doses, dose to be increased gradually, increased to up to 300 mg daily in divided doses

Nocturnal enuresis

BY MOUTH

▶ Child 6–7 years: 25 mg once daily, to be taken at bedtime, initial period of treatment (including gradual withdrawal) 3 months—full physical examination before further course

▶ Child 8–10 years: 25–50 mg once daily, to be taken at bedtime, initial period of treatment (including gradual withdrawal) 3 months—full physical examination before further course

▶ Child 11–17 years: 50–75 mg once daily, to be taken at bedtime, initial period of treatment (including gradual withdrawal) 3 months—full physical examination before further course

CONTRA-INDICATIONS immediate recovery period after myocardial infarction (in adults). Acute porphyrias p. 864. arrhythmia—during the manic phase of bipolar disorder—heart block

CAUTIONS Cardiovascular disease—chronic constipation—diabetes—epilepsy—history of bipolar disorder—history of psychosis—hyperthyroidism (risk of arrhythmias)—increased intra-ocular pressure (in adults)—patients with a significant risk of suicide—phaeochromocytoma (risk of arrhythmias)—prostatic hypertrophy (in adults)—susceptibility to angle-closure glaucoma—urinary retention

CAUTIONS, FURTHER INFORMATION

Treatment should be stopped if the patient enters a manic phase. Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

INTERACTIONS → Appendix 1 (antidepressants tricyclic).

SIDE-EFFECTS

▶ Common or very common Fatigue—flushing—headache—palpitation—restlessness

▶ Rare Extrapyramidal symptoms—paralytic ileus

▶ Very rare Abdominal pain—agression—allergic alveolitis—cardiac decompensation—diarrhoea (in children)—hypertension—mydriasis—myoclonus—neuroleptic malignant syndrome—oedema—peripheral vasospasm—precipitation of angle-closure glaucoma—stomatitis

Frequency not known Agitation—alopecia—anorexia—anxiety—arrhythmia—blurred vision—breast enlargement—changes in blood sugar—chills (on withdrawal)—confusion—constipation—convulsions—delusions—dizziness—drowsiness—dry mouth—dysarthria—ECG changes—galactorrhoea—gynaecomastia—haematological reactions—hallucinations—headache (on withdrawal)—heart block—hepatic reactions—hypomania—hypotenar paresthesia—increased appetite—flu—increased salivation—insomnia (on withdrawal)—irritability—mania—movement disorders (on withdrawal)—myalgia (on withdrawal)—nausea—nausea (on withdrawal)—paraesthesia—photosensitivity—postural hypotension—pruritus—rash—sexual dysfunction—sleep disturbances—sudden death of patients with cardiac disease—suicidal behaviour—swallowing—sweating (on withdrawal)—tachycardia—taste disturbance—tinnitus—tremor—urinary incontinence (on withdrawal)—urticaria—vivid dreams (on withdrawal)—vomiting—weight gain—weight loss

SIDE-EFFECTS, FURTHER INFORMATION

▶ In adults The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

OVERDOSE Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning, p. 1123.

PREGNANCY Colic, tachycardia, dyspnoea, irritability, muscle spasms, respiratory depression and withdrawal symptoms reported in neonates when used in the third trimester.

BREAST FEEDING The amount secreted into breast milk is too small to be harmful.

HEPATIC IMPAIRMENT Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.

RENAL IMPAIRMENT Use with caution in severe impairment.

TREATMENT CESSATION Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic antidepressants should be withdrawn slowly.

PRESCRIBING AND DISPENSING INFORMATION Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.

PATIENT AND CARER ADVICE Drowsiness may affect the performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

Trimiptyline

INDICATIONS AND DOSE
Depressive illness (particularly where sedation required)
BY MOUTH
• Adult: Initially 50–75 mg daily in divided doses, alternatively initially 50–75 mg once daily, dose to be taken at bedtime, increased if necessary to 150–300 mg daily
• Elderly: Initially 10–25 mg 3 times a day, maintenance 75–150 mg daily

CONTRA-INDICATIONS
Acute porphyrias p. 864 • arrhythmias • during the manic phase of bipolar disorder • heart block • immediate recovery period after myocardial infarction

CAUTIONS
Cardiovascular disease • chronic constipation • diabetes • epilepsy • history of bipolar disorder • history of psychosis • hyperthyroidism (risk of arrhythmias) • increased intra-ocular pressure • patients with a significant risk of suicide • phaeochromocytoma (risk of arrhythmias) • prostatic hypertrophy • susceptibility to angle-closure glaucoma • urinary retention

CAUTIONS, FURTHER INFORMATION
Treatment should be stopped if the patient enters a manic phase.
Elderly patients are particularly susceptible to many of the side-effects of tricyclic antidepressants; low initial doses should be used, with close monitoring, particularly for psychiatric and cardiac side-effects.

INTERACTIONS
• Appendix 1 (antidepressants, tricyclic).

SIDE-EFFECTS
• Rare Paralytic ileus
• Very rare Neuroleptic malignant syndrome • precipitation of angle-closure glaucoma
• Frequency not known Agitation • alopæcia • anorexia • anxiety • arrhythmia • blurred vision • breast enlargement • changes in blood sugar • chills (on withdrawal) • confusion • constipation • convulsions • delusions • diarrhoea • dizziness • dry mouth • dysarthria • ECG changes • flushing • galactorrhoea • gynaecomastia • haematological reactions • hallucinations • headache (on withdrawal) • heart block • hepatic reactions • hypomania • hypotension • increased appetite • influenza-like symptoms (on withdrawal) • insomnia (on withdrawal) • irritability • mania • movement disorders (on withdrawal) • myalgia (on withdrawal) • nausea • nausea (on withdrawal) • paraesthesia • photosensitivity • postural hypotension • pruritis • rash • sexual dysfunction • sleep disturbances • somnolence • sudden death of patients with cardiac disease • suicidal behaviour • sweating • sweating (on withdrawal) • tachycardia • taste disturbance • tinnitus • tremor • urinary retention • urticaria • vivid dreams (on withdrawal) • vomiting • weight gain • weight loss

SIDE-EFFECTS, FURTHER INFORMATION
The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

OVERDOSE
Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning, p. 1123.

PREGNANCY
Use only if potential benefit outweighs risk.

BREAST FEEDING
The amount secreted into breast milk is too small to be harmful.

HEPATIC IMPAIRMENT
Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.

MONITORING REQUIREMENTS
Manufacturer advises plasma-nortriptyline concentration monitoring if dose above 100 mg daily, but evidence of practical value uncertain.

TREATMENT CESSATION
Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

PRESCRIBING AND DISPENSING INFORMATION
Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.

PATIENT AND CARER ADVICE
Drowsiness may affect the performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.
to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible.

**Overdose** Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning, p. 1123.

### 2.5 Deviant antisocial sexual behaviour

#### ANTIPSYCHOTICS (FIRST-GENERATION)

**Benperidol**

The properties listed below are those particular to the drug only. For properties common to the class, see Antipsychotics, p. 303.

**INDICATIONS AND DOSE**

Control of deviant antisocial sexual behaviour

- **BY MOUTH**
  - Adult: 0.25–1.5 mg daily in divided doses, adjusted according to response, for debilitated patients, use elderly dose
  - Elderly: Initially 0.125–0.75 mg daily in divided doses, adjusted according to response

- **CONTRA-INDICATIONS** CNS depression - comatose states - phaeochromocytoma

- **CAUTIONS** Risk factors for stroke

- **PREGNANCY** Extrapyramidal effects and withdrawal syndrome have been reported occasionally in the neonate when antipsychotic drugs are taken during the third trimester of pregnancy. Following maternal use of antipsychotic drugs in the third trimester, neonates should be monitored for symptoms including agitation, hypertonia, hypotonia, tremors, drowsiness, feeding problems, and respiratory distress.

- **BREAST FEEDING** There is limited information available on the short- and long-term effects of antipsychotic drugs on the breast-fed infant. Animal studies indicate possible adverse effects of antipsychotic medicines on the developing nervous system. Chronic treatment with antipsychotic drugs whilst breast-feeding should be avoided unless absolutely necessary.

- **HEPATIC IMPAIRMENT** Can precipitate coma.

- **RENAI IMPAIRMENT** Start with small doses in severe renal impairment because of increased cerebral sensitivity.

- **MONITORING REQUIREMENTS** Manufacturer advises regular blood counts and liver function tests during long-term treatment.

- **PRESCRIBING AND DISPENSING INFORMATION** The proprietary name Benquil® has been used for benperidol tablets.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

- BENPERIDOL (Non-proprietary) Benperidol 250 microgram Benperidol 250microgram tablets | 112 tablet £56.96 DT price = £117.31
- Anquil (Archimedes Pharma UK Ltd) Benperidol 250 microgram Anquil 250microgram tablets | 112 tablet £56.96 DT price = £117.31

### 2.6 Psychoses and schizophrenia

#### Psychoses and related disorders

Advice of Royal College of Psychiatrists on doses of antipsychotic drugs above BNF upper limit

Unless otherwise stated, doses in the BNF are licensed doses—any higher dose is therefore unlicensed

- Consider alternative approaches including adjuvant therapy and newer or second-generation antipsychotic drugs such as clozapine.

- Bear in mind risk factors, including obesity; particular caution is indicated in older patients, especially those over 70.

- Consider potential for drug interactions—see interactions: Appendix 1 (antipsychotics).

- Carry out ECG to exclude untoward abnormalities such as prolonged QT interval; repeat ECG periodically and
reduce dose if prolonged QT interval or other adverse cardiac abnormality develops.
- Increase dose slowly and not more often than once weekly.
- Carry out regular pulse, blood pressure, and temperature checks; ensure that patient maintains adequate fluid intake.
- Consider high-dose therapy to be for limited period and review regularly; abandon if no improvement after 3 months (return to standard dosage).

**Important:** When prescribing an antipsychotic for administration on an emergency basis, the intramuscular dose should be lower than the corresponding oral dose (owing to absence of first-pass effect), particularly if the patient is very active (increased blood flow to muscle considerably increases the rate of absorption). The prescription should specify the dose for each route and should not imply that the same dose can be given by mouth or by intramuscular injection. The dose of antipsychotic for emergency use should be reviewed at least daily.

### Antipsychotic drugs

Antipsychotic drugs are also known as 'neuroleptics' and (misleadingly) as 'major tranquillisers'. In the short term they are used to calm disturbed patients whatever the underlying psychopathology, which may be schizophrenia, brain damage, mania, toxic delirium, or agitated depression. Antipsychotic drugs are used to alleviate severe anxiety but this too should be a short-term measure.

### Schizophrenia

The aim of treatment is to alleviate the suffering of the patient (and carer) and to improve social and cognitive functioning. Many patients require life-long treatment with antipsychotic medication. Antipsychotic drugs relieve positive psychotic symptoms such as thought disorder, hallucinations, and delusions, and prevent relapse; they are usually less effective on negative symptoms such as apathy and social withdrawal. In many patients, negative symptoms persist between episodes of treated positive symptoms, but earlier treatment of psychotic illness may protect against the development of negative symptoms over time. Patients with acute schizophrenia generally respond better than those with chronic symptoms.

**Long-term treatment:**

Long-term treatment of a patient with a definitive diagnosis of schizophrenia is usually required after the first episode of illness in order to prevent relapses. Doses that are effective in acute episodes should generally be continued as prophylaxis.

### First-generation antipsychotic drugs

The first-generation antipsychotic drugs act predominantly by blocking dopamine D₂ receptors in the brain. First-generation antipsychotic drugs are not selective for any of the four dopamine pathways in the brain and so can cause a range of side-effects, particularly extrapyramidal symptoms and elevated prolactin. The phenothiazine derivatives can be divided into 3 main groups:

- **Group 1:** chlorpromazine hydrochloride p. 304, levomepromazine p. 345, and promazine hydrochloride p. 320, generally characterised by pronounced sedative effects and moderate antimuscarinic and extrapyramidal side-effects.
- **Group 2:** perazine p. 308 and pipotiazine palmitate, generally characterised by moderate sedative effects, but fewer extrapyramidal side-effects than groups 1 or 3.
- **Group 3:** fluphenazine decanoate p. 306, perphenazine p. 308, prochlorperazine p. 309, and trifluoperazine p. 310, generally characterised by fewer sedative and antimuscarinic effects, but more pronounced extrapyramidal side-effects than groups 1 and 2.

### Butyrophenones

(benperidol p. 300 and haloperidol p. 306) resemble the group 3 phenothiazines in their clinical properties. Thioxanthenes (flupentixol p. 305 and zuclopenthixol p. 311) have moderate sedative, antimuscarinic effects, and extrapyramidal effects. Diphenylbutytopiperidines (pimozide p. 306) and the substituted benzamides (sulpiride p. 310) have reduced sedative, antimuscarinic, and extrapyramidal effects.

### Second-generation antipsychotic drugs

The second-generation antipsychotic drugs (sometimes referred to as atypical antipsychotic drugs) act on a range of receptors in comparison to first-generation antipsychotic drugs and have more distinct clinical profiles, particularly with regard to side-effects.

### Prescribing for the elderly

**The balance of risks and benefit should be considered before prescribing antipsychotic drugs for elderly patients.** In elderly patients with dementia, antipsychotic drugs are associated with a small increased risk of mortality and an increased risk of stroke or transient ischaemic attack. Furthermore, elderly patients are particularly susceptible to postural hypotension and to hyper- and hypothermia in hot or cold weather.

It is recommended that:

- Antipsychotic drugs should not be used in elderly patients to treat mild to moderate psychotic symptoms.
- Initial doses of antipsychotic drugs in elderly patients should be reduced (to half the adult dose or less), taking into account factors such as the patient’s weight, co-morbidity, and concomitant medication.
- Treatment should be reviewed regularly.

### Side effects of antipsychotic drugs

**Side-effects** caused by antipsychotic drugs are common and contribute significantly to non-adherence to therapy.

**Extrapyramidal symptoms** occur most frequently with the piperazine phenothiazines (fluphenazine, perphenazine, prochlorperazine, and trifluoperazine), the butyrophenones (benperidol and haloperidol), and the first-generation depot preparations. They are easy to recognise but cannot be predicted accurately because they depend on the dose, the type of drug, and on individual susceptibility.

**Extrapyramidal symptoms consist of:**

- parkinsonian symptoms (including tremor), which may occur more commonly in adults or the elderly and may appear gradually;
- dystonia (abnormal face and body movements) and dyskinesia, which occur more commonly in children or young adults and after only a few doses;
- akathisia (restlessness), which characteristically occurs after large initial doses and may resemble an exacerbation of the condition being treated;
- tardive dyskinesia (rhythmic, involuntary movements of tongue, face, and jaw), which usually develops on long-term therapy or with high dosage, but it may develop on short-term treatment with low doses—short-lived tardive dyskinesia may occur after withdrawal of the drug.

**Parkinsonian symptoms** remit if the drug is withdrawn and may be suppressed by the administration of antimuscarinic drugs. However, routine administration of such drugs is not justified because not all patients are affected and they may unmask or worsen tardive dyskinesia.

**Tardive dyskinesia** is the most serious manifestation of extrapyramidal symptoms; it is of particular concern because it may be irreversible on withdrawing therapy and treatment is usually ineffective. In children, tardive dyskinesia is more likely to occur when the antipsychotic drug is withdrawn. However, some manufacturers suggest that drug withdrawal at the earliest signs of tardive dyskinesia (fine vermicular movements of the tongue) may halt its full development. Tardive dyskinesia occurs fairly...
frequently, especially in the elderly, and treatment must be carefully and regularly reviewed.

Most antipsychotic drugs, both first- and second-generation, increase prolactin concentration to some extent because dopamine inhibits prolactin release. Aripiprazole reduces prolactin because it is a dopamine-receptor partial agonist. Risperidone, amisulpride, and first-generation antipsychotic drugs are most likely to cause symptomatic hyperprolactinemia. The clinical symptoms of hyperprolactinemia include sexual dysfunction, reduced bone mineral density, menstrual disturbances, breast enlargement, and galactorrhea.

Sexual dysfunction is one of the main causes of non-adherence to antipsychotic medication; physical illness, psychiatric illness, and substance misuse are contributing factors. Antipsychotic-induced sexual dysfunction is caused by more than one mechanism. Reduced dopamine transmission and hyperprolactinemia decrease libido; antimuscarinic effects can cause disorders of arousal; and alpha- and adrenoreceptor antagonists are associated with erection and ejaculation problems in men. Risperidone and haloperidol commonly cause sexual dysfunction. If sexual dysfunction is thought to be antipsychotic-induced, dose reduction or switching medication should be considered.

Antipsychotic drugs have side-effects associated with cardiovascular side-effects such as tachycardia, arrhythmias, and hypotension. QT-interval prolongation is a particular concern with pimozide and haloperidol. There is also a higher probability of QT-interval prolongation in patients using any intravenous antipsychotic drug; or any antipsychotic drug or combination of antipsychotic drugs with doses exceeding the recommended maximum. Cases of sudden death have occurred.

Hyperglycaemia and sometimes diabetes can occur with antipsychotic drugs, particularly clozapine, olanzapine, quetiapine, and risperidone. All antipsychotic drugs may cause weight gain, but the risk and extent varies. Clozapine and olanzapine commonly cause weight gain.

**Hypotension and interference with temperature regulation**

Hypotension and interference with temperature regulation are dose-related side-effects that are liable to cause dangerous falls and hypothermia or hyperthermia in the elderly. Clozapine, chlorpromazine, lurasidone, and quetiapine can cause postural hypotension (especially during initial dose titration) which may be associated with syncope or reflex tachycardia in some patients. Neuroleptic malignant syndrome (hyperthermia, fluctuating level of consciousness, muscle rigidity, and autonomic dysfunction with pallor, tachycardia, labile blood pressure, sweating, and urinary incontinence) is a rare but potentially fatal side-effect of all antipsychotic drugs. Discontinuation of the antipsychotic drug is essential because there is no proven effective treatment, but bromocriptine and dantrolene have been used. The syndrome, which usually lasts for 5–7 days after drug discontinuation, may be unduly prolonged if depot preparations have been used.

**Blood dyscrasias**

Perform blood counts if unexplained infection or fever develops.

**Choice**

There is little meaningful difference in efficacy between each of the antipsychotic drugs (other than clozapine p. 313), and response and tolerability to each antipsychotic drug varies. There is no first-line antipsychotic drug which is suitable for all patients. Choice of antipsychotic medication is influenced by the patient’s medication history, the degree of sedation required (although tolerance to this usually develops), and consideration of individual patient factors such as risk of extrapyramidal side-effects, weight gain, impaired glucose tolerance, QT-interval prolongation, or the presence of negative symptoms.

Second-generation antipsychotic drugs may be better at treating the negative symptoms of schizophrenia.

Second-generation antipsychotic drugs should be prescribed if extrapyramidal side-effects are a particular concern. Of these, aripiprazole p. 312, clozapine p. 313, olanzapine p. 315, and quetiapine p. 318 are least likely to cause extrapyramidal side-effects. Although amisulpride p. 312 is a dopamine-receptor antagonist, extrapyramidal side-effects are less common than with the first-generation antipsychotic drugs because amisulpride selectively blocks mesolimbic dopamine receptors, and extrapyramidal symptoms are caused by blockade of the striatal dopamine pathway.

Schizophrenia is associated with insulin resistance and diabetes; the risk of diabetes is increased in patients with schizophrenia who take antipsychotic drugs. First-generation antipsychotic drugs are less likely to cause diabetes than second-generation antipsychotic drugs, and of the first-generation antipsychotic drugs, fluphenazine decanoate p. 306 and haloperidol p. 306 are lowest risk. Amisulpride p. 312 and aripiprazole p. 312 have the lowest risk of diabetes of the second-generation antipsychotic drugs. Aripiprazole, amisulpride, haloperidol, sulpiride p. 310, and trifluoperazine p. 310 are least likely to cause weight gain.

The antipsychotic drugs with the lowest risk of sexual dysfunction are aripiprazole p. 312 and quetiapine p. 318. Olanzapine p. 315 may be considered if sexual dysfunction is judged to be secondary to hyperprolactinemia. Hyperprolactinemia is usually not clinically significant with aripiprazole, clozapine p. 313, olanzapine, and quetiapine treatment. When changing from other antipsychotic drugs, a reduction in prolactin concentration may increase fertility.

Patients should receive an antipsychotic drug for 4–6 weeks before it is deemed ineffective. Prescribing more than one antipsychotic drug at a time should be avoided except in exceptional circumstances (e.g. clozapine augmentation or when changing medication during titration) because of the increased risk of adverse effects such as extrapyramidal symptoms, QT-interval prolongation, and sudden cardiac death.

Clozapine is licensed for the treatment of schizophrenia in patients unresponsive to, or intolerant of, other antipsychotic drugs. Clozapine should be introduced if schizophrenia is not controlled despite the sequential use of two or more antipsychotic drugs (one of which should be a second-generation antipsychotic drug), each for at least 6–8 weeks. If symptoms do not respond adequately to an optimised dose of clozapine, plasma-clozapine concentration should be checked before adding a second antipsychotic drug to augment clozapine; allow 8–10 weeks’ treatment to assess response. Patients must be registered with a clozapine patient monitoring service.

**Monitoring**

Full blood count, urea and electrolytes, and liver function test monitoring is required at the start of therapy with antipsychotic drugs, and then annually thereafter.

Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly.

Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly.
Before initiating antipsychotic drugs, an ECG may be required, particularly if physical examination identifies cardiovascular risk factors, if there is a personal history of cardiovascular disease, or if the patient is being admitted as an inpatient.

Blood pressure monitoring is advised before starting therapy and frequently during dose titration of antipsychotic drugs.

**Other uses**

Some antipsychotic drugs can be used for the treatment of nausea and vomiting, choreas, and motor tic.

Chlorpromazine hydrochloride p. 304 and haloperidol p. 306 can be used for intractable hiccup. Benperidol p. 300 is used in deviant antisocial sexual behaviour but its value is not established.

Psychomotor agitation should be investigated for an underlying cause; it can be managed with low doses of chlorpromazine hydrochloride or haloperidol used for short periods. Antipsychotic drugs can be used with caution for the short-term treatment of severe agitation and restlessness in the elderly.

**Equivalent doses of oral antipsychotics**

These equivalences are intended only as an approximate guide; individual dosage instructions should also be checked; patients should be carefully monitored after any change in medication. Equivalent daily dose of antipsychotic drug:

- Chlorpromazine 100 mg
- Clozapine 50 mg
- Haloperidol 2–3 mg
- Pimozide 2 mg
- Risperidone 0.5–1 mg
- Sulpiride 200 mg
- Trifluoperazine 5 mg

**Important:** These equivalences must not be extrapolated beyond the maximum dose for the drug. Higher doses require careful titration in specialist units and the equivalences shown here may not be appropriate.

**Dosage**

After an initial period of stabilisation, in most patients, the total daily oral dose can be given as a single dose. The Royal College of Psychiatrists has published advice on doses of antipsychotic drugs above BNF upper limit.

**Antipsychotic depot injections**

Long-acting depot injections are used for maintenance therapy especially when compliance with oral treatment is unreliable. However, depot injections of conventional antipsychotics may give rise to a higher incidence of extrapyramidal reactions than oral preparations; extrapyramidal reactions occur less frequently with second-generation antipsychotic depot preparations, such as risperidone p. 319 and olanzapine embionate p. 316.

**Choice**

There is no clear-cut division in the use of the conventional antipsychotics, but zuclopenthixol p. 311 may be suitable for the treatment of agitation or aggressive patients whereas flupentixol decanoate p. 305 can cause over-excitement in such patients. Zuclopenthixol decanoate may be more effective in preventing relapses than other conventional antipsychotic depot preparations. The incidence of extrapyramidal reactions is similar for the conventional antipsychotics.

### Equivalent doses of depot antipsychotics

<table>
<thead>
<tr>
<th>Antipsychotic drug/interval</th>
<th>Dosage (mg)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flupentixol decanoate / 2 weeks</td>
<td>40</td>
</tr>
<tr>
<td>Fluphenazine decanoate / 2 weeks</td>
<td>25</td>
</tr>
<tr>
<td>Haloperidol (as decanoate) / 4 weeks</td>
<td>100</td>
</tr>
<tr>
<td>Pipotiazine pimelinate / 4 weeks</td>
<td>50</td>
</tr>
<tr>
<td>Zuclopenthixol decanoate / 2 weeks</td>
<td>200</td>
</tr>
</tbody>
</table>

**Important:** These equivalences must not be extrapolated beyond the maximum dose for the drug.

These equivalences are intended only as an approximate guide; individual dosage instructions should also be checked; patients should be carefully monitored after any change in medication.

**Dosage**

Individual responses to neuroleptic drugs are variable and to achieve optimum effect, dosage and dosage interval must be titrated according to the patient’s response.

### Antipsychotics (First-generation)

#### Antipsychotic drugs

- **CAUTIONS**
  - Blood dyscrasias - cardiovascular disease - conditions predisposing to seizures - depression - epilepsy - history of jaundice - myasthenia gravis - Parkinson’s disease (may be exacerbated) - photosensitisation (may occur with higher dosages) - prostatic hypertrophy - severe respiratory disease - susceptibility to angle-closure glaucoma

- **CAUTIONS, FURTHER INFORMATION**
  - Cardiovascular disease

- **Antipsychotic drugs**

- **SIDE-EFFECTS**
  - Rare Neuroleptic malignant syndrome—discontinue (potentially fatal)
  - Very rare Precipitation of angle-closure glaucoma

- **Overdose**

Phenothiazines cause less depression of consciousness and respiration than other sedatives. Hypotension, hypothermia, sinus tachycardia, and arrhythmias may complicate poisoning. For details on the management of poisoning see Antipsychotics under Emergency treatment of poisoning, p. 1123.
**Nervous system**

**Chlorpromazine hydrochloride**

### **INDICATIONS AND DOSE**

Schizophrenia and other psychoses | Mania | Short-term adjunctive management of severe anxiety | Psychomotor agitation, excitement, and violent or dangerously impulsive behaviour

**By mouth**
- Adult: Initially 25 mg 3 times a day, adjusted according to response, alternatively initially 75 mg once daily, adjusted according to response, dose to be taken at night; maintenance 75–300 mg daily, increased if necessary up to 1 g daily, this dose may be required in psychoses, take a third to half adult dose in the elderly and debilitated patients

**By rectum**
- Adult: 100 mg every 6–8 hours, dose expressed as chlorpromazine base

Intractable hiccup

**By mouth**
- Adult: 25–50 mg 3–4 times a day

Relief of acute symptoms of psychoses (under expert supervision)

**By deep intramuscular injection**
- Adult: 25–50 mg every 6–8 hours

Nausea and vomiting of terminal illness (where other drugs have failed or are not available)

**By mouth**
- Child 1–5 years: 500 micrograms/kg every 4–6 hours; maximum 40 mg per day
- Child 6–11 years: 500 micrograms/kg every 4–6 hours; maximum 75 mg per day
- Child 12–17 years: 25 mg, then 25–50 mg every 3–4 hours until vomiting stops
- Adult: Initially 25 mg, then 25–50 mg every 3–4 hours until vomiting stops

**By rectum**
- Adult: 100 mg every 6–8 hours

Dose adjustments due to interactions

Dose adjustment may be necessary if smoking started or stopped during treatment.

Dose equivalence and conversion

For equivalent therapeutic effect 100 mg chlorpromazine base given rectally as a suppository \(\equiv\) 20–25 mg chlorpromazine hydrochloride by intramuscular injection \(\equiv\) 40–50 mg of chlorpromazine base or hydrochloride given by mouth.

**SIDE-EFFECTS**

- Acute dystonic reactions: Phenothiazines can induce acute dystonic reactions such as facial and skeletal muscle spasms and oculogyric crises; children (especially girls, young women, and those under 10 kg) are particularly susceptible.
- Hepatic impairment: Can precipitate coma; phenothiazines are hepatotoxic.
- Renal impairment: Start with small doses in severe renal impairment because of increased cerebral sensitivity.

**UNLICENSED USE** Rectal route is not licensed.

**CONTRA-INDICATIONS** CNS depression - comatose states - hypothyroidism - phaeochromocytoma

**CAUTIONS** Diabetes

**SIDE-EFFECTS, FURTHER INFORMATION**

**Unexplained anaphylaxis**

**Phenothiazines**

- Photosensitisation may occur with higher dosages, especially during heat, sunlight, and sweating.
- Exiting machinery, especially at start of treatment; effects of alcohol are enhanced.
- Hiccups may affect performance of skilled tasks (e.g. driving or operating machinery), especially at start of treatment; effects of alcohol are enhanced.
- As photosensitisation may occur with higher dosages, patients should avoid direct sunlight.

**HANDLING AND STORAGE**

- Products should be stored in a cool, dry place.
- Chlorpromazine hydrochloride 5 mg per 1 ml Chlorpromazine 5 mg, 10 ml. Chlorpromazine 5 mg, 15 ml. Chlorpromazine 5 mg, 100 ml. Chlorpromazine 100 mg, 31 ml. Chlorpromazine 100 mg, 150 ml. Chlorpromazine 200 mg, 6 ml. Chlorpromazine 25 mg, 300 ml. Chlorpromazine 25 mg, 500 ml. Chlorpromazine 50 mg, 500 ml.

**By mouth**

- Chlorpromazine hydrochloride 25 mg, 50 mg, 100 mg, 200 mg.

**By deep intramuscular injection**

- Child 1–5 years: 500 micrograms/kg every 4–6 hours; maximum 40 mg per day
- Child 6–11 years: 500 micrograms/kg every 4–6 hours; maximum 75 mg per day
- Child 12–17 years: Initially 25 mg, then 25–50 mg every 3–4 hours until vomiting stops
- Adult: Initially 25 mg, then 25–50 mg every 3–4 hours until vomiting stops

**By rectum**

- Adult: 100 mg every 6–8 hours

### **MONITORING REQUIREMENTS**

- It is advisable to monitor prolactin concentration at the start of therapy, at 6 months, and then yearly. Patients taking antipsychotic drugs not normally associated with symptomatic hyperprolactinaemia should be considered for prolactin monitoring if they show symptoms of hyperprolactinaemia (such as breast enlargement and galactorrhoea).
- Patients with schizophrenia should have physical health monitoring (including cardiovascular disease risk assessment) at least once per year.

**PATIENT AND CARER ADVICE**

Drowsiness may affect performance of skilled tasks (e.g. driving or operating machinery), especially at start of treatment; effects of alcohol are enhanced.

There is limited information available on the short- and long-term effects of antipsychotic drugs on the breast-fed infant. Animal studies indicate possible adverse effects of antipsychotic medicines on the developing nervous system. Chronic treatment with antipsychotic drugs whilst breast-feeding should be avoided unless absolutely necessary. Phenothiazine derivatives are sometimes used in breast-feeding women for short-term treatment of nausea and vomiting.

### **SIDE-EFFECTS, FURTHER INFORMATION**

**Extrapyramidal effects and withdrawal syndrome**

- Agitation, excitement, and violent or dangerously impulsive behaviour
- Psychomotor agitation, excitement, and violent or dangerously impulsive behaviour

**CNS depression**

**Hypothyroidism**

**Phenothiazine**

- Photosensitisation may occur with higher dosages, especially during heat, sunlight, and sweating.
- Exiting machinery, especially at start of treatment; effects of alcohol are enhanced.
- Hiccups may affect performance of skilled tasks (e.g. driving or operating machinery), especially at start of treatment; effects of alcohol are enhanced.
- As photosensitisation may occur with higher dosages, patients should avoid direct sunlight.
Flupentixol
(Flupenthixol)

INDICATIONS AND DOSE
Schizophrenia and other psychoses, particularly with apathy and withdrawal but not mania or psychomotor hyperactivity

BY MOUTH
- Adult: Initially 3–9 mg twice daily, adjusted according to response, for debilitated patients, use elderly dose; maximum 18 mg per day
- Elderly: Initially 0.75–4.5 mg twice daily, adjusted according to response

Depressive Illness

BY MOUTH
- Adult: Initially 1 mg once daily, dose to be taken in the morning, increased if necessary to 2 mg after 1 week, doses above 2 mg to be given in divided doses, last dose to be taken before 4 pm; discontinue if no response after 1 week at maximum dosage; maximum 3 mg per day
- Elderly: Initially 500 micrograms daily, dose to be taken in the morning, then increased if necessary to 1 mg after 1 week, doses above 1 mg to be given in divided doses, last dose to be taken before 4 pm; discontinue if no response after 1 week at maximum dosage; maximum 1.5 mg per day

CONTRA-INDICATIONS
- Circulatory collapse
- CNS depression
- Comatose states
- Excitable patients
- Overactive patients
- Impaired consciousness
- Overactive patients
- Phaeochromocytoma

CAUTIONS
- Acute porphyrias
- Cardiac disorders
- Cardiovascular disease
- Cerebral arteriosclerosis
- Diabetes
- Elderly
- Parkinsonism
- QT-interval prolongation
- Senile confusional states

INTERACTIONS
- Avoid concomitant administration of drugs that prolong QT interval.

SIDE-EFFECTS
- Asthenia
- Dysphoria
- Hypersalivation
- Myalgia
- Sudden death
- Torsade de pointes

SIDE-EFFECTS, FURTHER INFORMATION
- Less sedating but extrapyramidal symptoms frequent.
- PREGNANCY
- Avoid unless potential benefit outweighs risk.
- BREAST FEEDING
- Present in breast milk—avoid.
- HEPATIC IMPAIRMENT
- Can precipitate coma.
- Consider serum-flupentixol concentration monitoring in hepatic impairment.
- RENAL IMPAIRMENT
- Start with small doses of antipsychotic drugs in severe renal impairment because of increased cerebral sensitivity.
- Manufacturer advises caution in renal failure.
- PATIENT AND CARER ADVICE
- Although drowsiness may occur, can also have an alerting effect so should not be taken in the evening.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- Largactil (Sanofi)
  Chlorpromazine hydrochloride 25 mg per 1 ml Largactil
  50mg/2ml solution for injection ampoules | 10 ampoules £7.51
- Depixol (Flupentixol decanoate) (Lundbeck Ltd)
  Flupentixol decanoate 100 mg per 1 ml Flupentixol Conc 100mg/1ml solution for injection ampoules | 10 ampoules £62.51
  Flupentixol 100 mg/1ml solution for injection ampoules | 200mg/1ml solution for injection ampoules | 5 ampoules £97.59
- Psytixol (Mylan Ltd)
  Flupentixol decanoate 20 mg per 1 ml Psytixol 20mg/1ml solution for injection ampoules | 10 ampoules £25.38
  Psytixol 20mg/1ml solution for injection ampoules | 5 ampoules £41.60
Fluphenazine decanoate

**INDICATIONS AND DOSE**

**Maintenance in schizophrenia and other psychoses**
- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: Test dose 12.5 mg, dose to be administered into the gluteal muscle, then 12.5–100 mg after 4–7 days, then 12.5–100 mg every 14–35 days, adjusted according to response
  - Elderly: Test dose 6.25 mg, dose to be administered into the gluteal muscle, then 12.5–100 mg after 4–7 days, then 12.5–100 mg every 14–35 days, adjusted according to response

**Dose adjustments due to interactions**
Dose adjustment may be necessary if smoking started or stopped during treatment.

- **CONTRA-INDICATIONS** Children - CNS depression - comatose states - marked cerebral atherosclerosis - phaeochromocytoma
- **CAUTIONS** QT-interval prolongation - when transferring from oral to depot therapy, the dose by mouth should be reduced gradually
- **INTERACTIONS** Avoid concomitant drugs that prolong QT interval.
- **SIDE-EFFECTS** Erythema - inappropriate anti-diuretic hormone secretion - nodules - oedema - pain at injection site - swelling - systemic lupus erythematosus
- **SIDE-EFFECTS, FURTHER INFORMATION** Less sedating and fewer antimuscarinic or hypotensive symptoms, but extrapyramidal symptoms, particularly dystonic reactions and akathisia, more frequent. Extrapyramidal symptoms usually appear a few hours after injection and continue for about 2 days but may be delayed.
  - If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose, therefore it may be a month or longer before side-effects subside.
- **HEPATIC IMPAIRMENT** Avoid in hepatic failure. Can precipitate coma; phenothiazines are hepatotoxic.
- **RENAL IMPAIRMENT** Manufacturer advises caution. Start with small doses of antipsychotic drugs in severe renal impairment because of increased cerebral sensitivity. Avoid in renal failure.
- **MONITORING REQUIREMENTS** Treatment requires careful monitoring for optimum effect.
- **DIRECTIONS FOR ADMINISTRATION** In general not more than 2–3 mL of oily injection should be administered at any one site. Correct injection technique (including use of z-track technique) and rotation of injection sites are essential. When initiating therapy with sustained-release preparations of conventional antipsychotics, patients should first be given a small test-dose as undesirable side-effects are prolonged.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for injection**
    - **EXCIPIENTS**: May contain Sesame oil
    - **Moderate** (Sanofi)
      - Fluphenazine decanoate 25 mg per 1 ml

- **Haloperidol**

**INDICATIONS AND DOSE**

**Schizophrenia | Psychoses | Mania and hypomania | Organic brain damage (depending on symptoms)**

- **BY MOUTH**
  - Adult: Initially 2–20 mg once daily, alternatively initially 2–20 mg daily in divided doses; maintenance 1–3 mg 3 times a day, adjusted according to response, daily maximum to be given in divided doses, for debilitated patients, use elderly dose; maximum 20 mg per day
  - Elderly: Initially 1–10 mg once daily, alternatively initially 1–10 mg daily in divided doses; maintenance 1–3 mg 3 times a day, adjusted according to response, daily maximum to be given in divided doses; maximum 20 mg per day

- **BY INTRAMUSCULAR INJECTION**
  - Adult: Initially 2–5 mg, repeated if necessary, repeated dose given according to response and tolerability, for debilitated patients, use elderly dose; maximum 12 mg per day
  - Elderly: Initially 1–2.5 mg, repeated if necessary, repeated dose given according to response and tolerability; maximum 12 mg per day

**Agitation and restlessness in the elderly**

- **BY MOUTH**
  - Elderly: Initially 0.75–1.5 mg 2–3 times a day, adjusted according to response

Management of mental or behavioural problems such as aggression, hyperactivity and self-mutilation in the mentally retarded and in patients with organic brain damage (depending on symptoms) | Gilles de la Tourette syndrome | Severe tics | Intractable hiccup | Adjunct to short-term management of moderate to severe psychomotor agitation, excitement and, violent or dangerously impulsive behaviour

- **BY MOUTH**
  - Adult: Initially 1.5–3 mg 2–3 times a day, alternatively initially 3–5 mg 2–3 times a day, higher dose in severely affected or resistant patients; maintenance 0.5–1 mg 3 times a day, increased if necessary to 2–3 mg 3 times a day, once symptoms are controlled, gradually reduce dose to the lowest effective maintenance dose, for debilitated patients, use elderly dose
  - Elderly: Initially 0.75–1.5 mg 2–3 times a day, alternatively initially 1.5–2.5 mg 2–3 times a day, higher dose in severely affected or resistant patients; maintenance 0.5–1 mg 3 times a day, increased if necessary to 2–3 mg 3 times a day, once symptoms are controlled, gradually reduce dose to the lowest effective maintenance dose

**Nausea and vomiting**

- **BY INTRAMUSCULAR INJECTION**
  - Adult: 1–2 mg

- **Nausea and vomiting in palliative care**
  - Adult: Initially 1.5 mg 1–2 times a day, increased if necessary to 5–10 mg daily in divided doses
Psychoses and schizophrenia 307

Capsule
CAUTIONARY AND ADVISORY LABELS 2
- Serenace (Teva UK Ltd)
  Haloperidol 500 microgram | 30 capsule (PO) £1.18 DT price = £1.18

Oral solution

  Haloperidol 1 mg per 1 ml | 500 ml (PO) £3.05
  Haloperidol 5mg/5ml oral solution sugar free (sugar-free) | 100 ml (PO) £6.41
  Haloperidol 10mg/5ml oral solution sugar free (sugar-free) | 100 ml (PO) £6.75

Solution for injection
- HALOPERIDOL (Non-proprietary)
  Haloperidol 5 mg per 1 ml | 10 ampule (PO) £8.65

Haloperidol decanoate
INDICATIONS AND DOSE
Maintenance in schizophrenia and other psychoses
BY DEEP INTRAMUSCULAR INJECTION
- Adult: Initially 50 mg every 4 weeks, increased in steps of 50 mg if required, increased if necessary up to 300 mg every 4 weeks, higher doses may be needed in some patients, dose to be administered into gluteal muscle, if 2-weekly administration preferred, doses should be halved
- Elderly: Initially 12.5–25 mg every 4 weeks, if 2-weekly administration preferred, doses should be halved
Dose adjustments due to interactions
Dose adjustment may be necessary if smoking started or stopped during treatment.

Important safety information
When prescribing, dispensing or administering, check that this is the correct preparation—this preparation is used for maintenance treatment and should not be used for the rapid control of an acute episode.

- CONTRA-INDICATIONS Bradydysria - children - CNS depression - comatose states - lesions of the basal ganglia - Parkinson’s disease - phaeochromocytoma - QT-interval prolongation
- CAUTIONS Arteriosclerosis - hypokalaemia - hypoglycaemia - hypomagnesaemia - metabolic disturbances - subarachnoid haemorrhage - thyrotoxicosis
- INTERACTIONS Avoid concomitant administration of drugs that prolong QT interval.

SIDE-EFFECTS
- Common or very common Depression - weight loss
- Uncommon Dysphoria - oedema
- Rare Bronchospasm - hypoglycaemia - inappropriate antidiuretic hormone secretion - photosensitivity reactions - pigmentation
- Frequency not known Hypertension - Stevens-Johnson syndrome - sweating - toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION
Less sedating and fewer antimuscarinic or hypotensive symptoms.

PREGNANCY
Avoid unless benefits outweigh risks.

HEPATIC IMPAIRMENT
Can precipitate coma.

RENAI IMPAIRMENT
Start with small doses in severe renal impairment because of increased cerebral sensitivity.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet
CAUTIONARY AND ADVISORY LABELS 2
- HALOPERIDOL (Non-proprietary)
  Haloperidol 500 microgram | 28 tablet (PO) £1.01
  Haloperidol 1.5 mg | 28 tablet (PO) £1.20
  Haloperidol 5 mg | 28 tablet (PO) £1.40
  Haloperidol 10 mg | 28 tablet (PO) £1.80
  Haloperidol 20 mg | 28 tablet (PO) £2.17

Important safety information
When prescribing, dispensing or administering, check that this is the correct preparation—this preparation is used for maintenance treatment and should not be used for the rapid control of an acute episode.
Pericyazine (Periciazine)

**INDICATIONS AND DOSE**

Schizophrenia | Psychoses
---|---
**BY MOUTH**
- Adult: Initially 75 mg daily in divided doses, then increased in steps of 25 mg every 1 week, adjusted according to response; maximum 300 mg per day
- Elderly: Initially 15–30 mg daily in divided doses, then increased in steps of 25 mg every 1 week, adjusted according to response; maximum 300 mg per day

Short-term adjunctive management of severe anxiety, psychomotor agitation, and violent or dangerously impulsive behaviour

**BY MOUTH**
- Adult: Initially 15–30 mg daily in 2 divided doses, adjusted according to response, larger dose to be taken at bedtime
- Elderly: Initially 5–10 mg daily in 2 divided doses, adjusted according to response, larger dose to be taken at bedtime

**SIDE-EFFECTS**
- Common or very common Hypotension (when treatment initiated)
- Frequency not known Respiratory depression

**HEPATIC IMPAIRMENT** Can precipitate coma; phenothiazines are hepatotoxic.

**RENAI IMPAIRMENT** Avoid in renal impairment.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension

**Tablet**

- **Pericyazine** (Non-proprietary)
  - Pericyazine 2.5 mg 84 tablet £16.93
  - Pericyazine 10 mg 100 tablet no price available

Pericyazine 10 mg Pericyazine 10 mg tablets | 84 tablet £43.75 | 100 tablet (POM) no price available

**Oral solution**

- **Pericyazine** (Non-proprietary)
  - Pericyazine 2 mg per 1 ml 100 ml (POM) £46.00–£46.01

Pericyazine 10 mg/5 ml oral solution | 100 ml (POM) £46.01

**CONTRA-INDICATIONS** Agitation in the elderly | CNS depression | Comatose states | Phaeochromocytoma | Restlessness in the elderly

**CAUTIONS**
- With oral use hypothyroidism

**SIDE-EFFECTS**
- Rare Systemic lupus erythematosus
- Frequency not known Dystonic reactions

**SIDE-EFFECTS, FURTHER INFORMATION**

Less sedating.

Acute dystonic reactions Phenothiazines can all induce acute dystonic reactions such as facial and skeletal muscle spasms and oculogyric crises; children (especially girls, young women, and those under 10 kg) are particularly susceptible.

**HEPATIC IMPAIRMENT** Can precipitate coma; phenothiazines are hepatotoxic.

**RENAI IMPAIRMENT** Start with small doses in severe renal impairment because of increased cerebral sensitivity.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension

**Pimozide**

**INDICATIONS AND DOSE**

**Schizophrenia**

**BY MOUTH**
- Adult: Initially 2 mg daily, adjusted according to response, then increased in steps of 2–4 mg at least every 1 week; usual dose 2–20 mg daily
- Elderly: Initially 1 mg daily, adjusted according to response, then increased in steps of 2–4 mg at least every 1 week; usual dose 2–20 mg daily

**Monosymptomatic hypochondriacal psychosis | Paranoid psychosis**

**BY MOUTH**
- Adult: Initially 4 mg daily, adjusted according to response, then increased in steps of 2–4 mg at least every 1 week; maximum 16 mg per day
- Elderly: Initially 2 mg daily, adjusted according to response, increased in steps of 2–4 mg at least every 1 week; maximum 16 mg per day

**MEDICATIONS**

- **Pericyazine** 2.5 mg, 10 mg tablets

**REFERENCE**

- Pericyazine 10 mg/5 ml oral solution | 100 ml (POM) £46.01
Prochlorperazine

INDICATIONS AND DOSE
Schizophrenia and other psychoses | Mania

By mouth
- Adult: 12.5 mg twice daily for 7 days, dose to be adjusted at intervals of 4–7 days according to response; usual dose 75–100 mg daily
- Adult: 12.5–25 mg 2–3 times a day

Short-term adjunctive management of severe anxiety

By mouth
- Adult: 15–20 mg daily in divided doses; maximum 40 mg per day

Nausea and vomiting, acute attack

By mouth
- Adult: Initially 20 mg, then 10 mg after 2 hours
- By deep intramuscular injection
- Adult: 12.5 mg as required, to be followed if necessary after 6 hours by an oral dose

Nausea and vomiting, prevention

By mouth
- Adult: 5–10 mg 2–3 times a day
- By deep intramuscular injection
- Adult: 12.5 mg as required, to be followed if necessary after 6 hours by an oral dose

Prevention and treatment of nausea

By mouth
- Child 1–11 years (body-weight 10 kg and above): 250 micrograms/kg 2–3 times a day
- Child 12-17 years: 5–10 mg up to 3 times a day if required
- By deep intramuscular injection
- Child 2–5 years: 1.25–2.5 mg up to 3 times a day if required
- Child 6–11 years: 5–6.25 mg up to 3 times a day if required
- Child 12–17 years: 12.5 mg up to 3 times a day if required

Labyrinthine disorders

Initially by mouth
- Adult: 5 mg 3 times a day, (by mouth) increased if necessary to 30 mg daily in divided doses, dose to be increased gradually, then reduced to 5–10 mg daily, dose is reduced after several weeks

Nausea and vomiting in previously diagnosed migraine

By mouth using buccal tablet
- Child 12–17 years: 3–6 mg twice daily, tablets to be placed high between upper lip and gum and left to dissolve
- Adult: 3–6 mg twice daily, tablets to be placed high between upper lip and gum and left to dissolve

Dose equivalence and conversion

Doses are expressed as prochlorperazine maleate or mesilate; 1 mg prochlorperazine maleate = 1 mg prochlorperazine mesilate.

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Sulpiride
INDICATIONS AND DOSE
Schizophrenia with predominantly negative symptoms
BY MOUTH
» Adult: 200–400 mg twice daily; maximum 800 mg per day
» Elderly: Lower initial dose to be given, increased gradually according to response
Schizophrenia with mainly positive symptoms
BY MOUTH
» Adult: 200–400 mg twice daily; maximum 2.4 g per day
» Elderly: Lower initial dose to be given, increased gradually according to response

• CONTRA-INDICATIONS CNS depression • comatose states • phaeochromocytoma
• CAUTIONS Aggressive patients (even low doses may aggravate symptoms) • agitated patients (even low doses may aggravate symptoms) • excited patients (even low doses may aggravate symptoms)
• SIDE-EFFECTS Hepatitis
• HEPATIC IMPAIRMENT Can precipitate coma.
• RENAL IMPAIRMENT Start with small doses in severe renal impairment because of increased cerebral sensitivity.
• MONITORING REQUIREMENTS Sulpiride does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.
• PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include lemon and aniseed.

• MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Trifluoperazine
INDICATIONS AND DOSE
Schizophrenia and other psychoses • Short-term adjunctive management of psychomotor agitation, excitement, and violent or dangerously impulsive behaviour
BY MOUTH
» Adults: Initially 5 mg twice daily for 1 week, then increased in steps of 5 mg daily, dose then to be increased at intervals of 3 days, according to response
» Elderly: Initially up to 2.5 mg twice daily for 1 week, then increased in steps of 5 mg daily, dose then to be increased at intervals of 3 days, according to response
Short-term adjunctive management of severe anxiety
BY MOUTH
» Adults: 2–4 mg daily in divided doses, increased if necessary to 6 mg daily
» Elderly: Up to 2 mg daily in divided doses, increased if necessary to 6 mg daily
Severe nausea and vomiting
BY MOUTH
» Adults: 2–4 mg daily in divided doses; maximum 6 mg per day

• CONTRA-INDICATIONS CNS depression • comatose states • phaeochromocytoma
• SIDE-EFFECTS Anorexia • dystonic reactions • muscle weakness
SIDE-EFFECTS, FURTHER INFORMATION
Extrapyramidal symptoms are more frequent, especially at doses exceeding 6 mg daily. Phenothiazines can also induce acute dystonic reactions such as facial and skeletal muscle spasms and oculogyric crises; children (especially girls, young women, and those under 10 kg) are particularly susceptible.
• HEPATIC IMPAIRMENT Can precipitate coma; phenothiazines are hepatotoxic.
• RENAL IMPAIRMENT Start with small doses in severe renal impairment because of increased cerebral sensitivity.
• MONITORING REQUIREMENTS Trifluoperazine does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.

• MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

**Zuclopenthixol**

**INDICATIONS AND DOSE**

**Schizophrenia and other psychoses**

**BY MOUTH**

- Adult: Initially 20–30 mg daily in divided doses, increased if necessary up to 150 mg daily; usual maintenance 20–50 mg daily (max. per dose 40 mg), for debilitated patients, use elderly dose.
- Elderly: Initially 5–15 mg daily in divided doses, increased if necessary up to 150 mg daily; usual maintenance 20–50 mg daily (max. per dose 40 mg).

- **CONTRA-INDICATIONS**
  - Apathetic states - CNS depression - comatose states - phaeochromocytoma - withdrawn states
- **CAUTIONS**
  - Avoid in Acute porphyrias p. 864
- **SIDE-EFFECTS**
  - Urinary frequency - urinary incontinence - weight loss (less common than weight gain)
- **HEPATIC IMPAIRMENT**
- **RENAI IMPAIRMENT**
  - Halve dose in renal failure; smaller starting doses used in severe renal impairment because of increased cerebral sensitivity.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- CAUTIONARY AND ADVISORY LABELS 2.
  - **Clopixol** (Zuclopenthixol) (Lundbeck Ltd)
  - Zuclopenthixol (as Zuclopenthixol dihydrochloride) 2 mg Clopixol 2mg tablets | 100 tablet £3.14 DT price = £3.14
  - Zuclopenthixol (as Zuclopenthixol dihydrochloride) 10 mg Clopixol 10mg tablets | 100 tablet £8.06 DT price = £8.06
  - Zuclopenthixol (as Zuclopenthixol dihydrochloride) 25 mg Clopixol 25mg tablets | 100 tablet £16.13 DT price = £16.13

**Zuclopenthixol acetate**

**INDICATIONS AND DOSE**

**Short-term management of acute psychosis | Short-term management of exacerbation of chronic psychosis**

**BY DEEP INTRAMUSCULAR INJECTION**

- Adult: 50–150 mg, then 50–150 mg after 2–3 days, repeated if necessary maximum duration of treatment 2 weeks, to be administered into the gluteal muscle or lateral thigh, 1 additional dose may be needed 1–2 days after the first injection, maximum cumulative dose 400 mg in 2 weeks and maximum 4 injections, if maintenance treatment necessary change to an oral antipsychotic 2–3 days after last injection, or to a longer acting antipsychotic depot injection given concomitantly with last injection of zuclopenthixol acetate.
- Elderly: 50–100 mg, then 50–100 mg after 2–3 days, repeated if necessary maximum duration of treatment 2 weeks, to be administered into the gluteal muscle or lateral thigh, 1 additional dose may be needed 1–2 days after the first injection, maximum cumulative dose 400 mg in 2 weeks and maximum 4 injections, if maintenance treatment necessary change to an oral antipsychotic 2–3 days after last injection, or to a longer acting antipsychotic depot injection given.

**Important safety information**

When prescribing, dispensing, or administering, check that this is the correct preparation—this preparation is usually used in hospital for an acute episode and should not be confused with depot preparations which are usually used in the community or clinics for maintenance treatment.

- **CONTRA-INDICATIONS**
  - CNS depression - comatose states - phaeochromocytoma
- **CAUTIONS**
  - Avoid in Acute porphyrias p. 864
- **HEPATIC IMPAIRMENT**
  - Can precipitate coma.
- **RENAI IMPAIRMENT**
  - Start with small doses in severe renal impairment because of increased cerebral sensitivity.

**Zuclopenthixol decanoate**

**INDICATIONS AND DOSE**

**Maintenance in schizophrenia and paranoid psychoses**

**BY DEEP INTRAMUSCULAR INJECTION**

- Adult: Test dose 100 mg, dose to be administered into the upper outer buttck or lateral thigh, followed by 200–500 mg after at least 7 days, then 200–500 mg every 1–4 weeks, adjusted according to response, higher doses of more than 500mg can be used; do not exceed 600 mg weekly.
- Elderly: A quarter to half usual starting dose to be used when transferring from oral to depot therapy, the dose by mouth should be reduced gradually.

**Important safety information**

When prescribing, dispensing, or administering, check that this is the correct preparation—this preparation is used for maintenance treatment and should not be used for the short-term management of an acute episode.

- **CONTRA-INDICATIONS**
  - Children - CNS depression - comatose states - phaeochromocytoma
- **CAUTIONS**
  - Avoid in Acute porphyrias p. 864 • QT interval prolongation • when transferring from oral to depot therapy, the dose by mouth should be reduced gradually
- **INTERACTIONS**
  - Avoid concomitant use of drugs that prolong QT interval.
- **SIDE-EFFECTS**
  - Erythema - nodules - pain at injection site - swelling

**SIDE-EFFECTS, FURTHER INFORMATION**

If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose, therefore it may be a month or longer before side-effects subside.

- **HEPATIC IMPAIRMENT**
  - Can precipitate coma.
- **RENAI IMPAIRMENT**
  - Start with small doses in severe renal impairment because of increased cerebral sensitivity.

**MONITORING REQUIREMENTS**

Treatment requires careful monitoring for optimum effect.

- **DIRECTIONS FOR ADMINISTRATION**
  - In general not more than 2–3 mL of oily injection should be administered at
any one site. Correct injection technique (including use of z-track technique) and rotation of injection sites are essential. When initiating therapy with sustained-release preparations of conventional antipsychotics, patients should first be given a small test-dose as undesirable side-effects are prolonged.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Clopixol** (Zuclopenthixol decanoate) (Lundbeck Ltd)
  - Zuclopenthixol decanoate 200 mg per 1 ml (Clopixol 200mg/1mL solution for injection ampoules) | 10 ampoule [POS] £31.51 DT price = £31.18
  - Zuclopenthixol decanoate 500 mg per 1 ml (Clopixol Conc 500mg/1mL solution for injection ampoules) | 5 ampoule [POS] £37.18 DT price = £37.18

**ANTIPSYCHOTICS (SECOND-GENERATION)**

**Amisulpride**

**DRUG ACTION**
Amisulpride is a selective dopamine receptor antagonist with high affinity for mesolimbic D₂ and D₃ receptors.

**INDICATIONS AND DOSE**

- **Acute psychotic episode in schizophrenia**
  - **BY MOUTH**
    - Adult: 400–800 mg daily in 2 divided doses, adjusted according to response; maximum 1.2 g per day
  - **Schizophrenia with predominantly negative symptoms**
    - Adult: 50–300 mg daily

**CONTRA-INDICATIONS**
CNS depression • comatose states • phaeochromocytoma • pre-pubertal children • prolactin-dependent tumours

**SIDE-EFFECTS**
- Common or very common Anxiety
- Uncommon Bradycardia
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid—no information available.
- **RENAL IMPAIRMENT** Halve dose if eGFR 30–60 mL/minute/1.73 m². Use one-third dose if eGFR 10–30 mL/minute/1.73 m². No information available if eGFR less than 10 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Amisulpride does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.

**PRESCRIBING AND DISPENSING INFORMATION**
Flavours of oral liquid formulations may include caramel.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**Tablet**

## Psychoses and schizophrenia 313

### Aripiprazole 10 mg

- **Oral solution**
  - Aripiprazole 10 mg orodispersible tablets
  - Aripiprazole 15 mg orodispersible tablets

- **Powder and solvent for suspension for injection**
  - Aripiprazole 400 mg

### Clozapine

- **DRUG ACTION**
  - Clozapine is a dopamine D₂, dopamine D₃, 5-HT₄, α₁, adrenergic, and muscarinic-receptor antagonist.

### INDICTIONS AND DOSE

#### Schizophrenia in patients unresponsive to, or intolerant of, conventional antipsychotic drugs

- **By mouth**
  - Adult 18–59 years: 12.5 mg 1–2 times a day for day 1, then 25–50 mg for day 2, then increased, if tolerated, in steps of 25–50 mg daily, up to 200 mg daily may be taken as a single dose at bedtime; increased in steps of 50–100 mg 1–2 times a week if required, it is preferable to increase once a week; usual dose 200–450 mg daily, restarting after interval of more than 48 hours, 12.5 mg once or twice on first day (but may be feasible to increase more quickly than on initiation)—extreme caution if previous respiratory or cardiac arrest with initial dosing; maximum 900 mg per day
  - Adult 60 years and over: 12.5 mg once daily for day 1, then increased to 25–37.5 mg for day 2, then increased, if tolerated, in steps of up to 25 mg daily, up to 200 mg daily may be taken as a single dose at bedtime; increased in steps of 50–100 mg 1–2 times a week if required, it is preferable to increase once a week; usual dose 200–450 mg daily, restarting after interval of more than 48 hours, 12.5 mg once or twice on first day (but may be feasible to increase more quickly than on initiation)—extreme caution if previous respiratory or cardiac arrest with initial dosing; maximum 900 mg per day

### Specific Contra-Indications:
- With intramuscular use do not use in children

### Cautions

#### General Cautions:
- Cerebrovascular disease - elderly (reduce initial dose)

#### Specific Cautions:
- With intramuscular use when transferring from oral to depot therapy, the dose by mouth should be reduced gradually

### Side-effects

#### General Side-effects
- Common or very common: Anxiety, hypersalivation, malaise
- Uncommon: Depression, dry mouth
- Frequency not known: Alopecia, anorexia, bradycardia, hepatitis, hyponatraemia, infection, laryngospasm, myalgia, oedema, oropharyngeal spasms, pancreatitis, pathological gambling, respiratory disorders, rhabdomyolysis, suicidal ideation, sweating, urinary disorders

### Specific Side-effects
- With intramuscular use: erythema, nodules, pain at injection site - swelling

### Cautions, Further Information
- With intramuscular use: If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose of the depot injection, it may be a month or longer before side-effects subside.

### Pregnancy
- Use only if potential benefit outweighs risk.

### Breast Feeding
- Manufacturer advises avoid—present in milk.

### Hepatic Impairment
- Use with caution in severe impairment (oral treatment preferred to intramuscular administration).

### Monitoring Requirements
- Aripiprazole does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.
- With intramuscular use: Treatment requires careful monitoring for optimum effect.

### Directions for Administration
- With oral use: Orodispersible tablets should be placed on the tongue and allowed to dissolve, or be dispersed in water and swallowed.
- With intramuscular use: Correct injection technique (including the use of z-track technique) and rotation of injection sites are essential.

### Patient and Carer Advice
- With oral use: Patients or carers should be given advice on how to administer aripiprazole orodispersible tablets.

### Medicinal Forms
- There can be variation in the licensing of different medicines containing the same drug.

- **Aripiprazole 15 mg**
  - Aripiprazole 15 mg tablets | 28 tablet | £69.04

### Clozapine

- **Indications and Dose**
  - Schizophrenia in patients unresponsive to, or intolerant of, conventional antipsychotic drugs
Psychosis in Parkinson's disease

BY MOUTH

- Adult: 12.5 mg once daily, dose to be taken at bedtime, then increased in steps of 12.5 mg up to twice weekly, adjusted according to response; usual dose 25–37.5 mg once daily, dose to be taken at bedtime; increased in steps of 12.5 mg once weekly, this applies only in exceptional cases, increased if necessary up to 100 mg daily in 1–2 divided doses; Usual maximum 50 mg/24 hours

Dose adjustments due to interactions

Dose adjustment may be necessary if smoking started or stopped during treatment.

- CONTRA-INDICATIONS Alcoholic and toxic psychoses - bone-marrow disorders - coma - drug intoxication - history of agranulocytosis - history of circulatory collapse - history of neutropenia - paralytic ileus - severe cardiac disorders (e.g. myocarditis) - severe CNS depression - uncontrolled epilepsy

- CAUTIONS Age over 60 years - prostatic hypertrophy - susceptibility to angle-closure glaucoma - taper off other antipsychotics before starting

CAUTIONS, FURTHER INFORMATION

Agranulocytosis Neutropenia and potentially fatal agranulocytosis reported. Leucocyte and differential blood counts must be normal before starting; monitor counts every week for 18 weeks then at least every 2 weeks and if clozapine continued and blood count stable after 1 year at least every 4 weeks (and 4 weeks after discontinuation); if leucocyte count below 3000/mm³ or if absolute neutrophil count below 1500/mm³ discontinue permanently and refer to haematologist. Patients who have a low white blood cell count because of benign ethnic neutropenia may be started on clozapine with the agreement of a haematologist. Avoid drugs which depress leucopoiesis; patients should report immediately symptoms of infection, especially influenza-like illness.

Myocarditis and cardiomyopathy Fatal myocarditis (most commonly in first 2 months) and cardiomyopathy reported.

- Perform physical examination and take full medical history before starting
- Specialist examination required if cardiac abnormalities or history of heart disease found—clozapine initiated only in absence of severe heart disease and if benefit outweighs risk
- Persistent tachycardia especially in first 2 months should prompt observation for other indicators for myocarditis or cardiomyopathy
- If myocarditis or cardiomyopathy suspected clozapine should be stopped and patient evaluated urgently by cardiologist
- Discontinue permanently in clozapine-induced myocarditis or cardiomyopathy

Intestinal obstruction Impairment of intestinal peristalsis, including constipation, intestinal obstruction, faecal impaction, and paralytic ileus, (including fatal cases) reported. Clozapine should be used with caution in patients receiving drugs that may cause constipation (e.g. antimuscarinic drugs) or in those with a history of colonic disease or lower abdominal surgery. It is essential that constipation is recognised and actively treated.

- INTERACTIONS Avoid concomitant use of clozapine with drugs that have a substantial potential for causing agranulocytosis.

- SIDE-EFFECTS

  Common or very common Anorexia - constipation - hypersalivation - malaise - speech disorders - urinary incontinence

  Uncommon Agranulocytosis

Rare Circulatory collapse - dysphagia - hepatitis - myocarditis - pancreatitis - pericarditis - pneumonia - pulmonary aspiration

Very rare Cardiomyopathy - hypercholesterolaemia - hypertriglyceridaemia - interstitial nephritis - intestinal obstruction (including fatal cases) - myocardial infarction - obsessive compulsive disorder - parotid gland enlargement - respiratory depression

Frequency not known Hepatic disorders - hepatic failure - muscle disorders - renal failure

SIDE-EFFECTS, FURTHER INFORMATION

Hypersalivation Hypersalivation associated with clozapine therapy can be treated with hyoscine hydrobromide (unlicensed indication), provided that the patient is not at particular risk from the additive antimuscarinic side-effects of hyoscine and clozapine.

- PREGNANCY Use with caution.

- BREAST FEEDING Avoid.

- RENAL IMPAIRMENT Avoid in severe impairment.

- MONITORING REQUIREMENTS

  - Monitor leucocyte and differential blood counts. Clozapine requires differential white blood cell monitoring weekly for 18 weeks, then fortnightly for up to one year, and then monthly as part of the clozapine patient monitoring service.
  - Close medical supervision during initiation (risk of collapse because of hypotension and convulsions).
  - Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotics. Patients taking clozapine require more frequent monitoring of these parameters: every 3 months for the first year, then yearly.
  - Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly. Patients taking clozapine should have fasting blood glucose tested at baseline, after one months' treatment, then every 4–6 months.
  - Patient, prescriber, and supplying pharmacist must be registered with the appropriate Patient Monitoring Service—it takes several days to do this.

TREATMENT CESSATION On planned withdrawal reduce dose over 1–2 weeks to avoid risk of rebound psychosis. If abrupt withdrawal necessary observe patient carefully.

DIRECTIONS FOR ADMINISTRATION Shake oral suspension well for 90 seconds when dispensing or if visibly settled and stand for 24 hours before use; otherwise shake well for 10 seconds before use. May be diluted with water.

- PATIENT AND CARER ADVICE Patients or carers should be given advice on how to administer clozapine oral suspension.

- MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 3, 10

- Clozaril (Novartis Pharmaceuticals UK Ltd)
  - Clozapine 25 mg Clozaril 25mg tablets | 28 tablet (£58.82) £3.02
  - 84 tablet (£160.78) £9.06 (Hospital only)
  - 100 tablet (£10.78) £6.06 (Hospital only)

- Clozapine 100 mg Clozaril 100mg tablets | 28 tablet (£12.07) £7.22
  - 84 tablet (£36.22) £21.12 (Hospital only)
  - 100 tablet (£43.12) £25.67 (Hospital only)

- Denzapine (Britannia Pharmaceuticals Ltd)
  - Clozapine 25 mg Denzapine 25mg tablets | 84 tablet (£1.98) £16.64
  - 100 tablet (£19.80) £11.90

- Clozapine 100 mg Denzapine 100mg tablets | 84 tablet (£7.20) £66.53
  - 100 tablet (£7.92) £43.25
Lurasidone hydrochloride

- **DRUG ACTION** Lurasidone is a dopamine D₂, 5-HT₃, 5-HT₄, alpha₁A- and alpha₁C- adrenoceptor antagonist, and is a partial agonist at 5-HT₁A receptors.

**INDICATIONS AND DOSE**

**Schizophrenia**

- **BY MOUTH**
  - Adult: Initially 37 mg once daily, increased if necessary up to 148 mg once daily
  - Schizophrenia when given with concomitant moderate CYP3A4 inhibitors (e.g. diltiazem, erythromycin, fluconazole, and verapamil)

- **BY MOUTH**
  - Adult: Initially 18.5 mg once daily (max. per dose 74 mg once daily)

- **CAUTIONS** High doses in elderly. Susceptibility to QT-interval prolongation

- **INTERACTIONS** Contra-indicated with concomitant use of potent CYP3A4 inhibitors. Contra-indicated with concomitant use of potent CYP3A4 inducers. Caution with concomitant use of drugs that prolong the QT interval.

- **SIDE-EFFECTS**
  - Common or very common: Anxiety - musculoskeletal stiffness
  - Uncommon: Catatonia - decreased appetite - dysarthria - dysuria - hot flush - myalgia - nightmares
  - Frequency not known: Angina - AV block - bradycardia - dysphagia - panic attacks - pruritus - suicidal behaviour - vertigo
  - Pregnancy: Use only if potential benefit outweighs risk—limited information available.

- **HEPATIC IMPAIRMENT** Initially 18.5 mg once daily, up to max. 74 mg once daily in moderate impairment. Use with caution in severe impairment—initially 18.5 mg once daily, up to max. 37 mg once daily.

- **RENAL IMPAIRMENT** Initially 18.5 mg once daily, up to max. 74 mg once daily if eGFR less than 50 mL/minute/1.73 m². Manufacturer advises use only if potential benefit outweighs risk if eGFR less than 15 mL/minute/1.73 m².

- **DIRECTIONS FOR ADMINISTRATION** Patients on doses higher than 111 mg once daily whose treatment is interrupted for longer than 3 days should restart on 111 mg once daily and titrate to usual dose; for all other doses, restart on usual dose.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
  - Cautionary and advisory labels 2, 21, 25
  - Lurasidone (as Lurasidone hydrochloride) 18.3 mg | Latuda 18.3 mg tablets | 28 tablet (PO) £90.72
  - Lurasidone (as Lurasidone hydrochloride) 37 mg | Latuda 37 mg tablets | 28 tablet (PO) £90.72

**Contra-indications**

- With intramuscular use: acute myocardial infarction - bradycardia - recent heart surgery - severe hypotension - sick sinus syndrome - unstable angina

- **Caution** Bone-marrow depression - diabetes mellitus (risk of exacerbation or ketoadiabetic) - hypereosinophilic disorders - low leucocyte count - low neutrophil count - myeloproliferative disease - paralytic ileus

**Cautions, Further Information**

- CNS and respiratory depression: Blood pressure, pulse and respiratory rate should be monitored for at least 4 hours after intramuscular injection, particularly in those also
receiving a benzodiazepine or another antipsychotic (leave at least one hour between administration of olanzapine intramuscular injection and parenteral benzodiazepines).

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Common or very common Arthralgia - hypercholesterolaemia - hypertriglyceridaemia - increased appetite - malaise - oedema
- Uncommon Alopecia - amnesia - bradycardia - epistaxis
- Rare Hepatitis - pancreatitis - rhabdomyolysis

**SPECIFIC SIDE-EFFECTS**

- With intramuscular use hyperventilation - sinus pause
- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** Avoid—present in milk.
- **HEPATIC IMPAIRMENT** Consider initial dose of 5 mg daily.
- **RENAL IMPAIRMENT** Consider initial dose of 5 mg daily.

**MONITORING REQUIREMENTS**

- Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotic drugs. Patients taking olanzapine require more frequent monitoring of these parameters: every 3 months from the first year, then yearly.
- Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly. Patients taking olanzapine should have fasting blood glucose tested at baseline, after one months’ treatment, then every 4–6 months.

**DIRECTIONS FOR ADMINISTRATION** Olanzapine orodispersible tablet may be placed on the tongue and allowed to dissolve, or dispersed in water, orange juice, apple juice, milk, or coffee.

**PRESCRIBING AND DISPENSING INFORMATION**

- With intramuscular use When prescribing, dispensing, or administering, check that this injection is the correct preparation—for this preparation is usually used in hospital for the rapid control of an acute episode and should not be confused with depot preparations which are usually used in the community or clinics for maintenance treatment.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer orodispersible tablets.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

**Tablet**

**INDICATIONS AND DOSE**

Maintenance in schizophrenia in patients tolerant to olanzapine by mouth (patients taking 10 mg oral olanzapine daily)

**BY DEEP INTRAMUSCULAR INJECTION**

- Adult 18-75 years: Initially 210 mg every 2 weeks, alternatively initially 405 mg every 4 weeks, then maintenance 150 mg every 2 weeks, alternatively maintenance 300 mg every 4 weeks, maintenance dose to be started after 2 months of initial treatment, dose to be administered into the gluteal muscle, consult product literature if supplementation with oral olanzapine required

Maintenance in schizophrenia in patients tolerant to olanzapine by mouth (patients taking 15 mg oral olanzapine daily)

**BY DEEP INTRAMUSCULAR INJECTION**

- Adult 18-75 years: Initially 300 mg every 2 weeks, then maintenance 210 mg every 2 weeks, alternatively maintenance 405 mg every 4 weeks, maintenance dose to be started after 2 months of initial treatment, dose to be administered into the gluteal muscle, consult product literature if supplementation with oral olanzapine required

Maintenance in schizophrenia in patients tolerant to olanzapine by mouth (patients taking 20 mg oral olanzapine daily)

**BY DEEP INTRAMUSCULAR INJECTION**

- Adult: Initially 300 mg every 2 weeks, then maintenance 300 mg every 2 weeks (max. per dose 300 mg every 2 weeks), adjusted according to response, dose to be administered into the gluteal muscle, consult product literature if supplementation with oral olanzapine required

**Olanzapine embonate**

*(Olanzapine pamoate)*
**Dose adjustments due to interactions**
Dose adjustment may be necessary if smoking started or stopped during treatment.

**Important safety information**
When prescribing, dispensing or administering, check that this is the correct preparation—this preparation is used for maintenance treatment and should not be used for the rapid control of an acute episode.

- **CONTRA-INDICATIONS** Children
- **CAUTIONS** Bone-marrow depression • diabetes mellitus (risk of exacerbation or ketoacidosis) • hypereosinophilic disorders • low leucocyte count • low neutrophil count • myeloproliferative disease • paralytic ileus • when transferring from oral to depot therapy, the dose by mouth should be reduced gradually
- **SIDE-EFFECTS**
  - Common or very common Arthralgia • hypercholesterolaemia • hypertriglyceridaemia • increased appetite • malaise • oedema
  - Rare Alopecia • anemia • bradycardia • epistaxis
  - Frequency not known Erythema • nodules • pain at injection site • swelling

**SIDE-EFFECTS, FURTHER INFORMATION**
If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose, therefore it may be a month or longer before side-effects subside.

**PREGNANCY** Post-injection reactions have been reported leading to signs and symptoms of overdose.

**BREAST FEEDING** Avoid—present in milk.

**HEPATIC IMPAIRMENT** Initially 150 mg every 4 weeks; increase with caution in moderate impairment.

**RENAI IMPAIRMENT** Initially 150 mg every 4 weeks.

**MONITORING REQUIREMENTS**
- Observe patient for at least 3 hours after injection.
- Treatment requires careful monitoring for optimum effect.
- Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotic drugs. Patients taking olanzapine require more frequent monitoring of these parameters: every 3 months for the first year, then yearly.
- Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly. Patients taking olanzapine should have fasting blood glucose tested at baseline, after one months’ treatment, then every 4–6 months.

**DIRECTIONS FOR ADMINISTRATION** Correct injection technique (including use of z-track technique) and rotation of injection sites are essential.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for suspension for injection**
- Zypadhera (Eli Lilly and Company Ltd)
  - Olanzapine (as Olanzapine embonate monohydrate) 210 mg Zypadhera 210mg powder and solvent for suspension for injection vials 1 vial (Pos) £14.76 (Hospital only)
  - Olanzapine (as Olanzapine embonate monohydrate) 300 mg Zypadhera 300mg powder and solvent for suspension for injection vials 1 vial (Pos) £22.64 (Hospital only)
  - Olanzapine (as Olanzapine embonate monohydrate) 405 mg Zypadhera 405mg powder and solvent for suspension for injection vials 1 vial (Pos) £28.52 (Hospital only)

**Paliperidone**

- **DRUG ACTION** Paliperidone is a metabolite of risperidone.

**INDICATIONS AND DOSE**
Maintenance in schizophrenia in patients previously responsive to paliperidone or risperidone

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 150 mg for 1 dose on day 1, then 100 mg for 1 dose on day 8, to be injected into the deltoid muscle, dose subsequently adjusted at monthly intervals according to response; maintenance 75 mg once a month, alternatively maintenance 25–150 mg once a month, following the second dose, monthly maintenance doses can be administered into either the deltoid or gluteal muscle, for missed doses see product literature

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Rotating injection sites are essential.
  - Inappropriate antidiuretic hormone secretion
  - When transferring from oral to depot therapy, the dose by mouth should be reduced gradually

- **CONTRA-INDICATIONS**
  - With intramuscular use children

- **CAUTIONS**
  - GENERAL CAUTIONS
    - Cataract surgery (risk of intraoperative floppy iris syndrome) • elderly patients with dementia • elderly patients with risk factors for stroke • predisposition to gastro-intestinal obstruction • prolactin-dependent tumours

  - SPECIFIC CAUTIONS
    - With intramuscular use when transferring from oral to depot therapy, the dose by mouth should be reduced gradually

- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - Common or very common Anxiety • appetite changes • arthralgia • depression • epistaxis • hypertension • infection • malaise • myalgia • oedema • respiratory disorders • sleep disorders • toothache • urinary disorders
    - Rare Inappropriate antidiuretic hormone secretion • intestinal obstruction • intra-operative floppy iris syndrome • pancreatitis • pulmonary embolism • rhabdomyolysis

  - **SPECIFIC SIDE-EFFECTS**
    - With intramuscular use erythema • nodules • pain at injection site • swelling

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - With intramuscular use if the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose, therefore it may be a month or longer before side-effects subside.

- **PREGNANCY** Use only if potential benefit outweighs risk—toxicity in animal studies; if discontinuation during pregnancy is necessary, withdraw gradually.

- **BREAST FEEDING** Avoid—present in milk.

- **HEPATIC IMPAIRMENT** Caution in severe impairment—no information available.

- **RENAI IMPAIRMENT**
  - With oral use Initially 3 mg once daily if eGFR 50–80 mL/minute/1.73 m² (max. 6 mg once daily).
Nervous system

Quetiapine

▶ With intramuscular use

MONITORING REQUIREMENTS

▶ With intramuscular use

Elderly:

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Schizophrenia

Quetiapine is a dopamine D₂, dopamine D₃, 5-HT₂, alpha₁-adrenoceptor, and histamine-1 receptor antagonist.

INDICATIONS AND DOSE

Schizophrenia

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Adult: 25 mg twice daily for day 1, then 50 mg twice daily for day 2, then 100 mg twice daily for day 3, then 150 mg twice daily for day 4, then, adjusted according to response, usual dose 300–450 mg daily in 2 divided doses, the rate of dose titration may need to be slower and the daily dose lower in elderly patients; maximum 750 mg per day

BY MOUTH USING MODIFIED-RELEASE MEDICINES

Adult: 300 mg once daily for day 1, then 600 mg once daily for day 2, then, adjusted according to response, usual dose 600 mg once daily, maximum dose under specialist supervision; maximum 800 mg per day

Elderly: Initially 50 mg once daily, adjusted according to response. Adjusted in steps of 50 mg daily

Treatment of mania in bipolar disorder

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Adult: 50 mg twice daily for day 1, then 100 mg twice daily for day 2, then, adjusted according to response, usual dose 200–240 mg daily in 2 divided doses, the rate of dose titration may need to be slower and the daily dose lower in elderly patients; maximum 800 mg per day

BY MOUTH USING MODIFIED-RELEASE MEDICINES

Adult: 300 mg once daily for day 1, then 600 mg once daily for day 2, then, adjusted according to response, usual dose 400–800 mg once daily

Treatment of depression in bipolar disorder

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Adult: 50 mg once daily for day 1, dose to be taken at bedtime, then 100 mg once daily for day 2, then 200 mg once daily for day 3, then 300 mg once daily for day 4, then, adjusted according to response; usual dose 300 mg once daily, the rate of dose titration may need to be slower and the daily dose lower in elderly patients; maximum 600 mg per day

BY MOUTH USING MODIFIED-RELEASE MEDICINES

Adult: 50 mg once daily for day 1, dose to be taken at bedtime, then 100 mg once daily for day 2, then 200 mg once daily for day 3, then 300 mg once daily for day 4, then, adjusted according to response; usual dose 300 mg once daily; maximum 600 mg per day

Prevention of mania and depression in bipolar disorder

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Adult: Continue at the dose effective for treatment of bipolar disorder and adjust to lowest effective dose; usual dose 300–800 mg daily in 2 divided doses

BY MOUTH USING MODIFIED-RELEASE MEDICINES

Adult: Continue at the dose effective for treatment of bipolar disorder and adjust to lowest effective dose; usual dose 300–800 mg once daily

Adjunctive treatment of major depression

BY MOUTH USING MODIFIED-RELEASE MEDICINES

Adult: 50 mg once daily for 2 days, dose to be taken at bedtime, then 150 mg once daily for 2 days, then, adjusted according to response, usual dose 150–300 mg once daily

Elderly: Initially 50 mg once daily for 3 days, then increased if necessary to 100 mg once daily for 4 days, then adjusted in steps of 50 mg, adjusted according to response, usual dose 50–300 mg once daily, dose of 300 mg should not be reached before day 22 of treatment

Dose equivalence and conversion

Patients can be switched from immediate-release to modified-release tablets at the equivalent daily dose; to maintain clinical response, dose titration may be required.

• CAUTIONS

Cerebrovascular disease • elderly • patients at risk of aspiration pneumonia • treatment of depression in patients under 25 years (increased risk of suicide)

SIDE-EFFECTS

• Common or very common

Asthenia • dysarthria • dysphagia • elevated plasma-cholesterol concentrations • elevated plasma-triglyceride concentrations • increased appetite • irritability • peripheral oedema • sleep disorders

• Uncommon

Hyponatraemia • hypothyroidism • restless legs syndrome • rhinitis

• Rare

Hepatitis • pancreatitis

MEDICATION FORMS

There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 2, 25

BNF 70
**Risperidone**

**DRUG ACTION** Risperidone is a dopamine D2, 5-HT2a, alpha-, adrenoceptor, and histamine-1 receptor antagonist.

**INDICATIONS AND DOSE**

Schizophrenia and other psychoses in patients tolerant to risperidone by mouth and taking oral risperidone up to 4 mg daily

**BY DEEP INTRAMUSCULAR INJECTION**

- Adult: Initially 25 mg every 2 weeks, to be administered into the deltoid or gluteal muscle, adjusted in steps of 12.5 mg at least every 4 weeks.
SPECIFIC SIDE-EFFECTS
> With intramuscular use erythema · nodules · pain at injection site · swelling

SIDE-EFFECTS, FURTHER INFORMATION
> With intramuscular use If the dose needs to be reduced to alleviate side-effects, it is important to recognise that the plasma-drug concentration may not fall for some time after reducing the dose, therefore it may be a month or longer before side-effects subside.

PREGNANCY Use only if potential benefit outweighs risk.
BREAST FEEDING Use only if potential benefit outweighs risk—small amount present in milk.

HEPATIC IMPAIRMENT
> With intramuscular use If an oral dose of at least 2 mg daily tolerated, 25 mg as a depot injection can be given every 2 weeks.
> With oral use Initial and subsequent oral doses should be halved.

RENAL IMPAIRMENT Initial and subsequent oral doses should be halved.

MONITORING REQUIREMENTS
> With intramuscular use Treatment requires careful monitoring for optimum effect.

DIRECTIONS FOR ADMINISTRATION
> With oral use Orodispersible tablets should be placed on the tongue, allowed to dissolve and swallowed. Oral liquid should be halved.

PATIENT AND CARER ADVICE
> With oral use Patients or carers should be given advice on how to administer risperidone orodispersible tablets. Patients or carers should be given advice on how to administer risperidone oral liquid; counselling on use of dose syringe advised.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

3 Movement disorders

3.1 Dystonias and other involuntary movements

Drugs used for Dystonias and other involuntary movements not listed below: Chlorpromazine hydrochloride, p. 304 · Clozapine hydrochloride, p. 137 · Clonazepam, p. 313 · Diazepam, p. 267 · Haloperidol, p. 306 · Orphenadrine hydrochloride, p. 325 · Perhexiline, p. 308 · Pramipexole, p. 336 · Prochelorperazine, p. 309 · Procyclidine hydrochloride, p. 326 · Roclopride, p. 338 · Rotigotine, p. 339 · Trifluoperazine, p. 310 · Trihexyphenidyl, p. 326

ANTIPSYCHOTICS (FIRST-GENERATION)
Promazine hydrochloride

The properties listed below are those particular to the drug only. For properties common to the class, see Antipsychotics, p. 303.

INDICATIONS AND DOSE
Short-term adjunctive management of psychomotor agitation
BY MOUTH
> Adult: 100–200 mg 4 times a day
Dystonias and other involuntary movements

Agitation and restlessness in elderly
BY MOUTH
▶ Elderly: 25–50 mg 4 times a day

- CONTRA-INDICATIONS CNS depression - comatose states - phaeochromocytoma
- CAUTIONS Cerebral arteriosclerosis
- SIDE-EFFECTS Haemolytic anaemia
- HEPATIC IMPAIRMENT Can precipitate coma; phenothiazines are hepatotoxic.
- RENAL IMPAIRMENT Start with small doses in severe renal impairment because of increased cerebral sensitivity.
- LESS SUITABLE FOR PRESCRIBING Promazine hydrochloride is less suitable for prescribing.

- MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet
CAUTIONARY AND ADVISORY LABELS 2
▶ PROMAZINE HYDROCHLORIDE (Non-proprietary)
Promazine hydrochloride 25 mg Promazine 25mg tablets | 100 tablet (P) £39.50
Promazine hydrochloride 50 mg Promazine 50mg tablets | 100 tablet (P) £76.49

Oral solution
CAUTIONARY AND ADVISORY LABELS 2
▶ PROMAZINE HYDROCHLORIDE (Non-proprietary)
Promazine hydrochloride 5 mg per 1 ml Promazine 5mg/5ml syrup | 150 ml (P) £11.50 DT price = £11.87
Promazine 25mg/5ml oral solution | 150 ml (P) £11.87 DT price = £11.87
Promazine hydrochloride 10 mg per 1 ml Promazine 10mg/5ml syrup | 150 ml (P) £13.50 DT price = £13.93
Promazine 50mg/5ml oral solution | 150 ml (P) £13.93 DT price = £13.93

CNS STIMULANTS

Piracetam

INDICATIONS AND DOSE
Adjunctive treatment of cortical myoclonus
BY MOUTH
▶ Adult: Initially 7.2 g daily in 2–3 divided doses, then increased in steps of 4.8 g every 3–4 days, adjusted according to response, subsequently, attempts should be made to reduce dose of concurrent therapy; maximum 24 g per day

- CONTRA-INDICATIONS Cerebral haemorrhage - Huntington’s chorea
- CAUTIONS Gastric ulcer - history of haemorrhagic stroke - increased risk of bleeding - major surgery - underlying disorders of haemostasis
- INTERACTIONS Caution with concomitant drugs that increase bleeding.
- SIDE-EFFECTS
  - Common or very common Hyperkinesia - nervousness - weight gain
- PREGNANCY Avoid.
- BREAST FEEDING Avoid.
- HEPATIC IMPAIRMENT Adjust dose if both hepatic and renal impairment.
- RENAL IMPAIRMENT Use two-thirds of normal dose if eGFR 50–80 mL/minute/1.73 m²; use one-third of normal dose in 2 divided doses if eGFR 30–50 mL/
minute/1.73 m²; use one-sixth of normal dose as a single dose if eGFR 20–30 mL/minute/1.73 m². Avoid if eGFR less than 20 mL/minute/1.73 m².
- TREATMENT CESSATION Avoid abrupt withdrawal.
- PRESCRIBING AND DISPENSING INFORMATION Piracetam has been used in children 16 years and over as adjunctive treatment for cortical myoclonus.
- DIRECTIONS FOR ADMINISTRATION Follow the oral solution with a glass of water (or soft drink) to reduce bitter taste.

- MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet
CAUTIONARY AND ADVISORY LABELS 3
▶ Nootropil (UCB Pharma Ltd)
Piracetam 800 mg Nootropil 800mg tablets | 90 tablet (P) £11.75
Piracetam 1.2 gram Nootropil 1.2g tablets | 60 tablet (P) £10.97

Oral solution
CAUTIONARY AND ADVISORY LABELS 3
▶ Nootropil (UCB Pharma Ltd)
Piracetam 33.3 mg per 1 ml Nootropil 33% oral solution (sugar-free) | 300 ml (P) £16.31

MONOAMINE DEPLETING DRUGS

Tetrabenazine

INDICATIONS AND DOSE
Movement disorders due to Huntington’s chorea, hemiballismus, senile chorea, and related neurological conditions
BY MOUTH
▶ Adult: Initially 25 mg 3 times a day, then increased, if tolerated, in steps of 25 mg every 3–4 days; maximum 200 mg per day
▶ Elderly: Lower initial dose may be necessary
Moderate to severe tardive dyskinesia
BY MOUTH
▶ Adult: Initially 12.5 mg daily, dose to be gradually increased according to response

- CONTRA-INDICATIONS Depression - parkinsonism - phaeochromocytoma - prolactin-dependent tumours
- CAUTIONS Susceptibility to QT-interval prolongation
- INTERACTIONS Appendix 1 (tetrabenazine).
Caution with concomitant use of drugs that prolong QT interval.

- SIDE-EFFECTS
  - Common or very common Anxiety - confusion - constipation - depression - diarrhoea - drowsiness - dysphagia - hypotension - insomnia - nausea - parkinsonism - vomiting
  - Uncommon Altered consciousness level - extrapyramidal disorders - hyperthermia
  - Rare Neuroleptic malignant syndrome
  - Very rare Rhabdomyolysis
  - Frequency not known Agitation - amnesia - ataxia - bradycardia - disorientation - dizziness - dry mouth - dyspepsia
- PREGNANCY Avoid unless essential—toxicity in animal studies.
- BREAST FEEDING Avoid.
- HEPATIC IMPAIRMENT Use half initial dose and slower dose titration in mild to moderate impairment. Use with caution in severe impairment.
- RENAL IMPAIRMENT Use with caution.
- TREATMENT CESSATION Avoid abrupt withdrawal.
PATIENT AND CARER ADVICE  May affect performance of skilled tasks (e.g. driving).

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, powder preparation.

Tablet
- RILUZOLE (Non-proprietary)

Riluzole

CONTRA-INDICATIONS  Acute porphyria

CAUTIONS  History of abnormal hepatic function (consult product literature for details) - interstitial lung disease

CAUTIONS, FURTHER INFORMATION
Interstitial lung disease Perform chest radiography if symptoms such as dry cough or dyspnoea develop; discontinue if interstitial lung disease is diagnosed.

SIDE-EFFECTS
- Common or very common Abdominal pain · asthenia · diarrhoea · dizziness · drowsiness · headache · nausea · oral paraesthesia · tachycardia · vomiting
- Uncommon Anaemia · angioedema · interstitial lung disease · pancreatitis
- Rare Neutropenia
- Very rare Hepatitis

SIDE-EFFECTS, FURTHER INFORMATION
Neutropenia White blood cell counts should be determined in febrile illness; neutropenia requires discontinuation of riluzole.

PREGNANCY  Avoid—no information available.

BREAST FEEDING  Avoid—no information available.

HEPATIC IMPAIRMENT  Avoid.

RENAI IMPAIRMENT  Avoid—no information available.

PATIENT AND CARER ADVICE  Dizziness or vertigo may affect performance of skilled tasks (e.g. driving). Blood disorders Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever occur.

NATIONAL FUNDING/ACCESS DECISIONS
NICE technology appraisals (TAs)
- Riluzole for motor neurone disease (January 2001) NICE TA20 Riluzole is recommended for treating the amyotrophic lateral sclerosis (ALS) form of motor neurone disease (MND). Treatment should be initiated by a specialist in MND but it can then be supervised under a shared-care arrangement involving the general practitioner.

www.nice.org.uk/TA20

Tafamidis

INDICATIONS AND DOSE
Treatment of transthyretin familial amyloid polyneuropathy (TTR-FAP) in patients with stage 1 symptomatic polyneuropathy to delay peripheral neurological impairment (initiated under specialist supervision)

BY MOUTH
- Adult: 20 mg once daily

SIDE-EFFECTS  Abdominal pain · diarrhoea · urinary tract infection · vaginal infection

CONCEPTION AND CONTRACEPTION  Exclude pregnancy before treatment and ensure effective contraception during and for one month after stopping treatment.

PREGNANCY  Avoid (toxicity in animal studies).

BREAST FEEDING  Avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT  Caution in severe impairment—no information available.

PRESCRIBING AND DISPENSING INFORMATION  Tafamidis should be prescribed in addition to standard treatment, but before liver transplantation; it should be discontinued in patients who undergo liver transplantation.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Capsule

  Tafamidis 20 mg Vyndaqel 20mg capsules | 30 capsule POM £10.685.00

NEUROTOXINS (BOTULINUM TOXINS)

Botulinum toxin type A

INDICATIONS AND DOSE
Treatment of focal spasticity (including hand and wrist disability associated with stroke) (specialist use only) · Blepharospasm (specialist use only) · Hemifacial spasm (specialist use only) · Spasmodic torticollis (specialist use only) · Severe hyperhidrosis of the axillae (specialist use only) · Prophylaxis of headaches in adults with chronic migraine (specialist use only) · Temporary improvement of moderate to severe wrinkles between the eyebrows in adults under 65 years (specialist use only) · Ankle disability due to lower limb spasticity associated with stroke (specialist use only) · Management of bladder dysfunctions (specialist use only) · Temporary improvement of moderate to severe crow’s feet (specialist use only)· BY SUBCUTANEOUS INJECTION OR BY INTRADERMAL INJECTION OR BY INTRAMUSCULAR INJECTION
- Adult: (consult product literature)

Dose equivalence and conversion
Important: information is specific to each individual preparation.
CONTRA-INDICATIONS  Acute urinary retention (specific to use in bladder disorders only) • catheterisation difficulties (specific to use in bladder disorders only) • generalised disorders of muscle activity • infection at injection site • myasthenia gravis • presence of bladder calculi (specific to use in bladder disorders only) • urinary tract infection (specific to use in bladder disorders only)

CAUTIONS

GENERAL CAUTIONS:
Atrophy in target muscle • chronic respiratory disorder • elderly • excessive weakness in target muscle • history of aspiration • history of dysphagia • inflammation in target muscle • neurological disorders • neuromuscular disorders • off-label use (fatal adverse events reported)

SPECIFIC CAUTIONS:
When used for blepharospasm or hemifacial spasm • risk of angle-closure glaucoma

CAUTIONS, FURTHER INFORMATION
When used for blepharospasm and hemifacial spasm, reduced blinking can lead to corneal exposure, persistent epithelial defect and corneal ulceration (especially in those with VIIth nerve disorders)—careful testing of corneal sensation in previously operated eyes, avoidance of injection in lower lid area to avoid ectropion, and vigorous treatment of epithelial defect needed. Neuromuscular or neurological disorders can lead to increased sensitivity and exaggerated muscle weakness including dysphagia and respiratory compromise.

SIDE-EFFECTS

GENERAL SIDE-EFFECTS
• Common or very common Excessive doses may paralyse distant muscles • increased electrophysiologic jitter in some distant muscles • influenza-like symptoms • misplaced injections may paralyse nearby muscle groups

• Rare Antibody formation (substantial deterioration in response) • arthralgia or myalgia • fever • generalized weakness or malaise • seizures

• Very rare Aspiration • dysphagia • dysphonia • exaggerated muscle weakness • respiratory disorders

SPECIFIC SIDE-EFFECTS
• Common or very common
• When used for focal upper-limb spasticity associated with stroke dysphagia • hypertension • purpura
• When used for axillary hyperhidrosis pain in extremities
• When used for spasmodic torticollis back pain • dizziness • drowsiness • dry mouth • dysphagia and pooling of saliva (occurs most frequently after injection into sternomastoid muscle) • headache • hypertension • malaise • nausea • numbness • rhinitis • stiffness • weakness

• When used for hemifacial spasm dry eye • ecchymosis • facial oedema • irritation • keratitis • lacrimation • lagophthalmos • pharyngitis • ptosis

• When used for temporary improvement of moderate to severe wrinkles between the eyebrows facial oedema • headache • ptosis

• When used for blepharospasm dry eye • ecchymosis • facial oedema • irritation • keratitis • lacrimation • lagophthalmos • pharyngitis • ptosis

• When used for axillary hyperhidrosis abnormal skin odour • alopecia • hot flushes • non-axillary sweating • paraesthesia • pruritus • subcutaneous nodule

• Uncommon
• When used for focal upper-limb spasticity associated with stroke amnesia • arthralgia • bursitis • cough • depression • dry mouth • dysaesthesia • haematoma • headache • insomnia • malaise • pain in extremities • paraesthesia • peripheral oedema • vertigo

• When used for blepharospasm conjunctivitis • dermatitis • diplopia • dizziness • drooping • dry mouth • ectropion • entropion • facial weakness • headache • paraesthesia • tiredness • visual disturbances

• When used for axillary hyperhidrosis joint pain • myalgia

When used for hemifacial spasm conjunctivitis • dermatitis • diplopia • dizziness • drooping • dry mouth • ectropion • entropion • facial weakness • headache • paraesthesia • tiredness • visual disturbances

When used for spasmodic torticollis colitis • diarrhoea • diplopia • dysphagia • eye pain • myalgia • ptosis • skeletal pain • sweating • tremor • voice alteration • vomiting

When used for focal upper-limb specificity associated with stroke nausea

When used for temporary improvement of moderate to severe wrinkles between the eyebrows anxiety • asthenia • blepharitis • dizziness • dry mouth • dry skin • muscle cramp • nausea • paraesthesia • photosensitivity reactions • tinnitus • visual disturbances

Rare

When used for blepharospasm eyelid bruising and swelling (minimised by applying gentle pressure at injection site immediately after injection)

When used for hemifacial spasm eyelid bruising and swelling (minimised by applying gentle pressure at injection site immediately after injection)

Very rare

When used for blepharospasm angle-closure glaucoma • corneal epithelial defect • corneal perforation • corneal ulceration

When used for hemifacial spasm angle-closure glaucoma • corneal epithelial defect • corneal perforation • corneal ulceration

Frequency not known

When used for focal lower-limb spasticity associated with stroke arthralgia • peripheral oedema • rash

CONCEPTION AND CONTRACEPTION Avoid in women of child-bearing age unless using effective contraception.

PREGNANCY Avoid unless essential—toxicity in animal studies (manufacturer of Botox® advise avoid).

BREAST FEEDING Low risk of systemic absorption but avoid unless essential.

PRESCRIBING AND DISPENSING INFORMATION Preparations are not interchangeable.

PATIENT AND CARER ADVICE Patients and carers should be warned of the signs and symptoms of toxin spread, such as muscle weakness and breathing difficulties; they should be advised to seek immediate medical attention if swallowing, speech or breathing difficulties occur.

NATIONAL FUNDING / ACCESS DECISIONS

NICE technology appraisals (TAs)
Botulinum toxin type A for the prevention of headaches in adults with chronic migraine (June 2012) NICE TA260 Botulinum toxin type A is recommended as an option for the prophylaxis of headaches in adults with chronic migraine, (defined as headaches on at least 15 days per month, of which at least 8 days are with migraine), that has not responded to at least three prior pharmacological prophylaxis therapies and whose condition is appropriately managed for medication overuse.

www.nice.org.uk/TA260

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (March 2011 and March 2013) that Botox® is not recommended for use within NHS Scotland for prophylaxis of headaches in adults with chronic migraine. The Scottish Medicines Consortium has advised that Azzalure® and Vistabel® (December 2010), and Bocouture® (February 2011) are not recommended for use within NHS Scotland.

### 3.2 Parkinson’s disease

#### Parkinson’s disease and related disorders

**Parkinson’s disease**

In idiopathic Parkinson’s disease, the progressive degeneration of pigmented neurones in the substantia nigra leads to a deficiency of the neurotransmitter dopamine. The resulting neurochemical imbalance in the basal ganglia causes the characteristic signs and symptoms of the illness. Drug therapy does not prevent disease progression, but it improves most patients’ quality of life.

With suspected Parkinson’s disease should be referred to a specialist to confirm the diagnosis; the diagnosis should be reviewed every 6–12 months.

Features resembling those of Parkinson’s disease can occur in diseases such as progressive supranuclear palsy and multiple system atrophy, but they do not normally show a sustained response to the drugs used in the treatment of idiopathic Parkinson’s disease.

When initiating treatment, patients should be advised about its limitations and possible side-effects. About 5–10% of patients with Parkinson’s disease respond poorly to treatment.

Treatment is usually not started until symptoms cause significant disruption of daily activities. Levodopa, non-ergot-derived dopamine-receptor agonists, or monoamine-oxidase-B inhibitors can be prescribed for initial treatment in early Parkinson’s disease. Therapy with two or more antiparkinsonian drugs may be necessary as the disease progresses. Most patients eventually require levodopa and subsequently develop motor complications.

**Elderly**

Antiparkinsonian drugs can cause confusion in the elderly. It is particularly important to initiate treatment with low doses and to increase the dose gradually.

**Dopaminergic drugs used in Parkinson’s disease**

- **Dopamine-receptor agonists**
  - The dopamine-receptor agonists have a direct action on dopamine receptors. Initial treatment of Parkinson’s disease is often with the dopamine-receptor agonists pramipexole p. 336, ropinirole p. 338, and rotigotine p. 339. The ergot-derived dopamine-receptor agonists bromocriptine p. 333, cabergoline p. 334, and pergolide p. 336 are rarely used because of the risk of fibrotic reactions.
  - When used alone, dopamine-receptor agonists cause fewer motor complications in long-term treatment compared with levodopa treatment but the overall motor performance improves slightly less. The dopamine-receptor agonists are associated with more psychiatric side-effects than levodopa.
  - Dopamine-receptor agonists are also used with levodopa in more advanced disease. If a dopamine-receptor agonist is added to levodopa therapy, the dose of levodopa needs to be reduced.
  - Apomorphine hydrochloride p. 332 is a potent dopamine-receptor agonist that is sometimes helpful in advanced
disease for patients experiencing unpredictable ‘off’ periods with levodopa treatment. Apomorphine hydrochloride should be initiated in a specialist clinic. After an overnight withdrawal of oral antiparkinsonian medication to induce an ‘off’ episode, the threshold dose of apomorphine hydrochloride is determined. Oral antiparkinsonian medication is then restarted. The patient must be taught to self-administer apomorphine hydrochloride by subcutaneous injection into the lower abdomen or outer thigh at the first sign of an ‘off’ episode. Once treatment has been established it may be possible to gradually reduce other antiparkinsonian medications.

**Levodopa**

Levodopa, the amino-acid precursor of dopamine, acts by replenishing depleted striatal dopamine. It is given with an extracerebral dopa-decarboxylase inhibitor, which reduces the peripheral conversion of levodopa to dopamine, thereby limiting side-effects such as nausea, vomiting, and cardiovascular effects; additionally, effective brain-dopamine concentrations are achieved with lower doses of levodopa. The extracerebral dopa-decarboxylase inhibitors used with levodopa are benserazide (in co-beneldopa p. 328) and carbidopa (in co-careldopa p. 329).

Levodopa, in combination with a dopa-decarboxylase inhibitor, is useful in the elderly or frail, in patients with other significant illnesses, and in those with more severe symptoms. It is effective and well tolerated in the majority of patients.

Levodopa therapy should be initiated at a low dose and increased in small steps; the final dose should be as low as possible. Intervals between doses should be chosen to suit the needs of the individual patient.

Nausea and vomiting with co-beneldopa or co-careldopa are rarely dose-limiting and domperidone p. 346 can be useful in controlling these effects.

Levodopa treatment is associated with potentially troublesome motor complications including response fluctuations and dyskinesias. Response fluctuations are characterised by large variations in motor performance, with normal function during the ‘on’ period, and weakness and restricted mobility during the ‘off’ period. ‘End-of-dose’ deterioration with progressively shorter duration of benefit also occurs. Modified-release preparations may help with ‘end-of-dose’ deterioration or nocturnal immobility and rigidity. Motor complications are particularly problematic in young patients treated with levodopa.

**Monoamine-oxidase-B inhibitors**

Rasagiline p. 340 and selegiline hydrochloride p. 340 are monoamine-oxidase-B inhibitors used in Parkinson’s disease. Early treatment with selegiline hydrochloride alone can delay the need for levodopa therapy.

**Antimuscarinic drugs used in parkinsonism**

Antimuscarinic drugs can be useful in drug-induced parkinsonism, but they are generally not used in idiopathic Parkinson’s disease because they are less effective than dopaminergic drugs and they are associated with cognitive impairment.

The antimuscarinic drugs orphenadrine hydrochloride below, procyclidine hydrochloride p. 326, and trihexyphenidyl hydrochloride p. 326 reduce the symptoms of parkinsonism induced by antipsychotic drugs, but there is no justification for giving them routinely in the absence of parkinsonian side-effects. Tardive dyskinesia is not improved by antimuscarinic drugs and may be made worse.

In idiopathic Parkinson’s disease, antimuscarinic drugs reduce tremor and rigidity but they have little effect on bradykinesia. They may be useful in reducing sialorrhoea.

There are no important differences between the antimuscarinic drugs, but some patients tolerate one better than another.

Procyclidine hydrochloride can be given parenterally and is effective emergency treatment for acute drug-induced dystonic reactions.

If treatment with an antimuscarinic is ineffective, intravenous diazepam p. 267 can be given for life-threatening acute drug-induced dystonic reactions.

**Drugs used in essential tremor, chorea, tics, and related disorders**

Tetrahydrobenzidine p. 321 is mainly used to control movement disorders in Huntington’s chorea and related disorders. Tetrahydrobenzidine can also be prescribed for the treatment of tardive dyskinesia if switching or withdrawing the causative antipsychotic drug is not effective. It acts by depleting nerve endings of dopamine. It is effective in only a proportion of patients and its use may be limited by the development of depression.

Haloperidol p. 306 [unlicensed indication], olanzapine p. 315 [unlicensed indication], risperidone p. 319 [unlicensed indication], and quetiapine p. 318 [unlicensed indication] can also be used to suppress chorea in Huntington’s disease.

Haloperidol can also improve motor tics and symptoms of Tourette syndrome and related choreas. Other treatments for Tourette syndrome include pimozide p. 308 [unlicensed indication] (important: ECG monitoring required), clonidine hydrochloride p. 137 [unlicensed indication], and sulpiride p. 310 [unlicensed indication]. Trihexyphenidyl hydrochloride p. 326 in high dosage can also improve some movement disorders; it is sometimes necessary to build the dose up over many weeks. Chlorpromazine hydrochloride p. 304 and haloperidol p. 306 are used to relieve intractable hiccup.

Propranolol hydrochloride p. 146 or another beta-adrenoceptor blocking drug may be useful in treating essential tremor or tremors associated with anxiety or thyrotoxicosis.

Primaldine p. 401 in some cases provides relief from benign essential tremor; the dose is increased slowly to reduce side-effects.

Piracetam p. 321 is used as an adjunctive treatment for myoclonus of cortical myoclonus of cortical origin. After an acute episode, attempts should be made every 6 months to decrease or discontinue treatment.

Riluzole p. 322 is used to extend life in patients with motor neurone disease who have amyotrophic lateral sclerosis.

**Torsion dystonia and other involuntary movements**

Treatment with botulinum toxin type A p. 322 can be considered after an acquired non-progressive brain injury if rapid-onset spasticity causes postural or functional difficulties.

**ANTIMUSCARINICS**

**Orphenadrine hydrochloride**

- **Drug action** Orphenadrine exerts its antiparkinsonian action by reducing the effects of the relative central cholinergic excess that occurs as a result of dopamine deficiency.

**INDICATIONS AND DOSE**

**Parkinsonism** | Drug-induced extrapyramidal symptoms (but not tardive dyskinesia)

**By mouth**

- **Adult:** Initially 150 mg daily in divided doses, then increased in steps of 50 mg every 2–3 days, adjusted according to response; usual dose 150–300 mg daily in divided doses; maximum 400 mg per day
- **Elderly:** Preferably dose at lower end of range
**Procyclidine hydrochloride**

**INDICATIONS AND DOSE**

**Parkinsonism | Extrapyramidal symptoms (but not tardive dyskinesia)**

**BY MOUTH**

- Adult: 2.5 mg 3 times a day, then increased in steps of 2.5–5 mg daily if required; increased if necessary up to 30 mg daily in 2–4 divided doses, to be increased at 2–3 day intervals. Maximum daily dose only to be used in exceptional circumstances; maximum 60 mg per day.
- Elderly: Lower end of range preferable

---

**Acute dystonia**

**BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION**

- Adult: 5–10 mg, occasionally, more than 10 mg, dose usually effective in 5–10 minutes but may need 30 minutes for relief
- Elderly: Lower end of range preferable

---

**Trihexyphenidyl hydrochloride** *(Benzhexol hydrochloride)*

**INDICATIONS AND DOSE**

Parkinson’s disease (if used in combination with carbidopa or co-beneldopa)

- Adult: Maintenance 2–6 mg daily in divided doses, use not recommended because of toxicity in the elderly and the risk of aggravating dementia
Parkeinson's disease 327

**CATECHOL-O-METHYLMUTRANSFERASE INHIBITORS**

**Entacapone**

**DRUG ACTION** Entacapone prevents the peripheral breakdown of levodopa, by inhibiting catechol-O-methyltransferase, allowing more levodopa to reach the brain.

**INDICATIONS AND DOSE**

Adjunct to co-beneldopa or co-careldopa in Parkinson's disease with 'end-of-dose' motor fluctuations (under expert supervision)

**BY MOUTH**

- Adult: 200 mg, dose to be given with each dose of levodopa with dopa-decarboxylase inhibitor; maximum 2 g per day

**CONTRA-INDICATIONS** History of neuroleptic malignant syndrome, history of non-traumatic rhabdomyolysis, phaeochromocytoma

**CAUTIONS** Concurrent levodopa dose may need to be reduced by about 10–30% ischaemic heart disease

**INTERACTIONS** Appendix 1 (entacapone). Avoid iron-containing products at the same time of day.

**SIDE-EFFECTS**

- Common or very common Abdominal pain, abnormal dreams, confusion, constipation, diarrhea, dizziness, dry mouth, dyskinesia, dystonia, fatigue, hallucinations, insomnia, ischaemic heart disease, nausea, sweating, urinary incontinence, urinary retention, vomiting
- Uncommon Myocardial infarction, Rash
- Rare Agitation, anorexia, urticaria, weight loss
- Frequency not known Colitis, hepatitis, neuroleptic malignant syndrome, rhabdomyolysis, skin, hair, and nail discoloration

**PREGNANCY** Avoid—no information available.

**BREAST FEEDING** Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Avoid.

**TREATMENT CESSATION** Avoid abrupt withdrawal.

**PATIENT AND CARER ADVICE** Patient counselling is advised (may colour urine reddish-brown, concomitant iron containing products).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**Tablet**

- **ENTACAPONE (Non-proprietary)**
  - Entacapone 200 mg Entacapone 200mg tablets | 30 tablet [POM] £6.38 DT price = £6.12 | 100 tablet [POM] £5.45
  - Comtess (Orion Pharma (UK) Ltd) Entacapone 200 mg Comtess 200mg tablets | 30 tablet [POM] £17.24 DT price = £6.12 | 100 tablet [POM] £5.74

Also available in combination with carbidopa with entacapone and levodopa, p. 331

**Tolcapone**

**DRUG ACTION** Tolcapone prevents the peripheral breakdown of levodopa, by inhibiting catechol-O-methyltransferase, allowing more levodopa to reach the brain.

**INDICATIONS AND DOSE**

Adjunct to co-beneldopa or co-careldopa in Parkinson's disease with 'end-of-dose' motor fluctuations if another inhibitor of peripheral catechol-O-methyltransferase inappropriate (under expert supervision)

**BY MOUTH**

- Adult: 100 mg 3 times a day (max. per dose 200 mg 3 times a day) continuing beyond 3 weeks only if substantial improvement, leave 6 hours between each dose; first daily dose should be taken at the same time as levodopa with dopa-decarboxylase inhibitor, dose maximum only in exceptional circumstances
CONTRA-INDICATIONS Phaeochromocytoma - previous history of hyperthermia - previous history of neuroleptic malignant syndrome - previous history of rhabdomyolysis - severe dyskinesia

CAUTIONS Most patients receiving more than 600 mg levodopa daily require reduction of levodopa dose by about 30%

CAUTIONS, FURTHER INFORMATION Hepatotoxicity Potentially life-threatening hepatotoxicity including fulminant hepatitis reported rarely, usually in women and during the first 6 months, but late-onset liver injury also reported; discontinue if abnormal liver function tests or symptoms of liver disorder; do not reintroduce tolcapone once discontinued.

INTERACTIONS → Appendix 1 (tolcapone).

SIDE-EFFECTS
- Common or very common Abdominal pain - anorexia - chest pain - confusion - constipation - diarrhoea - dizziness - drowsiness - dyskinesia - dyspepsia - dystonia - excessive dreaming - hallucinations - headache - hepatotoxicity - nausea - sleep disturbances - sweating - syncpe - urine discoloration - vomiting - xerostomia
- Frequency not known Neuroleptic malignant syndrome reported on dose reduction or withdrawal - rhabdomyolysis reported on dose reduction or withdrawal

PREGNANCY Toxicity in animal studies—use only if potential benefit outweighs risk.

BREAST FEEDING Avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT Avoid.

RENAL IMPAIRMENT Caution if eGFR less than 30 mL/minute/1.73 m².

MONITORING REQUIREMENTS Test liver function before treatment, and monitor every 2 weeks for first year, every 4 weeks for next 6 months and then every 8 weeks thereafter (restart monitoring schedule if dose increased).

TREATMENT CESSION Avoid abrupt withdrawal.

PATIENT AND CARER ADVICE Patients should be told how to recognise signs of liver disorder and advised to seek immediate medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, dark urine, or pruritus develop.

MEDICINAL FORMS

TREATMENT CESSATION

1. BY MOUTH USING MODIFIED-RELEASE MEDICINES
   - Adult: Initially 1 capsule 3 times a day; maximum 6 capsules per day

PARKINSON’S DISEASE (PATIENTS TRANSFERRING FROM IMMEDIATE-RELEASE LEVODOPA/DOPA-DECARBOXYLASE INHIBITOR PREPARATIONS)

BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: Initially 1 capsule substituted for every 100 mg of levodopa and given at same dosage frequency, increased every 2–3 days according to response; average increase 50% needed over previous levodopa dose and titration may take up to 4 weeks, supplementary dose of immediate-release Madopar® may be needed with first morning dose; if response still poor to total daily dose of Madopar® CR plus Madopar® corresponding to 1.2 g levodopa—consider alternative therapy.

Dose equivalence and conversion
Dose is expressed as levodopa.

IMPULSIVE CONTROL DISORDERS
Treatment with levodopa is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. If the patient develops an impulse control disorder, levodopa should be withdrawn or the dose reduced until the symptoms resolve.

CAUTIONS
- Cushing’s syndrome - diabetes mellitus - endocrine disorders - history of convulsions - history of myocardial infarction with residual arrhythmia - history of peptic ulcer - hyperthyroidism - osteomalacia - phaeochromocytoma - psychiatric illness (avoid if severe and discontinue if deterioration) - severe cardiovascular disease - severe pulmonary disease - susceptibility to angle-closure glaucoma

INTERACTIONS → Appendix 1 (co-beneldopa, levodopa).

SIDE-EFFECTS
- Common or very common Abnormal dreams - anorexia - anxiety - arrhythmias - chorea - confusion - depression - dizziness - drowsiness - dry mouth - dyskinesia - dystonia - euphoria - fatigue - insomnia - nausea - palpitations - postural hypotension - psychosis - syncpe - taste disturbances - vomiting
- Uncommon Ataxia - chest pain - constipation - diaphoresis - dysphagia - flatulence - hand tremor - hoarseness - hypersalivation - hypertension - malaise - muscle cramps - oedema - reddish discoloration of the urine and other body fluids - weakness - weight changes
- Very rare Angle-closure glaucoma - suicidal ideation
- Frequency not known Compulsive behaviour

Important safety information

Co-beneldopa

INDICATIONS AND DOSE

PARKINSON’S DISEASE

INITIALLY BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 50 mg 3–4 times a day, then (by mouth) increased in steps of 100 mg daily, dose to be increased once or twice weekly according to response; maintenance 400–800 mg daily in divided doses

PARKINSON’S DISEASE (IN ADVANCED DISEASE)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 100 mg 3 times a day, then increased in steps of 100 mg daily, dose to be increased once or twice weekly according to response; maintenance 400–800 mg daily in divided doses

Important safety information

IMPULSIVE CONTROL DISORDERS
Treatment with levodopa is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. If the patient develops an impulse control disorder, levodopa should be withdrawn or the dose reduced until the symptoms resolve.

CAUTIONS
- Cushing’s syndrome - diabetes mellitus - endocrine disorders - history of convulsions - history of myocardial infarction with residual arrhythmia - history of peptic ulcer - hyperthyroidism - osteomalacia - phaeochromocytoma - psychiatric illness (avoid if severe and discontinue if deterioration) - severe cardiovascular disease - severe pulmonary disease - susceptibility to angle-closure glaucoma

INTERACTIONS → Appendix 1 (co-beneldopa, levodopa).

SIDE-EFFECTS
- Common or very common Abnormal dreams - anorexia - anxiety - arrhythmias - chorea - confusion - depression - dizziness - drowsiness - dry mouth - dyskinesia - dystonia - euphoria - fatigue - insomnia - nausea - palpitations - postural hypotension - psychosis - syncpe - taste disturbances - vomiting
- Uncommon Ataxia - chest pain - constipation - diaphoresis - dysphagia - flatulence - hand tremor - hoarseness - hypersalivation - hypertension - malaise - muscle cramps - oedema - reddish discoloration of the urine and other body fluids - weakness - weight changes
- Very rare Angle-closure glaucoma - suicidal ideation
- Frequency not known Compulsive behaviour

Important safety information

IMPULSIVE CONTROL DISORDERS
Treatment with levodopa is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. Benserazide (as Benserazide hydrochloride) 25 mg, Levodopa 100 mg

Madopar 100mg/25mg capsules | 100 capsule £6.91
DT price = £6.91

Benserazide (as Benserazide hydrochloride) 50 mg, Levodopa 200 mg
Madopar 200mg/50mg capsules | 100 capsule £11.78
DT price = £11.78

Co-careldopa

INDICATIONS AND DOSE
Parkinson’s disease
BY MOUTH
Adult: Initially 25/100 mg 3 times a day, then increased in steps of 12.5/50 mg once daily or on alternate days, adjusted according to response, alternatively increased in steps of 25/100 mg once daily or on alternate days, adjusted according to response; dose increased until 800 mg levodopa (with 200 mg carbidopa) daily in divided doses is reached, then maintenance up to 200/2000 mg daily in divided doses, adjusted according to response, when co-careldopa is used, the total daily dose of carbidopa should be at least 70 mg. A lower dose may not achieve full inhibition of extracerebral dopa-decarboxylase, with a resultant increase in side-effects.

Parkinson’s disease—alternative regimen
BY MOUTH
Adult: Initially 12.5/50 mg 3–4 times a day, alternatively initially 10/100 mg 3–4 times a day, then increased in steps of 12.5/50 mg once daily or on alternate days, adjusted according to response, alternatively increased in steps of 10/100 mg once daily or on alternate days, adjusted according to response; dose increased until 500 mg levodopa (with up to 200 mg carbidopa) daily in divided doses is reached, then maintenance up to 200/2000 mg daily in divided doses, adjusted according to response, when co-careldopa is used, the total daily dose of carbidopa should be at least 70 mg. A lower dose may not achieve full inhibition of extracerebral dopa-decarboxylase, with a resultant increase in side-effects.

Dose equivalence and conversion
The proportions are expressed in the form x/y where x and y are the strengths in milligrams of carbidopa and levodopa respectively.

CARAMET® CR
Parkinson’s disease (patients not receiving levodopa/dopa-decarboxylase inhibitor preparations, expressed as levodopa)

BY MOUTH USING MODIFIED-RELEASE TABLETS
Adult: Initially 100–200 mg twice daily, dose to be given at least 6 hours apart; dose adjusted according to response at intervals of at least 2 days

Parkinson’s disease (patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations)

BY MOUTH USING MODIFIED-RELEASE TABLETS
Adult: Discontinue previous preparation at least 12 hours before first dose of Caramet® CR; substitute Caramet® CR to provide a similar amount of levodopa daily and extend dosing interval by 30–50%; dose then adjusted according to response at intervals of at least 2 days. continued

Benserazide (as Benserazide hydrochloride) 12.5 mg, Levodopa 50 mg

Benserazide (as Benserazide hydrochloride) 25 mg, Levodopa 100 mg
Madopar CR capsules | 100 capsule £12.77 DT price = £12.77

Nervous system

PATIENT AND CARER ADVICE
Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with co-beneldopa. Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour. Patients or carers should be given advice on how to administer co-beneldopa dispersible tablets.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution and dispersible tablet.

Dispersible tablet
CAUTIONARY AND ADVISORY LABELS 10, 14, 21

Madopar 50mg/12.5mg capsules | 100 capsule £4.96 DT price = £4.96

Co-careldopa
**SINEMET® CR**

Parkinson's disease (patients not receiving levodopa/dopa-decarboxylase inhibitor therapy)

**BY MOUTH**
- **Adult:** Initially 1 tablet twice daily, both dose and interval then adjusted according to response at intervals of not less than 3 days

Parkinson's disease (patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations)

**BY MOUTH**
- **Adult:** 1 tablet twice daily, dose can be substituted for a daily dose of levodopa 300–400 mg in immediate-release Sinemet® tablets (substitute Sinemet® CR to provide approximately 10% more levodopa per day and extend dosing interval by 30–50%); dose and interval then adjusted according to response at intervals of not less than 3 days.

**HALF SINEMET® CR**

Parkinson's disease (for fine adjustment of Sinemet® CR dose)

**BY MOUTH**
- **Adult:** (consult product literature)

**DUPODA®**

Severe Parkinson's disease inadequately controlled by other preparations

- **Adult:** Administered as intestinal gel, for use with enteral tube (consult product literature)

---

**Important safety information**

**IMPULSE CONTROL DISORDERS**

Treatment with levodopa is associated with impulse control disorders. If the patient develops an impulse control disorder, levodopa should be withdrawn or the dose reduced until the symptoms resolve.

- **CAUTIONS** Cushing's syndrome · diabetes mellitus · endocrine disorders · history of convulsions · history of myocardial infarction with residual arrhythmia · history of peptic ulcer · hyperthyroidism · osteomalacia · phaeochromocytoma · psychiatric illness (avoid if severe and discontinue if deterioration) · severe cardiovascular disease · severe pulmonary disease · susceptibility to angle-closure glaucoma

- **INTERACTIONS** → Appendix 1 (co-careldopa, levodopa).

- **SIDE-EFFECTS**
  
  - **Common or very common** Abnormal dreams · anorexia · anxiety · arthralgia · chorea · confusion · dementia · depression · dizziness · drowsiness · dry mouth · dyskinesia · dystonia · euphoria · fatigue · insomnia · nausea · palpitations · postural hypotension · psychosis · syncope · taste disturbances · vomiting
  
  - **Uncommon** Ataxia · chest pain · constipation · diarrhoea · dysphagia · flatulence · hand tremor · hoarseness · hypersalivation · hypertension · malaise · muscle cramps · oedema · reddish discoloration of the urine and other body fluids · weakness · weight changes
  
  - **Rare** Abdominal pain · activation of Horner's syndrome · activation of malignant melanoma · agitation · agranulocytosis · alopecia · blepharospasm · blurred vision · bruxism · convulsions · diplopia · disorientation · duodenal ulcer · dyspepsia · dyspnoea · exanthema · flushing · gastro-intestinal bleeding · haemolytic anaemia · headache · Henoch-Schönlein purpura · hiccups · leucopenia · neurological malignant syndrome (associated with abrupt withdrawal) · non-haemolytic anaemia · ocular crisis · paraesthesia · phlebitis · priapism · pupil dilatation · reduced mental acuity · sweating · thrombocytopenia · trismus · urinary incontinence · urinary retention
  
  - **Very rare** Angle-closure glaucoma · suicidal ideation
  
  - **Frequency not known** Compulsive behaviour
  
  - **PREGNANCY** Use with caution—toxicity has occurred in animal studies.
  
  - **BREAST FEEDING** May suppress lactation; present in milk—avoid
  
  - **HEPATIC IMPAIRMENT** Use with caution.
  
  - **RENAL IMPAIRMENT** Use with caution.
  
  - **EFFECT ON LABORATORY TESTS** False positive tests for urinary ketones have been reported.

- **TREATMENT CESSATION** Avoid abrupt withdrawal (risk of neuroleptic malignant syndrome and rhabdomyolysis).

- **PREscribing and dispensing information** Co-careldopa is a mixture of carbidopa and levodopa; the proportions are expressed in the form x/y where x and y are the strengths in milligrams of carbidopa and levodopa respectively. When transferring patients from another levodopa/dopa-decarboxylase inhibitor preparation, the previous preparation should be discontinued at least 12 hours before.

  Co-careldopa 25/100 provides an adequate dose of carbidopa when low doses of levodopa are needed. 2 tablets Sinemet® 12.5 mg/50 mg → 1 tablet Sinemet® Plus 25 mg/100 mg.

Carbidopa with entacapone and levodopa

The properties listed below are those particular to the combination only. For the properties of the components please consider, entacapone p. 327, co-careldopa p. 329.

**INDICATIONS AND DOSE**

**STALEVO® 75/18.75/200**
Parkinson’s disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

**BY MOUTH**

- Adult: 1 tablet for each dose; maximum 10 tablets per day

**STALEVO® 50/12.5/200**
Parkinson’s disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

**BY MOUTH**

- Adult: 1 tablet for each dose; maximum 10 tablets per day

**STALEVO® 150/37.5/200**
Parkinson’s disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

**BY MOUTH**

- Adult: 1 tablet for each dose; maximum 10 tablets per day

**STALEVO® 200/50/200**
Parkinson’s disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

**BY MOUTH**

- Adult: 1 tablet for each dose; maximum 7 tablets per day

**STALEVO® 125/31.25/200**
Parkinson’s disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

**BY MOUTH**

- Adult: 1 tablet for each dose; maximum 10 tablets per day

**STALEVO® 175/43.75/200**
Parkinson’s disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

**BY MOUTH**

- Adult: 1 tablet for each dose; maximum 8 tablets per day

**STALEVO® 100/25/200**
Parkinson’s disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

**BY MOUTH**

- Adult: 1 tablet for each dose; maximum 10 tablets per day

**PRESCRIBING AND DISPENSING INFORMATION**

Patients receiving standard-release co-careldopa or co-beneldopa alone, initiate Stalevo® at a dose that provides similar (or slightly lower) amount of levodopa. Patients with dyskinesia or receiving more than 800 mg levodopa daily, introduce entacapone before transferring to Stalevo® (levodopa dose may need to be reduced by 10–30% initially). Patients receiving entacapone and standard-release co-careldopa or co-beneldopa, initiate Stalevo® at a dose that provides similar (or slightly higher) amount of levodopa.

**PATIENT AND CARER ADVICE**

**Sudden onset of sleep**
Excessive daytime sleepiness and sudden onset of sleep can occur with Stalevo®.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

  - Tablet for each dose; maximum 100 tablets per day

**DOPAMINE RECEPTOR AGONISTS**

**Amantadine hydrochloride**

**DRUG ACTION**
Amantadine is a weak dopamine agonist with modest antiparkinsonian effects.
 Oral solution
- AMANTADINE HYDROCHLORIDE (Non-proprietary)
  Amantadine hydrochloride 10 mg per 1 ml
  Oral solution sugar free (sugar-free) 150 ml
  Pod: £89.30–£117.20
  DT price = £101.25

Apomorphine hydrochloride

INDICATIONS AND DOSE
Refractory motor fluctuations in Parkinson’s disease (‘off’ episodes) inadequately controlled by co-beneldopa or co-carbidopa or other dopaminergics (in patients requiring division into more than 10 injections daily) (under expert supervision)

BY CONTINUOUS SUBCUTANEOUS INFUSION
- Adult: Initially 1 mg/hour, adjusted according to response, then increased in steps of up to 500 micrograms/hour, dose to be increased at intervals not more often than every 4 hours; usual dose 1–4 mg/hour, alternatively usual dose 15–60 micrograms/kg/hour, change infusion site every 12 hours and give during waking hours only (tolerance may occur unless there is a 4-hour treatment-free period at night—24-hour infusions not recommended unless severe night time symptoms); intermittent bolus doses may be needed; maximum 100 mg per day

Important safety information
IMPULSE CONTROL DISORDERS
Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist or levodopa should be withdrawn or the dose reduced until the symptoms resolve.

CONTRA-INDICATIONS
Avoid if ‘on’ response to levodopa marred by severe dyskinesia or dystonia • dementia • psychosis • respiratory depression

CAUTIONS
Cardiovascular disease • history of postural hypotension (special care on initiation) • neuropsychiatric conditions • pulmonary disease • susceptibility to QT-interval prolongation

INTERACTIONS
- Appendix 1 (apomorphine).

SIDE-EFFECTS
- Common or very common Confusion • drowsiness • hallucinations • nausea • sudden onset of sleep • vomiting • yawning
Solution for infusion

CAUTIONARY AND ADVISORY LABELS 10

EXCIPIENTS: May contain Sulphites

APO-go PF5 (Britannia Pharmaceuticals Ltd)

Apomorphine hydrochloride 5 mg per 1 ml
APO-go PF5
50mg/10ml solution for infusion pre-filled syringes | 5 pre-filled disposable injection £73.11

Bromocriptine

• DRUG ACTION Bromocriptine is a stimulant of dopamine receptors in the brain; it also inhibits release of prolactin by the pituitary.

INDICATIONS AND DOSE

Prevention of lactation
BY MOUTH
• Adult: Initially 2.5 mg daily for 1 day, then 2.5 mg twice daily for 14 days

Suppression of lactation
BY MOUTH
• Adult: Initially 2.5 mg daily for 2–3 days, then 2.5 mg twice daily for 14 days

Hypogonadism | Galactorrhoea | Infertility
BY MOUTH
• Adult: Initially 1–1.25 mg daily, dose to be taken at bedtime, increase dose gradually; usual dose 7.5 mg daily in divided doses, increased if necessary up to 30 mg daily, usual dose in infertility without hyperprolactinaemia is 2.5 mg twice daily

Acromegaly
BY MOUTH
• Adult: Initially 1–1.25 mg daily, dose to be taken at bedtime, then increased to 5 mg every 6 hours, increase dose gradually

Prolactinoma
BY MOUTH
• Adult: Initially 1–1.25 mg daily, dose to be taken at bedtime, then increased to 5 mg every 6 hours, increase dose gradually. Occasionally patients may require up to 30 mg daily

Parkinson's disease
BY MOUTH
• Adult: Initially 1–1.25 mg daily for 1 week, dose to be taken at night, then 2–2.5 mg daily for 1 week, dose to be taken at night, then 2.5 mg twice daily for 1 week, then 2.5 mg 3 times a day for 1 week, then increased in steps of 2.5 mg every 3–14 days, adjusted according to response; maintenance 10–30 mg daily

Important safety information

FIBROTIC REACTIONS
Bromocriptine has been associated with pulmonary, retropertitoneal, and pericardial fibrotic reactions. Exclude cardiac valvulopathy with echocardiography before starting treatment with these ergot derivatives for Parkinson's disease or chronic endocrine disorders (excludes suppression of lactation); it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful.

IMPULSE CONTROL DISORDERS
Treatment with dopamine-receptor agonists are associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders.
There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

- **CONTRA-INDICATIONS** Avoid in pre-eclampsia, cardiac valvulopathy (exclude before treatment), hypertension in postpartum women, or in puерperium.

**CONTRA-INDICATIONS, FURTHER INFORMATION**

Postpartum or puërperium: Should not be used postpartum or in puërperium in women with high blood pressure, coronary artery disease, or symptoms (or history) of serious mental disorder; monitor blood pressure carefully (especially during first few days) in postpartum women. Very rarely hypertension, myocardial infarction, seizures or stroke (both sometimes preceded by severe headache or visual disturbances), and mental disorders have been reported in postpartum women given bromocriptine for lactation suppression—caution with antihypertensive therapy and avoid other ergot alkaloids. Discontinue immediately if hypertension, unrelenting headache, or oedema.

- **CAUTIONS** Acute porphyrias p. 864; cardiovascular disease; history of peptic ulcer (particularly in acromegalic patients); history of serious mental disorders (especially psychotic disorders) - Raynaud’s syndrome.

**CAUTIONS, FURTHER INFORMATION**

Hyperprolactinemic patients: In hyperprolactinaemic patients, the source of the hyperprolactinaemia should be established (i.e. exclude pituitary tumour before treatment).

- **INTERACTIONS** Appendix 1 (bromocriptine).

Tolerance may be reduced by alcohol.

- **SIDE-EFFECTS**
  - Common or very common: Constipation, headache, nasal congestion, nausea.
  - Uncommon: Confusion (particularly with high doses), dizziness, dry mouth, fatigue, hallucinations (particularly with high doses), postural hypotension, psychomotor excitation (particularly with high doses), vomiting.
  - Rare: Abdominal pain, arrhythmia, bradycardia, diarrhoea, gastric ulcer, gastrointestinal bleeding, insomnia, paraesthesia, psychosis, tachycardia, tinnitus, visual disturbances.
  - Very rare: Neuroleptic malignant syndrome on withdrawal, vasospasm of fingers and toes (particularly in patients with Raynaud’s syndrome).

- **Frequency not known**
  - Allergic skin reactions, alopecia, cardiomyopathy, constriuctive pericarditis, drowsiness, dyskinesia, dyspnoea, hypotension, increased libido, leg cramps, leucopenia, pathological gambling, pericardial effusion, peripheral oedema, pleural effusion, pleural fibrosis, pleuritis, pulmonary fibrosis, retroperitoneal fibrosis, reversible hearing loss, thrombocytopenia, urinary incontinence.

- **SIDE-EFFECTS, FURTHER INFORMATION**

**Gastro-intestinal bleeding** Treatment should be withdrawn if gastro-intestinal bleeding occurs.

- **ALLERGY AND CROSS-SENSITIVITY** Bromocriptine should not be used in patients with hypersensitivity to ergot alkaloids.

- **CONCEPTION AND CONTRACEPTION** Caution—provide contraceptive advice if appropriate (oral contraceptives may increase prolactin concentration).

- **BREAST FEEDING** Suppresses lactation; avoid breast feeding for about 5 days if lactation prevention fails.

- **HEPATIC IMPAIRMENT** Dose reduction may be necessary.

- **MONITORING REQUIREMENTS**
  - Specialist evaluation—monitor for pituitary enlargement, particularly during pregnancy; monitor visual field to detect secondary field loss in macroprolactinoma.
  - Monitor for fibrotic disease.
  - Monitor blood pressure for a few days after starting treatment and following dosage increase.

- **TREATMENT CESSATION** Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

- **PATIENT AND CARER ADVICE**

**Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

**Hypotensive reactions** Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension.

**Tablet**

**Cabergoline**

- **DRUG ACTION** Cabergoline is a stimulant of dopamine receptors in the brain and it also inhibits release of prolactin by the pituitary.

**INDICATIONS AND DOSE**

**Prevention of lactation**

- Adult: 1 mg, to be taken as a single dose on the first day postpartum.

**Suppression of established lactation**

- Adult: 250 micrograms every 12 hours for 2 days.

**Hyperprolactinaemic disorders**

- Adult: Initially 500 micrograms once weekly, dose may be taken as a single dose or as 2 divided doses on
Cabergoline has been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions. Exclude cardiac valvulopathy with echocardiography before starting treatment with these ergot derivatives for Parkinson’s disease or chronic endocrine disorders (excludes suppression of lactation); it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful. Patients taking cabergoline should be regularly monitored for cardiac fibrosis by echocardiography (within 3–6 months of initiating treatment and subsequently at 6–12 month intervals).

**IMPALE CONTROL DISORDERS**

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

**CONTRA-INDICATIONS**

Avoid in pre-eclampsia - cardiac valvulopathy (excludes before treatment) - history of periarterial fibrotic disorders - history of puerperal disease - history of serious mental disorders - operating machinery.

**INTERACTIONS**

Appendix 1 (cabergoline). Tolerance may be reduced by alcohol.

**SIDE-EFFECTS**

Abdominal pain - angina - breast pain - confusion - constipation - depression - dyspepsia - epigastric pain - gastritis - hallucinations - headache - nausea - syncope

**Caution**

- Digital vasospasm.
- Epistaxis.
- Hot flushes.
- Muscle weakness.
- Palpitation.
- Paraesthesia.
- Transient hemianopia.
- Vomiting.

**Frequency not known**

- Allergic skin reactions.
- Alopecia.
- Angioedema.
- Cardiac valvulopathy.
- Constrictive pericarditis.
- Drowsiness.
- Dyskinesia.
- Erythromelalgia.
- Hypersexuality.
- Hypertension.
- Increased libido.
- Leg cramps.
- Pathological gambling.
- Pericardial effusion.
- Peripheral oedema.
- Pleural effusion.
- Pleural fibrosis.
- Pleuritis.
- Pulmonary fibrosis.
- Retropertitoneal fibrosis.

**Gastro-intestinal bleeding**

Treatment should be withdrawn if gastro-intestinal bleeding occurs.

**ALLERGY AND CROSS-SENSITIVITY**

Cabergoline should not be used in patients with hypersensitivity to ergot alkaloids.

**CONCEPTION AND CONTRACEPTION**

Exclude pregnancy before starting and perform monthly pregnancy tests during the amenorrhoeic period. Caution—advise non-hormonal contraception if pregnancy not desired. Discontinue 1 month before intended conception (ovulatory cycles persist for 6 months).

**PREGNANCY**

Discontinue if pregnancy occurs during treatment (specialist advice needed).

**BREAST FEEDING**

Suppresses lactation; avoid breast-feeding if lactation prevention fails.

**HEPATIC IMPAIRMENT**

Reduce dose in severe hepatic impairment.

**MONITORING REQUIREMENTS**

- Monitor for fibrotic disease.
- Monitor blood pressure for a few days after starting treatment and following dosage increase.

**TREATMENT CESSATION**

Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

**PRESCRIBING AND DISPENSING INFORMATION**

Dispense in original container (contains desiccant).

**PATIENT AND CARER ADVICE**

Sudden onset of sleep

Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists. Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring. Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

**Hypotensive reactions**

Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

Pergolide

INDICATIONS AND DOSE
Monotherapy in Parkinson’s disease where dopamine-receptor agonists other than ergot derivative not appropriate
BY MOUTH
Adult: Initially 50 micrograms once daily for day 1, dose to be taken at bedtime, then 50 micrograms twice daily for days 2–4, then increased in steps of 100–250 micrograms daily, dose to be increased at intervals of 3–4 days, increased to 1.5 mg daily in 3 divided doses at day 28, then increased in steps of up to 250 micrograms every 3–4 days, this increase to be started after day 30; maintenance 2.1–2.5 mg daily; maximum 3 mg per day

Adjunctive therapy with co-beneldopa or co-careldopa in Parkinson’s disease where dopamine-receptor agonists other than ergot derivative not appropriate
BY MOUTH
Adult: Initially 50 micrograms daily for 2 days, then increased in steps of 100–150 micrograms every 3 days, dose to be adjusted over next 12 days following initial dose and usually given in 3 divided doses, then increased in steps of 250 micrograms every 3 days, during pergolide titration, levodopa dose may be reduced cautiously; maximum 3 mg per day

Important safety information
FIBROTIC REACTIONS
Pergolide has been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions. Exclude cardiac valvulopathy with echocardiography before starting treatment with pergolide; it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful. Patients taking pergolide should be regularly monitored for cardiac fibrosis by echocardiography (within 3–6 months of initiating treatment and subsequently at 6–12 month intervals).

UNCONTROLLED HYPERPLASIA
Treatment with dopamine-receptor agonists is associated with uncontrolled hyperplasia, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of uncontrolled hyperplasia. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause uncontrolled hyperplasia, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an uncontrolled hyperplasia, the dopamine-receptor agonist or levodopa should be withdrawn or the dose reduced until the symptoms resolve.

CONTRA-INDICATIONS
Cardiac valvulopathy (exclude before treatment) - history of fibrotic disorders

★ CAUTIONS
Acute porphyrias p. 864 - arrhythmias - dyskinesia (may exacerbate) - hallucinations - history of confusion - psychosis - underlying cardiac disease

★ INTERACTIONS
→ Appendix 1 (pergolide).

★ SIDE-EFFECTS

★ PREGNANCY
Use only if potential benefit outweighs risk.

★ BREAST FEEDING
May suppress lactation.

★ TREATMENT CESSATION
Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

★ PATIENT AND CARER ADVICE
Sudden onset of sleep
Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists. Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions
Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

Pramipexole

INDICATIONS AND DOSE
Parkinson’s disease, used alone or as an adjunct to co-beneldopa or co-careldopa
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
Adult: Initially 88 micrograms 3 times a day, increased if tolerated to 350 micrograms 3 times a day, dose to be increased by doubling dose every 5–7 days, then increased in steps of 180 micrograms 3 times a day if required, dose to be increased at weekly intervals, during dose titration and maintenance, levodopa dose may be reduced, maximum daily dose to be given in 3 divided doses; maximum 3.3 mg per day

BY MOUTH USING MODIFIED-RELEASE MEDICINES
Adult: Initially 260 micrograms once daily, increased to 1.05 mg once daily, dose to be increased by doubling dose every 5–7 days, then increased in steps of 520 micrograms every 1 week if required, during dose titration and maintenance, levodopa dose may be reduced according to response; maximum 3.15 mg per day
Restless legs syndrome

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 88 micrograms once daily, dose to be taken 2–3 hours before bedtime, dose to be increased by doubling dose every 4–7 days, repeat dose titration if restarting treatment after an interval of more than a few days; maximum 540 micrograms per day

Dose equivalence and conversion

Doses and strengths are stated in terms of pramipexole (base).

Equivalent strengths of pramipexole (base) in terms of pramipexole dihydrochloride monohydrate (salt) for immediate-release preparations are as follows:

- 88 micrograms base = 125 micrograms salt;
- 180 micrograms base = 250 micrograms salt;
- 350 micrograms base = 500 micrograms salt;
- 700 micrograms base = 1 mg salt.

Equivalent strengths of pramipexole (base) in terms of pramipexole dihydrochloride monohydrate (salt) for modified-release preparations are as follows:

- 260 micrograms base = 375 micrograms salt;
- 520 micrograms base = 750 micrograms salt;
- 1.05 mg base = 1.5 mg salt;
- 1.57 mg base = 2.25 mg salt;
- 2.1 mg base = 3 mg salt;
- 2.62 mg base = 3.75 mg salt;
- 3.15 mg base = 4.5 mg salt.

Important safety information

IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

- CAUTIONS Psychotic disorders • risk of visual disorders (ophthalmological testing recommended) • severe cardiovascular disease
- INTERACTIONS Appendix 1 (pramipexole).
- SIDE-EFFECTS
  - Common or very common Confusion • constipation • decreased appetite • dizziness • drowsiness • dyskinesia • hallucinations • headache • hyperkinesia • hypotension • nausea • peripheral oedema • postural hypotension • restlessness • sleep disturbances • sudden onset of sleep • visual disturbances • vomiting • weight changes
  - Uncommon Anorexia • binge eating • cardiac failure • compulsive behaviour • delusion • dysphoria • hiccup • paranoia • pneumonia • pruritus • rash • syncope
  - Frequency not known Paradoxical worsening of restless legs syndrome
- PREGNANCY Use only if potential benefit outweighs risk—no information available.
- BREAST FEEDING May suppress lactation; avoid—present in milk in animal studies.
- RENAL IMPAIRMENT For immediate-release tablets in Parkinson’s disease, initially 88 micrograms twice daily (max. 1.57 mg daily in 2 divided doses) if eGFR 20–50 mL/minute/1.73 m²; initially 88 micrograms once daily (max. 1.1 mg once daily) if eGFR less than 20 mL/minute/1.73 m². If renal function declines during treatment, reduce dose by the same percentage as the decline in eGFR. For immediate-release tablets, reduce dose if eGFR less than 20 mL/minute/1.73 m². For modified-release tablets, initially 260 micrograms on alternate days if eGFR 30–50 mL/minute/1.73 m², increased to 250 micrograms once daily after 1 week, further increased if necessary by 260 micrograms daily at weekly intervals to max. 1.57 mg daily. For modified-release tablets, avoid if eGFR less than 30 mL/minute/1.73 m².

MONITORING REQUIREMENTS Risk of postural hypotension (especially on initiation)—monitor blood pressure.

TREATMENT CESSATION Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

PATIENT AND CARER ADVICE

- Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists. Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

- Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

in patients over 75 years, when administered as adjunct to levodopa, concurrent dose of levodopa may gradually be reduced by approx. 30%, if treatment interrupted for 1 day or more, consider re-initiation with immediate-release tablets

Moderate to severe restless legs syndrome
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 250 micrograms once daily for 2 days, increased if tolerated to 500 micrograms once daily for 5 days, then increased if tolerated to 1 mg once daily for 7 days, then increased in steps of 500 micrograms daily, adjusted according to response, dose to be increased at weekly intervals; usual dose 2 mg once daily, doses to be taken at night, repeat dose titration if restarting after interval of more than a few days; maximum 4 mg per day

Dose adjustments due to interactions
Dose adjustment may be necessary if smoking started or stopped during treatment.

UNLICENSED USE Doses in the BNF may differ from those in product literature.

Important safety information
IMPULSE CONTROL DISORDERS
Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

CAUTIONS Elderly - major psychiatric disorders - severe cardiovascular disease (risk of hypotension—monitor blood pressure)

INTERACTIONS Appendix 1 (ropinirole).

SIDE-EFFECTS
- Common or very common Abdominal pain, confusion, constipation, dizziness, drowsiness, dyskinesia, dyspepsia, fatigue, gastro-esophageal reflux disease, hallucinations, hypotension, nausea, nervousness, peripheral oedema, sudden onset of sleep - syncope - vomiting
- Uncommon Compulsive behaviour - psychosis
- Very rare Hepatic disorders
- Frequency not known Paradoxical worsening of restless legs syndrome

PREGNANCY Avoid unless potential benefit outweighs risk—toxicity in animal studies.

BREAST FEEDING May suppress lactation—avoid.

HEPATIC IMPAIRMENT Avoid—no information available.

RENAL IMPAIRMENT Avoid if eGFR less than 30 mL/minute/1.73 m².

TREATMENT CESSATION Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

PATIENT AND CARER ADVICE

Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists. Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep...
sleep should refrain from driving or operating machines until these effects have stopped occurring. Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

- NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (June 2006) that Ropinirole should be restricted for use in patients with a baseline score of 24 points or more on the International Restless Legs Scale.

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, powder Tableta

Tablet

Rotigotine

INDICATIONS AND DOSE

Monotherapy in Parkinson’s disease

BY TRANSDERMAL APPLICATION USING PATCHES

- Adult: Initially 2 mg/24 hours, then increased in steps of 2 mg/24 hours every 1 week if required; maximum 8 mg/24 hours per day

Adjunctive therapy with co-beneldopa or co-careldopa in Parkinson’s disease

BY TRANSDERMAL APPLICATION USING PATCHES

- Adult: Initially 4 mg/24 hours, then increased in steps of 2 mg/24 hours every 1 week if required; maximum 16 mg/24 hours per day

Moderate to severe restless legs syndrome

BY TRANSDERMAL APPLICATION USING PATCHES

- Adult: Initially 1 mg/24 hours, then increased in steps of 1 mg/24 hours every 1 week if required; maximum 3 mg/24 hours per day

Important safety information

IMPULSE CONTROL DISORDERS

Treatment with dopamine-receptor agonists is associated with impulse control disorders, including pathological gambling, binge eating, and hypersexuality. Patients and their carers should be informed about the risk of impulse control disorders. There is no evidence that ergot- and non-ergot-derived dopamine-receptor agonists differ in their propensity to cause impulse control disorders, so switching between dopamine-receptor agonists to control these side-effects is not recommended. If the patient develops an impulse control disorder, the dopamine-receptor agonist should be withdrawn or the dose reduced until the symptoms resolve.

- CAUTIONS Avoid exposure of patch to heat - remove patch (aluminium-containing) before magnetic resonance imaging or cardioversion

- INTERACTIONS Appendix 1 (rotigotine).

SIDE-EFFECTS

- Common or very common Abnormal behaviour - abnormal thinking - aggression - application site reactions - confusion - constipation - dizziness - drowsiness - dry mouth - dyskinesia - dyspepsia - hallucinations - headache - hiccups - hypertension - malaise - nausea - palpitations - paranoia - peripheral oedema - postural hypotension - pruritus - psychosis - rash - sleep disturbances - sudden onset of sleep - sweating - syncope - vomiting - weight changes

- Uncommon Abdominal pain - atrial fibrillation - erectile dysfunction - hypotension - impulse control disorders - visual disturbances

- Rare Irritability - obsessive compulsive disorder - seizures - tachycardia

PREGNANCY Avoid—no information available.

BREAST FEEDING May suppress lactation—avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT Caution in severe impairment—no information available.

MONITORING REQUIREMENTS Ophthalmic testing recommended.

TREATMENT CESSATION Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

DIRECTIONS FOR ADMINISTRATION Apply patch to dry, non-irritated skin on torso, thigh, or upper arm, removing after 24 hours and siting replacement patch on a different area (avoid using the same area for 14 days).
PATIENT AND CARER ADVICE

Sudden onset of sleep  Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists. Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Hypotensive reactions  Hypotensive reactions can occur in some patients taking dopamine-receptor agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised that Neupro® is accepted for restricted use for the treatment of advanced Parkinson’s disease in combination with levodopa where the transdermal route would facilitate treatment (July 2007).

The Scottish Medicines Consortium has advised that Neupro® is accepted as monotherapy for the treatment of early-stage idiopathic Parkinson’s disease (June 2007).

The Scottish Medicines Consortium has advised (April 2009) that rotigotine (Neupro®) is accepted for restricted use within NHS Scotland for the symptomatic treatment of moderate to severe idiopathic restless legs syndrome in adults with a baseline score of 15 points or more on the International Restless Legs Scale.

MEDICINAL FORMS

MONOAmine-OxIdase B inhibItors

Rasagiline

DRUG ACTION  Rasagiline is a monoamine-oxidase B inhibitor.

INDICATIONS AND DOSE  Parkinson’s disease, used alone or as adjunct to co-beneldopa or co-careldopa for ‘end-of-dose’ fluctuations

BY MOUTH

Adult: 1 mg daily

INTERACTIONS  Appendix 1 (rasagiline).

SIDE-EFFECTS

Common or very common  Abnormal dreams - angina - anorexia - arthralgia - conjunctivitis - constipation - depression - dry mouth - dryness - hallucinations - headache - hypotension - incontinence - fatigue - fever - influenza-like symptoms - leucopenia - rash - rhinitis - skin carcinoma - urinary urgency - vertigo - weight loss

Uncommon  Cerebrovascular accident - myocardial infarction

PREGNANCY  Use with caution.

BREAST FEEDING  Use with caution—may suppress lactation.

HEPATIC IMPAIRMENT  Use with caution in mild impairment. Avoid in moderate to severe impairment.

TREATMENT CESSATION  Avoid abrupt withdrawal.

MEdICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet

Azilect (Teva UK Ltd)

Rasagiline (as Rasagiline mesilate) 1 mg  Azilect 1mg tablets | 28 tablet | £70.72 DT price = £70.72

Selegiline hydrochloride

DRUG ACTION  Selegiline is a monoamine-oxidase-B inhibitor.

INDICATIONS AND DOSE  Parkinson’s disease, used alone or as adjunct to co-beneldopa or co-careldopa to reduce ‘end of dose’ deterioration | Symptomatic parkinsonism

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Adult: Initially 5 mg once daily for 2–4 weeks, then increased if tolerated to 10 mg daily, dose to be taken in the morning

BY MOUTH USING ORAL LYOPHILISATE

Adult: 1.25 mg once daily, dose to be taken before breakfast

Dose equivalence and conversion

1.25–mg oral lyophilisate is equivalent to 10–mg tablet.

Patients receiving 10 mg conventional selegiline hydrochloride tablets can be switched to oral lyophilisates (Zelapar®) 1.25 mg.

CONTRA-INDICATIONS  Active duodenal ulceration - active gastric ulceration - avoid or use with great caution in postural hypotension (when used in combination with levodopa)

CAUTIONS  Angina - arrhythmias - avoid in Acute porphyrias p. 864 - duodenal ulceration - gastric ulceration - history of hepatic dysfunction - patients predisposed to confusion and psychosis - psychosis - uncontrolled hypertension

INTERACTIONS  Appendix 1 (selegiline).

Avoid with drugs that increase blood pressure.

SIDE-EFFECTS

Frequency not known  Hypersexuality
Nausea and labyrinth disorders

Nausea and labyrinth disorders

Antiemetics should be prescribed only when the cause of vomiting is known because otherwise they may delay diagnosis, particularly in children. Antiemetics are unnecessary and sometimes harmful when the cause can be treated, such as in diabetic ketoacidosis, or in digoxin p. 94 or antiepileptic overdose.

If antiemetic drug treatment is indicated, the drug is chosen according to the aetiology of vomiting.

Antihistamines are effective against nausea and vomiting resulting from many underlying conditions. There is no evidence that any one antihistamine is superior to another but their duration of action and incidence of adverse effects (drowsiness and antimuscarinic effects) differ.

The phenothiazines are dopamine antagonists and act centrally by blocking the chemoreceptor trigger zone. They are of considerable value for the prophylaxis and treatment of nausea and vomiting associated with diffuse neoplastic disease, radiation sickness, and the emesis caused by drugs such as opioids, general anaesthetics, and cytotoxics. Prochlorperazine p. 309, perphenazine p. 308, and trifluoperazine p. 310 are less sedating than chlorpromazine hydrochloride p. 304; severe dystonic reactions sometimes occur with phenothiazines, especially in children. Some phenothiazines are available as rectal suppositories, which can be useful in patients with persistent vomiting or with severe nausea; prochlorperazine p. 309 can also be administered as a buccal tablet which is placed between the upper lip and the gum.

Other antipsychotic drugs including haloperidol p. 306 and levomepromazine p. 345 are used for the relief of nausea and vomiting in terminal illness. Metoclopramide hydrochloride p. 347 is an effective antiemetic and its activity closely resembles that of the phenothiazines. Metoclopramide hydrochloride also acts directly on the gastro-intestinal tract and it may be superior to the phenothiazines for emesis associated with gastroduodenal, hepatic, and biliary disease. Domperidone p. 346 acts at the chemoreceptor trigger zone; it is licensed only for the relief of nausea and vomiting. It has the advantage over metoclopramide hydrochloride and the phenothiazines of being less likely to cause central effects such as sedation and dystonic reactions because it does not readily cross the blood-brain barrier. In Parkinson’s disease, it can be used to treat nausea caused by dopaminergic drugs.

Granisetron p. 348 and ondansetron p. 349 are of value in the management of nausea and vomiting in patients receiving cytotoxics and in postoperative nausea and vomiting. Palonosetron p. 350 is licensed for prevention of nausea and vomiting associated with moderately or highly emetogenic cytotoxic chemotherapy.

Dexamethasone p. 581 has antiemetic effects and it is used in vomiting associated with cancer chemotherapy. It can be used alone or with metoclopramide hydrochloride, prochlorperazine p. 309, lorazepam p. 412, or a 5HT,- receptor antagonist.

Aprepitant p. 351 and fosaprepitant p. 351 are neurokinin 1-receptor antagonists licensed for the prevention of acute and delayed nausea and vomiting associated with cisplatin-based cytotoxic chemotherapy; they are given with dexamethasone p. 581 and a 5HT,- receptor antagonist.

Nabilone p. 346 is a synthetic cannabinoid with antiemetic properties. It may be used for nausea and vomiting caused by cytotoxic chemotherapy that is unresponsive to conventional antiemetics.

Vomiting during pregnancy

Nausea in the first trimester of pregnancy is generally mild and does not require drug therapy. On rare occasions if vomiting is severe, short-term treatment with an antihistamine, such as promethazine, may be required. Prochlorperazine p. 309 or metoclopramide hydrochloride p. 347 are alternatives. If symptoms do not settle in 24 to 48 hours then specialist opinion should be sought.

Hyperemesis gravidarum is a more serious condition, which requires regular antiemetic therapy, intravenous fluid and electrolyte replacement and sometimes nutritional support. Supplementation with thiamine p. 882 must be considered in order to reduce the risk of Wernicke’s encephalopathy.

Postoperative nausea and vomiting

The incidence of postoperative nausea and vomiting depends on many factors including the anaesthetic used,
and the type and duration of surgery. Other risk factors include female sex, non-smokers, a history of postoperative nausea and vomiting or motion sickness, and intraoperative and postoperative use of opioids. Therapy to prevent postoperative nausea and vomiting should be based on the assessed risk of postoperative nausea and vomiting in each patient. Drugs used include 5HT3-receptor antagonists, droperidol p. 345, dexamethasone p. 581, some phenothiazines (e.g. prochlorperazine p. 309), and antihistamines (e.g. cyclizine p. 343). A combination of two or more antiemetic drugs that have different mechanisms of action is often indicated in those at high risk of postoperative nausea and vomiting or where postoperative vomiting presents a particular danger (e.g. in some types of surgery). When a prophylactic antiemetic drug has failed, postoperative nausea and vomiting should be treated with one or more drugs from a different class.

Motion sickness
Antiemetics should be given to prevent motion sickness rather than after nausea or vomiting develop. The most effective drug for the prevention of motion sickness is hyoscine. If a sedative effect is desired promethazine is useful, but generally a slightly sedating antihistamine such as cyclizine p. 343 or cinnarizine below is preferred. Domperidone p. 346, metoclopramide hydrochloride p. 347, 5HT3-receptor antagonists, and the phenothiazines (except the antihistamine promethazine p. 343) are ineffective in motion sickness.

Other vestibular disorders
Management of vestibular diseases is aimed at treating the underlying cause as well as treating symptoms of the balance disturbance and associated nausea and vomiting. Vertigo and nausea associated with Ménière’s disease and middle-ear surgery can be difficult to treat. Betahistine dihydrochloride p. 352 is an analogue of histamine and is claimed to reduce endolymphatic pressure by improving the microcirculation. Betahistine dihydrochloride is licensed for vertigo, tinnitus, and hearing loss associated with Ménière’s disease.

A diuretic alone or combined with salt restriction may provide some benefit in vertigo associated with Ménière’s disease; antihistamines (such as cinnarizine below), and anticholecterol agents (such as prochlorperazine p. 309) are also used. Where possible, prochlorperazine should be reserved for the treatment of acute symptoms.

Cytotoxic chemotherapy, palliative care, and migraine
Antiemetics have a role in the management of nausea and vomiting induced by cytotoxic chemotherapy, in palliative care, and associated with migraine.

**Drugs used for Nausea and labyrinth disorders not listed below; Chlorpromazine hydrochloride, p. 304 - Haloperidol, p. 306 - Lorazepam, p. 412 - Perphenazine, p. 308 - Prochlorperazine, p. 309 - Promethazine hydrochloride, p. 251 - Promazine teoclote, p. 252 - Trifluoperazine, p. 310**

**ANTIHISTAMINES**

### Cinnarizine

#### INDICATIONS AND DOSE

Relief of symptoms of vestibular disorders, such as vertigo, tinnitus, nausea, and vomiting in Ménière’s disease

**BY MOUTH**
- Child 5-11 years: 15 mg 3 times a day
- Child 12-17 years: 30 mg 3 times a day
- Adult: 30 mg 3 times a day

#### Motion sickness

**BY MOUTH**
- Child 5-11 years: Initially 15 mg, dose to be taken 2 hours before travel, then 7.5 mg every 8 hours if required, dose to be taken during journey
- Child 12-17 years: Initially 30 mg, dose to be taken 2 hours before travel, then 15 mg every 8 hours if required, dose to be taken during journey
- Adult: Initially 30 mg, dose to be taken 2 hours before travel, then 15 mg every 8 hours if required, dose to be taken during journey

#### SIDE-EFFECTS

- **Common or very common** Drowsiness
- **Rare** Anaphylaxis - angioedema - angle-closure glaucoma - arrhythmias - blood disorders - bronchospasm - confusion - convulsions - depression - dizziness - extrapyramidal effects - hypersensitivity reactions - hypotension - lichen planus - liver dysfunction - lupus-like skin reactions - palpitation - paradoxical stimulation (especially with high doses in children) (in children) - paradoxical stimulation (especially with high doses in the elderly) (in adults) - photosensitivity reactions - rashes - sleep disturbances - sweating - tremor - weight gain
- **Frequency not known** Antimuscarinic effects - blurred vision - dry mouth - gastro-intestinal disturbances - headache - psychomotor impairment - urinary retention

**SIDE-EFFECTS, FURTHER INFORMATION**

Children and the elderly are more susceptible to side-effects. Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses or in children and the elderly. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

- **PREGNANCY** Manufacturer advises avoid; however, there is no evidence of teratogenicity. The use of sedating antihistamines in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.
- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid in severe liver disease—increased risk of coma.
- **RENAL IMPAIRMENT** Use with caution—no information available.
- **PATIENT AND CARER ADVICE** Drowsiness may affect performance of skilled tasks (e.g. cycling, driving); sedating effects enhanced by alcohol.
Cinnarizine with dimenhydrinate

The properties listed below are those particular to the combination only. For the properties of the components please consider, cinnarizine.

**INDICATIONS AND DOSE**

**Vertigo**

**BY MOUTH**

- Adult: 1 tablet 3 times a day

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS**

- CINNARIZINE (Non-proprietary)

  - Cinnarizine 15 mg: Cinnarizine 15mg tablets | 84 tablet | £42.00

Cyclizine

**INDICATIONS AND DOSE**

**Nausea** | **Vomiting** | **Vertigo** | **Motion sickness** | **Labyrinthine disorders**

**BY MOUTH OR BY INTRAVENOUS INJECTION**

- Adult: 50 mg up to 3 times a day (max. per dose 25 mg), intravenous injection to be given over 3–5 minutes, for motion sickness, take 1–2 hours before departure

- Child 6-11 years: 25 mg up to 3 times a day, intravenous injection to be given over 3–5 minutes, for motion sickness, take 1–2 hours before departure

- Child 12-17 years: 50 mg up to 3 times a day, intravenous injection to be given over 3–5 minutes, for motion sickness, take 1–2 hours before departure

**BY RECTUM**

- Child 2-5 years: 12.5 mg up to 3 times a day

- Child 6-11 years: 25 mg up to 3 times a day

- Child 12-17 years: 50 mg up to 3 times a day

**BY CONTINUOUS INTRAVENOUS INFUSION OR BY SUBCUTANEOUS INFUSION**

- Child 1 month-1 year: 3 mg/kg, dose to be given over 24 hours

- Child 2-4 years: 50 mg, dose to be given over 24 hours

- Child 6-11 years: 75 mg, dose to be given over 24 hours

- Child 12-17 years: 150 mg, dose to be given over 24 hours

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- **Rare** Anaphylaxis - angioedema - angle-closure glaucoma - arrhythmias - blood disorders - bronchospasm - confusion - convulsions - depression - dizziness - extrapyramidal effects - hypersensitivity reactions - hypotension - liver dysfunction - palpitation - paradoxical stimulation (especially with high doses in children) - paradoxical stimulation (especially with high doses in the elderly) (in adults) - photosensitivity reactions - rashes - sleep disturbances - tremor

- **Frequency not known** Antimuscarinic effects - blurred vision - dry mouth - gastrointestinal disturbances - hallucinations - headache - hypertension - movement disorders - ocular emergencies - paraesthesia - psychromotor impairment - tachycardia - transient speech disorders - twitching - urinary retention

**SPECIFIC SIDE-EFFECTS**

- **Nausea and vomiting associated with palliative care**

  **BY SUBCUTANEOUS INFUSION**

  - Adult: 150 mg, dose to be given over 24 hours

  **BY MOUTH**

  - Adult: 50 mg up to 3 times a day

**UNLICENSED USE**

**CONTRA-INDICATIONS**

- Avoid in Acute porphyrias p. 864 (some antihistamines are thought to be safe) - neonate (due to significant antimuscarinic activity) (in neonates)

**CAUTIONS**

- Epilepsy - glaucoma - may counteract haemodynamic benefits of opioids - neuromuscular disorders - increased risk of transient paralysis with intravenous use - prostatic hypertrophy (in adults) - pyloroduodenal obstruction - severe heart failure - may cause fall in cardiac output and associated increase in heart rate, mean arterial pressure and pulmonary wedge pressure - susceptibility to angle-closure glaucoma - urinary retention

**INTERACTIONS**

- See Appendix 1 (antihistamines).

**PREGNANCY**

- Manufacturer advises avoid; however, there is no evidence of teratogenicity. The use of sedating antihistamines in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitation, and tremor.

**BREAST FEEDING**

- No information available. Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

**HEPATIC IMPAIRMENT**

- Avoid in severe liver disease - increased risk of coma

**DIRECTIONS FOR ADMINISTRATION**

- For administration by mouth, tablets may be crushed. Mixing and compatibility for the use of syringe drivers in palliative care Cyclizine may precipitate at concentrations above 10 mg/mL or in the presence of sodium chloride 0.9%
PATIENT AND CARER ADVICE
Drowsiness may affect performance of skilled tasks (e.g. cycling, driving); effects of alcohol enhanced.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: suppository, oral suspension, oral solution.

- CYCLIZINE (Non-proprietary)
  - Cyclizine hydrochloride 50 mg: Cyclizine 50mg tablets | 100 tablet: £13.64 DT price = £10.97

Solution for injection
- CYCLIZINE (Non-proprietary)
  - Cyclizine lactate 50 mg per 1 ml: Cyclizine 50mg/1ml solution for injection ampoules | 5 ampoule: £6.65 DT price = £8.65

ANTIMUSCARINICS
Hyoscine hydrobromide (Scopolamine hydrobromide)
The properties listed below are those particular to the drug only. For properties common to the class, see Antimuscarinics, Systemic, p. 668.

INDICATIONS AND DOSE
Motion sickness
BY MOUTH
- Child 4–9 years: 75–150 micrograms, dose to be taken up to 30 minutes before the start of journey, then 75–150 micrograms every 6 hours if required; maximum 450 micrograms per day.
- Child 10–17 years: 150–300 micrograms, dose to be taken up to 30 minutes before the start of journey, then 150–300 micrograms every 6 hours if required; maximum 900 micrograms per day.
- Adult: 150–300 micrograms, dose to be taken up to 30 minutes before the start of journey, then 150–300 micrograms every 6 hours if required; maximum 900 micrograms per day.

BY TRANSDERMAL APPLICATION
- Child 10–17 years: Apply 1 patch, apply behind ear 5–6 hours before journey, then apply 1 patch after 72 hours if required, remove old patch and site replacement patch behind the other ear.
- Adult: Apply 1 patch, apply behind ear 5–6 hours before journey, then apply 1 patch after 72 hours if required, remove old patch and site replacement patch behind the other ear.

Hyper-salivation associated with clozapine therapy
BY MOUTH
- Adult: 300 micrograms up to 3 times a day; maximum 900 micrograms per day.

Excessive respiratory secretion (in palliative care)
BY SUBCUTANEOUS INJECTION
- Adult: 400 micrograms every 4 hours as required, hourly use is occasionally necessary

Bowel colic in palliative care
BY SUBCUTANEOUS INJECTION
- Adult: 400 micrograms every 4 hours as required, hourly use is occasionally necessary

UNLICENSED USE
- In children Not licensed for use in excessive respiratory secretions or hyper-salivation associated with clozapine therapy.

Important safety information
Antimuscarinic drugs used for premedication to general anaesthesia should only be administered by, or under the direct supervision of, personnel experienced in their use.

CAUTIONS
Epilepsy
CAUTIONS, FURTHER INFORMATION
Anticholinergic syndrome
In some patients, especially children and the elderly, hyoscine may cause the central anticholinergic syndrome (excitement, ataxia, hallucinations, behavioural abnormalities, and drowsiness).

PREGNANCY
Use only if potential benefit outweighs risk.
Injection may depress neonatal respiration.

BREAST FEEDING
Amount too small to be harmful.

HEPATIC IMPAIRMENT
Use with caution.

RENAL IMPAIRMENT
Use with caution.

DIRECTIONS FOR ADMINISTRATION
- With topical use Patch applied to hairless area of skin behind ear; if less than whole patch required either cut with scissors along full thickness ensuring membrane is not peeled away or cover portion to prevent contact with skin.
- With oral use in children For administration by mouth, injection solution may be given orally.

PRESCRIBING AND DISPENSING INFORMATION
Flavours of chewable tablet formulations may include raspberry.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, oral suspension, oral solution.

- HYOSCINE HYDROBROMIDE (Non-proprietary)
  - Hyoscine hydrobromide 300 microgram: Hyoscine hydrobromide 300microgram tablets | 12 tablet: £1.67
  - Kwells (Bayer Plc)
  - Hyoscine hydrobromide 150 microgram: Kwells Kids 150microgram tablets | 12 tablet: £1.67

- Brands may include Travel Calm
**Droperidol**

The properties listed below are those particular to the drug only. For properties common to the class, see Antipsychotics, p. 303.

- **DRUG ACTION** Droperidol is a butyrophenone, structurally related to haloperidol, which blocks dopamine receptors in the chemoreceptor trigger zone.

### INDICATIONS AND DOSE

**Prevention and treatment of postoperative nausea and vomiting**

- **BY INTRAVENOUS INJECTION**
  - Adult: 0.625–1.25 mg, dose to be given 30 minutes before end of surgery, then 0.625–1.25 mg every 6 hours as required
  - Elderly: 625 micrograms, dose to be given 30 minutes before end of surgery, then 625 micrograms every 6 hours as required

**Prevention of nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia (PCA)**

- **BY INTRAVENOUS INJECTION**
  - Adult: 15–50 micrograms of droperidol for every 1 mg of morphine in PCA, reduce dose in elderly; maximum 5 mg per day

- **CONTRA-INDICATIONS** Bradycardia · CNS depression · comatose states · hypokalaemia · hypomagnesaemia · phaeochromocytoma · QT-interval prolongation
- **CAUTIONS** Chronic obstructive pulmonary disease · electrolyte disturbances · history of alcohol abuse · respiratory failure
- **INTERACTIONS** → Appendix 1 (droperidol). Avoid concomitant administration of drugs that prolong QT interval.
- **SIDE-EFFECTS** Anxiety · cardiac arrest · hallucinations · inappropriate antidiuretic hormone secretion
- **PREGNANCY** Extrapyramidal effects and withdrawal syndrome have been reported occasionally in the neonate when antipsychotic drugs are taken during the third trimester of pregnancy. Following maternal use of antipsychotic drugs in the third trimester, neonates should be monitored for symptoms including agitation, hypertonia, hypotonia, tremor, drowsiness, feeding problems, and respiratory distress.
- **BREAST FEEDING** Limited information available—avoid repeated administration.
- **HEPATIC IMPAIRMENT** In postoperative nausea and vomiting, max. 625 micrograms repeated every 6 hours as required. For nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia, reduce dose.
- **RENA L IMPAIRMENT** In postoperative nausea and vomiting, max. 625 micrograms repeated every 6 hours as required. For nausea and vomiting caused by opioid analgesics in postoperative patient-controlled analgesia, reduce dose.
- **MONITORING REQUIREMENTS** Continuous pulse oximetry required if risk of ventricular arrhythmia—continue for 30 minutes following administration.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, capsule

### Solution for injection

- **HYOSCINE HYDROBROMIDE (Non-proprietary)**
  - Hyoscine hydrobromide 400 microgram per 1 ml Hyoscine hydrobromide 400microgram/1ml solution for injection ampoules | 10 ampoule [P] £31.29

- **HYOSCINE HYDROBROMIDE 600 microgram per 1 ml** Hyoscine hydrobromide 600microgram/1ml solution for injection ampoules | 10 ampoule [P] £33.50

### Transdermal patch

- **CAUTIONARY AND ADVISORY LABELS**
  - Scopoderm (Novartis Consumer Health UK Ltd)
  - Hyoscine 1 mg per 72 hour Scopoderm 1.5mg patches | 2 patch [P] £4.52 DT price = £4.52

### Chewable tablet

- **Joy-Rides** (Forest Laboratories UK Ltd)

### HYOSCINE HYDROBROMIDE (Non-proprietary)

- **Joy-rides 150microgram chewable tablets (sugar-free) | 12 tablet [P] £1.55**

### Levomepromazine

(Methotrimeprazine)

The properties listed below are those particular to the drug only. For properties common to the class, see Antipsychotics, p. 303.

### INDICATIONS AND DOSE

**Pain in palliative care (reserved for distressed patients with severe pain unresponsive to other measures)**

- **BY CONTINUOUS SUBCUTANEOUS INFUSION OR BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION**
  - Adult: Seek specialist advice

**Restlessness and confusion in palliative care**

- **BY CONTINUOUS SUBCUTANEOUS INFUSION**
  - Child 1-11 years: 0.35–3 mg/kg, to be administered over 24 hours
  - Child 12-17 years: 12.5–200 mg, to be administered over 24 hours

- **BY MOUTH**
  - Adult: 6 mg every 2 hours as required
  - **BY SUBCUTANEOUS INJECTION**
    - Adult: 6.25 mg every 2 hours as required
  - **BY SUBCUTANEOUS INFUSION**
    - Adult: Initially 12.5–50 mg/24 hours, titrated according to response (doses greater than 100 mg/24 hours should be given under specialist supervision)

**Nausea and vomiting in palliative care**

- **BY CONTINUOUS INTRAVENOUS INFUSION OR BY SUBCUTANEOUS INFUSION**
  - Child 1 month-11 years: 100–400 micrograms/kg, to be administered over 24 hours
  - Child 12-17 years: 5–25 mg, to be administered over 24 hours

- **BY MOUTH**
  - Adult: 6 mg once daily, dose to be taken at bedtime, increased if necessary to 12.5–25 mg twice daily
  - **BY SUBCUTANEOUS INJECTION**
    - Adult: 6.25 mg once daily, dose to be given at bedtime, increased if necessary to 12.5–25 mg twice daily
  - **BY SUBCUTANEOUS INFUSION**
    - Adult: 5–25 mg/24 hours, sedation can limit the dose

**Schizophrenia**

- **BY MOUTH**
  - Adult: Initially 25–50 mg daily in divided doses, dose can be increased as necessary

**Schizophrenia (bed patients)**

- **BY MOUTH**
  - Adult: Initially 100–200 mg daily in 3 divided doses, increased if necessary to 1 g daily
Nabilone

**INDICATIONS AND DOSE**

Nausea and vomiting caused by cytotoxic chemotherapy, unresponsive to conventional antiemetics (preferably in hospital setting) (under close medical supervision) **BY MOUTH**

- Adult: Initially 1 mg twice daily, increased if necessary to 2 mg twice daily throughout each cycle of cytotoxic therapy and, if necessary, for 48 hours after the last dose of each cycle, the first dose should be taken the night before initiation of cytotoxic treatment and the second dose 1–3 hours before the first dose of cytotoxic drug, daily dose maximum should be given in 3 divided doses; maximum 6 mg per day

**CAUTIONS**

- Adverse effects on mental state can persist for 48–72 hours after stopping; elderly – heart disease; history of psychiatric disorder – hypertension

**SIDE-EFFECTS**

**SIDE-EFFECTS, FURTHER INFORMATION**

Drowsiness and dizziness occur frequently with standard doses.

**PREGNANCY**

- Avoid unless essential.

**BREAST FEEDING**

- Avoid—no information available.

**HEPATIC IMPAIRMENT**

- Avoid in severe impairment.

**PATIENT AND CARER ADVICE**

Drowsiness may affect performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including nabilone, see Drugs and driving under Guidance on prescribing p. 1. Behavioural effects: Patients should be made aware of possible changes of mood and other adverse behavioural effects.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral solution, oral suspension

**Tablet**

- CAUTIONARY AND ADVISORY LABELS 2

  - **Levomepromazine maleate** 6 mg
  - 28 tablet (P) no price available

- **Noziman (Sanofi)**

  - Levomepromazine maleate 25 mg
  - 84 tablet (P) £20.26 DT price = £20.26

**Solution for injection**

- **LEVOMEPROMAZINE (Non-proprietary)**

  - Levomepromazine hydrochloride 25 mg per 1 ml
  - 10 ampoule (P) £20.13 DT price = £20.13

- **Noziman (Sanofi)**

  - Levomepromazine hydrochloride 25 mg per 1 ml
  - 10 ampoule (P) £20.13 DT price = £20.13

**CANNABINOIDS**

**Nabilone**

**INDICATIONS AND DOSE**

Nausea and vomiting caused by cytotoxic chemotherapy, unresponsive to conventional antiemetics (preferably in hospital setting) (under close medical supervision) **BY MOUTH**

- Adult: Initially 1 mg twice daily, increased if necessary to 2 mg twice daily throughout each cycle of cytotoxic therapy and, if necessary, for 48 hours after the last dose of each cycle, the first dose should be taken the night before initiation of cytotoxic treatment and the second dose 1–3 hours before the first dose of cytotoxic drug, daily dose maximum should be given in 3 divided doses; maximum 6 mg per day

**CAUTIONS**

- Risk of postural hypotension; not recommended for ambulant patients over 50 years unless risk of hypotensive reaction assessed.

**SIDE-EFFECTS**

- Raised erythrocyte sedimentation rate

**PREGNANCY**

- There is limited information available

**SIDE-EFFECTS, FURTHER INFORMATION**

- Frequency not known: Drowsiness – dizziness – hypotension – nausea – sleep disturbance – vertigo – visual disturbance

**SIDE-EFFECTS, FURTHER INFORMATION**

Drowsiness and dizziness occur frequently with standard doses.

**PREGNANCY**

- Avoid unless essential.

**BREAST FEEDING**

- Avoid—no information available.

**HEPATIC IMPAIRMENT**

- Avoid in severe impairment.

**PATIENT AND CARER ADVICE**

Drowsiness may affect performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including nabilone, see Drugs and driving under Guidance on prescribing p. 1. Behavioural effects: Patients should be made aware of possible changes of mood and other adverse behavioural effects.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

**Capsule**

- CAUTIONARY AND ADVISORY LABELS 2

  - **NABILONE (Non-proprietary)**

    - Nabilone 250 microgram Nabilone 250microgram capsules | 20 capsule (P) £96.11 Schedule 2 (CD)

    - Nabilone 1 mg Nabilone 1mg capsules | 20 capsule (P) £125.84 Schedule 2 (CD)

**DOPAMINE RECEPTOR ANTAGONISTS**

**Domperidone**

**INDICATIONS AND DOSE**

Relief of nausea and vomiting **BY MOUTH**

- Child (body-weight up to 35 kg): 250 micrograms/kg up to 3 times a day; maximum 750 micrograms/kg per day

- Child 12-17 years (body-weight 35 kg and above): 10 mg up to 3 times a day; maximum 30 mg per day

- Adult (body-weight 35 kg and above): 10 mg up to 3 times a day; maximum 30 mg per day

**Gastro-intestinal pain in palliative care** **BY MOUTH**

- Adult: 10 mg 3 times a day, before meals

**UNLICENSED USE**

- Not licensed for use in children for gastro-oesophageal reflux disease.

**Important safety information**

MHRA/CHM ADVICE—DOMPERIDONE: RISK OF CARDIAC SIDE-EFFECTS—RESTRICTED INDICATION, NEW CONTRA-INDICATIONS, REDUCED DOSE AND DURATION OF USE

The benefits and risks of domperidone have been reviewed. As domperidone is associated with a small increased risk of serious cardiac side-effects, the following restrictions to indication, dose and
duration of treatment have been made, and new contra-
indications added:

- Domperidone should only be used for the relief of the
  symptoms of nausea and vomiting;
- Domperidone should be used at the lowest effective
dose for the shortest possible duration (max.
treatment duration should not normally exceed 1
week);
- Domperidone is contra-indicated for use in conditions
where cardiac conduction is, or could be impaired, or
where there is underlying cardiac disease, when
administered concomitantly with drugs that prolong
the QT interval or potent CYP3A4 inhibitors, and in
severe hepatic impairment;
- The recommended dose in adults and adolescents
over 12 years and over 35 kg is 10 mg up to 3 times
daily;
- The recommended dose in children under 35 kg is
250 micrograms/kg up to 3 times daily;
- Oral liquid formulations should be given via an
appropriately designed, graduated oral syringe to
ensure dose accuracy.
This advice does not apply to unlicensed uses of
domperidone (e.g. palliative care).

- CONTRA-INDICATIONS Cardiac disease - conditions where
cardiac conduction is, or could be, impaired (in adults) -
gastro-intestinal haemorrhage (in children) - if increased
gastrointestinal motility harmful (in adults) - mechanical
obstruction (in children) - mechanical perforation (in
children) - predisposition to cardiac conduction disorders
(in children) - prolactinoma
- CAUTIONS Children - if there are cardiac concerns, obtain
ECG before and during treatment (in children) - patients
over 60 years - increased risk of ventricular arrhythmia (in
adults)
- INTERACTIONS → Appendix 1 (domperidone).
Contra-indicated with concomitant use of drugs that
prolong the QT interval.
Contra-indicated with concomitant use of potent CYP3A4
inhibitors.
- SIDE-EFFECTS
  - Common or very common Drowsiness - dry mouth - malaise
  - Uncommon Anxiety - breast pain - decreased libido -
diarrhoea - galactorrhoea - headache - pruritus - rash
  - Frequency not known Agitation - amenorrhea -
convulsions - extrapyramidal disorders - gynaecomastia -
nervousness - oculogyric crisis - QT-interval prolongation -
sudden cardiac death - urinary retention - ventricular
arrhythmias
- PREGNANCY Use only if potential benefit outweighs risk.
- BREAST FEEDING Amount too small to be harmful.
- HEPATIC IMPAIRMENT Avoid in moderate or severe
impairment.

- RENAL IMPAIRMENT Reduce frequency.

- PATIENT AND CARER ADVICE
  Arrhythmia Patients and their carers should be told how to
recognise signs of arrhythmia and advised to seek medical
attention if symptoms such as palpitation or syncope
develop.
Medicines for Children leaflet: Domperidone for gastro-
oesophageal reflux www.medicinesforchildren.org.uk/
domperidone-for-gastro-oesophageal-reflux

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines
containing the same drug. Forms available from special-order
manufacturers include: solution for injection, oral suspension,
suppository

Nausea and labyrinth disorders

Tablet

CAUTIONARY AND ADVISORY LABELS 22

- DOMPERIDONE (Non-proprietary)
  - Domperidone (as Domperidone maleate) 10 mg
    Domperidone 10mg tablets | 30 tablet (P) £1.75 | 100 tablet (P) £9.04 DT price = £5.83

    - Domperidone (as Domperidone maleate) 10 mg
      Motilium 10mg tablets | 30 tablet (P) £2.71 DT price = £1.75 | 100 tablet (P) £9.04 DT price = £5.83

Oral suspension

CAUTIONARY AND ADVISORY LABELS 22

- DOMPERIDONE (Non-proprietary)
  - Domperidone 1 mg per 1 ml
    Domperidone 5mg/5ml oral suspension sugar free (sugar-free) | 200 ml (P) £13.43 DT price = £13.43

Metoclopramide hydrochloride

INDICATIONS AND DOSE

Symptomatic treatment of nausea and vomiting including
that associated with acute migraine | Delayed (but not
acute) chemotherapy-induced nausea and vomiting | Radiotherapy-induced nausea and vomiting | Prevention of
postoperative nausea and vomiting

BY MOUTH OR BY INTRAMUSCULAR INJECTION OR BY SLOW
INTRAVENOUS INJECTION

- Adult (body-weight up to 60 kg): Up to 500 micrograms/kg
daily in 3 divided doses, when administered by slow
intravenous injection, to be given over at least 3
minutes
- Adult (body-weight 60 kg and above): 10 mg up to 3 times
a day, when administered by slow intravenous
injection, to be given over at least 3 minutes

Hiccup in palliative care

BY MOUTH OR BY INTRAMUSCULAR INJECTION OR BY
SUBCUTANEOUS INJECTION

- Adult: 10 mg every 6–8 hours

Nausea and vomiting in palliative care

BY MOUTH

- Adult: 10 mg 3 times a day

BY SUBCUTANEOUS INFUSION

- Adult: 30–100 mg/24 hours

Important safety information

MHRA/CHM ADVICE—METOCLOPRAMIDE: RISK OF
NEUROLOGICAL ADVERSE EFFECTS—RESTRICTED DOSE AND
DURATION OF USE (AUGUST 2013)
The benefits and risks of metoclopramide have been
reviewed by the European Medicines Agency’s
Committee on Medicinal Products for Human Use,
which concluded that the risk of neurological effects
such as extrapyramidal disorders and tardive dyskinesia
outweigh the benefits in long-term or high-dose
 treatment. To help minimise the risk of potentially
serious neurological adverse effects, the following
restrictions to indications, dose, and duration of use
have been made:

- In adults over 18 years, metoclopramide should only
  be used for prevention of postoperative nausea and
  vomiting, radiotherapy-induced nausea and vomiting,
delayed (but not acute) chemotherapy-induced
  nausea and vomiting, and symptomatic treatment of
  nausea and vomiting, including that associated with
  acute migraine (where it may also be used to improve
  absorption of oral analgesics);
- Metoclopramide should only be prescribed for short-
term use (up to 5 days);
- Usual dose is 10 mg, repeated up to 3 times daily;
  max. daily dose is 500 micrograms/kg;
PATIENT AND CARER ADVICE

DIRECTIONS FOR ADMINISTRATION

- With intravenous use
  - Frequency not known

SIDE-EFFECTS

- Common or very common Extrapyramidal effects
  - galactorrhoea
  - gynaecomastia
  - hyperprolactinaemia
  - menstrual changes
- Very rare Depression
  - methaemoglobinæmia (more severe in G6PD deficiency)
  - neuroleptic malignant syndrome
- Frequency not known Anxiety
  - confusion
  - diarrhoea
  - dizziness
  - drowsiness
  - dyspnoea
  - hypotension
  - oedema
  - pruritis
  - rash
  - restlessness
  - tardive dyskinesia on prolonged administration
  - tremor
  - urticaria
  - visual disturbances

SPECIFIC SIDE-EFFECTS

- Very rare
- With intravenous use cardiac conduction abnormalities

SIDE-EFFECTS, FURTHER INFORMATION

Metoclopramide can induce acute dystonic reactions involving facial and skeletal muscle spasms and oculogryric crises. These dystonic effects are more common in the young (especially girls and young women) and the very old; they usually occur shortly after starting treatment with metoclopramide and subside within 24 hours of stopping it. Injection of an antiparkinsonian drug such as procyclidine will abort dystonic attacks.

PREGNANCY

Not known to be harmful.

BREAST FEEDING

Small amount present in milk; avoid.

HEPATIC IMPAIRMENT

Reduce dose.

RENAL IMPAIRMENT

Avoid or use small dose in severe impairment; increased risk of extrapyramidal reactions.

DIRECTIONS FOR ADMINISTRATION

Oral liquid preparation to be given via a graduated oral dosing syringe.

PATIENT AND CARER ADVICE

Counselling on use of pipette advised with oral solution.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Tablet

- METOCLOPRAMIDE HYDROCHLORIDE (Non-proprietary)
  - Metoclopramide hydrochloride 10 mg Metoclopramide 10mg tablets | 28 tablet £1.23 DT price = £0.97
  - Maxolon (AMCo)

- Metoclopramide hydrochloride 10 mg Maxolon 10mg tablets | 84 tablet £5.24

Oral solution

- METOCLOPRAMIDE HYDROCHLORIDE (Non-proprietary)
  - Metoclopramide hydrochloride 1 mg per 1 ml Metoclopramide 5mg/5ml oral solution sugar free (sugar-free) | 150 ml £19.77 DT price = £13.77

Solution for injection

- METOCLOPRAMIDE HYDROCHLORIDE (Non-proprietary)
  - Metoclopramide hydrochloride 5 mg per 1 ml Metoclopramide 10mg/2ml solution for injection ampoules | 5 ampoule £1.31-£1.82 | 10 ampoule £3.50 DT price = £3.23
  - Maxolon (AMCo)

- Metoclopramide hydrochloride 5 mg per 1 ml Maxolon 10mg/2ml solution for injection ampoules | 12 ampoule £3.21
  - Maxolon High Dose 100mg/20ml solution for injection ampoules | 10 ampoule £26.68

5HT3 RECEPTOR ANTAGONISTS

Granisetron

- DRUG ACTION
  - Granisetron is a specific 5HT3-receptor antagonist which blocks 5HT3 receptors in the gastrointestinal tract and in the CNS.

INDICATIONS AND DOSE

Nausea and vomiting induced by cytotoxic chemotherapy for planned duration of 3–5 days where oral antiemetics cannot be used

BY TRANSDERMAL APPLICATION USING PATCHES

- Adult: Apply 3.1 mg/24 hours, apply patch to clean, dry, non-irritated, non-hairy skin on upper arm (or abdomen if upper arm cannot be used) 24–48 hours before treatment, patch may be worn for up to 7 days; remove at least 24 hours after completing chemotherapy

Prevention of postoperative nausea and vomiting

BY INTRAVENOUS INJECTION

- Adult: 1 mg, to be administered before induction of anaesthesia, dose to be diluted to 5 mL and given over 30 seconds

Treatment of postoperative nausea and vomiting

BY INTRAVENOUS INJECTION

- Adult: 1 mg, dose to be diluted to 5 mL and given over 30 seconds; maximum 3 mg per day

Management of nausea and vomiting induced by cytotoxic chemotherapy or radiotherapy

BY MOUTH

- Adult: 1–2 mg, to be taken within 1 hour before start of treatment, then 2 mg daily in 1–2 divided doses for up to 1 week following treatment, when intravenous route also used, maximum combined total dose 9 mg in 24 hours

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- Adult: 10–40 micrograms/kg (max. per dose 3 mg), to be given 5 minutes before start of treatment, dose may be repeated if necessary, further maintenance doses must not be given less than 10 minutes apart, for intravenous injection, each 1 mg granisetron diluted to 5 mL and given over not less than 30 seconds, for intravenous infusion, to be given over 5 minutes; maximum 9 mg per day

CAUTIONS

Subacute intestinal obstruction • susceptibility to QT-interval prolongation (including electrolyte disturbances)

INTERACTIONS

Appendix 1 (5HT3-receptor Antagonists).

Caution with concomitant use of drugs that prolong QT interval.

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- Common or very common Constipation • diarrhoea • headache • insomnia
Severely emetogenic chemotherapy (consult product literature for dose of concomitant corticosteroid)

**INITIALLY BY MOUTH**

- Adult: 24 mg, dose to be taken 1–2 hours before treatment, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days

**INITIALLY BY RECTUM**

- Adult: 16 mg, dose to be administered 1–2 hours before treatment, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days

**INITIALLY BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION**

- Adult 18–65 years: Initially 8 mg, dose to be administered immediately before treatment, followed by (by intramuscular injection or by slow intravenous injection) 8 mg every 4 hours if required for 2 doses, alternatively followed by (by continuous intravenous infusion) 1 mg/hour for up to 24 hours, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days

**INDICATIONS AND DOSE**

Moderately emetogenic chemotherapy or radiotherapy

**INITIALLY BY MOUTH**

- Adult: Initially 8 mg, dose to be taken 1–2 hours before treatment, alternatively (by rectum) initially 16 mg, dose to be administered 1–2 hours before treatment, alternatively (by intramuscular injection or by slow intravenous injection) initially 8 mg, dose to be administered immediately before treatment, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days

- Elderly: Initially 8 mg, dose to be taken 1–2 hours before treatment, alternatively (by rectum) initially 16 mg, dose to be administered 1–2 hours before treatment, alternatively (by intramuscular injection or by intravenous infusion) initially 8 mg, dose to be administered immediately before treatment, intravenous infusion dose to be administered over at least 15 minutes, then (by mouth) 8 mg every 12 hours for up to 5 days, alternatively (by rectum) 16 mg daily for up to 5 days

**PREVENTION OF POSTOPERATIVE NAUSEA AND VOMITING**

**INITIALLY BY MOUTH**

- Adult: 16 mg, dose to be taken 1 hour before anaesthesia, alternatively (by intramuscular injection or by slow intravenous injection) 4 mg, dose to be administered at induction of anaesthesia

**TREATMENT OF POSTOPERATIVE NAUSEA AND VOMITING**

**BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION**

- Adult: 4 mg for 1 dose

**CONTRA-INDICATIONS**

- Congenital long QT syndrome

**CAUTIONS**

- Adenotonsillar surgery - subacute intestinal obstruction - susceptibility to QT-interval prolongation (including electrolyte disturbances)

**INTERACTIONS**

- Appendix 1 (5HT3-receptor Antagonists).
Caution with concomitant use of drugs that prolong QT interval.

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
- Common or very common: Constipation, flushing, headache, injection site-reactions
- Uncommon: Arrhythmias, bradycardia, chest pain, hiccups, hypotension, movement disorders, seizures

**SPECIFIC SIDE-EFFECTS**
- Rare
- With intravenous use: dizziness, transient visual disturbances
- Very rare
- With intravenous use: transient blindness
- Frequency not known
- With rectal use: rectal irritation

**PREGNANCY**
- No information available; avoid unless potential benefit outweighs risks.

**BREAST FEEDING**
- Present in milk in animal studies—avoid.

**HEPATIC IMPAIRMENT**
- Maximum 8 mg daily in moderate or severe impairment.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use: For intravenous infusion (Zofran®), give continuously or intermittently in Glucose 5% or Glucose 5% with Potassium chloride 0.3% or Sodium chloride 0.9% or Sodium chloride 0.9% with Potassium chloride 0.3% or Mannitol 10% or Ringsers solution; for intermittent infusion, dilute the required dose in 50–100 mL of infusion fluid and give over at least 15 minutes.
- With oral use: Orodispersible films and lyophilisates should be placed on the tongue, allowed to disperse and swallowed.

**PRESCRIBING AND DISPENSING INFORMATION**
- Flavours of oral liquid formulations may include strawberry.

**PATIENT AND CARER ADVICE**
- Patients or carers should be given advice on how to administer orodispersible films and lyophilisates.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Table**
- **ONDANSETRON (Non-proprietary)**
  - Ondansetron (as Ondansetron hydrochloride) 4 mg
    - 4mg tablets | 10 tablet (PO) £25.46 DT price = £1.88 | 30 tablet (PO) £76.38
    - Ondansetron 8 mg tablets | 10 tablet (PO) £47.99 DT price = £6.94
  - Ondansetron (as Ondansetron hydrochloride) 8 mg
    - Zofran 4mg tablets | 30 tablet (PO) £10.79
  - Ondansetron (as Ondansetron hydrochloride) 8 mg
    - Ondansetron 8mg tablets | 10 tablet (PO) £11.94 DT price = £1.64
  - Brands may include Ondemet

**Orodispersible tablet**
- **ONDANSETRON (Non-proprietary)**
  - Ondansetron 4 mg
    - Ondansetron 4mg orodispersible tablets | 10 tablet (PO) £40.46 DT price = £4.04
  - Ondansetron 8 mg
    - Ondansetron 4mg orodispersible tablets | 10 tablet (PO) £80.93 DT price = £8.09

**Orodispersible film**
- Setofilm (Norgine Pharmaceuticals Ltd)
  - Ondansetron 4 mg
    - Setofilm 4mg orodispersible films (sugar-free) | 10 film (PO) £28.50
  - Ondansetron 8 mg
    - Setofilm 8mg orodispersible films (sugar-free) | 10 film (PO) £57.00

**Oral solution**
- **ONDANSETRON (Non-proprietary)**
  - Ondansetron (as Ondansetron hydrochloride) 800 microgram per 1 ml
    - Ondansetron 4mg/5ml oral solution sugar free (sugar-free) | 50 ml (PO) £38.08 DT price = £3.74

**Solution for injection**
- **ONDANSETRON (Non-proprietary)**
  - Ondansetron (as Ondansetron hydrochloride) 2 mg per 1 ml
    - Ondansetron 8mg/4ml solution for injection ampoules | 5 ampoule (PO) £58.45
    - Ondansetron 4mg/2ml solution for injection ampoules | 5 ampoule (PO) £29.20 | 10 ampoule (PO) £75.00

**Zofran Flexi-amp (Novartis Pharmaceuticals UK Ltd)**
- Ondansetron (as Ondansetron hydrochloride) 2 mg per 1 ml
  - Zofran Flexi-amp 8mg/4ml solution for injection | 5 ampoule (PO) £59.95
  - Zofran Flexi-amp 4mg/2ml solution for injection | 5 ampoule (PO) £29.97

**Suppository**
- **Zofran (Novartis Pharmaceuticals UK Ltd)**
  - Ondansetron 16 mg
    - Zofran 16mg suppositories | 1 suppository (PO) £14.39

**Palonosetron**

**DRUG ACTION**
- Palonosetron is a specific 5HT3 receptor antagonist which blocks 5HT3 receptors in the gastrointestinal tract and in the CNS.

**INDICATIONS AND DOSE**
- Moderately emetogenic chemotherapy
  - Initially by mouth
    - Adult: 500 micrograms, dose to be taken 1 hour before treatment, alternatively by (intravenous injection), 250 micrograms for 1 dose, dose to be administered over 30 seconds, 30 minutes before treatment
  - Severely emetogenic chemotherapy
    - By intravenous injection
      - Adult: 250 micrograms for 1 dose, dose to be administered over 30 seconds, 30 minutes before treatment

**CAUTIONS**
- History of constipation, intestinal obstruction, susceptibility to QT-interval prolongation (including electrolyte disturbances)

**INTERACTIONS**
- Caution with concomitant use of drugs that prolong QT interval.

**SIDE-EFFECTS**
- Common or very common: Constipation, diarrhoea, dizziness, headache
- Uncommon: Abdominal pain, amebolgia, anorexia, anxiety, arrhythmia, arthralgia, asthena, atrioventricular block, bradycardia, changes in blood pressure, dry mouth, dyspnea, electrolyte disturbance, euphoria, extrasystoles, eye irritation, eye swelling, flatulence, glycosuria, hiccups, hyperglycaemia, influenza-like symptoms, insomnia, motion sickness, myalgia, myocardial ischaemia, peripheral neuropathy, rash, tachycardia, tinnitus, urinary retention

**PREGNANCY**
- Avoid—no information available.

**BREAST FEEDING**
- Avoid—no information available.

**PATIENT AND CARER ADVICE**
- Dizziness or drowsiness may affect performance of skilled tasks (e.g. driving).
Fosaprepitant

- **DRUG ACTION** Fosaprepitant is a prodrug of aprepitant.

**INDICATIONS AND DOSE**

Adjunct to dexamethasone and a 5HT3-receptor antagonist in preventing nausea and vomiting associated with moderately and highly emetogenic chemotherapy

**BY INTRAVENOUS INFUSION**

- Adult: 150 mg, dose to be administered over 20–30 minutes and given 30 minutes before chemotherapy on day 1 of cycle only; consult product literature for dose of concomitant corticosteroid and 5HT3-receptor antagonist

**CONTRA-INDICATIONS** Acute porphyrias p. 864

**INTERACTIONS** → Appendix 1 (aprepitant).

**SIDE-EFFECTS**

- Common or very common Anorexia · asthenia · constipation · diarrhoea · dizziness · dyspepsia · headache · hiccups
- Uncommon Abdominal pain · abnormal dreams · acne · anaemia · anxiety · bradycardia · chills · colitis · confusion · conjunctivitis · cough · drowsiness · dry mouth · duodenal ulcer · dysuria · euphoria · flatulence · flushing · haematuria · hyperglycaemia · hypernatraemia · myalgia · neutropenia · oedema · palpitations · pharyngitis · photosensitivity · polyuria · pruritus · rash · sneezing · stomatitis · sweating · taste disturbance · thirst · tinnitus · weight changes
- Frequency not known Dysarthria · dyspnoea · insomnia · Stevens-Johnson syndrome · urticaria · visual disturbances

**CONCEPTION AND CONTRACEPTION** Efficacy of hormonal contraceptives reduced—effective non-hormonal methods of contraception necessary during treatment and for 2 months after stopping fosaprepitant.

**PREGNANCY** Avoid unless potential benefit outweighs risk—no information available.

**BREAST FEEDING** Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Caution in moderate to severe impairment.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Ivemend®), give intermittently in Sodium chloride 0.9%; reconstitute each 150 mg vial with 5 mL sodium chloride 0.9% gently without shaking to avoid foaming, then dilute in 145 mL infusion fluid; give over 20–30 minutes.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (January 2011) that fosaprepitant (Ivemend®) is accepted for restricted use within NHS Scotland for the prevention of acute and delayed nausea and vomiting associated with highly emetogenic cisplatin-based chemotherapy.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

- Ivemend (Merck Sharp & Dohme Ltd) Fosaprepitant (as Fosaprepitant dimeglumine) 150 mg I vial 150 mg powder for solution for infusion vials | 1 vial £47.42

---

**NEUROKININ RECEPTOR ANTAGONISTS**

Aprepitant

**INDICATIONS AND DOSE**

Adjunct to dexamethasone and a 5HT3-receptor antagonist in preventing nausea and vomiting associated with moderately and highly emetogenic chemotherapy

**BY MOUTH**

- Adult: Initially 125 mg, dose to be taken 1 hour before chemotherapy, then 80 mg once daily for 2 days; consult product literature for dose of concomitant corticosteroid and 5HT3-receptor antagonist

**CONTRA-INDICATIONS** Acute porphyrias p. 864

**INTERACTIONS** → Appendix 1 (aprepitant).

**SIDE-EFFECTS**

- Common or very common Anorexia · asthenia · constipation · diarrhoea · dizziness · dyspepsia · headache · hiccups
- Uncommon Abdominal pain · abnormal dreams · acne · anaemia · anxiety · bradycardia · chills · colitis · confusion · conjunctivitis · cough · drowsiness · dry mouth · duodenal ulcer · dysuria · euphoria · flatulence · flushing · haematuria · hyperglycaemia · hypernatraemia · myalgia · neutropenia · oedema · palpitations · pharyngitis · photosensitivity · polyuria · pruritus · rash · sneezing · stomatitis · sweating · taste disturbance · thirst · tinnitus · weight changes

4.1 Meniere’s disease

HISTAMINE ANALOGUES

**Beta-histidine dihydrochloride**

**INDICATIONS AND DOSE**

Vertigo, tinnitus and hearing loss associated with Ménière’s disease

**BY MOUTH**

- **Adult:** Initially 16 mg 3 times a day, dose preferably
taken with food; maintenance 24–48 mg daily

- **CONTRA-INDICATIONS** Phaeochromocytoma

- **CAUTIONS** Asthma - history of peptic ulcer

- **INTERACTIONS** → Appendix 1 (betahistine).

- **SIDE-EFFECTS** Gastro-intestinal disturbances - headache -
pruritus - rashes

- **PREGNANCY** Avoid unless clearly necessary — no
information available.

- **BREAST FEEDING** Use only if potential benefit outweighs
risk — no information available.

5 Pain

**Analgesics**

The non-opioid drugs, paracetamol p. 354 and aspirin p. 104
(and other NSAIDs), are particularly suitable for pain in
musculoskeletal conditions, whereas the opioid analgesics
are more suitable for moderate to severe pain, particularly
of visceral origin.

**Pain in sickle-cell disease**

The pain of mild sickle-cell crises is managed with
paracetamol p. 354, a NSAID, codeine phosphate p. 360, or
dihydrocodeine tartrate p. 362. Severe crises may require
the use of morphine p. 367 or diamorphine hydrochloride
p. 361; concomitant use of a NSAID may potentiate
analgesia and allow lower doses of the opioid to be used.
Pethidine hydrochloride p. 372 should be avoided if possible
because accumulation of a neurotoxic metabolite can
precipitate seizures; the relatively short half-life of
pethidine hydrochloride necessitates frequent injections.

**Dental and orofacial pain**

Analgesics should be used judiciously in dental care as a
temporary measure until the cause of the pain has been dealt with.

Dental pain of inflammatory origin, such as that
associated with pulpitis, apical infection, localised osteitis
or pericoronitis is usually best managed by treating the
infection, providing drainage, restorative procedures, and
other local measures. Analgesics provide temporary relief of
pain (usually for about 1 to 7 days) until the causative
factors have been brought under control. In the case of
pulpitis, intra-osseous infection or abscess, reliance on
analgesics alone is usually inappropriate.

Similarly the pain and discomfort associated with acute
problems of the oral mucosa (e.g. acute herpetic
gingivostomatitis, erythema multiforme) may be relieved by
benzylamine hydrochloride p. 993 mouthwash or spray
until the cause of the mucosal disorder has been dealt with.
However, where a patient is febrile, the antipyretic action of
paracetamol p. 354 or ibuprofen p. 927 is often helpful.

The choice of an analgesic for dental purposes should be
based on its suitability for the patient. Most dental pain is
relieved effectively by non-steroidal anti-inflammatory
( NSAIDS). NSAIDs that are used for dental pain
include ibuprofen p. 927, diclofenac sodium p. 921, and
aspirin p. 104. Paracetamol p. 354 has analgesic and
antipyretic effects but no anti-inflammatory effect.

Opioid analgesics such as dihydrocodeine tartrate p. 362
act on the central nervous system and are traditionally used for moderate to severe pain. However, opioid analgesics are
relatively ineffective in dental pain and their side-effects
may be unpleasant. Paracetamol, ibuprofen, or aspirin are
adequate for most cases of dental pain and an opioid is
rarely required.

Combining a non-opioid with an opioid analgesic can
provide greater relief of pain than either analgesic given
alone. However, this applies only when an adequate dose of
each analgesic is used. Most combination analgesic
preparations have not been shown to provide greater relief
of pain than an adequate dose of the non-opioid component
given alone. Moreover, combination preparations have the
disadvantage of an increased number of side-effects.

Any analgesic given before a dental procedure should
have a low risk of increasing postoperative bleeding. In the
case of pain after the dental procedure, taking an analgesic
before the effect of the local anaesthetic has worn off can
improve control. Postoperative analgesia with ibuprofen or
aspirin is usually continued for about 24 to 72 hours.

**Temporomandibular dysfunction** can be related to anxiety
in some patients who may clench or grind their teeth
(bruxism) during the day or night. The muscle spasm (which
appears to be the main source of pain) may be treated
empirically with an oral appliance which provides a free
sliding occlusion and may also interfere with grinding. In
addition, diazepam p. 267, which has muscle relaxant as
well as anti-inflammatory properties, may be helpful but it
should only be prescribed on a short-term basis during the
acute phase. Analgesics such as aspirin or ibuprofen may also
be required.

**Dysmenorrhoea**

Use of an oral contraceptive prevents the pain of
dysmenorrhoea which is generally associated with ovulatory
cycles. If treatment is necessary paracetamol p. 354 or a
NSAID will generally provide adequate relief of pain. The
vomiting and severe pain associated with dysmenorrhoea in
women with endometriosis may call for an antiemetic (in
addition to an analgesic). Antispasmodics (such as alverine
citrate p. 74) have been advocated for dysmenorrhoea but
the antispasmodic action does not generally provide
significant relief.

**Non-opioid analgesics and compound analgesic
preparations**

Aspirin p. 104 is indicated for headache, transient
musculoskeletal pain, dysmenorrhoea, and pyrexia. In
inflammatory conditions, most physicians prefer anti-
inflammatory treatment with another NSAID which may be
better tolerated and more convenient for the patient.
Aspirin is used increasingly for its antiplatelet properties.
Aspirin tablets or dispersible aspirin tablets are adequate for most purposes as they act rapidly. Gastric irritation may be a problem; it is minimised by taking the dose after food. Enteric-coated preparations are available, but have a slow onset of action and are therefore unsuitable for single-dose analgesic use (though their prolonged action may be useful for night pain).

Aspirin interacts significantly with a number of other drugs and its interaction with warfarin sodium is a special hazard.

Paracetamol p. 354 is similar in efficacy to aspirin, but has no demonstrable anti-inflammatory activity; it is less irritant to the stomach and for that reason is now generally preferred to aspirin, particularly in the elderly. Overdosage with paracetamol is particularly dangerous as it may cause hepatic damage which is sometimes not apparent for 4 to 6 days. Nefopam hydrochloride p. 356 may have a place in the relief of persistent pain unresponsive to other non-opioid analgesics. It causes little or no respiratory depression, but sympathomimetic and antimuscarinic side-effects may be troublesome.

Non-steroidal anti-inflammatory analgesics (NSAIDs) are particularly useful for the treatment of patients with chronic disease accompanied by pain and inflammation. Some of them are also used in the short-term treatment of mild to moderate pain including transient musculoskeletal pain but paracetamol is now often preferred, particularly in the elderly. They are also suitable for the relief of pain in dysmenorrhoea and to treat pain caused by secondary bone tumours, many of which produce lysis of bone and release prostaglandins. Selective inhibitors of cyclo-oxygenase-2 may be used in preference to non-selective NSAIDs for patients at high risk of developing serious gastro-intestinal side-effects. Several NSAIDs are also used for postoperative analgesia.

A non-opioid analgesic administered by intrathecal infusion (ziconotide (Prialt®), available from Eisai) is licensed for the treatment of chronic severe pain; ziconotide can be used by a hospital specialist as an adjunct to opioid analgesics.

Compound analgesic preparations

Compound analgesic preparations that contain a simple analgesic (such as aspirin p. 104 or paracetamol p. 354) with an opioid component reduce the need for effective titration of the individual components in the management of pain of varying intensity. Compound analgesic preparations containing paracetamol p. 354 or aspirin p. 104 with a low dose of an opioid analgesic (e.g. 8 mg of codeine phosphate per compound tablet) are commonly used, but the advantages have not been substantiated. The low dose of the opioid may be enough to cause opioid side-effects (in particular, constipation) and can complicate the treatment of overdosage yet may not provide significant additional relief of pain.

A full dose of the opioid component (e.g. 60 mg codeine phosphate) in compound analgesic preparations effectively augments the analgesic activity but is associated with the full range of opioid side-effects (including nausea, vomiting, severe constipation, drowsiness, respiratory depression, and risk of dependence on long-term administration). Important: the elderly are particularly susceptible to opioid side-effects and should receive lower doses.

In general, when assessing pain, it is necessary to weigh up carefully whether there is a need for a non-opioid and an opioid analgesic to be taken simultaneously.

Caffeine is a weak stimulant that is often included, in small doses, in analgesic preparations. It is claimed that the addition of caffeine may enhance the analgesic effect, but the alerting effect, mild habit-forming effect and possible provocation of headache may not always be desirable.

Moreover, in excessive dosage or on withdrawal caffeine may itself induce headache.

Co-proxamol tablets (dextropropoxyphene in combination with paracetamol) are no longer licensed because of safety concerns, particularly toxicity in overdose. Co-proxamol tablets (unlicensed) may still be prescribed for patients who find it difficult to change, because alternatives are not effective or suitable.

Opioid analgesics

Opioid analgesics are usually used to relieve moderate to severe pain particularly of visceral origin. Repeated administration may cause dependence and tolerance, but this is no deterrent in the control of pain in terminal illness. Regular use of a potent opioid may be appropriate for certain cases of chronic non-malignant pain; treatment should be supervised by a specialist and the patient should be assessed at regular intervals.

Strong opioids

Morphine p. 367 remains the most valuable opioid analgesic for severe pain although it frequently causes nausea and vomiting. It is the standard against which other opioid analgesics are compared. In addition to relief of pain, morphine also confers a state of euphoria and mental detachment.

Methadone hydrochloride p. 436 has both opioid agonist and antagonist properties and may precipitate withdrawal symptoms, including pain, in patients dependent on other opioids. It has abuse potential and may itself cause dependence. It has a much longer duration of action than morphine and sublingually is an effective analgesic for 6 to 8 hours. Unlike most opioid analgesics, the effects of buprenorphine are only partially reversed by naloxone hydrochloride p. 113.

Dipipanone hydrochloride used alone is less sedating than morphine but the only preparation available contains an antiemetic and is therefore not suitable for regular regimens in palliative care. Diamorphine hydrochloride p. 361 (heroin) is a powerful opioid analgesic. It may cause less nausea and hypotension than morphine. In palliative care the greater solubility of diamorphine hydrochloride allows effective doses to be injected in smaller volumes and this is important in the emaciated patient.

Alfentanil p. 357, fentanyl p. 362 and remifentanil p. 1108 are used by injection for intra-operative analgesia; fentanyl is available in a transdermal drug delivery system as a self-adhesive patch which is changed every 72 hours.

Methadone hydrochloride p. 436 is less sedating than morphine and acts for longer periods. In prolonged use, methadone hydrochloride should not be administered more often than twice daily to avoid the risk of accumulation and opioid over dosage. Methadone hydrochloride may be used instead of morphine in the occasional patient who experiences excitation (or exacerbation of pain) with morphine.

Oxycodone hydrochloride p. 369 has an efficacy and side-effect profile similar to that of morphine. It is used primarily for control of pain in palliative care.

Papaveretum p. 371 is rarely used; morphine is easier to prescribe and less prone to error with regard to the strength and dose.

Pentazocine p. 371 has both agonist and antagonist properties and precipitates withdrawal symptoms, including pain in patients dependent on opioids. By injection it is more potent than dihydrocodeine tartrate or codeine phosphate, but hallucinations and thought disturbances may occur. It is not recommended and, in particular, should
be avoided after myocardial infarction as it may increase pulmonary and aortic blood pressure as well as cardiac work.

Pethidine hydrochloride p. 372 produces prompt but short-lasting anaesthesia; it is less constipating than morphine, but even in high doses is a less potent analgesic. It is not suitable for severe continuing pain. It is used for analgesia in labour; however, other opioids, such as morphine or diamorphine hydrochloride p. 361, are often preferred for obstetric pain.

Tapentadol p. 372 produces analgesia by two mechanisms. It is an opioid-receptor agonist and it also inhibits noradrenaline reuptake. Nausea, vomiting, and constipation are less likely to occur with tapentadol than with other strong opioid analgesics.

Tramadol hydrochloride p. 373 produces analgesia by two mechanisms: an opioid effect and an enhancement of serotonergic and adrenergic pathways. It has fewer of the typical opioid side-effects (notably, less respiratory depression, less constipation and less addiction potential); psychiatric reactions have been reported.

Weak opioids
Codeine phosphate p. 360 can be used for the relief of mild to moderate pain where other painkillers such as paracetamol or ibuprofen have proved ineffective. Dihydrocodeine tartrate p. 362 has an analgesic efficacy similar to that of codeine phosphate. Higher doses may provide some additional pain relief but this may be at the cost of more nausea and vomiting.

Meptazinol p. 367 is claimed to have a low incidence of respiratory depression. It has a reported length of action of 2 to 7 hours with onset within 15 minutes.

Postoperative analgesia
A combination of opioid and non-opioid analgesics is used to treat postoperative pain. The use of intra-operative opioids affects the prescribing of postoperative analgesics. A postoperative opioid analgesic should be given with care since it may potentiate any residual respiratory depression.

Morphine p. 367 is used most widely. Tramadol hydrochloride p. 373 is not as effective in severe pain as other opioid analgesics. Buprenorphine p. 434 may antagonise the analgesic effect of previously administered opioids and is generally not recommended. Pethidine hydrochloride p. 372 is generally not recommended for postoperative pain because it is metabolised to norpethidine which may accumulate, particularly in renal impairment; norpethidine stimulates the central nervous system and may cause convulsions.

Opioids are also given epidurally [unlicensed route] in the postoperative period but are associated with side-effects such as pruritus, urinary retention, nausea and vomiting; respiratory depression can be delayed, particularly with morphine.

Patient-controlled analgesia (PCA) can be used to relieve postoperative pain—consult individual hospital protocols.

Pain management and opioid dependence
Although caution is necessary, patients who are dependent on opioids or have a history of drug dependence may be treated with opioid analgesics when there is a clinical need. Treatment with opioid analgesics in this patient group should normally be carried out with the advice of specialists. However, doctors do not require a special licence to prescribe opioid analgesics to patients with opioid dependence for relief of pain due to organic disease or injury.

ANALGESICS

Aspirin with codeine
The properties listed below are those particular to the combination only. For the properties of the components please consider, aspirin p. 104, codeine phosphate p. 360.

INDICATIONS AND DOSE
Mild to moderate pain | Pyrexia

BY MOUTH
▶ Adult: 1–2 tablets every 4–6 hours as required, dose to be dispersed in water; maximum 8 tablets per day

PRESCRIBING AND DISPENSING INFORMATION When co-codaprin tablets or dispersible tablets are prescribed and no strength is stated, tablets or dispersible tablets, respectively, containing codeine phosphate 8 mg and aspirin 400 mg should be dispensed.

LESS SUITABLE FOR PRESCRIBING Aspirin with codeine is less suitable for prescribing.

EXCEPTIONS TO LEGAL CATEGORY Aspirin with codeine can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Dispersible tablet

CODIS (Reckitt Benckiser Healthcare (UK) Ltd)

Mild to moderate pain | Pyrexia

BY MOUTH
▶ Adult: 0.5–1 g every 4–6 hours; maximum 4 g per day

BY INTRAVENOUS INFUSION
▶ Adult (body-weight 10–50 kg): 15 mg/kg every 4–6 hours, dose to be administered over 15 minutes; maximum 60 mg/kg per day
▶ Adult (body-weight 50 kg and above): 1 g every 4–6 hours, dose to be administered over 15 minutes; maximum 4 g per day

BY RECTUM
▶ Adult: 0.5–1 g every 4–6 hours; maximum 4 g per day
Pain

**Pain**

**PYREXIA**

- **By mouth**
  - Child 3-5 months: 60 mg every 4–6 hours; maximum 4 doses per day
  - Child 6 months-1 year: 120 mg every 4–6 hours; maximum 4 doses per day
  - Child 2-3 years: 180 mg every 4–6 hours; maximum 4 doses per day
  - Child 4-5 years: 240 mg every 4–6 hours; maximum 4 doses per day
  - Child 6-7 years: 240–250 mg every 4–6 hours; maximum 4 doses per day
  - Child 8-9 years: 360–375 mg every 4–6 hours; maximum 4 doses per day
  - Child 10-11 years: 480–500 mg every 4–6 hours; maximum 4 doses per day
  - Child 12-15 years: 480–750 mg every 4–6 hours; maximum 4 doses per day
  - Child 16-17 years: 0.5–1 g every 4–6 hours; maximum 4 doses per day

- **By rectum**
  - Child 3-11 months: 60–125 mg every 4–6 hours as required; maximum 4 doses per day
  - Child 1-4 years: 125–250 mg every 4–6 hours as required; maximum 4 doses per day
  - Child 5-11 years: 250–500 mg every 4–6 hours as required; maximum 4 doses per day
  - Child 12-17 years: 500 mg every 4–6 hours

**Post-immunisation pyrexia in infants**

- **By mouth**
  - Child 2 months: 60 mg for 1 dose, then 60 mg after 4–6 hours if required

**PANADOL ON**

**Mild to moderate pain**

- **By mouth**
  - Adult: 1 g up to 4 times a day, dose not to be taken more often than every 4 hours

**UNLICENSED USE**

- Paracetamol oral suspension 500 mg/5 mL not licensed for use in children under 16 years. Not licensed for use in children under 2 months by mouth; under 3 months by rectum. Intra muscular infusion not licensed in pre-term neonates, or children and neonates with body-weight under 10 kg.

**CAUTIONS**

- Alcohol dependence - before administering, check when paracetamol last administered and cumulative paracetamol dose over previous 24 hours - chronic alcoholism - chronic dehydration - chronic malnutrition - hepatocellular insufficiency

**INTERACTIONS** → Appendix 1 (paracetamol).

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Rare: Acute generalised exanthematous pustulosis - malaise - skin reactions - Stevens-Johnson syndrome - toxic epidermal necrolysis

- Frequency not known: Blood disorders - leucopenia - neutropenia - thrombocytopenia

**SPECIFIC SIDE-EFFECTS**

- Rare
  - With intravenous use: flushing - tachycardia
  - Frequency not known
  - With intravenous use: hypotension

**OVERDOSE**

**Important**:

Liver damage and less frequently renal damage may occur following overdose.

Nausea and vomiting, the only early features of poisoning, usually settle within 24 hours. Persistence beyond this time, often associated with the onset of right subcostal pain and tenderness, usually indicates development of hepatic necrosis.

For specific details on the management of poisoning, see Paracetamol, under Emergency treatment of poisoning, p. 1123

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Dose-related toxicity—avoid large doses.

**DIRECTIONS FOR ADMINISTRATION**

For intravenous infusion (Perfalgan®), give in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of not less than 1 mg/mL and use within an hour; may also be given undiluted. For children under 33 kg, use 50 mL-vial.

**PRESCRIBING AND DISPENSING INFORMATION**

BP directs that when Paediatric Paracetamol Oral Suspension or Paediatric Paracetamol Mixture is prescribed Paracetamol Oral Suspension 120 mg/5 mL should be dispensed.

**PATIENT AND CARER ADVICE**

- In children: Medicines for Children leaflet: Paracetamol for mild-to-moderate pain www.medicinesforchildren.org.uk/paracetamol-for-mildtomoderate-pain

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners’ formulary

Paracetamol Tablets may be prescribed. Paracetamol Soluble Tablets 500 mg may be prescribed. Paracetamol Oral Suspension may be prescribed.

**EXCEPTIONS TO LEGAL CATEGORY**

Paracetamol capsules or tablets can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: suppository, oral suspension, oral solution

**Tablet**

**CAUTIONARY AND ADVISORY LABELS**

29, 30

- **PARACETAMOL (Non-proprietary)**
  - Paracetamol 500 mg
    - 16 tablet [GS] £0.43 | 32 tablet [P] £2.11 DT price = £0.96 | 100 tablet [PS] £3.18 DT price = £3.00
  - Paracetamol 500 mg tablets

    - 16 tablet [GS] £0.07 | 32 tablet [P] £1.74 DT price = £0.96
  - Brands may include Mandinal

**Effervescent tablet**

- **PARACETAMOL (Non-proprietary)**
  - Paracetamol 500 mg
## Paracetamol (Non-proprietary)

### Solution for infusion
- **Paracetamol 120 mg** Disprol Paracetamol 120mg solution tablets (sugar-free) 16 tablet (GSL) £0.97
- **Oral solution**
  - **Capol Fastmelts** McNeil Products Ltd
  - **Paracetamol 250 mg** Capol Six Plus Fastmelts 250mg tablets (sugar-free) 12 tablet (P) £2.28 (sugar-free) 24 tablet (P) £3.59

### Capsule
- **Paracetamol 500 mg** Numark Paracetamol 500mg capsules | 12 capsule (P) £0.54 DT price = £1.33
- **Paracetamol 500mg capsules** | 16 capsule (P) £0.55
- **Paracetamol 500mg capsules** | 16 capsule (GSL) no price available

### Oral suspension
- **Paracetamol 24 mg per 1 ml** Paracetamol 120mg/5ml oral suspension paediatric | 100 ml (P) £0.72 | 500 ml (P) £3.10 DT price = £1.10
- **Paracetamol 120mg/5ml oral suspension paediatric sugar-free** (sugar-free) | 100 ml (P) £2.40 DT price = £1.39 (sugar-free) | 200 ml (P) £2.78 (sugar-free) | 500 ml (P) £6.95 (sugar-free) | 1000 ml (P) £13.90

### Paracetamol with tramadol

The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p.354, tramadol hydrochloride p.373.

### INDICATIONS AND DOSE

**Moderate to severe pain**

**By mouth**
- **Child:** 12-17 years: 2 tablets up to every 6 hours; maximum 8 tablets per day
- **Adult:** 2 tablets up to every 6 hours; maximum 8 tablets per day

### MEDICINAL FORMS

There may be variation in the licensing of different medicines containing the same drug.

### Tablet

- **Paracetamol 325 mg, Tramadol hydrochloride 37.5 mg** Tramadol 37.5mg / Paracetamol 325mg tablets | 60 tablet (GSL) £9.20-£9.68 DT price = £9.22 Schedule 3 (CD No Register Exempt Safe Custody)
- **Tramact (Grunenthal Ltd)**
  - **Paracetamol 325 mg, Tramadol hydrochloride 37.5 mg** Tramact 37.5mg/325mg effervescent tablets (sugar-free) | 60 tablet (P) £9.68 DT price = £9.22 Schedule 3 (CD No Register Exempt Safe Custody)

### Effervescent tablet

- **Paracetamol with tramadol**
  - **By mouth**
    - **Adult:** Initially 60 mg 3 times a day, adjusted according to response; usual dose 30–90 mg 3 times a day

### Nefopam hydrochloride

### INDICATIONS AND DOSE

**Moderate pain**

**By mouth**
- **Adult:** Initially 60 mg 3 times a day, adjusted according to response; usual dose 30–90 mg 3 times a day
Opioids

CONTRA-INDICATIONS Acute respiratory depression • comatose patients • head injury (opioid analgesics interfere with pupillary responses vital for neurological assessment) • raised intracranial pressure (opioid analgesics interfere with pupillary responses vital for neurological assessment) • risk of paralytic ileus

CAUTIONS Adrenocortical insufficiency (reduced dose is recommended) • asthma (avoid during an acute attack) • convulsive disorders • debilitated patients (reduced dose is recommended) • diseases of the biliary tract • elderly (reduced dose is recommended) • hypotension • hypothyroidism (reduced dose is recommended) • impaired respiratory function (avoid in chronic obstructive pulmonary disease) • inflammatory bowel disorders • myasthenia gravis • obstructive bowel disorders • prostatic hypertrophy • shock • urethral stenosis

CAUTIONS, FURTHER INFORMATION Dependence Repeated use of opioid analgesics is associated with the development of psychological and physical dependence; although this is rarely a problem with therapeutic use, caution is advised if prescribing for patients with a history of drug dependence.

Palliative care In the control of pain in terminal illness, the cautions listed should not necessarily be a deterrent to the use of opioid analgesics.

INTERACTIONS → Appendix 1 (opioid analgesics).

SIDE-EFFECTS

Common or very common Biliary spasm • bradycardia • confusion • constipation • dependence • difficulty with micturition • dizziness • drowsiness • dry mouth • dysphoria • euphoria • flushing • hallucinations • headache • hypotension (larger doses) • miosis • mood changes • muscle rigidity (larger doses) • nausea (particularly in initial stages) • oedema • palpitation • postural hypotension • pruritus • rash • respiratory depression (larger doses) • sexual dysfunction • sleep disturbances • sweating • tachycardia • ureteric spasm • urinary retention • urticaria • vertigo • visual disturbances • vomiting (particularly in initial stages)

Frequency not known Adrenal insufficiency (long-term use) • hyperalgesia (long-term use) • hypogonadism (long-term use)

SIDE-EFFECTS, FURTHER INFORMATION

Hypogonadism and adrenal insufficiency Long-term use of opioid analgesics can cause hypogonadism and adrenal insufficiency in both males and females. This is thought to be dose related and can lead to amenorrhoea, reduced libido, infertility, depression, and erectile dysfunction.

Hyperalgesia Long-term use of opioid analgesics has also been associated with a state of abnormal pain sensitivity (hyperalgesia). Pain associated with hyperalgesia is usually distinct from pain associated with disease progression or breakthrough pain, and is often more diffuse and less defined. Treatment of hyperalgesia involves reducing the dose of opioid medication or switching therapy; cases of suspected hyperalgesia should be referred to a specialist pain team.

Respiratory depression Respiratory depression is a major concern with opioid analgesics and it may be treated by artificial ventilation or be reversed by naloxone.

Dependence and withdrawal Psychological dependence rarely occurs when opioids are used therapeutically (e.g. for pain relief) but tolerance can develop during long-term treatment.

Overdose Opioids (narcotic analgesics) cause coma, respiratory depression, and pinpoint pupils. For details on the management of poisoning, see Opioids, under Emergency treatment of poisoning p. 1123 and consider the specific antidote, naloxone hydrochloride p. 1133.

Pregnancy Respiratory depression and withdrawal symptoms can occur in the neonate if opioid analgesics are used during delivery; also gastric stasis and inhalation pneumonia has been reported in the mother if opioid analgesics are used during labour.

Hepatic impairment Avoid use or reduce dose; may precipitate coma in patients with hepatic impairment.

Renal impairment Avoid use or reduce dose; may precipitate coma in patients with renal impairment.

Drug and driving legislation regarding driving whilst taking certain controlled drugs, including opioids, see Drugs and driving under Guidance on prescribing p. 1.

Alfentanil

INDICATIONS AND DOSE

Spontaneous respiration: analgesia and enhancement of anaesthesia for short procedures

BY INTRAVENOUS INJECTION

Adult: Initially up to 500 micrograms, dose to be administered over 30 seconds; supplemental doses 250 micrograms

Assisted ventilation: analgesia and enhancement of anaesthesia for short procedures

BY INTRAVENOUS INJECTION

Adult: Initially 30–50 micrograms/kg, supplemental doses 15 micrograms/kg
Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia for longer procedures

**BY INTRAVENOUS INFUSION**
- Adult: Initially 50–100 micrograms/kg, dose to be administered over 10 minutes or as a bolus, followed by maintenance 30–60 micrograms/kg/hour

**Assisted ventilation: analgesia and suppression of respiratory activity during intensive care**

**BY INTRAVENOUS INFUSION**
- Adult: Initially 2 mg/hour, adjusted according to response; usual dose 0.5–10 mg/hour, alternatively initially 5 mg in divided doses, to be administered over 10 minutes; dose used for more rapid initial control, reduce rate of administration if hypotension or bradycardia occur; additional doses of 0.5–1 mg may be given by intravenous injection during short painful procedures

**Doses at extremes of body-weight**
To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal bodyweight.

**PHARMACOKINETICS**
Half-life is prolonged in neonates and accumulation is likely with prolonged use. Clearance may be increased in children 1 month–12 years and higher infusion doses might be needed.

**CAUTIONS**

**CAUTIONS, FURTHER INFORMATION**
Repeated intra-operative doses Repeated intra-operative doses of alfentanil should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive.

**SIDE-EFFECTS**
- **Common or very common** Hypertension - myoclonic movements
- **Uncommon** Arrhythmias - hiccup - laryngospasm
- **Rare** Epistaxis
- **Frequency not known** Cardiac arrest - convulsions - cough - muscle rigidity - pyrexia

**SIDE-EFFECTS, FURTHER INFORMATION**
Muscle rigidity Alfentanil can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

**BREAST FEEDING**
Present in milk— withhold breastfeeding for 24 hours.

**RENAL IMPAIRMENT**
Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**DIRECTIONS FOR ADMINISTRATION**
5 mg/mL injection to be diluted before use. For continuous or intermittent intravenous infusion dilute in Glucose 5% or Sodium Chloride 0.9%.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, spray

**Solution for injection**
- **ALFENTANIL** (Non-proprietary) Alfentanil (as Alfentanil hydrochloride) 500 microgram per 1 ml Alfentanil 1mg/2ml solution for injection ampoules | 10 ampoule (Pom) £7.00 Schedule 2 (CD)
Alfentanil 5mg/1ml solution for injection ampoules | 5 ampoule (Pom) £16.00 Schedule 2 (CD)
Alfentanil (as Alfentanil hydrochloride) 5 mg per 1 ml Alfentanil 5mg/1ml solution for injection ampoules | 10 ampoule (Pom) £25.00 Schedule 2 (CD)

**Co-codamol**

**INDICATIONS AND DOSE**
Mild to moderate pain (using co-codamol 8/500 preparations only)

**BY MOUTH**
- Adult: 8/500–16/1000 mg every 4–6 hours as required; maximum 64/4000 mg per day

Mild to moderate pain (using co-codamol 15/500 preparations only)

**BY MOUTH**
- Adult: 15/500–30/1000 mg every 4–6 hours as required; maximum 120/4000 mg per day

Severe pain (using co-codamol 30/500 preparations only)

**BY MOUTH**
- Adult: 30/500–60/1000 mg every 4–6 hours as required; maximum 240/4000 mg per day

**SOLPADOIL® CAPLETS**
Severe pain

**BY MOUTH**
- Adult: 2 tablets every 4–6 hours as required; maximum 8 tablets per day

**KAPACE® 15/500**
Mild to moderate pain

**BY MOUTH**
- Adult: 2 tablets every 4–6 hours as required; maximum 8 tablets per day

**SOLPADOIL® EFFERVESCENT TABLETS**
Severe pain

**BY MOUTH USING EFFERVESCENT TABLETS**
- Adult: 2 tablets every 4–6 hours as required, tablets to be dispersed in water; maximum 8 tablets per day

**SOLPADOIL® CAPSULES**
Severe pain

**BY MOUTH**
- Adult: 2 capsules every 4–6 hours as required; maximum 8 capsules per day

**Important safety information**
See codeine phosphate p. 360 for MHRA/CHM advice for restrictions on the use of codeine as an analgesic in children.

**CONTRA-INDICATIONS**
Acute ulcerative colitis - antibiotic-associated colitis - children under 18 years who undergo the removal of tonsils or adenoids for the treatment of obstructive sleep apnoea - conditions where abdominal distention develops - conditions where inhibition of peristalsis should be avoided - known ultra-rapid codeine metabolisers

**CAUTIONS**
Acute abdomen - alcohol dependence - avoid abrupt withdrawal after long-term treatment - cardiac arrhythmias - chronic alcoholism - chronic dehydration - chronic malnutrition - convulsive disorders - gallstones - hepatocellular insufficiency

**CAUTIONS, FURTHER INFORMATION**
Variation in metabolism The capacity to metabolise codeine to morphine can vary considerably between

**Rapifen (Janssen-Cilag Ltd)**
Alfentanil (as Alfentanil hydrochloride) 500 microgram per 1 ml Rapifen 5mg/10ml solution for injection ampoules | 5 ampoule (Pom) £14.50 Schedule 2 (CD)
Alfentanil 1mg/2ml solution for injection ampoules | 10 ampoule (Pom) £6.34 Schedule 2 (CD)
Alfentanil (as Alfentanil hydrochloride) 5 mg per 1 ml Rapifen Intensive Care 5mg/1ml solution for injection ampoules | 10 ampoule (Pom) £23.19 (Hospital only) Schedule 2 (CD)
individuals; there is a marked increase in morphine toxicity in patients who are ultra-rapid codeine metabolisers (CYP2D6 ultra-rapid metabolisers) and a reduced therapeutic effect in poor codeine metabolisers.

**INTERACTIONS**  Appendix 1 (paracetamol).

**SIDE-EFFECTS** Abdominal pain, anorexia, blood disorders, depression (with larger doses), hypothermia, leucopenia, malaise, muscle fasciculation, neutropenia, pancreatitis, seizures, thrombocytopenia.

**Overdose Important:** liver damage (and less frequently renal damage) following overdosage with paracetamol.

**BREAST FEEDING** Avoid—although amount of codeine usually too small to be harmful, mothers vary considerably in their capacity to metabolise codeine—risk of morphine overdose in infant.

**HEPATIC IMPAIRMENT** Dose-related toxicity with paracetamol—avoid large doses.

**RENAI IMPAIRMENT** Reduce dose or avoid codeine; increased and prolonged effect; increased cerebral sensitivity.

**PRESCRIBING AND DISPENSING INFORMATION** Co-codamol is a mixture of codeine phosphate and paracetamol; the proportions are expressed in the form x/y, where x and y are the strengths in milligrams of codeine phosphate and paracetamol respectively.

When co-codamol tablets, dispersible (or effervescent) tablets, or capsules are prescribed and no strength is stated, tablets, dispersible (or effervescent) tablets, or capsules, respectively, containing codeine phosphate 8 mg and paracetamol 500 mg should be dispensed. The Drug Tariff allows tablets of co-codamol labelled "dispersible" to be dispensed against an order for "effervescent" and vice versa.

**LESS SUITABLE FOR PRESCRIBING** Co-codamol is less suitable for prescribing.

**EXCEPTIONS TO LEGAL CATEGORY** Co-codamol 8/500 can be sold to the public in certain circumstances; for exemptions see Medicines, Ethics and Practice. London, Pharmaceutical Press (always consult latest edition).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

**Tablet**

**CO-CODAMOL (Non-proprietary)**

**Co-dydramol**

**INDICATIONS AND DOSE**

Mild to moderate pain (using co-dydramol 10/500 preparations only)

**BY MOUTH**

Adult: 10/500 – 20/1000 mg every 4 – 6 hours as required; maximum 80/4000 mg per day

Severe pain (using co-dydramol 20/500 preparations only)

**BY MOUTH**

Adult: 20/500 – 40/1000 mg every 4 – 6 hours as required; maximum 160/4000 mg per day

Severe pain (using co-dydramol 30/500 preparations only)

**BY MOUTH**

Adult: 30/500 – 60/1000 mg every 4 – 6 hours as required; maximum 240/4000 mg per day

**Dose equivalence and conversion**

A mixture of dihydrocodeine tartrate and paracetamol; the proportions are expressed in the form x/y,
Nervous system

Codeine phosphate

**PRESCRIBING AND DISPENSING INFORMATION**

**RENAL IMPAIRMENT**
Reduce dose or avoid.

**SIDE-EFFECTS**
- Abdominal pain
- Acute diarrhoea
- Constipation
- Reversible liver damage (and less frequently renal damage) following overdose with paracetamol.
- **OVERDOSAGE**
  - **Important:** liver damage (and less frequently renal damage) following overdose with paracetamol.

**INTERACTIONS**
- **Appendix 1 (paracetamol).**
- **CO-DYDRAMOL (Non-proprietary)**
  - Dihydrocodeine tartrate 10 mg, Paracetamol 500 mg
  - **Tablet**
    - Containing the same drug. Forms available from special-order
    - There can be variation in the licensing of different medicines.

**CONTRADICTION**
- Codeine is contra-indicated in all children (under 18 years) who undergo the removal of tonsils or adenoids for the treatment of obstructive sleep apnoea.
- **Cautions and Advisory Labels**
  - Co-dyramol tablets are prescribed and no strength is stated, tablets containing dihydrocodeine tartrate 10 mg and paracetamol 500 mg should be dispensed.
  - Co-dyramol is less suitable for prescribing.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, powder.

**Important safety information**

**MHRA/CHM ADVICE (JULY 2013) CODEINE FOR ANALGESIA:**
- RESTRICTED USE IN CHILDREN DUE TO REPORTS OF MORPHINE TOXICITY
- Codeine should only be used to relieve acute moderate pain in children older than 12 years and only if it cannot be relieved by other painkillers such as paracetamol or ibuprofen alone.

**Codeine phosphate**

**INDICATIONS AND DOSE**

**Acute diarrhoea**

**BY MOUTH**
- Child: 30 mg 3–4 times a day; usual dose 15–60 mg 3–4 times a day.
- Adult: 30 mg 3–4 times a day; usual dose 15–60 mg 3–4 times a day.

**Mild to moderate pain**

**BY MOUTH**
- Adult: 30–60 mg every 4 hours if required; maximum 240 mg per day.
- **BY INTRAMUSCULAR INJECTION**
- Adult: 30–60 mg every 4 hours if required.

**Short-term treatment of acute moderate pain**

**BY MOUTH OR BY INTRAMUSCULAR INJECTION**
- Child 12-17 years: 30–60 mg every 6 hours if required for maximum 3 days; maximum 240 mg per day.

**CONTRA-INDICATIONS**
- Acute ulcerative colitis - antibiotic-associated colitis - children under 18 years who undergo the removal of tonsils or adenoids for the treatment of obstructive sleep apnoea - conditions where abdominal distension develops - conditions where inhibition of peristalsis should be avoided - known ultrarapid codeine metabolisers

**CAUTIONS**
- Acute abdominal - cardiac arrhythmias - gallstones - not recommended for adolescents aged 12–18 years with breathing problems

**CAUTIONS, FURTHER INFORMATION**

**Variation in metabolism**
- The capacity to metabolise codeine to morphine can vary considerably between individuals; there is a marked increase in morphine toxicity in patients who are ultrarapid codeine.

**500 tablet (P) £13.50 Schedule 5 (CD Inv)**

---

**MEDICATION SYSTEM OF CLASSIFICATION**

- N02C Codeine
- N02CA09 Dihydrocodeine
- N02B20 Paracetamol

---

**DRY OR PAINFUL COUGH**

**BY MOUTH USING LINCTUS**

- Adult: 15–30 mg 3–4 times a day.
metabolisers (CYP2D6 ultra-rapid metabolisers) and a reduced therapeutic effect in poor codeine metabolisers.

- **SIDE-EFFECTS** Abdominal pain · anorexia · antidiuretic effect · hypothermia · malaise · muscle fasciculation · pancreatitis · seizures
- **BREAST FEEDING** Avoid—although amount usually too small to be harmful, mothers vary considerably in their capacity to metabolise codeine—risk of morphine overdose in infant.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **PRESCRIBING AND DISPENSING INFORMATION** BP directs that when Diabetic Codeine Linctus is prescribed, Codeine Linctus formulated with a vehicle appropriate for administration to diabetics, whether or not labelled 'Diabetic Codeine Linctus', shall be dispensed or supplied.
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Codeine phosphate for pain www.medicinesforchildren.org.uk/codeine-phosphate-pain-0

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: suppository, solution for injection, oral suspension, oral solution

**Tablet**

  - Codeine phosphate 60 mg per 1 ml Codeine 60mg/1ml solution for injection ampoules | 10 ampoule (PBM) £23.70–£25.00 Schedule 2 (CD)

---

**Diamorphine hydrochloride**

*Heroin hydrochloride*

**INDICATIONS AND DOSE**

**Acute pain**

- **BY INTRAMUSCULAR INJECTION OR BY SUBCUTANEOUS INJECTION**
  - Adult: 5 mg every 4 hours if required
  - By SLOW INTRAVENOUS INJECTION
  - Adult: 1.25–2.5 mg every 4 hours if required

**Acute pain (heavier, well-muscled patients)**

- **BY INTRAMUSCULAR INJECTION OR BY SUBCUTANEOUS INJECTION**
  - Adult: Up to 10 mg every 4 hours if required
  - By SLOW INTRAVENOUS INJECTION
  - Adult: 2.5–5 mg every 4 hours if required

**Chronic pain not currently treated with a strong opioid analgesic**

- **BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION**
  - Adult: Initially 2.5–5 mg every 4 hours, adjusted according to response
  - By SUBCUTANEOUS INFUSION
  - Adult: Initially 5–10 mg, adjusted according to response, dose to be administered over 24 hours

**Acute pulmonary oedema**

- **BY SLOW INTRAVENOUS INJECTION**
  - Adult: 2.5–5 mg, dose to be administered at a rate of 1 mg/minute

**Myocardial infarction**

- **BY SLOW INTRAVENOUS INJECTION**
  - Adult: 5 mg, followed by 2.5–5 mg if required, dose to be administered at a rate of 1–2 mg/minute
  - Elderly: 2.5 mg, followed by 1.25–2.5 mg if required, dose to be administered at a rate of 1–2 mg/minute

**Myocardial infarction (frail patients)**

- **BY SLOW INTRAVENOUS INJECTION**
  - Adult: 2.5 mg, followed by 1.25–2.5 mg if required, dose to be administered at a rate of 1–2 mg/minute

- **CONTRA-INDICATIONS** Delayed gastric emptying · phaeochromocytoma

- **CAUTIONS** CNS depression · severe cor pulmonale · severe diarrhoea · toxic psychosis

- **SIDE-EFFECTS** Anorexia · asthenia · myocardial infarction · raised intracranial pressure · syncope · taste disturbance

- **BREAST FEEDING** Therapeutic doses unlikely to affect infant; withdrawal symptoms in infants of dependent mothers; breast-feeding not best method of treating dependence in offspring.

- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: powder for solution for injection, suppository, solution for injection, oral solution, capsule, impregnated cigarette

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 2**

  - Diamorphine hydrochloride 50 mg Diamorphine 50mg powder for solution for injection ampoules | 5 vial (PBM) £14.02 DT price = £14.02 Schedule 2 (CD)
  - Diamorphine hydrochloride 100 mg Diamorphine 100mg powder for solution for injection ampoules | 5 vial (PBM) £42.99–£54.00 Schedule 2 (CD)
Dihydrocodeine tartrate

INDICATIONS AND DOSE
Moderate to severe pain
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 4–11 years: 0.5–1 mg/kg every 4–6 hours (max. per dose 30 mg)
- Child 12–17 years: 30 mg every 4–6 hours
- Adult: 30 mg every 4–6 hours as required
BY DEEP SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION
- Adult: Up to 50 mg every 4–6 hours if required
Chronic severe pain
BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Child 12–17 years: 60–120 mg every 12 hours
- Adult: 60–120 mg every 12 hours

DF118 FORTE

Severe pain
BY MOUTH
- Child 12–17 years: 40–80 mg 3 times a day; maximum 240 mg per day
- Adult: 40–80 mg 3 times a day; maximum 240 mg per day

- UNLICENSED USE Most preparations not licensed for use in children under 4 years.
- CAUTIONS Pancreatitis, severe corticosteroids, paralytic ileus.
- SIDE-EFFECTS Abdominal pain, diarrhoea, paraesthesia, raised intracranial pressure.
- BREAST FEEDING Use only if potential benefit outweighs risk.
- RENAL IMPAIRMENT Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- PROFESSIONAL SPECIFIC INFORMATION
- Dental practitioners’ formulary Dihydrocodeine tablets 30 mg may be prescribed.
- MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Dipipanone hydrochloride with cyclizine

INDICATIONS AND DOSE
Acute pain
BY MOUTH
- Adult: Initially 1 tablet every 6 hours, then increased if necessary up to 3 tablets every 6 hours, dose to be increased gradually

- CAUTIONS Diabetes mellitus, palliative care (not recommended), phaeochromocytoma.
- SIDE-EFFECTS Psychosis, raised intracranial pressure, restlessness.
- BREAST FEEDING No information available.
- RENAL IMPAIRMENT Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

- MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Table
- DIPANNONE HYDROCHLORIDE WITH CYCLIZINE (Non-proprietary)
  - Cyclizine hydrochloride 30 mg, Dipipanone hydrochloride
  - 10 mg
  - Dipipanone 10mg / Cyclizine 30mg tablets
  - 50 tablet PO £181.67 DT price = £181.67 Schedule 2 (CD)

Fentanyl

INDICATIONS AND DOSE
Chronic intractable pain not currently treated with a strong opioid analgesic
BY TRANSDERMAL APPLICATION
- Child 16–17 years: Initially 12 micrograms/hour every 72 hours, alternatively initially 25 micrograms/hour every 72 hours, when starting, evaluation of the analgesic effect should not be made before the system has been worn for 24 hours (to allow for the gradual increase in plasma-fentanyl concentration)—previous analgesic therapy should be phased out gradually from time of first patch application, dose should be adjusted at 48–72 hour intervals in steps of 12–25 micrograms/hour if necessary, more than one patch may be used at a time (but applied at the same time to avoid confusion)—consider additional or alternative analgesic therapy if dose required exceeds 300 micrograms/hour (important: it takes 17 hours or more for the plasma-fentanyl concentration to decrease by 50%—replacement opioid therapy should be initiated at a low dose and increased gradually)
- Adult: Initially 12 micrograms/hour every 72 hours, alternatively initially 25 micrograms/hour every 72 hours, when starting, evaluation of the analgesic effect should not be made before the system has been worn for 24 hours (to allow for the gradual increase in plasma-fentanyl concentration)—previous analgesic
therapy should be phased out gradually from time of first patch application, dose should be adjusted at 48–72 hour intervals in steps of 12–25 micrograms/hour if necessary, more than one patch may be used at a time (but applied at the same time to avoid confusion)—consider additional or alternative analgesic therapy if dose required exceeds 300 micrograms/hour (important: it takes 17 hours or more for the plasma-fentanyl concentration to decrease by 50%—replacement opioid therapy should be initiated at a low dose and increased gradually).

**Chronic intractable pain currently treated with a strong opioid analgesic**

**By Transdermal Application**

- Child 2-17 years: Initial dose based on previous 24-hour opioid requirement (consult product literature), for evaluating analgesic efficacy and dose increments, see under Chronic intractable pain not currently treated with a strong opioid analgesic, for conversion from long-term oral morphine to transdermal fentanyl, see Pain management with opioids under p. 20.
- Adult: Initial dose based on previous 24-hour opioid requirement (consult product literature), for evaluating analgesic efficacy and dose increments, see under Chronic intractable pain not currently treated with a strong opioid analgesic, for conversion from long-term oral morphine to transdermal fentanyl, see Pain management with opioids under p. 20.

**Spontaneous respiration: analgesia and enhancement of anaesthesia, during operation**

**By Slow Intravenous Injection**

- Adult: Initially 50–100 micrograms (max. per dose 200 micrograms); dose maximum on specialist advice, then 25–50 micrograms as required

**By Intravenous Infusion**

- Adult: 3–4.8 micrograms/kg/hour, adjusted according to response

**Assisted ventilation: analgesia and enhancement of anaesthesia during operation**

**By Slow Intravenous Injection**

- Adult: Initially 10 micrograms/kg, dose to be given over 10 minutes, then 6 micrograms/kg/hour, adjusted according to response, may require up to 180 micrograms/kg/hour during cardiac surgery

**By Intravenous Infusion**

- Adult: Initially 10 micrograms/kg, dose to be given over 10 minutes, then 6 micrograms/kg/hour, adjusted according to response, may require up to 180 micrograms/kg/hour during cardiac surgery

**Breakthrough pain in patients receiving opioid therapy for chronic cancer pain**

**INITIALLY BY BUCCAL ADMINISTRATION USING LOZENGES**

- Child 16-17 years: Initially 200 micrograms, dose to be given over 15 minutes, then (by buccal administration) 200 micrograms after 15 minutes if required, no more than 2 dose units for each pain episode; if adequate pain relief not achieved with 1 dose unit for consecutive breakthrough pain episodes, increase the strength of the dose unit until adequate pain relief achieved with 4 lozenges or less daily, if more than 4 episodes of breakthrough pain each day, adjust background analgesia

- Adult: Initially 200 micrograms, dose to be given over 15 minutes, then (by buccal administration) 200 micrograms after 15 minutes if required, no more than 2 dose units for each pain episode; if adequate pain relief not achieved with 1 dose unit for consecutive breakthrough pain episodes, increase the strength of the dose unit until adequate pain relief achieved with 4 lozenges or less daily, if more than 4 episodes of breakthrough pain each day, adjust background analgesia

**By Buccal Administration Using Buccal Films**

- Adult: Initially 200 micrograms, adjusted according to response, consult product literature for information on dose adjustments, maximum 1.2 mg per episode of breakthrough pain; leave at least 4 hours between treatment of episodes of breakthrough pain, if more than 4 episodes of breakthrough pain each day occur on more than 4 consecutive days, adjust background analgesia

**Doses at extremes of body-weight**

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal bodyweight.

**Dose equivalence and conversion**

Fentanyl films are not bioequivalent to other fentanyl preparations. Fentanyl preparations for the treatment of breakthrough pain are not interchangeable; if patients are switched from another fentanyl-containing preparation, a new dose titration is required.

**ABSTRAL®**

**Breakthrough pain in patients receiving opioid therapy for chronic cancer pain**

**By Mouth Using SUBLINGUAL TABLETS**

- Adult: Initially 100 micrograms, then 100 micrograms after 15–30 minutes if required, dose to be adjusted according to response—consult product literature, no more than 2 dose units 15–30 minutes apart, for each pain episode; max. 800 micrograms per episode of breakthrough pain; leave at least 2 hours between treatment of episodes of breakthrough pain, if more than 4 episodes of breakthrough pain each day occur on more than 4 consecutive days, adjust background analgesia

**RECIVIT® SUBLINGUAL TABLETS**

**Breakthrough pain in patients receiving opioid therapy for chronic cancer pain**

**By Mouth**

- Adult: Initially 133 micrograms, then 133 micrograms after 15–30 minutes (max. per dose 800 micrograms), dose to be repeated only if necessary. Consult product literature for dose adjustments, no more than 2 dose units 15–30 minutes apart, for each pain episode, maximum of 800 micrograms per episode of breakthrough pain, if more than 4 episodes of breakthrough pain each day occur on more than 4 consecutive days, adjust background analgesia; maximum 4 doses per day

**EFFENTORA®**

**Breakthrough pain in patients receiving opioid therapy for chronic cancer pain**

**By Mouth Using SUBLINGUAL TABLETS**

- Adult: Initially 100 micrograms, then 100 micrograms after 30 minutes if required, dose to be adjusted according to response—consult product literature, no more than 2 dose units for each pain episode; max. 800 micrograms per episode of breakthrough pain; leave at least 4 hours between treatment of episodes of breakthrough pain during titration

Continued →
PECFENT®
Breakthrough pain in patients receiving opioid therapy for chronic cancer pain
BY INTRanasAL ADMINISTRATION
- Adult: Initially 100 micrograms, adjusted according to response, dose to be administered into one nostril only, maximum 2 sprays for each pain episode and minimum 4 hours between treatment of each pain episode, if more than 4 breakthrough pain episodes daily, adjust background analgesia

INSTANyL®
Breakthrough pain in patients receiving opioid therapy for chronic cancer pain
BY INTRanasAL ADMINISTRATION
- Adult: Initially 50 micrograms, dose to be administered into one nostril, then 50 micrograms after 10 minutes if required, dose to be adjusted according to response, maximum 2 sprays for each pain episode and minimum 4 hours between treatment of each pain episode, if more than 4 breakthrough pain episodes daily, adjust background analgesia

UNLICENSED USE
- Not licensed for use in children under 2 years; infusion not licensed for use in children under 12 years.

CAUTIONS
- GENERAL CAUTIONS: Cerebral tumour, diabetes mellitus (with Actiq® lozenges), impaired consciousness
- SPECIFIC CAUTIONS
  - With buccal use: mucositis—absorption from oral preparations may be increased, caution during dose titration (in adults)
  - Transdermal preparations
    - Transdermal fentanyl patches are not suitable for acute pain or in those patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. Risk of fatal respiratory depression, particularly in patients not previously treated with a strong opioid analgesic; manufacturer recommends use only in opioid tolerant patients.
    - Repeated intra-operative doses
      - Repeated intra-operative doses should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive.

SIDE-EFFECTS
- COMMON SIDE-EFFECTS
  - Uncommon: amnesia, arthralgia, blood disorders, chills, depressed level of consciousness, dysgeusia, flatulence, hypoventilation, ileus, impaired coordination, impaired vasodilation
  - Rare: hiccups
  - Very rare: Apnoea, arrhythmia, ataxia, bladder pain, delusions, haemoptysis

SPECIFIC SIDE-EFFECTS
- Common or very common
  - With intravenous use: myoclonic movements
  - Uncommon
  - With intravenous use: laryngospasm
  - Rare
    - With intravenous use: astyole, insomnia

SIDE-EFFECTS, FURTHER INFORMATION
- Fever or external heat: Monitor patients using patches for increased side-effects if fever present (increased absorption possible); avoid exposing application site to external heat, for example a hot bath or sauna (may also increase absorption).
- Muscle rigidity: Intravenous fentanyl can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

BREAST FEEDING
- Monitor infant for opioid-induced side-effects.

RENAL IMPAIRMENT
- Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

DIRECTIONS FOR ADMINISTRATION
- With transdermal use: For patches, apply to dry, non-irritated, non-irradiated, non-hairy skin on torso or upper arm, removing after 72 hours and siting replacement patch on a different area (avoid using the same area for several days).
- With intravenous use in children: For intravenous infusion, injection solution may be diluted in Glucose 5% or Sodium Chloride 0.9%.
- With intravenous use in adults: For intravenous infusion (Sublimaze), give continuously or intermittently in Glucose 5% or Sodium Chloride 0.9%.
- With buccal use: For buccal films, moisten mouth, place film on inner lining of cheek (pink side to cheek), hold for at least 5 seconds until it sticks, and leave to dissolve (15–30 minutes); if more than 1 film required do not overlap, but use another area of the mouth. Avoid liquids for 5 minutes after application; avoid food until the film has dissolved.
  - With buccal use: Patients should be advised to place the lozenge in the mouth against the cheek and move it around the mouth using the applicator; each lozenge should be sucked over a 15 minute period. In patients with a dry mouth, water may be used to moisten the buccal mucosa. Patients with diabetes should be advised each lozenge contains approximately 2 g glucose.

EFFENTORA®
- Place tablet between cheek and gum and leave to dissolve; if more than 1 tablet required, place second tablet on the other side of the mouth; tablet may alternatively be placed under the tongue (sublingually).

INSTANyL®
- Patient should sit or stand during administration.

PRESCRIBING AND DISPENSING INFORMATION
- Prescriptions for fentanyl patches can be written to show the strength in terms of the release rate and it is acceptable to write ‘Fentanyl 25 patches’ to prescribe patches that release fentanyl 25 micrograms per hour. The dosage should be expressed in terms of the interval between applying a patch and replacing it with a new one, e.g. ‘one patch to be applied every 72 hours’. The total quantity of patches to be supplied should be written in words and figures.

PATIENT AND CARER ADVICE
- Medicines for Children leaflet: Fentanyl lozenges for pain
  - www.medicinesforchildren.org.uk/fentanyl-lozenges-for-pain
- Medicines for Children leaflet: Fentanyl patches for pain
  - www.medicinesforchildren.org.uk/fentanyl-patches-for-pain
- With transdermal use: Patients and carers should be informed about safe use, including correct administration and disposal, strict adherence to dosage instructions, and the symptoms and signs of opioid overdose. Patches should be removed immediately in case of breathing difficulties, marked drowsiness, confusion, dizziness, or
impaired speech, and patients and carers should seek prompt medical attention.

- With buccal use Patients or carers should be given advice on how to administer fentanyl buccal films or fentanyl lozenges.
- With intranasal use Patients or carers should be given advice on how to administer fentanyl nasal spray.

**ABSTRAL®**

Patients should be advised not to eat or drink until the tablet is completely dissolved. In patients with a dry mouth, the buccal mucosa may be moistened with water before administration of tablet.

**RECVIT® SUBLINGUAL TABLETS**

Patients should be advised not to eat or drink until the tablet is completely dissolved; after 30 minutes, if any remnants remain, they may be swallowed. In patients with a dry mouth, the buccal mucosa may be moistened with water before administration of tablet.

**EFFENTORA®**

Patients or carers should be given advice on how to administer Effentora® buccal tablets. Patients should be advised not to eat or drink until the tablet is completely dissolved; after 30 minutes, if any remnants remain, they may be swallowed with a glass of water. Patients with a dry mouth should be advised to drink water to moisten the buccal mucosa before administration of the tablets; if appropriate effervescence does not occur, a switch of therapy may be advised.

**PECFENT® INSTANYL®**

Avoid concomitant use of other nasal preparations. Patients or carers should be given advice on how to administer the spray.

### NATIONAL FUNDING/ACCESS DECISIONS

**ABSTRAL®**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (January 2005) that Abstral® sublingual tablets should be restricted for use within NHS Scotland for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

**EFFENTORA®**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised that Effentora® buccal tablets should be restricted for use within NHS Scotland for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

**PECFENT®**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised PecFent® nasal spray should be restricted for use within NHS Scotland for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

**INSTANYL®**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised that Instanyl® nasal spray should be restricted for use within NHS Scotland for the management of breakthrough pain in adult patients using opioid therapy for chronic cancer pain, when other short-acting opioids are unsuitable.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion, infusion.
Lozenge
CAUTIONARY AND ADVISORY LABELS 2
EXCIPIENTS: May contain Propylene glycol
- Actiq (Teva UK Ltd)
- Fentanyl (as Fentanyl citrate) 200 microgram Actiq 200 microgram lozenges with integral oromucosal applicator | 3 lozenge (P) £21.05 Schedule 2 (CD) | 30 lozenge (P) £210.41 Schedule 2 (CD)

Hydromorphone hydrochloride

INDICATIONS AND DOSE
Severe pain in cancer
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 12-17 years: 1.3 mg every 4 hours, dose to be increased if necessary according to severity of pain
- Adult: 1.3 mg every 4 hours, dose to be increased if necessary according to severity of pain

BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Child 12-17 years: 4 mg every 12 hours, dose to be increased if necessary according to severity of pain
- Adult: 4 mg every 12 hours, dose to be increased if necessary according to severity of pain

CONTRA-INDICATIONS
- Acute abdomen

CAUTIONS
- Pancreatitis - toxic psychosis

SIDE-EFFECTS
- Common or very common Abdominal pain - anorexia - anxiety
- Uncommon Agitation - diarrhoea - dysgeusia - dyskinesia - myoclonus - paraesthesia - paralytic ileus - peripheral oedema - seizures - tremor
- BREAST FEEDING
- Avoid—no information available.

RENAL IMPAIRMENT
- Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

DIRECTIONS FOR ADMINISTRATION
For immediate-release capsules, swallow whole capsule or sprinkle contents on soft food. For modified-release capsules, swallow whole or open capsule and sprinkle contents on soft cold food (swallow the pellets within the capsule whole; do not crush or chew).

PATIENT AND CARER ADVICE
- Patients or carers should be given advice on how to administer hydromorphone hydrochloride capsules and modified-release capsules.

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, oral solution

Capsule
CAUTIONARY AND ADVISORY LABELS 2
- Palladone (Napp Pharmaceuticals Ltd)
  - Hydromorphone hydrochloride 1.3 mg Palladone 1.3 mg capsules | 56 capsule (P) £8.82 Schedule 2 (CD)
  - Hydromorphone hydrochloride 2.6 mg Palladone 2.6 mg capsules | 56 capsule (P) £17.64 Schedule 2 (CD)
**Meptazinol**

**INDICATIONS AND DOSE**

Moderate to severe pain, including post-operative and obstetric pain and renal colic

**BY MOUTH**

- **Adult:** 200 mg every 3–6 hours as required
- **BY INTRAMUSCULAR INJECTION**
  - **Adult:** 75–100 mg every 2–4 hours if required
  - **BY SLOW INTRAVENOUS INJECTION**
  - **Adult:** 50–100 mg every 2–4 hours if required

**Obstetric analgesia**

- **BY INTRAMUSCULAR INJECTION**
- **Adult:** 2 mg/kg, usual dose 100–150 mg

**CONTRA-INDICATIONS**

- **Myocardial infarction - phaeochromocytoma**

**SIDE-EFFECTS**

- **Abdominal pain** - can induce withdrawal symptoms in patients dependent on opioids - diarrhoea - dyspepsia - hypothermia

**Overdose**

- Effects only partially reversed by naloxone.

**BREAST FEEDING**

- Use only if potential benefit outweighs risk.

**RENAL IMPAIRMENT**

- Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS 2**
- **Meptid (Almirall Ltd)**
  - Meptazinol (as Meptazinol hydrochloride) 200 mg Meptid 200mg tablets | 112 tablet | £22.11 DT price = £22.11

**Solution for injection**

- **Meptid (Almirall Ltd)**
  - Meptazinol (as Meptazinol hydrochloride) 100 mg per 1 ml Meptid 100mg/ml solution for injection ampoules | 10 ampoule | £19.21

**Morphine**

**INDICATIONS AND DOSE**

**Pain**

**BY SUBCUTANEOUS INJECTION**

- **Child 1-5 months:** Initially 100–200 micrograms/kg every 6 hours, adjusted according to response
- **Child 6 months-1 year:** Initially 100–200 micrograms/kg every 4 hours, adjusted according to response
- **Child 2-11 years:** Initially 200 micrograms/kg every 4 hours, adjusted according to response
- **Child 12-17 years:** Initially 2.5–10 mg every 4 hours, adjusted according to response

**BY INTRAMUSCULAR INJECTION**

- **Child 1-5 months:** 100 micrograms/kg every 6 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 100 micrograms/kg, dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 10–30 micrograms/kg/hour, adjusted according to response
- **Child 6 months-11 years:** 100 micrograms/kg every 4 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 100 micrograms/kg, dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 20–30 micrograms/kg/hour, adjusted according to response
- **Child 12-17 years:** 5 mg every 4 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 5 mg, dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 20–30 micrograms/kg/hour, adjusted according to response
- **Child 1-2 years:** Initially 50–100 micrograms/kg every 4 hours, adjusted according to response
- **Child 3-5 years:** 100–150 micrograms/kg every 4 hours, adjusted according to response
- **Child 6-11 years:** 200 micrograms/kg every 4 hours, adjusted according to response
- **Child 1 year:** Initially 200–300 micrograms/kg every 4 hours, adjusted according to response
- **Child 2-3 years:** Initially 200–300 micrograms/kg every 4 hours (max. per dose 10 mg), adjusted according to response
- **Child 12-17 years:** Initially 5–10 mg every 4 hours, adjusted according to response

**Acute pain**

**BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION**

- **Adult:** Initially 10 mg every 4 hours, adjusted according to response, subcutaneous injection not suitable for oedematous patients, dose can be given more frequently during titration, use dose for elderly in frail patients
- **Elderly:** Initially 5 mg every 4 hours, adjusted according to response, subcutaneous injection not suitable for oedematous patients, dose can be given more frequently during titration

**BY SLOW INTRAVENOUS INJECTION**

- **Adult:** Initially 5 mg every 4 hours, adjusted according to response, subcutaneous injection not suitable for oedematous patients, dose can be adjusted more frequently during titration, reduced dose recommended in frail and elderly patients

**Chronic pain**

**BY MOUTH OR BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION**

- **Adult:** Initially 5–10 mg every 4 hours, adjusted according to response, subcutaneous injection not suitable for oedematous patients
- **Child:** Initially 0.15 mg/kg every 4 hours, increased according to response
- **Child 2-11 years:** 200 micrograms/kg every 4 hours, adjusted according to response
- **Child 12-17 years:** 2.5–10 mg every 4 hours, adjusted according to response

**Pain (with modified-release 12-hourly preparations)**

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- **Adult:** Every 12 hours, dose adjusted according to daily morphine requirements, dosage requirements should be reviewed if the brand is altered
Pain with modified-release 24-hourly preparations

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- Adult: Every 24 hours, dose adjusted according to daily morphine requirements, dosage requirements should be reviewed if the brand is altered.

Pain in palliative care

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- Adult: Usual dose 30–200 mg every 4 hours, for management of breakthrough pain and other general advice, see Pain management with opioids under p. 20.
- By Mouth using modified-release medicines
  - Adult: Usual dose 100–600 mg every 12 hours, for management of breakthrough pain and other general advice, see Pain management with opioids under p. 20.

Pain management in palliative care (starting dose for opioid-naive patients)

**BY MOUTH**
- Adult: 20–30 mg daily in divided doses, dose for either immediate-release or a 12-hour modified-release preparation, for management of breakthrough pain and other general advice, see Pain management with opioids under p. 20.

Pain management in palliative care (starting dose for patients being switched from a regular weak opioid)

**BY MOUTH**
- Adult: 40–60 mg daily in divided doses, for management of breakthrough pain and other general advice, see Pain management with opioids under p. 20.

Cough in terminal disease

**BY MOUTH**
- Adult: Initially 5 mg every 4 hours

Prenicitation

**BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION**
- Adult: Up to 10 mg, dose to be administered 60–90 minutes before operation

Patient controlled analgesia (PCA)

**BY INTRAVENOUS INFUSION**
- Adult: (consult local protocol)

Myocardial infarction

**BY SLOW INTRAVENOUS INJECTION**
- Adult: 5–10 mg, followed by 5–10 mg if required, dose to be administered at a rate of 1–2 mg/minute, use dose for elderly in frail patients
- Elderly: 2.5–5 mg, followed by 2.5–5 mg if required, dose to be administered at a rate of 1–2 mg/minute

Acute pulmonary oedema

**BY SLOW INTRAVENOUS INJECTION**
- Adult: 5–10 mg, dose to be administered at a rate of 2 mg/minute, use dose for elderly in frail patients
- Elderly: 2.5–5 mg, dose to be administered at a rate of 2 mg/minute

Persistent cyanosis in congenital heart disease when blood glucose less than 3 mmol/litre (following glucose)

**BY INTRAVENOUS INJECTION OR BY INTRAMUSCULAR INJECTION**
- Child: 100 micrograms/kg

Dyspnoea in palliative care

**BY MOUTH**
- Adult: Initially 5 mg every 4 hours, to be given in carefully titrated doses

Dose equivalence and conversion

The doses stated refer equally to morphine hydrochloride and sulfate.

**UNLICENSED USE**

Oramorph® solution and MX® capsules not licensed for use in children under 1 year. Sevedrol® tablets not licensed for use in children under 3 years.

Oramorph® unit dose vials and Filmarine® SR tablets not licensed for use in children under 6 years. MST Continus® preparations licensed to treat children with cancer pain (age-range not specified by manufacturer). Suppositories are not licensed for use in children.

**CONTRA-INDICATIONS**
- Acute abdomen
- delayed gastric emptying
- heart failure secondary to chronic lung disease
- phaeochromocytoma

**CAUTIONS**
- Cardiac arrhythmias
- pancreatitis
- severe cor pulmonale

**SIDE-EFFECTS**
- Abdominal pain
- agitation
- amenorrhoea
- anorexia
- asthenia
- bronchospasm
- delirium
- disorientation
- dyspepsia
- exacerbation of pancreatitis
- excitement
- hypertension
- hypothermia
- inhibition of cough reflex
- malaise
- muscle fasciculation
- myoclonus
- nystagmus
- paraesthesia
- paralytic ileus
- raised intracranial pressure
- restlessless
- rhabdomyolysis
- seizures
- syncope
- taste disturbance

**BREAST FEEDING**

Therapeutic doses unlikely to affect infant.

**RENAL IMPAIRMENT**

Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use in children For continuous intravenous infusion, dilute with Glucose 5% or 10% or Sodium Chloride 0.9%.
- With intravenous use in neonates Neonatal intensive care, dilute 2.5 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 5 micrograms/kg/hour.
- With oral use For modified release capsules—swallow whole or open capsule and sprinkle contents on soft food.

**PRESCRIBING AND DISPENSING INFORMATION**

Prescriptions must also specify the ‘form’.

With rectal use Both the strength of the suppositories and the morphine salt contained in them must be specified by the prescriber.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Morphine for pain www.medicinesforchildren.org.uk/morphine-for-pain

Patients or carers should be given advice on how to administer morphine modified-release capsules.

**EXCEPTIONS TO LEGAL CATEGORY**

Morphine Oral Solutions Prescription-only medicines or schedule 2 controlled drug. The proportion of morphine hydrochloride may be altered when specified by the prescriber; if above 13 mg per 5 mL the solution becomes a schedule 2 controlled drug. It is usual to adjust the strength so that the dose volume is 5 or 10 mL.

Oral solutions of morphine can be prescribed by writing the formula:

Morphine hydrochloride 5 mg
Chloroform water to 5 mL

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: suppository, solution for injection, solution for infusion, oral solution, gel, capsule, nebuliser liquid, infusion

**Tablet**

### BY INTRAVENOUS INFUSION
- **Adult:** Initially 2 mg/hour, adjusted according to response
- **BY SUBCUTANEOUS INJECTION**
- **Adult:** Initially 5 mg every 4 hours as required
- **BY SUBCUTANEOUS INFUSION**
- **Adult:** Initially 7.5 mg/24 hours, adjusted according to response

### Patient controlled analgesia (PCA)
- **BY INTRAVENOUS INFUSION**
- **Adult:** (consult local protocol)

### Dose equivalence and conversion
2 mg oral oxycodone is approximately equivalent to 1 mg parenteral oxycodone.

#### CONTRA-INDICATIONS
- Acute abdomen - chronic constipation - cor pulmonale - delayed gastric emptying

#### CAUTIONS
- Pancreatitis - toxic psychosis

#### SIDE-EFFECTS
- **Common or very common** Abdominal pain - anorexia - anxiety - asthenia - bronchospasm - chills - diarrhoea - dyspepsia - dyspnoea - impaired cough reflex

#### BREAST FEEDING
- Present in milk—avoid.

#### HEPATIC IMPAIRMENT
- Max. initial dose 2.5 mg every 6 hours in patients not currently treated with an opioid with mild impairment. Avoid in moderate to severe impairment.

#### RENAL IMPAIRMENT
- Max. initial dose 2.5 mg every 6 hours in patients not currently with an opioid with mild to moderate impairment. Avoid if eGFR less than 10 mL/minute/1.73 m².

#### DIRECTIONS FOR ADMINISTRATION
- For intravenous infusion (Oxynorm®), give continuously or intermittently in Glucose 5% or Sodium chloride 0.9%; dilute to a concentration of 1 mg/mL.

#### NATIONAL FUNDING/ACCESS DECISIONS

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (October 2004 and November 2010) that Oxynorm® injection is restricted for use within NHS Scotland for patients with cancer who have difficulty in tolerating morphine or diamorphine.

#### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: suppository, solution for infusion, oral solution

---

**Oxycodone with naloxone**

The properties listed below are those particular to the combination only. For the properties of the components please consider, naloxone hydrochloride p. 1133, oxycodone hydrochloride p. 369.
Pentazocine

**INDICATIONS AND DOSE**

Moderate to severe pain

**BY MOUTH**
- Adult: 50 mg every 3–4 hours, dose to be taken preferably after food, usual dose 25–100 mg every 3–4 hours; maximum 600 mg per day

**Severe pain**
- Adult: 45–60 mg every 3–4 hours as required; maximum 360 mg per day

**CONTRA-INDICATIONS**
- Acute porphyrias p. 864 - heart failure secondary to chronic lung disease - patients dependent on opioids (can precipitate withdrawal)
- **CAUTIONS**
  - Arterial hypertension - cardiac arrhythmias - myocardial infarction - pancreatitis - phaeochromocytoma - pulmonary hypertension
- **SIDE-EFFECTS**
  - Abdominal pain - blood disorders - chills - disorientation - hypertension - hypothermia - myalgia - paraesthesia - raised intracranial pressure - seizures - syncope - toxic epidermal necrolysis - tremor
- **Overdose**
  - Effects only partially reversed by naloxone.
- **BREAST FEEDING**
  - Use with caution—limited information available.
- **RENAL IMPAIRMENT**
  - Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **LESS SUITABLE FOR PRESCRIBING**
  - Pentazocine is less suitable for prescribing.

**MEDICATION FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for injection**
- **PAPAVERETUM (Non-proprietary)**
  - Papaveretum 15.4 mg per 1 ml Papaveretum 15.4mg/1ml solution for injection ampoules | 10 ampoule | £48.96 Schedule 2 (CD)

---

**Papaveretum**

**INDICATIONS AND DOSE**

Postoperative analgesia | Severe chronic pain

**BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION**
- Adult: 7.7–15.4 mg every 4 hours if required
- Elderly: Initially 7.7 mg every 4 hours if required

**BY INTRAVENOUS INJECTION**
- Adult: Use 25 to 50% of the corresponding subcutaneous/intramuscular dose

**PREMEDICATION**

**BY INTRAVENOUS INJECTION**
- Adult: Use 25 to 50% of the corresponding subcutaneous/intramuscular dose

**Important safety information**

Do not confuse with papaverine.

**CONTRA-INDICATIONS**
- Heart failure secondary to chronic lung disease - phaeochromocytoma

**CAUTIONS**
- Supraventricular tachycardia

**SIDE-EFFECTS**
- Hypothermia

**BREAST FEEDING**
- Therapeutic doses unlikely to affect infant.

**RENAL IMPAIRMENT**
- Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**PRESCRIBING AND DISPENSING INFORMATION**

The name Omnopon® was formerly used for papaveretum preparations. Papaveretum is a mixture of 253 parts of morphine hydrochloride, 23 parts of papaverine hydrochloride and 20 parts of codeine hydrochloride.

**LESS SUITABLE FOR PRESCRIBING**
- Papaveretum is less suitable for prescribing.
### Pethidine hydrochloride (Meperidine)

**INDICATIONS AND DOSE**

**Acute pain**
- **By mouth**
  - Adult: 50–150 mg every 4 hours
  - By subcutaneous injection or by intramuscular injection
  - Adult: 25–100 mg, then 25–100 mg after 4 hours, for debilitated patients use dose described for elderly patients.
  - Elderly: Initially 25 mg, then 25–100 mg after 4 hours
- By slow intravenous injection
  - Adult: 25–50 mg, then 25–50 mg after 4 hours, for debilitated patients use dose described for elderly patients.
  - Elderly: Initially 25 mg, then 25–50 mg after 4 hours

**Obstetric analgesia**
- By subcutaneous injection or by intramuscular injection
  - Adult: 50–100 mg, then 50–100 mg after 1–3 hours if required; maximum 400 mg per day

**Premedication**
- By intramuscular injection
  - Adult: 25–100 mg, dose to be given 1 hour before operation, for debilitated patients use dose described for elderly patients.
  - Elderly: 25 mg, dose to be given 1 hour before operation

**Postoperative pain**
- By subcutaneous injection or by intramuscular injection
  - Adult: 25–100 mg every 2–3 hours if required, for debilitated patients use dose described for elderly patients.
  - Elderly: Initially 25 mg every 2–3 hours if required

**SIDE-EFFECTS**
- Phaeochromocytoma
- Accumulation of metabolites may result in neurotoxicity - cardiac arrhythmias - not suitable for severe continuing pain - severe cor pulmonale
- Hypothermia - restlessless - tremor
- Convulsions reported in overdosage.

**RENAI IMPAIRMENT**
- Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (May 2011) that tapentadol (Palexia® SR) is accepted for restricted use within NHS Scotland for the management of severe chronic pain in adult patients, which can be adequately managed only with opioid analgesics, when morphine sulphate modified-release has failed to provide adequate pain control or is not tolerated.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: suppository, solution for injection, oral solution, capsule

**Tablet**

### Tapentadol

**INDICATIONS AND DOSE**

Moderate to severe acute pain which can be managed only with opioid analgesics

**By mouth using immediate-release medicines**
- Adult: Initially 50 mg every 4–6 hours, adjusted according to response, maximum 700 mg in the first 24 hours, during the first 24 hours of treatment, an additional dose of 50 mg may be taken 1 hour after the initial dose, if pain control not achieved; maximum 600 mg per day

**Severe chronic pain**
- Adult: Initially 50 mg every 12 hours, adjusted according to response; maximum 500 mg per day

**SIDE-EFFECTS**

**BREAST FEEDING**
- Avoid — no information available.

**HEPATIC IMPAIRMENT**
- For immediate-release tablets, initial max. daily dose 150 mg; for modified-release tablets, initial max. daily dose 50 mg.

**RENAI IMPAIRMENT**
- Manufacturer advises no dose adjustment needed in mild or moderate impairment.
- Avoid in severe impairment. Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (May 2011) that tapentadol (Palexia® SR) is accepted for restricted use within NHS Scotland for the management of severe chronic pain in adult patients, which can be adequately managed only with opioid analgesics, when morphine sulphate modified-release has failed to provide adequate pain control or is not tolerated.
Tramadol hydrochloride

**INDICATIONS AND DOSE**

Moderate to severe pain

**BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION**

- Adult: 50–100 mg every 4–6 hours, intravenous injection to be given over 2–3 minutes

Moderate to severe acute pain

**BY MOUTH**

- Child 12-17 years: Initially 100 mg, then 50–100 mg every 4–6 hours; maximum 400 mg per day
- Adult: Initially 100 mg, then 50–100 mg every 4–6 hours; maximum 400 mg per day

Moderate to severe chronic pain

**BY MOUTH**

- Child 12-17 years: Initially 50 mg, then adjusted according to response to; maximum 400 mg per day
- Adult: Initially 50 mg, then adjusted according to response to; maximum 400 mg per day

Postoperative pain

**BY INTRAVENOUS INJECTION**

- Adult: Initially 100 mg, then 50 mg every 10–20 minutes if required to a total maximum of 250 mg (including initial dose) in first hour, then 50–100 mg every 4–6 hours; intravenous injection to be given over 2–3 minutes; maximum 600 mg per day

Moderate to severe pain (with modified-release 12-hourly preparations)

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- Child 12-17 years: 50–100 mg twice daily, increased if necessary to 150–200 mg twice daily; maximum daily dose not usually required; maximum 400 mg per day
- Adult: 50–100 mg twice daily, increased if necessary to up to 150–200 mg twice daily; maximum daily dose not usually required; maximum 400 mg per day

Moderate to severe pain (with modified-release 24-hourly preparations)

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- Child 12-17 years: Initially 100–150 mg once daily, increased if necessary up to 400 mg once daily
- Adult: Initially 100–150 mg once daily, increased if necessary up to 400 mg once daily

**SYMPTOMATICALLY**

- Child 12-17 years: Initially 150 mg once daily, increased if necessary up to 400 mg once daily
- Adult: Initially 150 mg once daily, increased if necessary up to 400 mg once daily

**CONTRAINDICATIONS**

- Acute intoxication with alcohol - acute intoxication with analgesics - acute intoxication with hypnotics - acute intoxication with opioids - not suitable for narcotic withdrawal treatment - uncontrolled epilepsy

**CAUTIONS**

- Excessive bronchial secretions - history of epilepsy - use tramadol only if compelling reasons - impaired consciousness - not suitable as a substitute in opioid-dependent patients - not suitable in some types of general anaesthesia - susceptibility to seizures - use tramadol only if compelling reasons

**CAUTIONS, FURTHER INFORMATION**

**General anaesthesia**

Not recommended for analgesia during potentially light planes of general anaesthesia (possibly increased intra-operative recall reported).

**SIDE-EFFECTS**

- Common or very common Malaise
- Uncommon Diarrhoea - flatulence - gastritis - retching
- Rare Abnormal coordination - anorexia - anxiety - bronchospasm - changes in appetite - delirium - dysphonia - hypertension - muscle weakness - nightmares - paraesthesia - seizures - syncope - tremor - wheezing

**OCEANIC**

- Frequency not known Blood disorders - hypoglycaemia - speech disorders

**PREGNANCY**

Embryotoxic in animal studies - manufacturers advise avoid.

**BREAST FEEDING**

Amount probably too small to be harmful, but manufacturer advises avoid.

**HEPATIC IMPAIRMENT**

Caution (avoid for oral drops) in severe impairment.

**RENAL IMPAIRMENT**

Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs. Caution (avoid for oral drops) in severe impairment.

**DIRECTIONS FOR ADMINISTRATION**

Tramadol hydrochloride orodispersible tablets should be sucked and then swallowed. May also be dispersed in water. Some tramadol hydrochloride modified-release capsule preparations may be opened and the content swallowed immediately without chewing - check individual preparations. For intravenous infusion, dilute in glucose 5% or Sodium Chloride 0.9%

**PRESCRIBING AND DISPENSING INFORMATION**

Do not confuse modified-release 12-hourly preparations with 24-hourly preparations.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Tramadol for pain

www.medicinesforchildren.org.uk/tramadol-for-pain

Patients or carers should be given advice on how to administer tramadol hydrochloride orodispersible tablets.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Brands may include Zamadol; Zydol

5.1 Migraine

Migraine

Treatment of acute migraine

Treatment of a migraine attack should be guided by response to previous treatment and the severity of the attacks. A simple analgesic such as aspirin p. 104, paracetamol p. 354 (preferably in a soluble or dispersible form) or a NSAID is often effective; concomitant antiemetic treatment may be required. If treatment with an analgesic is inadequate, an attack may be treated with a specific antimigraine compound such as a 5HT1-receptor agonist ('triptan'). Ergot alkaloids are rarely required now; oral preparations are associated with many side-effects and should be avoided in cerebrovascular or cardiovascular disease.

Excessive use of acute treatments for migraine (opioid and non-opioid analgesics, 5HT1-receptor agonists, and ergotamine) is associated with medication-overuse headache (analgesic-induced headache); therefore, increasing consumption of these medicines needs careful management.

Analgesics

Most migraine headaches respond to analgesics such as aspirin p. 104 or paracetamol p. 354 but because peristalsis is often reduced during migraine attacks the medication may not be sufficiently well absorbed to be effective; dispersible or effervescent preparations are therefore preferred. Compound preparations containing analgesics and antiemetics are available.

The NSAID tolfenamic acid p. 381 is licensed specifically for the treatment of an acute attack of migraine; diclofenac potassium p. 920, flurbiprofen p. 927, and ibuprofen p. 927 are also licensed for use in migraine.

5HT1-receptor agonists

A 5HT1-receptor agonist is of considerable value in the treatment of an acute migraine attack. The 5HT1-receptor agonists (‘tripts’) act on the 5HT (serotonin) 1B/1D receptors and they are therefore sometimes referred to as 5HT1B/D-receptor agonists. A 5HT1-receptor agonist may be used during the established headache phase of an attack and is the preferred treatment in those who fail to respond to conventional analgesics.

The 5HT1-receptor agonists available for treating migraine are almotriptan p. 377, eletriptan p. 377, frovatriptan p. 378, naratriptan p. 378, rizatriptan p. 379, sumatriptan p. 379, and zolmitriptan p. 380. If a patient does not respond to one 5HT1-receptor agonist, an alternative 5HT1-receptor agonist should be tried. For patients who have prolonged attacks that frequently recur despite treatment with a 5HT1-receptor agonist, combination therapy with a NSAID such as naproxen can be considered. Sumatriptan or zolmitriptan are also used to treat cluster headache.

Ergot Alkaloids

The value of ergotamine tartrate p. 376 for migraine is limited by difficulties in absorption and by its side-effects, particularly nausea, vomiting, abdominal pain, and...
muscular cramps; it is best avoided. The recommended doses of ergotamine tartrate preparations should not be exceeded and treatment should not be repeated at intervals of less than 4 days. To avoid habituation the frequency of administration of ergotamine tartrate should be limited to no more than twice a month. It should never be prescribed prophylactically but in the management of cluster headache a low dose is occasionally given for 1 to 2 weeks [unlicensed indication].

**Antiemetics**

Antiemetics, such as metoclopramide hydrochloride p. 347 or domperidone p. 346, or phenothiazine and antihistamine antiemetics, relieve the nausea associated with migraine attacks. Antiemetics may be given by intramuscular injection or rectally if vomiting is a problem. Metoclopramide hydrochloride and domperidone have the added advantage of promoting gastric emptying and normal peristalsis; a single dose should be given at the onset of symptoms. Oral analgesic preparations containing metoclopramide hydrochloride are a convenient alternative.

**Prophylaxis of migraine**

Where migraine attacks are frequent, possible provoking factors such as stress, irregular lifestyle (e.g. lack of sleep), or chemical triggers (e.g. alcohol and nitrates) should be sought; combined oral contraceptives may also provoke migraine.

Preventive treatment for migraine should be considered for patients who:

- suffer at least two attacks a month;
- suffer an increasing frequency of headaches;
- suffer significant disability despite suitable treatment for migraine attacks;
- cannot take suitable treatment for migraine attacks.

Prophylaxis is also necessary in some rare migraine subtypes and those at risk of migrainous infarction. The beta-blockers propranolol hydrochloride p. 146, atenolol p. 141, metoprolol tartrate p. 144, nadolol p. 145, and timolol maleate p. 147 are all effective. Propranolol hydrochloride p. 146 is the most commonly used.

Tricyclic antidepressants [unlicensed indication], topiramate p. 406, sodium valproate p. 403 [unlicensed indication], valproic acid p. 275 [unlicensed indication], and gabapentin p. 392 [unlicensed indication] are also effective for preventing migraine.

Pizotifen p. 376 is an antihistamine and a serotonin-receptor antagonist, structurally related to the tricyclic antidepressants. It is of limited value and may cause weight gain.

Botulinum toxin type A is licensed for the prophylaxis of headaches in adults with chronic migraine.

**Cluster headache and the trigeminal autonomic cephalalgias**

Cluster headache rarely responds to standard analgesics. Sumatriptan p. 379 given by subcutaneous injection is the drug of choice for the treatment of cluster headache. If an injection is unsuitable, sumatriptan nasal spray or zolmitriptan p. 380 nasal spray [both unlicensed use] may be used. Alternatively, 100% oxygen at a rate of 10–15 litres/minute for 10–20 minutes is useful in aborting an attack.

Prophylaxis of cluster headache is considered if the attacks are frequent, last over 3 weeks, or if they cannot be treated effectively. Verapamil hydrochloride p. 156 or lithium [both unlicensed use] are used for prophylaxis.

Prednisolone p. 585 can be used for short-term prophylaxis of episodic cluster headache [unlicensed use] either as monotherapy, or in combination with verapamil hydrochloride p. 156 during verapamil titration.

Ergotamine tartrate p. 376, used on an intermittent basis is an alternative for patients with short bouts, but it should not be used for prolonged periods.

The other trigeminal autonomic cephalalgias, paroxysmal hemihemiania (sensitive to indometacin p. 929), and short-lasting unilateral neuralgiform headache attacks with conjunctival injection and tearing, are seen rarely and are best managed by a specialist.

**Drugs used for Migraine not listed below:** Amitriptyline hydrochloride, p. 290 · Atenolol, p. 141 · Botulinum toxin type A, p. 322 · Clonidine hydrochloride, p. 137 · Diclofenac potassium, p. 920 · Gabapentin, p. 392 · Metoprolol tartrate, p. 144 · Nadolol, p. 145 · Sodium valproate, p. 403 · Timolol maleate, p. 147 · Topiramate, p. 406 · Trifluoperazine, p. 310 · Valproic acid, p. 275

### ANALGESICS

**Buclizine hydrochloride with codeine phosphate and paracetamol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, codeine phosphate p. 360, paracetamol p. 354.

#### INDICATIONS AND DOSE

**MIGRALEVE®**

**Acute migraine**

**BY MOUTH**

- **Child 12-14 years:** Initially 1 pink tablet to be taken at onset of attack, or if it is imminent, followed by 1 yellow tablet every 4 hours if required; maximum 1 pink and 3 yellow tablets in 24 hours
- **Child 15-17 years:** Initially 2 pink tablets to be taken at onset of attack, or if it is imminent, followed by 2 yellow tablets every 4 hours if required; maximum 2 pink and 6 yellow tablets in 24 hours
- **Adult:** Initially 2 pink tablets to be taken at onset of attack, or if it is imminent, followed by 2 yellow tablets every 4 hours if required; maximum 2 pink and 6 yellow tablets in 24 hours

#### LESS SUITABLE FOR PRESCRIBING

Migraleve® is less suitable for prescribing.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 2, 17, 30**

- **Migraleve Pink** (McNeil Products Ltd)
  - Buclizine hydrochloride 6.25 mg, Codeine phosphate 8 mg, Paracetamol 500 mg Migraleve Pink tablets | 8 tablet | £no price available Schedule 5 (CD Inv) | 12 tablet | £3.21 Schedule 5 (CD Inv) | 16 tablet | £3.16 Schedule 5 (CD Inv) | 32 tablet | £no price available Schedule 5 (CD Inv) | 48 tablet | £3.97 Schedule 5 (CD Inv)

- **Migraleve** (McNeil Products Ltd)
  - Migraleve tablets | 12 tablet | £3.45 Schedule 5 (CD Inv) | 24 tablet | £5.45 Schedule 5 (CD Inv) | 48 tablet | £3.64 Schedule 5 (CD Inv)

**Metoclopramide with paracetamol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, metoclopramide hydrochloride p. 347, paracetamol p. 354.
INDICATIONS AND DOSE

Acute migraine
INITIALLY BY MOUTH USING TABLETS
- Adult: 2 tablets, to be taken at the onset of attack, followed by (by mouth) 2 tablets every 4 hours if required; maximum 6 tablets per day

INITIALLY BY MOUTH USING EFFERVESCENT POWDER SACHETS
- Adult: 2 sachets, to be taken at the onset of attack, then (by mouth) 2 sachets every 4 hours if required, sachets to be dissolved in a quarter tumblerful of water; maximum 6 sachets per day

SIDE-EFFECTS

- BREAST FEEDING Amount probably too small to be harmful, but manufacturer advises avoid.
- HEPATIC IMPAIRMENT Use with caution.
- RENAL IMPAIRMENT Use with caution.
- PATIENT AND CARER ADVICE Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

Medicines for Children leaflet: Pizotifen to prevent migraine headaches www.medicinesforchildren.org.uk/pizotifen-to-prevent-migraine-headaches

INTERACTIONS

- MUSCARINIC ANTAGONISTS Increased risk of antimuscarinic effects
- MAO INHIBITORS Increased risk of hypertensive crisis
- CYCLOSPORINE Increased risk of hypercalcemia
- LITHIUM Increased risk of hypercalcaemia
- ORAL ANTICOAGULANTS Increased risk of anticoagulant effects
- CARBAMAZEPINE Increased risk of carbamazepine toxicity
- PROTON PUMP INHIBITORS Increased risk of paroxysmal hypertension

Mediterranean lynx

- CONTRA-INDICATIONS
  - Known hypersensitivity to pizotifen, ergot alkaloids, or any component of the product
  - Hypertension (including severe hypertension)
  - Cardiac disease (including severe cardiac disease)
  - Hypothyroidism
  - Renal artery spasm

- PATIENTS WITH A HISTORY OF:
  - Familiar or personal cardiovascular disease
  - Cardiac arrhythmias
  - Renal disease
  - Hypotension
  - Seizures (including epilepsy)
  - Urinary retention (including prostatic hypertrophy)
  - Myasthenia gravis
  - Myocardial ischaemia
  - Severe anaemia

- PATIENTS TREATED WITH:
  - Ergot alkaloids
  - Monamine oxidase inhibitors
  - Lithium
  - Tricyclic antidepressants
  - Antihypertensive agents
  - Digitalis
  - Intravenous vasopressors

- PRECAUTIONS
  - Pregnancy
  - Breastfeeding
  - Renal impairment
  - Hepatic impairment

- Use with caution in:
  - Hypertension
  - Hyperthyroidism
  - Thyrotoxicosis
  - Hypotension
  - Cardiac disease
  - Renal disease
  - Seizures
  - Intestinal ischaemia
  - Severe renal artery spasm

- Avoid; risk of renal vasoconstriction.

- Avoid in severe impairment

- Avoid; oxytocic effect on the uterus.

- Avoid; risk of renal vasoconstriction.

ANTIHISTAMINES

Pizotifen

INDICATIONS AND DOSE

Prevention of vascular headache | Prevention of classical migraine | Prevention of common migraine | Prevention of cluster headache

BY MOUTH
- Adult: Initially 500 micrograms at night, increased gradually up to 1.5 mg at night, alternatively increased gradually to 1.5 mg daily in 3 divided doses; further increased if necessary up to 4.5 mg daily (but rarely necessary); max. single dose 3 mg

Prophylaxis of migraine

BY MOUTH
- Child 5-17 years: Initially 500 micrograms at night, then increased gradually up to 1.5 mg daily in divided doses, max. single dose (at night) 1 mg

- UNLICENSED USE 1.5–mg tablets not licensed for use in children.
- CAUTIONS Avoid abrupt withdrawal; history of epilepsy; susceptibility to angle-closure glaucoma; urinary retention
- INTERACTIONS → Appendix 1 (pizotifen).
- SIDE-EFFECTS
  - Common or very common Dizziness; drowsiness; dry mouth; increased appetite; nausea; weight gain
  - Uncommon Constipation
  - Rare Aggression; anxiety; arthralgia; depression; hallucination; insomnia; myalgia; paraesthesia
  - Very rare Rash (in adults); seizures; urticaria (in adults)
  - Frequency not known Hepatitis; jaundice; muscle cramps
- PREGNANCY Avoid unless potential benefit outweighs risk.

- MEDICINAL FORMS
  - Tablet
  - Effervescent powder
  - CAUTIONARY AND ADVISORY LABELS

ERGOT ALKALOIDS

Ergotamine tartrate

INDICATIONS AND DOSE

Management of cluster headache

BY MOUTH USING TABLETS
- Adult: 1 mg once daily for 6 nights in 7; occasionally given for 1–2 weeks, dose to be taken at night

- UNLICENSED USE Not licensed for the management of cluster headache.

- CONTRA-INDICATIONS
  - Acute porphyrias p. 864
  - Coronary heart disease
  - Hyperthyroidism
  - Inadequately controlled hypertension
  - Obliterative vascular disease
  - Peripheral vascular disease
  - Raynaud’s syndrome
  - Sepsis
  - Severe hypertension
  - Temporal arteritis

- CAUTIONS
  - Anaemia
  - Cardiac disease
  - Dependence
  - Elderly
  - Risk of peripheral vasospasm

- INTERACTIONS → Appendix 1 (ergot alkaloids).

- SIDE-EFFECTS
  - Common or very common Abdominal pain; dizziness; nausea; vomiting
  - Uncommon Cyanosis; diarrhoea; hypoaesthesia; pain in extremities; paraesthesia; peripheral vasoconstriction; weakness in extremities
  - Rare Arrhythmias; bradycardia; dysphoae; ergotism (including absence of pulse and numbness in extremities); increased blood pressure; intestinal ischaemia; myalgia; rash; tachycardia; urticaria
  - Very rare Gangrene; heart-valve fibrosis; myocardial infarction; myocardial ischaemia

- Frequency not known Anxiety; arthralgia; blood disorders; blurred vision; cerebral ischaemia; confusion; constipation; depression; drowsiness; dry mouth; extrapyramidal effects; hallucinations; renal artery spasm; seizures; sleep disturbances; thrombosis; tremor; urinary retention

- PREGNANCY Avoid; oxytocic effect on the uterus.

- BREAST FEEDING Avoid; ergotism may occur in infant; repeated doses may inhibit lactation.

- HEPATIC IMPAIRMENT Avoid in severe impairment—risk of toxicity increased.

- RENAL IMPAIRMENT Avoid; risk of renal vasoconstriction.

Important safety information

Metoclopramide can cause severe extrapyramidal effects, particularly in young adults.

- CAUTIONS Treatment should not exceed 3 months due to risk of tardive dyskinesia.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

  Tablet
  - CAUTIONARY AND ADVISORY LABELS 17, 30
    - Paramax (Zentiva)
      - Metoclopramide hydrochloride 5 mg, Paracetamol 500 mg Paramax tablets | 42 tablet [R] £0.64 DT price = £3.64
  - Effervescent powder
    - CAUTIONARY AND ADVISORY LABELS 13, 17, 30
      - Paramax (Zentiva)
        - Metoclopramide hydrochloride 5 mg, Paracetamol 500 mg Paramax sachets (sugar-free) | 42 sachet [R] £12.52 DT price = £12.52

- PATIENT AND CARER ADVICE

- CONTRA-INDICATIONS
  - History of epilepsy
  - History of renal impairment
  - History of cardiac disease
  - History of Raynaud’s syndrome
  - History of peripheral vascular disease

- PATIENTS TREATED WITH:
  - Ergot alkaloids
  - Monoamine oxidase inhibitors
  - Lithium
  - Tricyclic antidepressants

- PRECAUTIONS
  - Pregnancy
  - Breastfeeding
  - Renal impairment
  - Hepatic impairment

- Use with caution in:
  - Hypertension
  - Hyperthyroidism
  - Thyrotoxicosis
  - Hypotension
  - Cardiac disease
  - Renal disease
  - Seizures
  - Intestinal ischaemia
  - Severe renal artery spasm

- Avoid; risk of renal vasoconstriction.

- Avoid in severe impairment

- Avoid; oxytocic effect on the uterus.

- Avoid; risk of renal vasoconstriction.
Ergotamine tartrate with caffeine hydrate and cyclizine hydrochloride

The properties listed below are those particular to the combination only. For the properties of the components please consider, cyclizine p. 343, ergotamine tartrate p. 376.

**INDICATIONS AND DOSE**

**Treatment of acute migraine and migraine variants unresponsive to analgesics**

**BY MOUTH**

- **Adult**: 1 tablet, to be taken at onset, followed by 0.5–1 tablet after 30 minutes, then 0.5–1 tablet every 30 minutes if required, max. 3 tablets in 24 hours, max. 4 tablets per attack, max. 6 tablets in one week

**SIDE-EFFECTS, FURTHER INFORMATION**

Sensations of tingling, heat, heaviness, pressure, or tightness of any part of the body may occur (including throat and chest—discontinue if intense, may be due to coronary vasoconstriction or to anaphylaxis).

**INTERACTIONS**

- **Sensitivities**
  - Sulfonamides: cross-sensitivity may occur.
  - Cimetidine: increased levels of ergotamine may occur.

**CONTRA-INDICATIONS**

- Recent ischaemic stroke
- Severe hypertension
- Severe peripheral vascular disease
- Severe ischaemic heart disease
- Severe heart failure
- Severe depression
- Severe tinnitus
- Severe photophobia
- Severe anaphylaxis

**PRECAUTIONS**

- Discontinue if intense, may be due to coronary vasoconstriction or to anaphylaxis.

**PATIENT AND CARER ADVICE**

Patient counselling is advised.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS**

3

- **ALMOTRIPTAN (Non-proprietary)**
  - Almotriptan (as Almotriptan hydrogen malate) 12.5 mg, Almotriptan 12.5 mg tablets | 3 tablet (PO) £9.07 | 6 tablet (PO) £18.14 DT price + £18.14 | 9 tablet (PO) £27.21
  - Almogran (Almirall Ltd)
    - Almotriptan (as Almotriptan hydrogen malate) 12.5 mg, Almogran 12.5 mg tablets | 3 tablet (PO) £9.07 | 6 tablet (PO) £18.14 DT price + £18.14 | 9 tablet (PO) £27.20

**Eléctriptan**

**INDICATIONS AND DOSE**

**Treatment of acute migraine**

**BY MOUTH**

- **Adult**: 40 mg, followed by 40 mg after 2 hours if required, dose to be taken only if migraine recurs (patient not responding should not take second dose for same attack); increased if necessary to 80 mg, dose to be taken for subsequent attacks if 40 mg dose inadequate; maximum 80 mg per day

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain, diarrhoea, dry mouth, dyspepsia, headache, myalgia, myastenia, palpitation, pharyngitis, rhinitis, sweating, tachycardia
- **Uncommon** Agitation, anorexia, arthralgia, confusion, depersonalisation, depression, diarrhoea, dysarthria, dysphonia, euphoria, glossitis, hypertonia, insomnia, movement disorders, oedema, photophobia, pruritus, rash, stupor, taste disturbance, thirst, tinnitus, tremor, urinary frequency, visual disturbances, yawning

**INTERACTIONS**

- **Appendix 1 (5HT_1 agonists).**

**UNLICENSED USE**

Not licensed for use in elderly.

**CONTRA-INDICATIONS**

Arrhythmias, coronary vasospasm, heart failure, ischaemic heart disease, peripheral vascular disease, previous cerebrovascular accident, previous myocardial infarction, previous transient ischaemic attack, Prinzmetal’s angina, severe hypertension, uncontrolled hypertension

**CAUTIONS**

Conditions which predispose to coronary artery disease—elderly

**INTERACTIONS**

- Appendix 1 (5HT_1 agonists)

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain, diarrhoea, dry mouth, dyspepsia, headache, myalgia, myastenia, palpitation, pharyngitis, rhinitis, sweating, tachycardia
- **Uncommon** Agitation, anorexia, arthralgia, confusion, depersonalisation, depression, diarrhoea, dysarthria, dysphonia, euphoria, glossitis, hypertonia, insomnia, movement disorders, oedema, photophobia, pruritus, rash, stupor, taste disturbance, thirst, tinnitus, tremor, urinary frequency, visual disturbances, yawning
- **Rare** Asthma, bradycardia, constipation, lymphadenopathy, menorrhagia, oesophagitis, syncope
- **Frequency not known** Dizziness, fatigue, feeling of weakness, flushing, hypotension, ischaemic colitis, nausea, vomiting

**Ergotamine tartrate with caffeine hydrate and cyclizine hydrochloride**

**PATIENT AND CARER ADVICE**

Peripheral vasospasm: Warn patient to stop treatment immediately if numbness or tingling of extremities develops and to contact doctor.

**LESS SUITABLE FOR PRESCRIBING**

Ergotamine tartrate is less suitable for prescribing.

**INDICATIONS AND DOSE**

**Treatment of acute migraine and migraine variants unresponsive to analgesics**

**BY MOUTH**

- **Adult**: 12.5 mg, dose to be taken as soon as possible after onset, followed by 12.5 mg after 2 hours if required, dose to be taken only if migraine recurs (patient not responding should not take second dose for same attack); maximum 25 mg per day

**SIDE-EFFECTS**

Sensations of tingling, heat, heaviness, pressure, or tightness of any part of the body may occur (including throat and chest—discontinue if intense, may be due to coronary vasoconstriction or to anaphylaxis).

**ALLERGY AND CROSS-SENSITIVITY**

Caution in patients with sensitivity to sulfonamides.

**PREGNANCY**

There is limited experience of using 5HT_1 receptor agonists during pregnancy; manufacturers advise that they should be avoided unless the potential benefit outweighs the risk.

**BREAST FEEDING**

Present in milk in animal studies—hold breast-feeding for 24 hours.

**HEPATIC IMPAIRMENT**

Caution in mild to moderate impairment. Avoid in severe impairment.

**RENAL IMPAIRMENT**

Max. 12.5 mg in 24 hours if eGFR less than 30 mL/minute/1.73 m².

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS**

3

- **ALMOTRIPTAN (Non-proprietary)**
  - Almotriptan (as Almotriptan hydrogen malate) 12.5 mg, Almotriptan 12.5 mg tablets | 3 tablet (PO) £9.07 | 6 tablet (PO) £18.14 DT price + £18.14 | 9 tablet (PO) £27.21

**PATIENT AND CARER ADVICE** Drowsiness may affect performance of skilled tasks (e.g. driving). Patients or carers should be given advice on how to administer rizatriptan orodispersible tablets and oral lyophilisates.

---

**Migraine**

**INDICATIONS AND DOSE**

**Treatment of acute migraine**

**BY MOUTH**

- Adult: Initially 50–100 mg for 1 dose, followed by 50–100 mg after at least 2 hours if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack); maximum 300 mg per day

**BY SUBCUTANEOUS INJECTION**

- Adult: Initially 6 mg for 1 dose, followed by 6 mg after at least 1 hour if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack), dose to be administered using an auto-injector; not for intravenous injection which may cause coronary vasospasm and angina; maximum 12 mg per day

**Treatment of acute cluster headache**

**BY SUBCUTANEOUS INJECTION**

- Adult: Initially 6 mg for 1 dose, followed by 6 mg after at least 1 hour if required, to be taken only if headache recurs (patient not responding to initial dose should not take second dose for same attack), dose to be administered using an auto-injector; not for intravenous injection which may cause coronary vasospasm and angina; maximum 12 mg per day

**BY INTRanasAL ADMINISTRATION**

- Adult 18–65 years: Initially 10–20 mg, to be administered into one nostril, followed by 10–20 mg after at least 2 hours if required, to be taken...
only if headache recurs (patient not responding to initial dose should not take second dose for same attack); maximum 40 mg per day

- **UNLICENSED USE** Not licensed for use in elderly.
- **CONTRA-INDICATIONS** Coronary vasospasm - ischaemic heart disease - mild uncontrolled hypertension - moderate and severe hypertension - peripheral vascular disease - previous cerebrovascular accident - previous myocardial infarction - previous transient ischaemic attack - Prinzmetal's angina
- **CAUTIONS** Conditions which predispose to coronary artery disease - elderly - history of seizures - mild, controlled hypertension - pre-existing cardiac disease - risk factors for seizures
- **INTERACTIONS** ➔ Appendix 1 (5HT, agonists).

**SIDE-EFFECTS**

- **GENERAL SIDE-EFFECTS**
  - Common or very common: Dizziness - drowsiness - dysphoena - fatigue - flushing - myalgia - nausea - sensory disturbances - transient increase in blood pressure - vomiting - weakness

**SPECIFIC SIDE-EFFECTS**

- Common or very common: With intranasal use dysgeusia - epistaxis

**SIDE-EFFECTS, FURTHER INFORMATION**
Sensations of tingling, heat, heaviness, pressure, or tightness of any part of the body may occur (including throat and chest—discontinue if intense, may be due to coronary vasoconstriction or anaphylaxis).

**ALLERGY AND CROSS-SENSITIVITY** Caution in patients with sensitivity to sulfonamides.

**PREGNANCY** There is limited experience of using 5HT₁-receptor agonists during pregnancy; manufacturers advise that they should be avoided unless the potential benefit outweighs the risk.

**BREAST FEEDING** Present in milk but amount probably too small to be harmful; withhold breast-feeding for 12 hours after treatment.

**HEPATIC IMPAIRMENT** Reduce oral dose to 25–50 mg. Avoid in severe impairment.

**RENAL IMPAIRMENT** Use with caution.

**PATIENT AND CARER ADVICE** Drowsiness may affect performance of skilled tasks (e.g. driving).

**EXCEPTIONS TO LEGAL CATEGORY** Sumatriptan 50 mg tablets can be sold to the public to treat previously diagnosed migraine; max. daily dose 100 mg.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **SUMATRIPTAN (Non-proprietary)**
  - **Sumatriptan (as Sumatriptan succinate) 50 mg** Sumatriptan 50mg tablets | 6 tablet (PPh) £24.85 DT price = £1.75
  - **Sumatriptan (as Sumatriptan succinate) 100 mg** Sumatriptan 100mg tablets | 6 tablet (PPh) £40.18 DT price = £1.83
  - **Imigran (GlaxoSmithKline UK Ltd, Forest Laboratories UK Ltd)**
  - **Sumatriptan (as Sumatriptan succinate) 50 mg** Imigran Radis 50mg tablets | 6 tablet (PPh) £23.90 DT price = £1.75
  - **Imigran 50mg tablets** | 6 tablet (PPh) £31.85 DT price = £1.75
  - **Imigran Recovery 50mg tablets** | 2 tablet (P) £4.76

**Solution for injection**

- **SUMATRIPTAN (Non-proprietary)**
  - **Sumatriptan (as Sumatriptan succinate) 12 mg per 1 ml** Sumatriptan 6mg/0.5ml solution for injection pre-filled pen | 2 pre-filled disposable injection (PPh) £39.50 DT price = £39.50
  - **Imigran Subject (GlaxoSmithKline UK Ltd)**
  - **Sumatriptan (as Sumatriptan succinate) 12 mg per 1 ml** Imigran Subject 6mg/0.5ml solution for injection syringe refill pack | 2 pre-filled disposable injection (PPh) £40.41 DT price = £40.41

**Spray**

- **Imigran (GlaxoSmithKline UK Ltd)**
  - **Sumatriptan 100 mg per 1 ml** Imigran 10mg nasal spray | 2 unit dose (PPh) £11.80 DT price = £1.18
  - **Sumatriptan 200 mg per 1 ml** Imigran 20mg nasal spray | 2 unit dose (PPh) £14.16 | 6 unit dose (PPh) £35.39 DT price = £3.35

**Zolmitriptan**

**INDICATIONS AND DOSE**

**Treatment of acute migraine**

**BY MOUTH**

- **Adult**: 2.5 mg, followed by 2.5 mg after at least 2 hours if required, dose to be taken only if migraine recurs, then increased if necessary to 5 mg, dose to be taken only for subsequent attacks in patients not achieving satisfactory relief with 2.5 mg dose; maximum 10 mg per day

**BY INTRanasal ADMINISTRATION**

- **Adult**: 5 mg, dose to be administered as soon as possible after onset into one nostril only, followed by 5 mg after at least 2 hours if required, dose to be administered only if migraine recurs; maximum 10 mg per day

**Treatment of acute cluster headache**

**BY INTRanasal ADMINISTRATION**

- **Adult**: 5 mg, dose to be administered as soon as possible after onset into one nostril only, followed by 5 mg after at least 2 hours if required, dose to be administered only if migraine recurs; maximum 10 mg per day

**Dose adjustments due to interactions**
Max. 5 mg in 24 hours with concomitant cimetidine, fluvoxamine, moclobemide, or quinolone antibiotics.

**Dose equivalence and conversion**
1 spray of Zomig® nasal spray = 5 mg zolmitriptan.
INDICATIONS AND DOSE
Acute migraine
BY MOUTH
• Adult: 1 sachet, sachet to be mixed in water, and dose to be taken at the start of the attack, then 1 sachet after 2 hours if required; maximum 3 sachets per day.

Important safety information
Metoclopramide can cause severe extrapyramidal effects, particularly in children and young adults.

CAUTIONS
• Treatment should not exceed 3 months due to risk of tardive dyskinesia.
• PRESCRIBING AND DISPENSING INFORMATION Flavours of oral powder formulations may include lemon.

MEDICINAL FORMS
• There can be variation in the licensing of different medicines containing the same drug.
• Powder CAUTIONARY AND ADVISORY LABELS 13, 21, 32 EXCIPIENTS: May contain Aspartame
  • MigraMax (Zentiva)
  Aspirin DL-Lysine 900 mg, Metoclopramide hydrochloride
  10 mg MigraMax oral powder sachets (sugar-free) | 6 sachet DT price = £6.61
  17 mg MigraMax oral powder sachets (sugar-free) | 6 sachet DT price = £6.61

Toltenamic acid

INDICATIONS AND DOSE
Treatment of acute migraine
BY MOUTH
• Adult: 200 mg, dose to be taken at onset, then 200 mg after 1–2 hours if required.

CONTRA-INDICATIONS
• Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal haemorrhage (two or more distinct episodes) - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure.

CAUTIONS
• Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - elderly (risk of serious side-effects and fatalities) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension.

INTERACTIONS
• Appendix I (NSAIDs).

SIDE-EFFECTS
• Rare Alveolitis - aspetic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - hepatic damage - interstitial fibrosis associated with NSAIDs can lead to renal failure - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure - pulmonary eosinophilia - Stevens-Johnson syndrome - toxic epidermal necrolysis.

Frequency not known
• Angioedema - blood disorders - bronchospasm - colitis (induction of or exacerbation of) - confusion - Crohn’s disease (induction of or exacerbation of) - depression - diarrhoea - dizziness - drowsiness - dysuria (most commonly in men) - euphoria - fluid retention (rarely precipitating congestive heart failure) - gastrointestinal bleeding - gastro-intestinal discomfort - gastro-intestinal disturbances - gastro-intestinal ulceration - haematuria - hallucination - headache -
5.2 Neuropathic pain

Neuropathic pain, which occurs as a result of damage to neural tissue, includes phantom limb pain, compression neuropathies, peripheral neuropathies (e.g. due to Diabetes p. 588, chronic excessive alcohol intake, HIV infection p. 555, chemotherapy, idiopathic neuropathy), trauma, central pain (e.g. pain following stroke, spinal cord injury, and syringomyelia), and postherpetic neuralgia (peripheral nerve damage following acute herpes zoster infection (shingles)). The pain may occur in an area of sensory deficit and is sometimes accompanied by pain that is evoked by a non-noxious stimulus (allodynia).

Trigeminal neuralgia is also caused by dysfunction of neural tissue, but its management is distinct from other forms of neuropathic pain.

Neuropathic pain is generally managed with a tricyclic antidepressant or with certain antiepileptic drugs.

Amitriptyline hydrochloride p. 292 [unlicensed indication] and pregabalin p. 400 are effective treatments for neuropathic pain. Amitriptyline hydrochloride p. 292 and pregabalin can be used in combination if the patient has an inadequate response to either drug at the maximum tolerated dose.

Nortriptyline p. 298 [unlicensed indication] may be better tolerated than amitriptyline hydrochloride.

Gabapentin p. 392 is also effective for the treatment of neuropathic pain.

Neuropathic pain may respond to opioid analgesics. There is evidence of efficacy for tramadol hydrochloride p. 373, morphine p. 367, and oxycodone hydrochloride p. 369; however, treatment with morphine or oxycodone hydrochloride should be initiated only under specialist supervision. Tramadol hydrochloride p. 373 can be prescribed when other treatments have been unsuccessful, while the patient is waiting for assessment by a specialist.

Patients with localised pain who are unable to take oral medicines may benefit from topical local anaesthetic preparations, such as lidocaine hydrochloride p. 1116 medicated plasters, while awaiting specialist review.

Capsaicin p. 383 is licensed for neuropathic pain (but the intense burning sensation during initial treatment may limit use). Capsaicin p. 383 0.075% cream is licensed for the symptomatic relief of postherpetic neuralgia. A self-adhesive patch containing capsaicin p. 383 8% is licensed for the treatment of peripheral neuropathic pain in non-diabetic patients. It should be used under specialist supervision.

A corticosteroid may help to relieve pressure in compression neuropathy and thereby reduce pain.

Neurmodulation by spinal cord stimulation may be of benefit in some patients. Many patients with chronic neuropathic pain require multidisciplinary management, including physiotherapy and psychological support.

Trigeminal neuralgia

Surgery may be the treatment of choice in many patients; a neurological assessment will identify those who stand to benefit. Carbamazepine p. 387 taken during the acute stages of trigeminal neuralgia, reduces the frequency and severity of attacks. It is very effective for the severe pain associated with trigeminal neuralgia and (less commonly) glossopharyngeal neuralgia. Blood counts and electrolytes should be monitored when high doses are given. Small doses should be used initially to reduce the incidence of side-effects e.g. dizziness. Some cases respond to phenytoin p. 398; the drug may be given by intravenous infusion (possibly as fosphenytoin sodium p. 391) in a crisis (specialist use only).

Chronic facial pain

Chronic oral and facial pain including persistent idiopathic facial pain (also termed ‘atypical facial pain’) and temporomandibular dysfunction (previously termed temporomandibular joint pain dysfunction syndrome) may call for prolonged use of analgesics or for other drugs. Tricyclic antidepressants may be useful for facial pain [unlicensed indication], but are not on the Dental Practitioners’ List. Disorders of this type require specialist referral and psychological support to accompany drug treatment. Patients on long-term therapy need to be monitored both for progress and for side-effects.

Drugs used for Neuropathic pain not listed below; Amantadine hydrochloride, p. 331 - Amitriptyline hydrochloride, p. 292 - Capsaicin, p. 383 - Carbamazepine, p. 387 - Nortriptyline, p. 298 - Oxycodone hydrochloride, p. 369 - Phenytoin, p. 398 - Pregabalin, p. 400
ALKALOID ANALGESICS

Capsaicin

INDICATIONS AND DOSE

AXSAIN®

Post-herpetic neuralgia
 TO THE SKIN
 ▶ Adult: Apply 3–4 times a day, dose to be applied sparingly; important; after lesions have healed, not more often than every 4 hours

Painful diabetic neuropathy (under expert supervision)
 TO THE SKIN
 ▶ Adult: Apply 3–4 times a day for 8 weeks then review, dose to be applied sparingly, not more often than every 4 hours

ZACIN®

Symptomatic relief in osteoarthritis
 TO THE SKIN
 ▶ Adult: Apply 4 times a day, dose to be applied sparingly, not more often than every 4 hours

QUTENZA®

Peripheral neuropathic pain in non-diabetic patients (under the supervision of a physician)
 TO THE SKIN
 ▶ Adult: (consult product literature)

CAUTIONS

GENERAL CAUTIONS
Avoid contact with broken skin - avoid contact with inflamed skin

SPECIFIC CAUTIONS:
▷ With topical use avoid contact with eyes - avoid hot shower or bath just before or after application (burning sensation enhanced) - avoid inhalation of vapours - not to be used under tight bandages
▷ With transdermal use avoid contact with the face, scalp or in proximity to mucous membranes - avoid holding near eyes or mucous membranes - recent cardiovascular events - uncontrolled hypertension

SIDE-EFFECTS
▷ Common or very common
 ▶ With topical use transient burning sensation during initial treatment (particularly if too much used or if administered less than 3–4 times daily)
 ▶ With transdermal use application site reactions - erythema - pruritus - transient burning
 ▶ Uncommon
 ▶ With transdermal use burning sensation - cough - dysgeusia - eye irritation - first degree AV block - hypertension - hypoesthesia - muscle spasm - nausea - pain in extremities - palpitations - peripheral oedema - pruritus - tachycardia - throat irritation
 ▶ Rare
 ▶ With topical use cough - eye irritation - sneezing
 ▶ Frequency not known
 ▶ With topical use dyspnoea - exacerbation of asthma

MONITORING REQUIREMENTS
▷ With transdermal use Monitor blood pressure during treatment procedure.

HANDLING AND STORAGE
▷ With topical use Wash hands immediately after use (or wash hands 30 minutes after application if hands treated).
▷ With transdermal use Nitrile gloves to be worn while handling patches and cleaning treatment areas (latex gloves do not provide adequate protection).

NATIONAL FUNDING/ACCESS DECISIONS

QUTENZA®
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (January 2011) that capsaicin 179 mg (8%) patch (Qutenza®) is accepted for restricted use within NHS Scotland for the treatment of postherpetic neuralgia in patients who have not achieved adequate pain relief from, or who have not tolerated conventional first and second line treatments. Treatment should be under the supervision of a specialist in pain management.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream

Cream
EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol)
▷ Axsain (Teva UK Ltd)
Capsaicin 750 microgram per 1 gram Axsain 0.075% cream | 45 gram (P) £14.58 DT price = £14.58
▷ Zacin (Teva UK Ltd)
Capsaicin 250 microgram per 1 gram Zacin 0.025% cream | 45 gram (P) £17.71 DT price = £17.71

Cutaneous patch
EXCIPIENTS: May contain Butylated hydroxyanisole
▷ Qutenza (Astellas Pharma Ltd)
Capsaicin 179 mg (Qutenza 179mg cutaneous patches | 1 patch (P) £210.00

6 Seizures

6.1 Epilepsy

Epilepsy

Control of the epilepsies
The object of treatment is to prevent the occurrence of seizures by maintaining an effective dose of one or more antiepileptic drugs. Careful adjustment of doses is necessary, starting with low doses and increasing gradually until seizures are controlled or there are significant adverse effects.

When choosing an antiepileptic drug, the presenting epilepsy syndrome should first be considered. If the syndrome is not clear, the seizure type should determine the choice of treatment. Concomitant medication, co-morbidity, age, and sex should also be taken into account.

The dosage frequency is often determined by the plasma-drug half-life, and should be kept as low as possible to encourage adherence with the prescribed regimen. Most antiepileptics, when used in the usual dosage, can be given twice daily. Lamotrigine p. 394, perampanel p. 398, phenobarbital p. 409, and phenytoin p. 398, which have long half-lives, can be given once daily at bedtime.

However, with large doses, some antiepileptics may need to be given more frequently to avoid adverse effects associated with high peak plasma-drug concentration.

Management
When monotherapy with a first-line antiepileptic drug has failed, monotherapy with a second drug should be tried; the diagnosis should be checked before starting an alternative drug if the first drug showed lack of efficacy. The change from one antiepileptic drug to another should be cautious, slowly withdrawing the first drug only when the new regimen has been established. Combination therapy with two or more antiepileptic drugs may be necessary, but the concurrent use of antiepileptic drugs increases the risk of adverse effects and drug interactions. If combination
therapy does not bring about worthwhile benefits, revert to the regimen (monotherapy or combination therapy) that provided the best balance between tolerability and efficacy. A single antiepileptic drug should be prescribed wherever possible.

MHRA/CHM advice: Antiepileptic drugs: new advice on switching between different manufacturers’ products for a particular drug (November 2013)

The CHM has reviewed spontaneous adverse reactions received by the MHRA and publications that reported potential harm arising from switching of antiepileptic drugs in patients previously stabilised on a branded product to a generic. The CHM concluded that reports of loss of seizure control and/or worsening of side-effects around the time of switching between products could be explained as chance associations, but that a causal role of switching could not be ruled out in all cases. The following guidance has been issued to help minimise risk:

- Different antiepileptic drugs vary considerably in their characteristics, which influences the risk of whether switching between different manufacturers’ products of a particular drug may cause adverse effects or loss of seizure control;
- Antiepileptic drugs have been divided into three risk-based categories to help healthcare professionals decide whether it is necessary to maintain continuity of supply of a specific manufacturer’s product. These categories are listed below;
- If it is felt desirable for a patient to be maintained on a specific manufacturer’s product this should be prescribed either by specifying a brand name, or by using the generic name and name of the manufacturer (otherwise known as the Marketing Authorisation Holder);
- This advice relates only to antiepileptic drug use for treatment of epilepsy; it does not apply to their use in other indications (e.g. mood stabilisation, neuropathic pain);
- Please report on a Yellow Card any suspected adverse reactions to antiepileptic drugs;
- Dispensing pharmacists should ensure the continuity of supply of a particular product when the prescription specifies it. If the prescribed product is unavailable, it may be necessary to dispense a product from a different manufacturer to maintain continuity of treatment of that antiepileptic drug. Such cases should be discussed and agreed with both the prescriber and patient (or carer);
- Usual dispensing practice can be followed when a specific product is not stated.

**Category 1**
Phenytoin p. 398, carbamazepine p. 387, phenobarbital p. 405, primidone p. 401. For these drugs, doctors are advised to ensure that their patient is maintained on a specific manufacturer’s product.

**Category 2**
Valproate, lamotrigine p. 394, perampanel p. 398, retigabine p. 402, rufinamide p. 402, clobazam p. 410, clonazepam p. 411, oxcarbazepine p. 397, eslicarbazepine acetate p. 390, zonisamide p. 408, topiramate p. 406. For these drugs, the need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient and/or carer taking into account factors such as seizure frequency and treatment history.

**Category 3**
Levetiracetam p. 396, lacosamide p. 393, tiagabine p. 406, gabapentin p. 292, pregabalin p. 400, ethosuximide p. 390, vigabatrin p. 407. For these drugs, it is usually unnecessary to ensure that patients are maintained on a specific manufacturer’s product unless there are specific concerns such as patient anxiety, and risk of confusion or dosing errors Interactions.

**Antiepileptic hypersensitivity syndrome**
Antiepileptic hypersensitivity syndrome is a rare but potentially fatal syndrome associated with some antiepileptic drugs (carbamazepine, lacosamide, lamotrigine, oxcarbazepine, phenobarbital, phenytoin, primidone, and rufinamide); rarely cross-sensitivity occurs between some of these antiepileptic drugs. Some other antiepileptics (eslicarbazepine, stiripentol, and zonisamide) have a theoretical risk. The symptoms usually start between 1 and 8 weeks of exposure; fever, rash, and lymphadenopathy are most commonly seen. Other systemic signs include liver dysfunction, haematological, renal, and pulmonary abnormalities, vasculitis, and multi-organ failure. If signs or symptoms of hypersensitivity syndrome occur, the drug should be withdrawn immediately, the patient must not be re-exposed, and expert advice should be sought.

**Interactions**
Interactions between antiepileptics are complex and may increase toxicity without a corresponding increase in antiepileptic effect. Interactions are usually caused by hepatic enzyme induction or inhibition; displacement from protein binding sites is not usually a problem. These interactions are highly variable and unpredictable.

**Withdrawal**
Antiepileptic drugs should be withdrawn under specialist supervision. Avoid abrupt withdrawal, particularly of barbiturates and benzodiazepines, because this can precipitate severe rebound seizures. Reduction in dosage should be gradual and, in the case of barbiturates, withdrawal of the drug may take months.

The decision to withdraw antiepileptic drugs from a seizure-free patient, and its timing, is often difficult and depends on individual circumstances. Even in patients who have been seizure-free for several years, there is a significant risk of seizure recurrence on drug withdrawal. In patients receiving several antiepileptic drugs, only one drug should be withdrawn at a time.

**Driving**
Patients with epilepsy may drive a motor vehicle (but not a large goods or passenger carrying vehicle) provided that they have been seizure-free for one year or, if subject to attacks only while asleep, have established a 3-year period of asleep attacks without awake attacks. Those affected by drowsiness should not drive or operate machinery.

Guidance issued by the Drivers Medical Unit of the Driver and Vehicle Licensing Agency (DVLA) recommends that patients should be advised not to drive during medication changes or withdrawal of antiepileptic drugs, and for 6 months afterwards.

Patients who have had a first or single epileptic seizure must not drive for 6 months (5 years in the case of large goods or passenger carrying vehicles) after the event; driving may then be resumed, provided the patient has been assessed by a specialist as fit to drive because no abnormality was detected on investigation.

**Pregnancy**
Women of child-bearing potential should discuss with a specialist the impact of both epilepsy, and its treatment, on the outcome of pregnancy.

There is an increased risk of teratogenicity associated with the use of antiepileptic drugs (especially if used during the first trimester and particularly if the patient takes two or more antiepileptic drugs). Valproate is associated with the highest risk of major and minor congenital malformations (in particular neural tube defects), and long-term neurodevelopmental effects. There is also an increased risk of teratogenicity with phenytoin, primidone, phenobarbital,
Lamotrigine, and carbamazepine. Topiramate carries an increased risk of cleft palate if taken in the first trimester of pregnancy. There is not enough evidence to establish the risk of teratogenicity with other antiepileptic drugs. Prescribers should also consider carefully the choice of antiepileptic therapy in pre-pubescent girls who may later become pregnant. Women of child-bearing potential who take antiepileptic drugs should be given contraceptive advice. Some antiepileptic drugs can reduce the efficacy of hormonal contraceptives, and the efficacy of some antiepileptics may be affected by hormonal contraceptives.

Women who want to become pregnant should be referred to a specialist for advice in advance of conception. For some women, the severity of seizure or the seizure type may not pose a serious threat, and drug withdrawal may be considered; therapy may be resumed after the first trimester. If treatment with antiepileptic drugs must continue throughout pregnancy, then monotherapy is preferable at the lowest effective dose. Once an unplanned pregnancy is discovered it is usually too late for changes to be made to the treatment regimen; the risk of harm to the mother and fetus from convulsive seizures outweighs the risk of continued therapy. The likelihood of a woman who is taking antiepileptic drugs having a baby with no malformations is at least 90%, and it is important that women do not stop taking essential treatment because of concern over harm to the fetus. To reduce the risk of neural tube defects, folate supplementation is advised before conception and throughout the first trimester.

The concentration of antiepileptic drugs in the plasma can change during pregnancy. Doses of phenytoin, carbamazepine, and lamotrigine should be adjusted on the basis of plasma-drug concentration monitoring; the dose of other antiepileptic drugs should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis. Plasma-drug concentration monitoring during pregnancy is also useful to check compliance. Additionally, in patients taking topiramate or levetiracetam, it is recommended that fetal growth should be monitored. Women who have seizures in the second half of pregnancy should be assessed for eclampsia before any change is made to antiepileptic treatment. Status epilepticus should be treated according to the standard protocol.

Routine injection of vitamin K at birth minimises the risk of neonatal haemorrhage associated with antiepileptics. Withdrawal effects in the newborn may occur with some antiepileptic drugs, in particular benzodiazepines and phenobarbital.

Epilepsy and Pregnancy Register

All pregnant women with epilepsy, whether taking medication or not, should be encouraged to notify the UK Epilepsy and Pregnancy Register (Tel: 0800 389 1248).

Breast-feeding

Women taking antiepileptic monotherapy should generally be encouraged to breast-feed; if a woman is on combination therapy or if there are other risk factors, such as premature birth, specialist advice should be sought. All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones. Infants should also be monitored for adverse effects associated with the antiepileptic drug particularly with newer antiepileptics, if the antiepileptic is readily transferred into breast-milk causing high infant serum-drug concentrations (e.g. ethosuximide, lamotrigine, primidone, and zonisamide), or if slower metabolism in the infant causes drugs to accumulate (e.g. phenobarbital and lamotrigine). Serum-drug concentration monitoring should be undertaken in breast-fed infants if suspected adverse reactions develop; if toxicity develops it may be necessary to introduce formula feeds to limit the infant’s drug exposure, or to wean the infant off breast-milk altogether.

Primidone, phenobarbital, and the benzodiazepines are associated with an established risk of drowsiness in breast-fed babies and caution is required.

Withdrawal effects may occur in infants if a mother suddenly stops breast-feeding, particularly if she is taking phenobarbital, primidone, or lamotrigine.

Focal seizures with or without secondary generalisation

Carbamazepine p. 387 and lamotrigine p. 394 are first-line options for treating newly diagnosed focal seizures; oxcarbazepine p. 397, sodium valproate p. 403 and levetiracetam p. 396 may be used if carbamazepine or lamotrigine are unsuitable or not tolerated. If monotherapy is unsuccessful with two of these first-line antiepileptic drugs, adjunctive treatment may be considered. Options for adjunctive treatment include carbamazepine, clobazam p. 410, gabapentin p. 392, lamotrigine, levetiracetam, oxcarbazepine, sodium valproate, or topiramate p. 406. If adjunctive treatment is ineffective or not tolerated, a tertiary epilepsy specialist should be consulted who may consider eslicarbazepine acetate p. 390, lacosamide p. 393, phenobarbital p. 409, phenytoin p. 398, pregabalin p. 400, tiagabine p. 406, vigabatrin p. 407 and zonisamide p. 408.

Generalised seizures

Tonic-clonic seizures

Sodium valproate p. 403 is the first-line treatment for newly diagnosed generalised tonic-clonic seizures. Lamotrigine p. 394 is the alternative choice if sodium valproate is not suitable, but may exacerbate myoclonic seizures. In those with established epilepsy with generalised tonic-clonic seizures only, lamotrigine or sodium valproate may be prescribed as the first-line treatment. Carbamazepine p. 387 and oxcarbazepine p. 397 may also be considered in newly diagnosed and established tonic-clonic seizures, but may exacerbate myoclonic and absence seizures. Clobazam p. 410, lamotrigine p. 394, levetiracetam p. 396, sodium valproate or topiramate p. 406 may be used as adjunctive treatment if monotherapy is ineffective or not tolerated.

Absence seizures

Ethosuximide p. 390 or sodium valproate p. 403 are the drugs of choice in absence seizures and syndromes; lamotrigine p. 394 is a suitable alternative when ethosuximide and sodium valproate are unsuitable, ineffective or not tolerated. Sodium valproate should be used as the first choice if there is a high risk of generalised tonic-clonic seizures. A combination of any two of these drugs may be used if monotherapy is ineffective. Clobazam p. 410, clonazepam p. 411, levetiracetam p. 396, topiramate p. 406 or zonisamide p. 408 may be considered by a tertiary epilepsy specialist if adjunctive treatment fails. Carbamazepine p. 387, gabapentin p. 392, oxcarbazepine p. 397, phenytoin p. 398, pregabalin p. 400, tiagabine p. 406 and vigabatrin p. 407 are not recommended in absence seizures or syndromes.

Myoclonic seizures

Myoclonic seizures (myoclonic jerks) occur in a variety of syndromes, and response to treatment varies considerably. Sodium valproate p. 403 is the drug of choice in newly diagnosed myoclonic seizures; topiramate p. 406 and levetiracetam p. 396 are alternative options if sodium valproate is unsuitable but consideration should be given to the less favourable side-effect profile of topiramate. A combination of two of these drugs may be used if monotherapy is ineffective or not tolerated. If adjunctive treatment fails, a tertiary epilepsy specialist should be consulted and may consider clobazam p. 410, clonazepam p. 411, zonisamide p. 408 or piracetam p. 321.

and vigabatrin p. 407 are not recommended for the treatment of myoclonic seizures. Sodium valproate and levetiracetam are effective in treating the generalised tonic-clonic seizures that coexist with myoclonic seizures in idiopathic generalised epilepsy.

**Atonic and tonic seizures**

Atonic and tonic seizures are usually seen in childhood, in specific epilepsy syndromes, or associated with cerebral damage or mental retardation. They may respond poorly to the traditional drugs. Sodium valproate p. 403 is the drug of choice; lamotrigine p. 394 can be added as adjunctive treatment. If adjunctive treatment is ineffective or not tolerated, a tertiary epilepsy specialist should be consulted, and may consider rufinamide p. 402 or topiramate p. 406. Carbamazepine p. 387, gabapentin p. 392, oxcarbazepine p. 397, pregabalin p. 400, tiagabine p. 406 or vigabatrin p. 407 are not recommended in atonic and tonic seizures.

**Epilepsy syndromes**

Some drugs are licensed for use in particular epilepsy syndromes, such as lamotrigine p. 394 and rufinamide p. 402 in Lennox-Gastaut syndrome. The epilepsy syndromes are specific types of epilepsy that are characterised according to a number of features including seizure type, age of onset, and EEG characteristics.

**Antiepileptic drugs**

**Carbamazepine and related antiepileptics**

Carbamazepine p. 387 is a drug of choice for simple and complex focal seizures and is a first-line treatment option for generalised tonic-clonic seizures. It can be used as adjunctive treatment for focal seizures when monotherapy has been ineffective. It is essential to initiate carbamazepine therapy at a low dose and build this up slowly. Carbamazepine may exacerbate tonic, atonic, myoclonic and absence seizures and is therefore not recommended if these seizures are present.

Oxcarbazepine p. 397 is licensed as monotherapy or adjunctive therapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures. It can also be considered for the treatment of primary generalised tonic-clonic seizures [unlicensed]. Oxcarbazepine is not recommended in tonic, atonic, absence or myoclonic seizures due to the risk of seizure exacerbation. Eslicarbazepine acetate p. 390 is licensed for adjunctive treatment in adults with focal seizures with or without secondary generalisation.

**Ethosuximide**

Ethosuximide p. 390 is a first-line treatment option for absence seizures. It may also be prescribed as adjunctive treatment for absence seizures when monotherapy is ineffective. Ethosuximide is also licensed for myoclonic seizures.

Gabapentin and pregabalin

Gabapentin p. 392 and pregabalin p. 400 are used for the treatment of focal seizures with or without secondary generalisation. They are not recommended if tonic, atonic, absence or myoclonic seizures are present. Both are also licensed for the treatment of neuropathic pain. Pregabalin is licensed for the treatment of generalised anxiety disorder. Gabapentin is an effective treatment for migraine prophylaxis [unlicensed].

**Lamotrigine**

Lamotrigine p. 394 is an antiepileptic drug recommended as a first-line treatment for focal seizures and primary and secondary generalised tonic-clonic seizures. It is also licensed for typical absence seizures in children (but efficacy may not be maintained in all children) and is an unlicensed treatment option in adults if first-line treatments have been unsuccessful. Lamotrigine can also be used as adjunctive treatment in atonic or tonic seizures if first-line treatment has failed [unlicensed]. Myoclonic seizures may be exacerbated by lamotrigine and it can cause serious rashes especially in children; dose recommendations should be adhered to closely.

Lamotrigine is used either as sole treatment or as an adjunct to treatment with other antiepileptic drugs. Valproate increases plasma-lamotrigine concentration, whereas the enzyme-inducing antiepileptics reduce it; care is therefore required in choosing the appropriate initial dose and subsequent titration. When the potential for interaction is not known, treatment should be initiated with lower doses, such as those used with valproate.

**Levetiracetam**

Levetiracetam p. 396 is used for monotherapy and adjunctive treatment of focal seizures with or without secondary generalisation, and for adjunctive treatment of myoclonic seizures in patients with juvenile myoclonic epilepsy and primary generalised tonic-clonic seizures. Levetiracetam may be prescribed alone and in combination for the treatment of myoclonic seizures, and under specialist supervision for absence seizures [both unlicensed].

**Phenobarbital and primidone**

Phenobarbital p. 409 is effective for tonic-clonic and focal seizures but may be sedative in adults. It may be tried for atypical absence, atonic, and tonic seizures. Rebound seizures may be a problem on withdrawal. Primidone p. 401 is largely converted to phenobarbital and this is probably responsible for its antiepileptic action. A low initial dose of primidone is essential.

**Phenytoin**

Phenytoin p. 398 is licensed for tonic-clonic and focal seizures but may exacerbate absence or myoclonic seizures and should be avoided if these seizures are present. It has a narrow therapeutic index and the relationship between dose and plasma-drug concentration is non-linear; small dosage increases in some patients may produce large increases in plasma concentration with acute toxic side-effects. Similarly, a few missed doses or a small change in drug absorption may result in a marked change in plasma-drug concentration. Monitoring of plasma-drug concentration improves dosage adjustment.

When only parenteral administration is possible, fosphenytoin sodium p. 391, a pro-drug of phenytoin, may be convenient to give. Unlike phenytoin (which should only be given intravenously), fosphenytoin sodium may also be given by intramuscular injection.

**Rufinamide**

Rufinamide p. 402 is licensed for the adjunctive treatment of seizures in Lennox-Gastaut syndrome. It may be considered by a tertiary specialist for the treatment of refractory tonic or atonic seizures [unlicensed].

**Topiramate**

Topiramate p. 406 can be given alone or as adjunctive treatment in generalised tonic-clonic seizures or focal seizures with or without secondary generalisation. It can be used as adjunctive treatment for seizures associated with Lennox-Gastaut syndrome and for absence, tonic and atonic seizures under specialist supervision [unlicensed]. It can also be considered as an option in myoclonic seizures [unlicensed]. Topiramate is also licensed for prophylaxis of migraine.

**Valproate**

Sodium valproate p. 403 is effective in controlling tonic-clonic seizures, particularly in primary generalised epilepsy. It is a drug of choice in a primary generalised tonic-clonic seizures, focal seizures, generalised absences and myoclonic seizures, and can be tried in atypical absence seizures. It is recommended as a first-line option in atonic and tonic seizures.
seizures. Sodium valproate has widespread metabolic effects and monitoring of liver function tests and full blood count is essential.

Valproic acid p. 275 (as semisodium valproate) is licensed for acute mania associated with bipolar disorder.

Zonisamide
Zonisamide p. 408 can be used alone for the treatment of focal seizures with or without secondary generalisation in adults with newly diagnosed epilepsy, and as adjunctive treatment for refractory focal seizures with or without secondary generalisation in adults and children aged 6 years and above. It can also be used under the supervision of a specialist for refractory absence and myoclonic seizures [unlicensed indications].

Benzodiazepines
Clobazam p. 410 may be used as adjunctive therapy in the treatment of generalised tonic-clonic and refractory focal seizures. It may be prescribed under the care of a specialist for refractory absence and myoclonic seizures. Clonazepam p. 411 may be prescribed by a specialist for refractory absence and myoclonic seizures, but its sedative side-effects may be prominent.

Other drugs
Acetazolamide p. 965, a carbonic anhydrase inhibitor, has a specific role in treating epilepsy associated with menstruation. Piracetam p. 321 is used as adjunctive treatment for cortical myoclonus.

Status epilepticus
Convulsive status epilepticus
Immediate measures to manage status epilepticus include positioning the patient to avoid injury, supporting respiration including the provision of oxygen, maintaining blood pressure, and the correction of any hypoglycaemia. Parenteral thiamine p. 882 should be considered if alcohol abuse is suspected; pyridoxine hydrochloride p. 882 should be given if the status epilepticus is caused by pyridoxine hydrochloride deficiency.

Seizures lasting longer than 5 minutes should be treated urgently with intravenous lorazepam p. 412 (repeated once after 10 minutes if seizures recur or fail to respond). Intravenous diazepam p. 267 is effective but it carries a high risk of thrombophlebitis (reduced by using an emulsion formulation). Absorption of diazepam p. 267 from intramuscular injection or from suppositories is too slow for refractory absence and myoclonic seizures. Diazepam can be administered as a rectal solution (formulation). Absorption of diazepam p. 4.24 may be prescribed under the care of a specialist for refractory absence and myoclonic seizures, but its sedative side-effects may be prominent.

Other drugs
Acetazolamide p. 965, a carbonic anhydrase inhibitor, has a specific role in treating epilepsy associated with menstruation. Piracetam p. 321 is used as adjunctive treatment for cortical myoclonus.

Status epilepticus
Convulsive status epilepticus
Immediate measures to manage status epilepticus include positioning the patient to avoid injury, supporting respiration including the provision of oxygen, maintaining blood pressure, and the correction of any hypoglycaemia. Parenteral thiamine p. 882 should be considered if alcohol abuse is suspected; pyridoxine hydrochloride p. 882 should be given if the status epilepticus is caused by pyridoxine hydrochloride deficiency.

Seizures lasting longer than 5 minutes should be treated urgently with intravenous lorazepam p. 412 (repeated once after 10 minutes if seizures recur or fail to respond). Intravenous diazepam p. 267 is effective but it carries a high risk of thrombophlebitis (reduced by using an emulsion formulation). Absorption of diazepam p. 267 from intramuscular injection or from suppositories is too slow for treatment of status epilepticus. Patients should be monitored for respiratory depression and hypotension.

Where facilities for resuscitation are not immediately available, diazepam can be administered as a rectal solution or midazolam p. 414 oromucosal solution can be given into the buccal cavity.

Important
If, after initial treatment with benzodiazepines, seizures recur or fail to respond 25 minutes after onset, phenytoin sodium, fosphenytoin sodium p. 391, or phenobarbital sodium should be used; contact intensive care unit if seizures continue. If these measures fail to control seizures 45 minutes after onset, anaesthesia with thiopental sodium p. 412, midazolam p. 414, or a non-barbiturate anaesthetic such as propofol p. 1095 [unlicensed indication], should be instituted with full intensive care support.

Phenytoin sodium can be given by slow intravenous injection, followed by the maintenance dosage if appropriate.

Alternatively, fosphenytoin sodium p. 391 (a pro-drug of phenytoin), can be given more rapidly and when given intravenously causes fewer injection-site reactions than phenytoin sodium. Although it can also be given intramuscularly, absorption is too slow by this route for treatment of status epilepticus. Doses of fosphenytoin sodium p. 391 should be expressed in terms of phenytoin sodium.

Non-convulsive status epilepticus
The urgency to treat non-convulsive status epilepticus depends on the severity of the patient’s condition. If there is incomplete loss of awareness, usual oral antiepileptic therapy should be continued or restarted. Patients who fail to respond to oral antiepileptic therapy or have complete lack of awareness can be treated in the same way as for convulsive status epilepticus, although anaesthesia is rarely needed.

Febrile convulsions
Brief febrile convulsions need no specific treatment; antipyretic medication (e.g. paracetamol p. 354), is commonly used to reduce fever and prevent further convulsions but evidence to support this practice is lacking. Prolonged febrile convulsions (those lasting 5 minutes or longer), or recurrent febrile convulsions without recovery must be treated actively (as for convulsive status epilepticus). Long-term anticonvulsant prophylaxis for febrile convulsions is rarely indicated.

Drugs used for Seizures not listed below: Acetazolamide, p. 965 - Lidocaine hydrochloride, p. 1116 - Magnesium sulfate, p. 858

ANTIEPILEPTICS
Carbamazepine

**INDICATIONS AND DOSE**

**Focal and secondary generalised tonic-clonic seizures | Primary generalised tonic-clonic seizures**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- **Adult:** Initially 100–200 mg 1–2 times a day, increased in steps of 100–200 mg every 2 weeks; usual dose 0.8–1.2 g daily in divided doses; increased if necessary up to 1.6–2 g daily in divided doses
- **Elderly:** Reduce initial dose
- **BY RECTUM**
- **Adult:** Up to 1 g daily in 4 divided doses for up to 7 days, for short-term use when oral therapy temporarily not possible

**Trigeminal neuralgia**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- **Adult:** Initially 100 mg 1–2 times a day, some patients may require higher initial dose, increased in steps of 100–200 mg every 2 weeks, adjusted according to response, usual dose 200 mg 3–4 times a day; increased if necessary up to 1.6 g daily

**Prophylaxis of bipolar disorder unresponsive to lithium**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- **Adult:** Initially 400 mg daily in divided doses, increased in steps of 100–200 mg every 2 weeks until symptoms controlled; usual dose 400–600 mg daily; maximum 1.6 g per day

**Treatment of alcohol withdrawal**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- **Adult:** Initially 800 mg daily in divided doses, then reduced to 200 mg daily usual treatment duration 7–10 days, dose to be reduced gradually over 5 days

**Diabetic neuropathy**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- **Adult:** Initially 100 mg 1–2 times a day, increased in steps of 100–200 mg every 2 weeks, adjusted according to response, usual dose 200 mg 3–4 times a day; increased if necessary up to 1.6 g daily

---

**BNF 70**

**Epilepsy 387**

**Nervous system**
Focal and generalised tonic-clonic seizures

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 1 month–11 years: Initially 5 mg/kg once daily, dose to be taken at night, alternatively initially 2.5 mg/kg twice daily, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 5 mg/kg 2–3 times a day, increased if necessary up to 20 mg/kg daily
- Child 12–17 years: Initially 100–200 mg 1–2 times a day, then increased to 200–400 mg 2–3 times a day, increased if necessary up to 1.8 g daily, dose should be increased slowly

Dose equivalence and conversion

Suppositories of 125 mg may be considered to be approximately equivalent in therapeutic effect to tablets of 100 mg but final adjustment should always depend on clinical response (plasma concentration monitoring recommended).

CARBAGEN® SR

Focal and secondary generalised tonic-clonic seizures

Primary generalised tonic-clonic seizures

BY MOUTH

- Adult: Initially 100–400 mg daily in 1–2 divided doses, increased in steps of 100–200 mg every 2 weeks, usual dose 8.1–12.2 g daily in 1–2 divided doses; increased if necessary up to 1.6–2 g daily in 1–2 divided doses
- Elderly: Reduce initial dose

Trigeminal neuralgia

BY MOUTH

- Adult: Initially 100–200 mg daily in 1–2 divided doses, some patients may require higher initial dose, increased in steps of 100–200 mg every 2 weeks, adjusted according to response, usual dose 600–800 mg daily in 2 divided doses; increased if necessary up to 1.6 g daily in 2 divided doses, dose should be increased slowly

Prophylaxis of bipolar disorder unresponsive to lithium

BY MOUTH

- Adult: Initially 400 mg daily in 2 divided doses, increased in steps of 100–200 mg every 2 weeks until symptoms controlled; usual dose 400–600 mg daily in 2 divided doses; maximum 1.6 g per day

Focal and generalised tonic-clonic seizures | Prophylaxis of bipolar disorder

BY MOUTH

- Child 5–11 years: Initially 5 mg/kg daily in 1–2 divided doses, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 10–15 mg/kg daily in 1–2 divided doses, increased if necessary up to 20 mg/kg daily in 1–2 divided doses
- Child 12–17 years: Initially 100–400 mg daily in 1–2 divided doses, then increased to 400–1200 mg daily in 1–2 divided doses, increased if necessary up to 1.8 g daily in 1–2 divided doses, dose should be increased slowly

TEGRETOL® PROLONGED RELEASE

Focal and secondary generalised tonic-clonic seizures

Primary generalised tonic-clonic seizures

BY MOUTH

- Adult: Initially 100–400 mg daily in 2 divided doses, increased in steps of 100–200 mg every 2 weeks, usual dose 0.8–1.2 g daily in 2 divided doses; increased if necessary up to 1.6–2 g daily in 2 divided doses
- Elderly: Reduce initial dose

Focal and generalised tonic-clonic seizures | Prophylaxis of bipolar disorder

BY MOUTH

- Child 5–11 years: Initially 5 mg/kg daily in 2 divided doses, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 10–15 mg/kg daily in 2 divided doses, increased if necessary up to 20 mg/kg daily in 2 divided doses
- Child 12–17 years: Initially 100–400 mg daily in 2 divided doses, then increased to 400–1200 mg daily in 2 divided doses, increased if necessary up to 1.6 g daily in 2 divided doses, dose should be increased slowly

Trigeminal neuralgia

BY MOUTH

- Adult: Initially 100–200 mg daily in 2 divided doses, some patients may require higher initial dose, increased in steps of 100–200 mg every 2 weeks, adjusted according to response, usual dose 600–800 mg daily in 2 divided doses; increased if necessary up to 1.6 g daily in 2 divided doses, dose should be increased slowly

Prophylaxis of bipolar disorder unresponsive to lithium

BY MOUTH

- Adult: Initially 400 mg daily in 2 divided doses, increased in steps of 100–200 mg every 2 weeks until symptoms controlled; usual dose 400–600 mg daily in 2 divided doses; maximum 1.6 g per day

- UNLICENSED USE

  - In children Suppositories not licensed for use in trigeminal neuralgia or prophylaxis of bipolar disorder.
  - In adults Use in the treatment of alcohol withdrawal is an unlicensed indication. Use in diabetic neuropathy is an unlicensed indication.

- CONTRA-INDICATIONS

  - Acute porphyrias p. 864. AV conduction abnormalities (unless paced). History of bone-marrow depression

- CAUTIONS

  - Cardiac disease. History of haematological reactions to other drugs. May exacerbate absence and myoclonic seizures. Skin reactions. Susceptibility to angle-closure glaucoma

- CAUTIONS, FURTHER INFORMATION

  - Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

Blood, hepatic, or skin disorders

Carbamazepine should be withdrawn immediately in cases of aggravated liver dysfunction or acute liver disease. Leucopenia that is severe, progressive, or associated with clinical symptoms requires withdrawal (if necessary under cover of a suitable alternative).

- INTERACTIONS

  - Appendix 1 (carbamazepine).

- SIDE-EFFECTS

  - Common or very common

  - Uncommon

  - Rare

  - Very rare

interstitial nephritis • muscle pain • neuroleptic malignant syndrome • osteomalacia • osteoporosis • pancreatitis • photosensitivity • pneumonia • pneumonitis • psychosis • pulmonary hypersensitivity • purpura • renal failure • sexual dysfunction • Stevens-Johnson syndrome • stomatitis • sweating • taste disturbance • thromboembolism • thrombophlebitis • toxic epidermal necrolysis • urinary frequency • urinary retention

- Frequency not known Suicidal ideation

SIDE-EFFECTS, FURTHER INFORMATION
Some side-effects (such as headache, ataxia, drowsiness, nausea, vomiting, blurring of vision, dizziness, unsteadiness, and allergic skin reactions) are dose-related, and may be dose-limiting. These side-effects are more common at the start of treatment and in the elderly. Patients should be offered a modified-release preparation to reduce the risk of side-effects; altering the timing of medication may also be beneficial.

Overdose
For details on the management of poisoning, see Active elimination techniques, under Emergency treatment of poisoning p. 1123.

- ALLERGY AND CROSS-SENSITIVITY Antiepileptic hypersensitivity syndrome associated with carbamazepine. See under Epilepsy p. 383 for more information. Caution—cross-sensitivity reported with oxcarbazepine and with phenytoin.

- PREGNANCY Doses should be adjusted on the basis of plasma-drug concentration monitoring.

- BREAST FEEDING Amount probably too small to be harmful. Monitor infant for possible adverse reactions.

- HEPATIC IMPAIRMENT Metabolism impaired in advanced liver disease.

- RENAL IMPAIRMENT Use with caution.

- PRE-TREATMENT SCREENING Test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele).

- MONITORING REQUIREMENTS
  - Plasma concentration for optimum response 4–12 mg/litre (20–50 micromol/litre) measured after 1–2 weeks.
  - Manufacturer recommends blood counts and hepatic and renal function tests (but evidence of practical value uncertain).

- TREATMENT CESSATION When stopping treatment with carbamazepine for bipolar disorder, reduce the dose gradually over a period of at least 4 weeks.

- DIRECTIONS FOR ADMINISTRATION
  - In children Oral liquid has been used rectally—should be retained for at least 2 hours (but may have laxative effect).
  - Tegretol® Prolonged Release tablets can be halved but should not be chewed.

- PRESCRIBING AND DISPENSING INFORMATION
  - Switching between formulations Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer’s product.

- PATIENT AND CARER ADVICE
  - Medicines for Childrenleaflet: Carbamazepine (oral) for preventing seizures www.medicinesforchildren.org.uk/carbamazepine-oral-preventing-seizures-0

Blood, hepatic, or skin disorders Patients or their carers should be told how to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical attention if symptoms such as fever, rash, mouth ulcers, bruising, or bleeding develop.

PROFESSION SPECIFIC INFORMATION
Dental practitioners’ formulation Carbamazepine Tablets may be prescribed.

MÉDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Eslicarbazepine acetate

INDICATIONS AND DOSE

Adjunctive treatment in adults with focal seizures with or without secondary generalisation

BY MOUTH

- Adult: Initially 400 mg once daily for 1–2 weeks, then increased to 800 mg once daily (max. per dose 1.2 g)

CONTRA-INDICATIONS
Second- or third-degree AV block

CAUTIONS
- Elderly - hyponatraemia - PR-interval prolongation

INTERACTIONS → Appendix 1 (eslicarbazepine). Caution—avoid concomitant administration of drugs that prolong PR interval.

SIDE-EFFECTS

- Common or very common Dizziness - drowsiness - fatigue - gastrointestinal disturbances - headache - impaired coordination - rash - tremor - visual disturbances

- Very rare Leucopenia - pancreatitis - thrombocytopenia

- Frequency not known PR-interval prolongation - suicidal ideation

ALLERGY AND CROSS-SENSITIVITY

Antiepileptic hypersensitivity syndrome theoretically associated with eslicarbazepine. See under Epilepsy p. 383 for more information.

PREGNANCY

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

HEPATIC IMPAIRMENT

Avoid in severe impairment—no information available.

RENAL IMPAIRMENT

Reduce initial dose to 400 mg every other day for 2 weeks then 400 mg once daily if eGFR 30–60 mL/minute/1.73 m², adjusted according to response. Avoid if eGFR less than 30 mL/minute/1.73 m².

PRE-TREATMENT SCREENING

Test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele).

MONITORING REQUIREMENTS

Monitor plasma-sodium concentration in patients at risk of hyponatraemia and discontinue treatment if hyponatraemia occurs.

PRESCRIBING AND DISPENSING INFORMATION

Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (October 2010) that eslicarbazepine acetate (Zebinix®) is accepted for restricted use within NHS Scotland as adjunctive therapy in adults with focal seizures with or without secondary generalisation. It is restricted for use in refractory epilepsy.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 8
- Zebinix (Eisai Ltd)

- Eslicarbazepine acetate 800 mg Zebinix 800mg tablets | 30 tablet(s) £13.60

Ethosuximide

INDICATIONS AND DOSE

Absence seizures | Atypical absence seizures | Myoclonic seizures

BY MOUTH

- Child 1 month-5 years: Initially 5 mg/kg twice daily (max. per dose 125 mg), dose to be increased every 5–7 days; maintenance 10–20 mg/kg twice daily (max. per dose 500 mg), total daily dose may rarely be given in 3 divided doses

- Child 6–17 years: Initially 250 mg twice daily, then increased in steps of 250 mg every 5–7 days; usual dose 500–750 mg twice daily, increased if necessary up to 1 g twice daily

- Adult: Initially 500 mg daily in 2 divided doses, then increased in steps of 250 mg every 5–7 days; usual dose 1–1.5 g daily in 2 divided doses, increased if necessary up to 2 g daily

CAUTIONS
- Avoid in Acute porphyrias p. 864

INTERACTIONS → Appendix 1 ( ethosuximide).

SIDE-EFFECTS

- Common or very common anorexia - abdominal pain - diarrhoea - gastro-intestinal disturbances - nausea - vomiting - weight loss

- Uncommon Agitation - ataxia - dizziness - drowsiness - euphoria - fatigue - headache - hiccups - impaired concentration - irritability

- Rare Depression - dyskinesia - gingival hypertrophy - increased libido - myopia - photophobia - psychosis - rash - sleep disturbances - tongue swelling - vaginal bleeding

- Frequency not known Agranulocytosis - aplastic anaemia - blood disorders - hyperactivity - increase in seizure frequency - leucopenia - pancytopenia - Stevens-Johnson syndrome - suicidal ideation - systemic lupus erythematosus

SIDE-EFFECTS, FURTHER INFORMATION

Blood disorders Blood counts required if features of infection.

PREGNANCY

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

BRIDDEN FREE

Present in milk. Hyperexcitability and sedation reported.

HEPATIC IMPAIRMENT

Use with caution.

RENAL IMPAIRMENT

Use with caution.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Ethosuximide for preventing seizures www.medicinesforchildren.org.uk/ ethosuximide-for-preventing-seizures

Blood disorders Patients or their carers should be told how to recognise signs of blood disorders, and advised to seek immediate medical attention if symptoms such as fever, mouth ulcers, bruising, or bleeding develop.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.
Fosphenytoin sodium

**DRUG ACTION**
Fosphenytoin is a pro-drug of phenytoin.

**INDICATIONS AND DOSE**

**Status epilepticus**

**BY INTRAVENOUS INFUSION**

- **Adult:** Initially 20 mg(PE)/kg, dose to be administered at a rate of 100–150 mg(PE)/minute, then 4–5 mg (PE)/kg daily in 1–2 divided doses, dose to be administered at a rate of 50–100 mg(PE)/minute, dose to be adjusted according to response and trough plasma-phenytoin concentration
- **Elderly:** Consider 10–25% reduction in dose or infusion rate

**Prophylaxis or treatment of seizures associated with neurosurgery or head injury**

**BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INFUSION**

- **Adult:** Initially 10–15 mg(PE)/kg, intravenous infusion to be administered at a rate of 50–100 mg(PE)/minute, then 4–5 mg(PE)/kg daily in 1–2 divided doses. Intravenous infusion to be administered at a rate of 50–100 mg(PE)/minute, dose to be adjusted according to response and trough plasma-phenytoin concentration
- **Elderly:** Consider 10–25% reduction in dose or infusion rate

**Temporary substitution for oral phenytoin**

**BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INFUSION**

- **Adult:** Intravenous infusion to be administered at a rate of 50–100 mg(PE)/minute, same dose and same dosing frequency as oral phenytoin therapy
- **Elderly:** Consider 10–25% reduction in dose or infusion rate

**Dose equivalence and conversion**

Doses are expressed as phenytoin sodium equivalent (PE); fosphenytoin sodium 1.5 mg = phenytoin sodium 1 mg.

**UNLICENSED USE**

Fosphenytoin sodium doses in BNF may differ from those in product literature.

**CONTRA-INDICATIONS**

- Acute porphyrias p. 864
- Second-degree heart block
- Sino-atrial block
- Sinus bradycardia
- Stokes-Adams syndrome
- Third-degree heart block

**CAUTIONS**

- Heart failure
- Hypotension
- Injection solutions alkaline (irritant to tissues)
- Respiratory depression
- Resuscitation facilities must be available

**INTERACTIONS**

- Appendix 1 (fosphenytoin).

**SIDE-EFFECTS**

**COMMON OR VERY COMMON**

- Alterations in respiratory function
- Arrhythmias
- Asthenia
- Cardiovascular collapse
- Cardiovascular depression (particularly if injection too rapid)
- Chills
- CNS depression (particularly if injection too rapid)
- Dry mouth
- Dysarthria
- Ecchymosis
- Euphoria
- Hypotension
- Incoordination
- Pruritus
- Respiratory arrest
- Taste disturbance

**UNCOMMON**

- Decreased reflexes
- Hypoacusis
- Hypoesthesia
- Increased reflexes
- Muscle spasm
- Muscle weakness
- Pain
- Stupor

**FREQUENCY NOT KNOWN**

- Bradycardia
- Confusion
- Extrapyramidal disorder
- Heart block
- Hyperglycaemia
- Purple glove syndrome
- Tonic seizures
- Twitching

**SIDE-EFFECTS, FURTHER INFORMATION**

**Important**

Intravenous infusion of fosphenytoin has been associated with severe cardiovascular reactions including asystole, ventricular fibrillation, and cardiac arrest. Hypotension, bradycardia, and heart block have also been reported. The following are recommended:

- Monitor heart rate, blood pressure, and respiratory function for duration of infusion;
- Observe patient for at least 30 minutes after infusion;
- If hypotension occurs, reduce infusion rate or discontinue;

**ALLERGY AND CROSS-SENSITIVITY**

Cross-sensitivity reported with carbamazepine.

**PREGNANCY**

Changes in plasma-protein binding make interpretation of plasma-phenytoin concentrations difficult—monitor unbound fraction. The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**BREAST FEEDING**

Small amounts present in milk, but not known to be harmful.

**HEPATIC IMPAIRMENT**

Consider 10–25% reduction in dose or infusion rate (except initial dose for status epilepticus).

**RENAL IMPAIRMENT**

Consider 10–25% reduction in dose or infusion rate (except initial dose for status epilepticus).

**PRE-TREATMENT SCREENING**

HLA-B*1502 allele in individuals of Han Chinese or Thai origin—avoid unless essential (increased risk of Stevens-Johnson syndrome).

**MONITORING REQUIREMENTS**

- Manufacturer recommends blood counts (but evidence of practical value uncertain).
- ECG monitoring required.
- Monitor heart rate, blood pressure, and respiratory function for duration of infusion.

**DIRECTIONS FOR ADMINISTRATION**

For intermittent intravenous infusion (Pro-Epanutin®), give in Glucose 5% or Sodium chloride 0.9%; dilute to a concentration of 1.5–25 mg (phenytoin sodium equivalent (PE))/mL.

**PRESCRIBING AND DISPENSING INFORMATION**

Prescriptions for fosphenytoin sodium should state the dose in terms of phenytoin sodium equivalent (PE); fosphenytoin sodium 1.5 mg = phenytoin sodium 1 mg.

**MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

**ELECTROLYTES**

May contain Phosphate

- **Pro-Epanutin** (Pfizer Ltd)
  - Fosphenytoin sodium 75 mg per 1 ml
  - Pro-Epanutin 750mg/10ml concentrate for solution for injection vials | 10 vial (£400.00 (Hospital only))
Gabapentin

INDICATIONS AND DOSE

Adjunctive treatment of focal seizures with or without secondary generalisation

**BY MOUTH**
- **Child 6–11 years**: Initially 300 mg once daily; then 10 mg/kg twice daily; then 300 mg 3 times a day; maximum 2–3 days in 3 divided doses, adjusted according to response; usual dose 6 mg/kg 3 times a day; some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate
- **Child 12–17 years**: Initially 300 mg once daily; then 300 mg twice daily; then 300 mg 3 times a day; maximum 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day); some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate
- **Adult**: Initially 300 mg once daily; then 300 mg twice daily; then 300 mg 3 times a day; maximum 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day); some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate

**Monotherapy for focal seizures with or without secondary generalisation**

**BY MOUTH**
- **Child 12–17 years**: Initially 300 mg once daily; then 300 mg twice daily; then 300 mg 3 times a day; maximum 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day); some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate
