- **Adult**: Initially 300 mg once daily; then 300 mg twice daily; then 300 mg 3 times a day; maximum 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day); some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate

**Neuropathic pain**

**BY MOUTH**
- **Adult**: Initially 300 mg once daily; then 300 mg twice daily; then 300 mg 3 times a day; maximum 2–3 days in 3 divided doses, adjusted according to response; maximum 3.6 g per day

**Migraine prophylaxis**

**BY MOUTH**
- **Adult**: Initially 300 mg daily; then increased to up to 2.4 g daily in divided doses, adjusted according to response

**UNLICENSED USE**
- In children Not licensed for use in children under 6 years. Not licensed at doses over 50 mg/kg daily in children under 12 years.
- In adults Not licensed for migraine prophylaxis.

**Important safety information**

The levels of propylene glycol, acesulfame K and saccharin sodium may exceed the recommended WHO daily intake limits if high doses of gabapentin oral solution (Rosemont brand) are given to adolescents or adults with low body-weight (35–50 kg)—consult product literature.

**CAUTIONS**

- Diabetes mellitus - elderly - high doses of oral solution in adolescents and adults with low body-weight - history of psychotic illness - mixed seizures (including absences)

**INTERACTIONS**

- **Uncommon** Palpitations

- **Frequency not known** Acute renal failure - alopecia - blood glucose fluctuations in patients with diabetes - breast hypertrophy - gynaecomastia - hallucinations - hepatitis - hypersensitivity syndrome - incontinence - pancreatitis - Stevens-Johnson syndrome - suicidal ideation - thrombocytopenia - tinnitus

**PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**BREAST FEEDING** Present in milk—manufacturer advises use only if potential benefit outweighs risk.

**RENAL IMPAIRMENT**
- In adults Reduce dose to 0.6–1.8 g daily in 3 divided doses if eGFR 50–80 mL/minute/1.73 m². Reduce dose to 300–900 mg daily in 3 divided doses if eGFR 30–50 mL/minute/1.73 m². Reduce dose to 300 mg on alternate days (up to max. 600 mg daily) in 3 divided doses if eGFR 15–30 mL/minute/1.73 m². Reduce dose to 300 mg on alternate days (up to max. 300 mg daily) in 3 divided doses if eGFR less than 15 mL/minute/1.73 m²—consult product literature.
- In children Reduce dose if estimated glomerular filtration rate less than 80 mL/minute/1.73 m²; consult product literature.

**EFFECT ON LABORATORY TESTS** False positive readings with some urinary protein tests.

**DIRECTIONS FOR ADMINISTRATION** Capsules can be opened but the bitter taste is difficult to mask.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Gabapentin for neuropathic pain www.medicinesforchildren.org.uk/gabapentin-for-neuropathic-pain

Medicines for Children leaflet: Gabapentin for preventing seizures www.medicinesforchildren.org.uk/gabapentin-for-preventing-seizures
LACOSAMIDE

**INDICATIONS AND DOSE**

Adjuvant treatment of focal seizures with or without secondary generalisation

**BY MOUTH OR BY INTRAVENOUS INFUSION**

- Child 16-17 years: Initially 50 mg twice daily, infusion to be administered over 15–60 minutes (for up to 5 days), then increased, if tolerated, in steps of 50 mg twice daily, adjusted according to response, dose to be increased in weekly intervals; maintenance 100 mg twice daily (max. per dose 200 mg twice daily)

- Adult: Initially 50 mg twice daily, infusion to be administered over 15–60 minutes (for up to 5 days), then increased, if tolerated, in steps of 50 mg twice daily, adjusted according to response, dose to be increased in weekly intervals; maintenance 100 mg twice daily (max. per dose 200 mg twice daily)

Adjuvant treatment of focal seizures with or without secondary generalisation (alternative loading dose regimen when it is necessary to rapidly attain therapeutic plasma concentrations) (under close medical supervision)

**BY MOUTH OR BY INTRAVENOUS INFUSION**

- Child 16-17 years: Loading dose 200 mg, infusion to be administered over 15–60 minutes (for up to 5 days), followed by maintenance 100 mg twice daily, to be given 12 hours after initial dose, then increased, if tolerated, in steps of 50 mg twice daily (max. per dose 200 mg twice daily), adjusted according to response, dose to be increased in weekly intervals

- Adult: Loading dose 200 mg, infusion to be administered over 15–60 minutes (for up to 5 days), followed by maintenance 100 mg twice daily, to be

given 12 hours after initial dose, then increased, if tolerated, in steps of 50 mg twice daily (max. per dose 200 mg twice daily), adjusted according to response, dose to be increased in weekly intervals

**CONTRA-INDICATIONS**

- Second- or third-degree AV block

**CAUTIONS**

- Conduction problems - elderly (in adults) - risk of PR-interval prolongation - severe cardiac disease

**INTERACTIONS**

- → Appendix 1 (Lacosamide). Caution with concomitant use of drugs that prolong PR interval.

**SIDE-EFFECTS**

- Common or very common Abnormal gait - blurred vision - cognitive disorder - constipation - depression - dizziness - drowsiness - fatigue - flatulence - headache - impaired coordination - nausea -ystagmus - pruritus - tremor - vomiting

- Rare Multi-organ hypersensitivity reaction

**ALLERGY AND CROSS-SENSITIVITY**

- Antiepileptic hypersensitivity syndrome associated with lacosamide. See under Epilepsy p. 383 for more information.

**PREGNANCY**

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**BREAST FEEDING**

Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

Titrated with caution in mild to moderate impairment if co-existing renal impairment. Caution in severe impairment—no information available.

**RENAL IMPAIRMENT**

Loading dose regimen can be considered in mild to moderate impairment—titrate above 200 mg with caution. Titrated with caution in severe impairment, max. 250 mg daily.

- In adults Consult product literature for loading dose if eGFR less than 30 mL/minute/1.73 m².

- In children Consult product literature for loading dose if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION**

- In children For intravenous infusion, give undiluted or dilute with Glucose 5% or Sodium Chloride 0.9%.

- In adults For intravenous infusion (Vimpat®), give intermittently in Glucose 5% or Sodium Chloride 0.9%. May be administered undiluted.

**PRESCRIBING AND DISPENSING INFORMATION**

- Flavours of syrup may include strawberry.

**PATIENT AND CARER ADVICE**

- Medicines for Children leaflet: Lacosamide for preventing seizures www.medicinesforchildren.org.uk/lacosamide-for-preventing-seizures

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (January 2009) that lacosamide (Vimpat®) is accepted for restricted use within NHS Scotland as adjunctive treatment for focal seizures with or without secondary generalisation in patients from 16 years. It is restricted for specialist use in refractory epilepsy.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.
Lamotrigine

**INDICATIONS AND DOSE**

**Monotherapy of focal seizures | Monotherapy of primary and secondary generalised tonic-clonic seizures | Monotherapy of seizures associated with Lennox-Gastaut syndrome**

**BY MOUTH**

- **Child 12-17 years:** Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses; increased if necessary up to 500 mg daily, dose titration should be repeated if restarting after interval of more than 5 days

- **Adult:** Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses; increased if necessary up to 500 mg daily, dose titration should be repeated if restarting after interval of more than 5 days

**Adjunctive therapy of focal seizures with valproate | Adjunctive therapy of primary and secondary generalised tonic-clonic seizures with valproate | Adjunctive therapy of seizures associated with Lennox-Gastaut syndrome with valproate**

**BY MOUTH**

- **Child 2–11 years (body-weight up to 13 kg):** Initially 2 mg once daily on alternate days for first 14 days, then 300 micrograms/kg once daily for further 14 days, then increased in steps of up to 300 micrograms/kg every 7–14 days; maintenance 1–5 mg/kg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day

- **Child 2–11 years (body-weight above 13 kg):** Initially 150 micrograms/kg once daily for 14 days, then 300 micrograms/kg once daily for further 14 days, then increased in steps of up to 300 micrograms/kg every 7–14 days; maintenance 1–5 mg/kg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day

- **Child 12–17 years:** Initially 25 mg once daily on alternate days for 14 days, then 25 mg once daily for further 14 days, then increased in steps of up to 50 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

- **Adult:** Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

**Adjunctive therapy of focal seizures (with enzyme inducing drugs) without valproate | Adjunctive therapy of primary and secondary generalised tonic-clonic seizures (with enzyme inducing drugs) without valproate | Adjunctive therapy of seizures associated with Lennox-Gastaut syndromes (with enzyme inducing drugs) without valproate**

**BY MOUTH**

- **Child 2–11 years:** Initially 300 micrograms/kg twice daily for 14 days, then 600 micrograms/kg twice daily for further 14 days, then increased in steps of up to 1.2 mg/kg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

- **Child 12–17 years:** Initially 50 mg once daily for 14 days, then 50 mg twice daily for further 14 days, then increased in steps of up to 50 mg every 7–14 days; maintenance 200–400 mg daily in 2 divided doses, increased if necessary up to 700 mg daily, dose titration should be repeated if restarting after interval of more than 5 days

**By MOUTH**

- **1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days**

- **Adult:** Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

**By MOUTH**

- **Child 2–11 years:** Initially 300 micrograms/kg daily in 1–2 divided doses for 14 days, then 600 micrograms/kg daily in 1–2 divided doses for further 14 days, then increased in steps of up to 600 micrograms/kg every 7–14 days; maintenance 1–10 mg/kg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

**By MOUTH**

- **Child 12–17 years:** Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 50 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

**By MOUTH**

- **Adult:** Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

**By MOUTH**

- **Child 2–11 years:** Initially 300 micrograms/kg daily in 1–2 divided doses for 14 days, then 600 micrograms/kg daily in 1–2 divided doses for further 14 days, then increased in steps of up to 600 micrograms/kg every 7–14 days; maintenance 1–10 mg/kg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

**By MOUTH**

- **Child 12–17 years:** Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 50 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

**By MOUTH**

- **Adult:** Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

**Monotherapy or adjunctive therapy of bipolar disorder (without enzyme inducing drugs) without valproate**

**By MOUTH**

- **Child 2–11 years:** Initially 25 mg once daily for 14 days, then 50 mg daily in 1–2 divided doses for further 14 days, then 100 mg daily in 1–2 divided doses for further 14 days.
7 days; maintenance 200 mg daily in 1–2 divided doses, patients stabilised on lamotrigine for bipolar disorder may require dose adjustments if other drugs are added to or withdrawn from their treatment regimens—consult product literature, dose titration should be repeated if restarting after interval of more than 5 days; maximum 400 mg per day

**Adjuvant therapy of bipolar disorder with valproate**

**BY MOUTH**

- Adult: Initially 25 mg once daily on alternate days for 14 days, then 25 mg once daily for further 14 days, then 50 mg daily in 1–2 divided doses for further 7 days; maintenance 100 mg daily in 1–2 divided doses; patients stabilised on lamotrigine for bipolar disorder may require dose adjustments if other drugs are added to or withdrawn from their treatment regimens—consult product literature, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day

**Adjuvant therapy of bipolar disorder (with enzyme inducing drugs) without valproate**

**BY MOUTH**

- Adult: Initially 50 mg once daily for 14 days, then 50 mg twice daily for further 14 days, then increased to 100 mg twice daily for further 7 days, then increased to 150 mg twice daily for further 7 days; maintenance 200 mg twice daily, patients stabilised on lamotrigine for bipolar disorder may require dose adjustments if other drugs are added to or withdrawn from their treatment regimens—consult product literature, dose titration should be repeated if restarting after interval of more than 5 days

**SIDE-EFFECTS, FURTHER INFORMATION**

**Skin reactions** Serious skin reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis have developed (especially in children); most rashes occur in the first 8 weeks. Rash is sometimes associated with hypersensitivity syndrome and is more common in patients with history of allergy or rash from other antiepileptic drugs. Consider withdrawal if rash or signs of hypersensitivity syndrome develop. Factors associated with increased risk of serious skin reactions include concomitant use of valproate, initial lamotrigine dosing higher than recommended, and more rapid dose escalation than recommended.

**ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with lamotrigine. See under Epilepsy p. 383 for more information.

**PRECAUTIONS** Myoclonic seizures (may be exacerbated). Parkinson’s disease (may be exacerbated) (in adults)

**INTERACTIONS** → Appendix 1 (lamotrigine)

**SIDE-EFFECTS**

- Common or very common: blurred vision, aggression, agitation, ataxia, back pain, diarrhea, diplopia, dizziness, drowsiness, dry mouth, headache, insomnia, nausea, nystagmus, rash, tremor, vomiting

- Rare: Conjunctivitis

- Very rare: Anaemia, blood disorders, confusion, exacerbation of Parkinson’s disease (in adults), hallucination, hepatic failure, hypersensitivity syndrome, increase in seizure frequency, leucopenia, lupus erythematosus-like reactions, movement disorders, pancytopenia, thrombocytopenia, unsteadiness

- Frequency not known: Aseptic meningitis, suicidal ideation

**SIDE-EFFECTS, FURTHER INFORMATION**

**Skin reactions** Aseptic meningitis

**PRECAUTIONS** Myoclonic seizures (may be exacerbated). Parkinson’s disease (may be exacerbated) (in adults)

**INTERACTIONS** → Appendix 1 (lamotrigine)

**SIDE-EFFECTS**

- Common or very common: blurred vision, aggression, agitation, ataxia, back pain, diarrhea, diplopia, dizziness, drowsiness, dry mouth, headache, insomnia, nausea, nystagmus, rash, tremor, vomiting

- Rare: Conjunctivitis

- Very rare: Anaemia, blood disorders, confusion, exacerbation of Parkinson’s disease (in adults), hallucination, hepatic failure, hypersensitivity syndrome, increase in seizure frequency, leucopenia, lupus erythematosus-like reactions, movement disorders, pancytopenia, thrombocytopenia, unsteadiness

Levetiracetam

**INDICATIONS AND DOSE**

**Monotherapy of focal seizures with or without secondary generalisation**

- **By mouth or by intravenous infusion**
  - **Child 16-17 years:** Initially 250 mg once daily for 1 week, then increased to 250 mg twice daily, then increased in steps of 250 mg twice daily (max. per dose 1.5 g twice daily), adjusted according to response, dose to be increased every 2 weeks
  - **Adult:** Initially 250 mg once daily for 1–2 weeks, then increased to 250 mg twice daily, then increased in steps of 250 mg twice daily (max. per dose 1.5 g twice daily), adjusted according to response, dose to be increased every 2 weeks

**Adjunctive therapy of focal seizures with or without secondary generalisation**

- **By mouth**
  - **Child 1-5 months:** Initially 7 mg/kg once daily, then increased in steps of up to 7 mg/kg twice daily (max. per dose 21 mg/kg twice daily), dose to be increased every 2 weeks
  - **Child 6 months–17 years (body-weight up to 50 kg):** Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks
  - **Child 12-17 years (body-weight 50 kg and above):** Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2–4 weeks
  - **Adult:** Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2–4 weeks

- **By intravenous infusion**
  - **Child 4-17 years (body-weight up to 50 kg):** Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks
  - **Child 12-17 years (body-weight 50 kg and above):** Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2 weeks
  - **Adult:** Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2–4 weeks

**Adjunctive therapy of myoclonic seizures and tonic-clonic seizures**

- **By mouth or by intravenous infusion**
  - **Child 12-17 years (body-weight up to 50 kg):** Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks
  - **Child 12-17 years (body-weight 50 kg and above):** Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2 weeks
  - **Adult:** Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2–4 weeks

**UNLICENSED USE**

- **In children** Granules not licensed for use in children under 6 years, for initial treatment in children with body-weight less than 25 kg, or for the administration of doses below 250 mg.

**In adults** Levetiracetam doses in BNF may differ from those in product literature.

**INTERACTIONS** → Appendix 1 (levetiracetam).

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain, agitation, anxiety, ataxia, convulsion, cough, depression, diarrhea, dizziness, drowsiness, dyspepsia, headache, insomnia, irritability, malaise, nasopharyngitis, nausea, rash, tremor, vertigo, vomiting

- **Uncommon** Agitation, alopecia, anemia, blurred vision, confusion, diplopia, eczema, impaired attention, leucopenia, myalgia, paraesthesia, pruritus, psychosis, suicidal ideation, thrombocytopenia, weight changes

- **Rare** Agranulocytosis, choreoathetosis, drug reaction with eosinophilia and systemic symptoms (DRESS), dyskinesia, erythema multiforme, hepatic failure, hyponatraemia, neutropenia, pancreatitis, pancytopenia, Stevens-Johnson syndrome, toxic epidermal necrolysis

**Frequency not known** Completed suicide, pancytopenia

**PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis. It is recommended that the fetal growth should be monitored.

**BREAST FEEDING** Present in milk—manufacturer advises avoid.

**HEPATIC IMPAIRMENT**

- In adults Halve dose in severe hepatic impairment if eGFR less than 60 mL/minute/1.73 m².

- In children Halve dose in severe hepatic impairment if estimated glomerular filtration rate less than 60 mL/minute/1.73 m².

**RENAL IMPAIRMENT**

- In children Reduce dose if estimated glomerular filtration rate less than 80 mL/minute/1.73 m² (consult product literature).

- In adults Maximum 2 g daily if eGFR 50–80 mL/minute/1.73 m². Maximum 1.5 g daily if eGFR 30–50 mL/minute/1.73 m². Maximum 1 g daily if eGFR less than 30 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use For intravenous infusion, dilute requisite dose with at least 100 mL Glucose 5% or Sodium Chloride 0.9% give over 15 minutes.

- With oral use For administration of oral solution, requisite dose may be diluted in a glass of water.

**PRESCRIBING AND DISPENSING INFORMATION** If switching between oral therapy and intravenous therapy (for those temporarily unable to take oral medication), the intravenous dose should be the same as the established oral dose.

Oxcarbazepine

INDICATIONS AND DOSE

Monotherapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures

BY MOUTH

- Child 6-17 years: Initially 4–5 mg/kg twice daily (max. per dose 300 mg), then increased in steps of up to 5 mg/kg twice daily, adjusted according to response, dose to be adjusted at weekly intervals; maximum 46 mg/kg per day
- Adult: Initially 300 mg twice daily, then increased in steps of up to 600 mg daily, adjusted according to response, dose to be adjusted at weekly intervals; usual dose 0.6–2.4 g daily in divided doses

Adjunctive therapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures

BY MOUTH

- Child 6-17 years: Initially 4–5 mg/kg twice daily (max. per dose 300 mg), then increased in steps of up to 5 mg/kg twice daily, adjusted according to response, dose to be adjusted at weekly intervals; maintenance 15 mg/kg twice daily; maximum 46 mg/kg per day
- Adult: Initially 300 mg twice daily, then increased in steps of up to 600 mg daily, adjusted according to response, dose to be adjusted at weekly intervals; usual dose 0.6–2.4 g daily in divided doses

Treatment of primary generalised tonic-clonic seizures

BY MOUTH

- Adult: Initially 300 mg twice daily, then increased in steps of up to 600 mg daily, adjusted according to response, dose to be adjusted at weekly intervals; usual dose 0.6–2.4 g daily in divided doses

Dose adjustments due to interactions

In adjunctive therapy, the dose of concomitant antiepileptics may need to be reduced when using high doses of oxcarbazepine.

• UNLICENSED USE

- In adults: Not licensed for the treatment of primary generalised tonic-clonic seizures.

• CAUTIONS

- Avoid in Acute porphyrias p. 864 - cardiac conduction disorders - heart failure - hyponatraemia

• INTERACTIONS → Appendix 1 (oxcarbazepine).

• SIDE-EFFECTS

- Common or very common Abdominal pain - acne - agitation - alopeica - amnesia - asthenia - ataxia - confusion - constipation - depression - diarrhoea - diplopia - dizziness - drowsiness - headache - hyponatraemia - impaired concentration - nausea - nyctagmus - rash - tremor - visual disorders - vomiting
- Uncommon Leucopenia - urticaria
- Frequency not known Aplastic anaemia - bone marrow depression - hypertension - hypothyroidism - neutropenia - osteoporotic bone disorders - pancytopenia - suicidal ideation

• ALLERGY AND CROSS-SENSITIVITY

Caution in patients with hypersensitivity to carbamazepine. Antiepileptic hypersensitivity syndrome associated with oxcarbazepine. See under Epilepsy p. 383 for more information.

• PREGNANCY

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

• BREAST FEEDING

Amount probably too small to be harmful but manufacturer advises avoid.

• HEPATIC IMPAIRMENT

Caution in severe impairment—no information available.

• RENAL IMPAIRMENT

- In adults: Halve initial dose if eGFR less than 30 mL/minute/1.73 m²; increase according to response at intervals of at least 1 week.
- In children: Halve initial dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²; increase according to response at intervals of at least 1 week.

• PRE-TREATMENT SCREENING

Test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele).

• MONITORING REQUIREMENTS

- Monitor plasma-sodium concentration in patients at risk of hyponatraemia.
- Monitor body-weight in patients with heart failure.

• PRESCRIBING AND DISPENSING INFORMATION

Patients may need to be maintained on a specific manufacturer’s branded or generic oxcarbazepine product. Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with...
the patient or their carer, taking into account factors such as seizure frequency and treatment history.

**PATIENT AND CARER ADVICE**
Medicines for Children: Oxcarbazepine for preventing seizures www.medicinesforchildren.org.uk/oxcarbazepine-for-preventing-seizures

Blood, hepatic, or skin disorders Patients or their carers should be told how to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical attention if symptoms such as lethargy, confusion, muscular twitching, fever, rash, blistering, mouth ulcers, bruising, or bleeding develop.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

### Tablet
**CAUTIONARY AND ADVISORY LABELS 3, 8**
- Oxcarbazepine (non-proprietary)
  - Oxcarbazepine 150 mg Oxcarbazepine 150mg tablets | 50 tablet [P] £11.14 DT price = £9.81
  - Oxcarbazepine 300 mg Oxcarbazepine 300mg tablets | 50 tablet [P] £22.61 DT price = £19.48
  - Oxcarbazepine 600 mg Oxcarbazepine 600mg tablets | 50 tablet [P] £45.19 DT price = £40.23
- Trileptal (Novartis Pharmaceuticals UK Ltd)
  - Oxcarbazepine 150 mg Trileptal 150mg tablets | 50 tablet [P] £10.20 DT price = £8.81
  - Oxcarbazepine 300 mg Trileptal 300mg tablets | 50 tablet [P] £20.40 DT price = £19.48
  - Oxcarbazepine 600 mg Trileptal 600mg tablets | 50 tablet [P] £40.80 DT price = £40.23

**Oral suspension**
**CAUTIONARY AND ADVISORY LABELS 3, 8**
- Excipients: May contain Propylene glycol
  - Trileptal (Novartis Pharmaceuticals UK Ltd)
  - Oxcarbazepine 60 mg per 1 ml Trileptal 60mg/ml oral suspension (sugar-free) | 250 ml [P] £40.80

**Perampanel**

### INDICATIONS AND DOSE
**Adjunctive treatment of focal seizures with or without secondary generalised seizures**

**BY MOUTH**
- **Child 12-17 years:** Initially 2 mg once daily, dose to be taken before bedtime, then increased, if tolerated, in steps of 2 mg at least every 2 weeks, adjusted according to response; maintenance 4–8 mg once daily; maximum 12 mg per day
- **Adult:** Initially 2 mg once daily, dose to be taken before bedtime, then increased, if tolerated, in steps of 2 mg at least every 2 weeks, adjusted according to response; maintenance 4–8 mg once daily; maximum 12 mg per day

**Dose adjustments due to interactions**
Titrates at intervals of at least 1 week with concomitant carbamazepine, fosphenytoin, oxcarbazepine, or phenytoin.

**INTERACTIONS**
- Appendix 1 (perampanel).

**SIDE-EFFECTS**
- Aggression · anxiety · ataxia · back pain · blurred vision · changes in appetite · confusion · diplopia · dizziness · drowsiness · dysarthria · gait disturbance · irritability · malaise · nausea · suicidal behaviour · suicidal ideation · vertigo · weight increase

**PREGNANCY**
Manufacturer advises avoid.
The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**BREAST FEEDING**
Avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Increase at intervals of at least 2 weeks, up to max. 8 mg daily in mild or moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Avoid in moderate or severe impairment.
- **PRESCRIBING AND DISPENSING INFORMATION**
  Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history. Patients may need to be maintained on a specific manufacturer’s branded or generic perampanel product.

**Phenytoin**

### INDICATIONS AND DOSE
**Tonic-clonic seizures | Focal seizures**

**BY MOUTH**
- **Child 1 month-11 years:** Initially 1.5–2.5 mg/kg twice daily, then adjusted according to response to 2.5–5 mg/kg twice daily (max. per dose 7.5 mg/kg twice daily), dose also adjusted according to plasma-phenytoin concentration; maximum 300 mg per day
- **Child 12-17 years:** Initially 75–150 mg twice daily, then adjusted according to response to 150–200 mg twice daily (max. per dose 300 mg twice daily), dose also adjusted according to plasma-phenytoin concentration
- **Adult:** Initially 3–4 mg/kg daily, alternatively 150–300 mg once daily, alternatively 150–300 mg daily in 2 divided doses, then increased to 200–500 mg daily to be taken preferably with or after food, dose to be increased gradually as necessary (with plasma-phenytoin concentration monitoring), exceptionally, higher doses may be used

**Status epilepticus | Acute symptomatic seizures associated with head trauma or neurosurgery**

**INITIALLY BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**
- **Adult:** Loading dose 20 mg/kg (max. per dose 2 g), to be given at a rate not exceeding 1 mg/kg/minute (max. 50 mg per minute), to be given with blood pressure and ECG monitoring, then (by intravenous infusion or by slow intravenous injection or by mouth) maintenance 100 mg every 6–8 hours adjusted according to plasma-concentration monitoring, to be given with blood pressure and ECG monitoring, adjusted according to plasma-phenytoin concentration
Status epilepticus | Acute symptomatic seizures associated with trauma or neurosurgery

**BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**

- **Child 1 month–11 years:** Loading dose 20 mg/kg, then 2.5–5 mg/kg twice daily, to be given with blood pressure and ECG monitoring.
- **Child 12–17 years:** Loading dose 20 mg/kg, then up to 100 mg 3–4 times a day, to be given with blood pressure and ECG monitoring.

**Dose equivalence and conversion**

Preparations containing phenytoin sodium are not bioequivalent to those containing phenytoin base (such as Epanutin Infatabs® and Epanutin® suspension); 100 mg of phenytoin sodium is approximately equivalent in therapeutic effect to 92 mg phenytoin base. The dose is the same for all phenytoin products when initiating therapy, however, if switching between these products the difference in phenytoin content may be clinically significant. Care is needed when making changes between formulations and plasma-phenytoin concentration monitoring is recommended.

- **UNLICENSED USE**
  - With oral use Licensed for use in children (age range not specified by manufacturer).
  - With intravenous use Phenytoin doses in BNF publications may differ from those in product literature.
- **CONTRA-INDICATIONS**
  - **GENERAL CONTRA-INDICATIONS**
    - Acute porphyrias p. 864
  - **SPECIFIC CONTRA-INDICATIONS**
    - With intravenous use second- and third-degree heart block.
    - sino-atrial block.
    - sinus bradycardia.
    - Stokes-Adam syndrome.
- **CAUTIONS**
  - **GENERAL CAUTIONS**
    - Enteral feeding (interrupt feeding for 2 hours before and after dose; more frequent monitoring may be necessary)
  - **SPECIFIC CAUTIONS**
    - With intravenous use heart failure.
    - Hypotension.
    - Injection solutions alkaline (irritant to tissues).
    - Respiratory depression.
    - Resuscitation facilities must be available.

**CAUTIONS, FURTHER INFORMATION**

Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium. Intramuscular phenytoin should not be used (absorption is slow and erratic).

**INTERACTIONS**

- Appendix 1 (phenytoin).
- **SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- **Common or very common**
  - Acne.
  - Anorexia.
  - Coarsening of facial appearance.
  - Constipation.
  - Dizziness.
  - Drowsiness.
  - Gingival hypertrophy and tenderness.
  - Maintain good oral hygiene.
  - Headache.
  - Hirsutism.
  - Insomnia.
  - Nausea.
  - Parasthesia.
  - Rash.
  - Transient nervousness.
  - Tremor.
  - Vomiting.

- **Rare**
  - Leucopenia.
  - Aplastic anaemia.
  - Blood disorders.
  - Dyskinesia.
  - Hepatotoxicity.
  - Lupus erythematosus.
  - Lymphadenopathy.
  - Megaloblastic anaemia.
  - Osteomalacia.
  - Peripheral neuropathy.
  - Polyanuritis nodosa.
  - Stevens-Johnson syndrome.
  - Thrombocytopenia.
  - Toxic epidermal necrolysis.

- **Frequency not known**
  - Hypersensitivity syndrome.
  - Interstitial nephritis.
  - Pneumonitis.
  - Polyarthropathy.
  - Suicidal ideation.

**SPECIFIC SIDE-EFFECTS**

- **Common or very common**
  - With intravenous use Alterations in respiratory function.
  - Arrhythmias.
  - Cardiovascular collapse.
  - Cardiovascular depression (particularly if injection too rapid).
  - CNS depression (particularly if injection too rapid).

- **Frequency not known**
  - With intravenous use Purple glove syndrome.

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Rash**
  - Discontinue; if mild re-introduce cautiously but discontinue immediately if recurrence.

- **Hepatotoxicity**
  - Discontinue immediately and do not re-administer.

- **With intravenous use**
  - Reduce rate of administration if bradycardia or hypotension occurs.
  - Phenytoin may cause coarsening of the facial appearance, acne, hirsutism, and gingival hyperplasia and so may be particularly undesirable in adolescent patients.

- **Overdose**
  - Symptoms of phenytoin toxicity include nyctagmus, diplopia, slurred speech, ataxia, confusion, and hyperglycaemia.

- **ALLERGY AND CROSS-SENSITIVITY**
  - Cross-sensitivity reported with carbamazepine.
  - Antiepileptic hypersensitivity syndrome associated with phenytoin. See under Epilepsy p. 383 for more information.

- **PREGNANCY**
  - Changes in plasma-protein binding make interpretation of plasma-phenytoin concentrations difficult—monitor unbound fraction. Doses should be adjusted on the basis of plasma-drug concentration monitoring.

- **BREAST FEEDING**
  - Small amounts present in milk, but not known to be harmful.

- **HEPATIC IMPAIRMENT**
  - Reduce dose to avoid toxicity.

- **PRE-TREATMENT SCREENING**
  - HLA® 1502 allele in individuals of Han Chinese or Thai origin—avoid unless essential (increased risk of Stevens-Johnson syndrome).

- **MONITORING REQUIREMENTS**

  - In adults The usual total plasma-phenytoin concentration for optimum response is 10–20 mg/litre (or 40–80 micromol/litre). In pregnancy, the elderly, and certain disease states where protein binding may be reduced, careful interpretation of total plasma-phenytoin concentration is necessary; it may be more appropriate to measure free plasma-phenytoin concentration.

  - In children Therapeutic plasma-phenytoin concentrations reduced in first 3 months of life because of reduced protein binding. Trough plasma concentration for optimum response: neonate—3 months, 6–15 mg/litre (25–60 micromol/litre); child 3 months–18 years, 10–20 mg/litre (40–80 micromol/litre).

  - Manufacturer recommends blood counts (but evidence of practical value uncertain).

  - Monitor ECG and blood pressure with intravenous use.

- **DIRECTIONS FOR ADMINISTRATION**

  - With intravenous use in children Before and after administration flush intravenous line with Sodium Chloride 0.9%. For intravenous injection, give into a large vein at rate not exceeding 1 mg/kg/minute (max. 50 mg/minute). For intravenous infusion, dilute to a concentration not exceeding 10 mg/mL with Sodium Chloride 0.9% and give into a large vein through an inline filter (0.22–0.50 micron) at a rate not exceeding 1 mg/kg/minute (max. 50 mg/minute); complete administration within 1 hour of preparation.

  - With intravenous use in adults For intravenous infusion (Epanutin®), give intermittently in Sodium chloride 0.9%. Flush intravenous line with Sodium chloride 0.9% before and after infusion; dilute in 50–100 mL infusion fluid (final concentration not to exceed 10 mg/mL) and give
Pregabalin

**INDICATIONS AND DOSE**

**Peripheral and central neuropathic pain**

**BY MOUTH**

- **Adult:** Initially 150 mg daily in 2–3 divided doses, then increased if necessary to 300 mg daily in 2–3 divided doses, dose to be increased after 3–7 days, then increased if necessary up to 600 mg daily in 2–3 divided doses, dose to be increased after 7 days

**Adjunctive therapy for focal seizures with or without secondary generalisation**

**BY MOUTH**

- **Adult:** Initially 25 mg twice daily, then increased in steps of 50 mg daily, dose to be increased at 7 day intervals, increased to 300 mg daily in 2–3 divided doses for 7 days, then increased if necessary up to 600 mg daily in 2–3 divided doses

**Generalised anxiety disorder**

**BY MOUTH**

- **Adult:** Initially 150 mg daily in 2–3 divided doses, then increased in steps of 150 mg daily if required, dose to be increased at 7 day intervals, increased if necessary up to 600 mg daily in 2–3 divided doses

**UNLICENSED USE** Pregabalin doses in BNF may differ from those in product literature.

**CAUTIONS** Conditions that may precipitate encephalopathy: severe congestive heart failure

**INTERACTIONS** → Appendix 1 (pregabalin).

**SIDE-EFFECTS**

- **Common or very common** Appetite changes • blurred vision • confusion • constipation • diplopia • disturbances in muscle control and movement • dizziness • drowsiness • dry mouth • euphoria • flatulence • impaired attention • impaired memory • insomnia • irritability • malaise • oedema • paraesthesia • sexual dysfunction • speech disorder • visual disturbances • visual field defects • vomiting • weight gain

- **Uncommon** Abdominal distension • abnormal dreams • agitation • arthralgia • chills • cognitive impairment • depersonalisation • depression • dry eye • dysphonia • dysuria • first-degree AV block • flushing • gastroesophageal reflux disease • hallucinations • hyperacusis • hypersalivation • hypertension • hypoglycaemia • hypotension • hyponatremia • lacrimation • myalgia • nasal dryness • nasopharyngitis • panic attacks • rash • stupor • sweating • syncope • tachycardia • taste disturbance • thirst • thrombocytopenia • urinary incontinence

- **Rare** Arrhythmia • asictes • bradycardia • breast discharge • breast hypertrophy • breast pain • cold extremities • cough • dysphagia • epistaxis • hyperglycaemia • hypokalaemia • leucopenia • menstrual disturbances • neutropenia • oliguria • pancreatitis • parosmia • renal failure • rhabdomyolysis • rhinitis • urticaria • weight loss

- **Frequency not known** Agitation • congestive heart failure • convulsions • diarrhoea • encephalopathy • headache • keratitis • nausea • puritus • QT-interval prolongation • Stevens-Johnson syndrome • suicidal ideation • urinary retention

**RENAL IMPAIRMENT** Initially 75 mg daily and maximum 300 mg daily if eGFR 30–60 mL/minute/1.73 m². Initially 25–50 mg daily and maximum 150 mg daily in 1–2 divided doses if eGFR 15–30 mL/minute/1.73 m². Initially 25 mg once daily and maximum 75 mg once daily if eGFR less than 15 mL/minute/1.73 m².

**TREATMENT CESSATION** Avoid abrupt withdrawal (taper over at least 1 week).

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (July 2007) that pregabalin (Lyrica®) is not recommended for the treatment of central neuropathic pain. The Scottish Medicines Consortium has advised (April 2009) that pregabalin (Lyrica®) is accepted for restricted use within NHS Scotland for the treatment of peripheral neuropathic pain.

  **Oral solution**

  **CAUTIONARY AND ADVISORY LABELS 3, 8**

  - Lyrica (Pfizer Ltd)
    - Pregabalin 20 mg per 1 ml: Lyrica 20mg/ml oral solution (sugar-free) | 473 ml [PO] £99.48
  
**Primidone**

**INDICATIONS AND DOSE**

- **All forms of epilepsy except typical absence seizures**
  
  - **BY MOUTH**
    - Child 1 month-1 year: Initially 125 mg daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, adjusted according to response; maintenance 125–250 mg twice daily.
    - Child 2-4 years: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, adjusted according to response; maintenance 250–375 mg twice daily.
    - Child 5-8 years: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, adjusted according to response; maintenance 375–500 mg twice daily.
    - Child 9-17 years: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, increased to 250 mg twice daily, then increased in steps of 250 mg every 3 days (max. per dose 750 mg twice daily), adjusted according to response.
      - Adult: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, increased to 500 mg daily in 2 divided doses, then increased in steps of 250 mg every 3 days, adjusted according to response; maintenance 0.75–1.5 g daily in 2 divided doses.

**Essential tremor**

- **BY MOUTH**
  - Adult: Initially 50 mg daily, then adjusted according to response to up to 750 mg daily, dose to be increased over 2–3 weeks.

- **CAUTIONS** Avoid in acute porphyria; children; debilitated; elderly; history of alcohol abuse; history of drug abuse; respiratory depression (avoid if severe).

- **CAUTIONS, FURTHER INFORMATION**

  - **SIDE-EFFECTS**
    - **Common or very common** Agranulocytosis; allergic skin reactions; ataxia; behavioural disturbances; cholestasis; depression; drowsiness; hallucinations; hepatitis; hyperactivity (in children); hyperactivity particularly in the elderly; hypotension; impaired cognition; impaired memory; irritability; lethargy; megaloblastic anaemia (may be treated with folic acid); nausea; nystagmus; osteomalacia; paradoxical excitement (in adults); respiratory depression; thrombocytopenia; visual disturbances.
    - **Uncommon** Dizziness; headache; vomiting.
    - **Rare** Arthralgia; lupus erythematosus; psychosis.
    - **Very rare** Antiepileptic hypersensitivity syndrome; Stevens-Johnson syndrome; suicidal ideation; toxic epidermal necrolysis.
    - **Frequency not known** Dupuytren’s contracture.

- **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with primidone. See under Epilepsy p. 383 for more information.

- **PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **HEPATIC IMPAIRMENT** Reduce dose. May precipitate coma.

- **RENAL IMPAIRMENT** Use with caution.

- **MONITORING REQUIREMENTS** Monitor plasma concentrations of derived phenobarbital; plasma concentration for optimum response is 15–40 mg/litre (60–180 micromol/litre).

- **TREATMENT CESSATION** Avoid abrupt withdrawal (dependence with prolonged use).

- **PRESCRIBING AND DISPENSING INFORMATION** Switching between formulations. Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer’s product.

**MEDICINAL FORMS**

- **Tablet**
  - **CAUTIONARY AND ADVISORY LABELS 2, 8**
  - **PRIMIDONE (Non-proprietary)**
    - Primidone 50 mg: Primidone 50mg tablets | 100 tablet [POA] £70.00–£75.00 DT price = £74.88
    - Primidone 250 mg: Primidone 250mg tablets | 90 tablet [POA] no price available | 100 tablet [POA] £77.50–£82.50 DT price = £82.43
**Retigabine**

**INDICATIONS AND DOSE**

Adjunctive treatment of drug-resistant focal seizures with or without secondary generalisation when other appropriate drug combinations have proved inadequate or have not been tolerated

**BY MOUTH**
- **Adult:** Initially up to 300 mg daily in 3 divided doses, then increased in steps of up to 150 mg every 1 week, adjusted according to response; maintenance 0.6–1.2 g daily
- **Elderly:** Initially 150 mg daily in 3 divided doses, then increased in steps of up to 150 mg every 1 week, adjusted according to response; maximum 900 mg per day

**CAUTIONS**
- Known QT-interval prolongation - risk of urinary retention

**SIDE-EFFECTS**
- **Common or very common** Amnesia • anxiety • blurred vision • confusion • constipation • diplopia • discolouration of lips • discolouration of nails • discolouration of ocular tissue • discolouration of skin • dizziness • drowsiness • dry mouth • dysuria • haematuria • impaired attention • impaired coordination • impaired speech • increased appetite • malaise • myoclonus • nausea • parasthesia • peripheral oedema • psychosis • tremor • vertigo • visual impairment • weight gain
- **Uncommon** Dyspepsia • dysphagia • hypokinesia • nephrolithiasis • rash • suicidal ideation • sweating • urinary retention

**PREGNANCY**
- The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**HEPATIC IMPAIRMENT**
- Reduce dose by 50% in moderate to severe impairment; increase by 50 mg every week according to response up to maximum 600 mg daily (450 mg in elderly).

**RENAL IMPAIRMENT**
- Reduce dose by 50% if eGFR less than 50 mL/minute/1.73 m²; increase by 50 mg every week according to response up to maximum 600 mg daily (450 mg in elderly).

**MONITORING REQUIREMENTS**
- Ophthalmological monitoring A comprehensive ophthalmological examination (including visual acuity test, slit-lamp examination, and dilated fundoscopy) should be performed at initiation of treatment and at least every 6 months thereafter during treatment. Changes in vision or retinal pigment should lead to re-assessment of the benefits and risks of continuing treatment—discontinue unless no other treatment options are available. Monitoring should be increased if treatment is continued.
- Monitor for discolouration of ocular tissue and visual impairment.
- Monitor for blue-grey discolouration of nails, lips and skin—continue treatment only if potential benefit outweighs risk.

**PRESCRIBING AND DISPENSING INFORMATION**

Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**
- Retigabine for the adjunctive treatment of partial onset seizures in epilepsy (July 2011) NICE TA232
- Retigabine is recommended as an option for the adjunctive treatment of partial onset seizures with or without secondary generalisation in adults aged 18 years and older with epilepsy, only when previous treatment with carbamazepine, clobazam, gabapentin, lamotrigine, levetiracetam, oxcarbazepine, sodium valproate, and topiramate has not provided an adequate response, or has not been tolerated. [www.nice.org.uk/TA232](http://www.nice.org.uk/TA232)

**Scottish Medicines Consortium (SMC) Decisions**
- The Scottish Medicines Consortium has advised (June 2011) that retigabine (Trobalt®) is accepted for restricted use within NHS Scotland as adjunctive therapy in adults with focal seizures with or without secondary generalisation. It is restricted use for refractory epilepsy.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

| Retigabine 50 mg | Trobalt 50mg tablets | 21 tablet [P] £4.87 | 84 tablet [P] £19.46 |
| Retigabine 100 mg | Trobalt 100mg tablets | 21 tablet [P] £3.73 | 42 tablet [P] no price available | 84 tablet [P] £7.89 |
| Retigabine 200 mg | Trobalt 200mg tablets | 84 tablet [P] £77.86 |
| Retigabine 300 mg | Trobalt 300mg tablets | 84 tablet [P] £116.78 |
| Retigabine 400 mg | Trobalt 400mg tablets | 84 tablet [P] £127.68 |

**Rufinamide**

**INDICATIONS AND DOSE**

Adjunctive treatment of seizures in Lennox-Gastaut syndrome

**BY MOUTH**
- **Child 4–17 years (body-weight up to 30 kg):** Initially 100 mg twice daily, then increased in steps of 100 mg twice daily (max. per dose 500 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days.
- **Child 4–17 years (body-weight 30–50 kg):** Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 900 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days.
- **Adult (body-weight 30–50 kg):** Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.2 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days.
Sodium valproate

INDICATIONS AND DOSE
All forms of epilepsy

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 1 month–11 years: Initially 10–15 mg/kg daily in 1–2 divided doses (max. per dose 600 mg); maintenance 25–30 mg/kg daily in 2 divided doses, doses up to 60 mg/kg daily in 2 divided doses may be used in infantile spasms; monitor clinical chemistry and haematological parameters if dose exceeds 40 mg/kg daily
- Child 12–17 years: Initially 600 mg daily in 1–2 divided doses, increased in steps of 150–300 mg every 3 days; maintenance 1–2 g daily in 2 divided doses; maximum 2.5 g per day
- Adult: Initially 600 mg daily in 1–2 divided doses, then increased in steps of 150–300 mg every 3 days; maintenance 1–2 g daily, alternatively maintenance 20–30 mg/kg daily; maximum 2.5 g per day

Initiation of valproate treatment
INITIALLY BY INTRAVENOUS INJECTION
- Adult: Initially 10 mg/kg, (usually 400–800 mg), followed by (by intravenous infusion or by intravenous injection) up to 2.5 g daily in 2–4 divided doses, alternatively (by continuous intravenous infusion) up to 2.5 g daily; usual dose 1–2 g daily, (20–30 mg/kg daily), intravenous injection to be administered over 3–5 minutes

Continuation of valproate treatment
BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION OR BY CONTINUOUS INTRAVENOUS INFUSION
- Adult: If switching from oral therapy to intravenous therapy give current oral daily dose, give over 3–5 minutes by intravenous injection or in 2–4 divided doses by intravenous infusion

EPILIM CHRONO®
All forms of epilepsy
BY MOUTH
- Adult: Total daily dose to be given in 1–2 divided doses (consult product literature)

EPIVAL®
All forms of epilepsy
BY MOUTH
- Adult: Total daily dose to be given in 1–2 divided doses (consult product literature)

EPISENTA® CAPSULES
All forms of epilepsy
BY MOUTH
- Adult: Total daily dose to be given in 1–2 divided doses (consult product literature)

Mania
BY MOUTH
- Adult: Initially 750 mg daily in 1–2 divided doses, adjusted according to response, usual dose 1–2 g daily in 1–2 divided doses, doses greater than 45 mg/kg daily require careful monitoring.
**EPISENTA® GRANULES**

All forms of epilepsy

**BY MOUTH**

- **Adult:** Total daily dose to be given in 1–2 divided doses (consult product literature)

**Mania**

**BY MOUTH**

- **Adult:** Initially 750 mg daily in 1–2 divided doses, adjusted according to response; usual dose 1–2 g daily in 1–2 divided doses, doses greater than 45 mg/kg daily require careful monitoring

**EPILIM CHRONOSPHERE®**

All forms of epilepsy

**BY MOUTH**

- **Adult:** Total daily dose to be given in 1–2 divided doses (consult product literature)

**Migraine prophylaxis**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- **Adult:** Initially 200 mg twice daily, then increased if necessary to 1.2–1.5 g daily in divided doses

### Side-effects, Further Information

**Liver toxicity**

Liver dysfunction (including fatal hepatic failure) has occurred in association with valproate (especially in children under 3 years and in those with metabolic or degenerative disorders, organic brain disease or severe seizure disorders associated with mental retardation) usually in first 6 months and usually involving multiple antiepileptic therapy. Raised liver enzymes during valproate treatment are usually transient but patients should be reassessed clinically and liver function (including prothrombin time) monitored until return to normal—discontinue if abnormally prolonged prothrombin time (particularly in association with other relevant abnormalities). Consider vitamin D supplementation in patients that are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

### Interactions

→ Appendix I (sodium valproate)

###UNLICENSED USE

- In adults Not licensed for migraine prophylaxis.

### Contra-Indications

Family history of severe hepatic dysfunction - knon mitochondrial disorders (higher rate of acute liver failure and liver-related deaths) - personal or family history of severe hepatic dysfunction - porphyria - suspected mitochondrial disorders (higher rate of acute liver failure and liver-related deaths)

### CAUTIONS

Systemic lupus erythematosus

### CAUTIONS, FURTHER INFORMATION

Liver toxicity

Liver dysfunction (including fatal hepatic failure) has occurred in association with valproate (especially in children under 3 years and in those with metabolic or degenerative disorders, organic brain disease or severe seizure disorders associated with mental retardation) usually in first 6 months and usually involving multiple antiepileptic therapy. Raised liver enzymes during valproate treatment are usually transient but patients should be reassessed clinically and liver function (including prothrombin time) monitored until return to normal—discontinue if abnormally prolonged prothrombin time (particularly in association with other relevant abnormalities). Consider vitamin D supplementation in patients that are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

### Side-Effects

- **Very rare** Acne - gynaecomastia - hepatic dysfunction - hirsutism - increase in bleeding time - pancreatitis

- **Frequency not known** Hypersensitivity reactions - suicidal ideation

**SIDE-EFFECTS, FURTHER INFORMATION**

**Hepatic dysfunction**

Withdraw treatment immediately if persistent vomiting and abdominal pain, anorexia, jaundice, oedema, malaise, drowsiness, or loss of seizure control.

**Conception and Contraception**

Valproate is associated with teratogenic risks and should not be used in women of child-bearing potential unless there is no safer alternative—this should be fully considered and discussed before prescribing for women of child-bearing age. Effective contraception advised in women of child-bearing potential.

**Pregnancy**

Valproate is associated with the highest risk of major and minor congenital malformations (in particular neural tube defects), and long-term neurodevelopmental effects. Valproate should not be used during pregnancy or in women of child-bearing potential unless there is no safer alternative and only after a careful discussion of the risks. If valproate is to be used during pregnancy, the lowest effective dose should be prescribed in divided doses or as modified-release tablets to avoid peaks in plasma-valproate concentrations; doses greater than 1 g daily are associated with an increased risk of teratogenicity. Avoid use in the treatment of epilepsy and bipolar disorder unless there is no safer alternative and only after a careful discussion of the risks—effective contraception advised in women of child-bearing potential. Avoid use for the prophylaxis of migraine [unlicensed]—exclude pregnancy before treatment and ensure effective contraception is used during treatment. Neonatal bleeding (related to hypofibrinemia) reported. Neonatal hepatotoxicity also reported. Specialist prenatal monitoring should be instigated when valproate has been taken in pregnancy. The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**Breast feeding**

Present in milk—risk of haematological disorders in breast-fed newborns and infants.

**Hepatic Impairment**

Avoid if possible—hepatotoxicity and hepatic failure may occasionally occur (usually in first 6 months). Avoid in active liver disease.

**Renal Impairment**

Reduce dose.

**Monitoring Requirements**

- Plasma-valproate concentrations are not a useful index of efficacy, therefore routine monitoring is unhelpful.
- Monitor liver function before therapy and during first 6 months especially in patients most at risk.
- Measure full blood count and ensure no undue potential for bleeding before starting and before surgery.

**Effect on Laboratory Tests**

False-positive urine tests for ketones.

**Directions for Administration**

- With rectal use in children For rectal administration, sodium valproate oral solution may be given rectally and retained for 15 minutes (may require dilution with water to prevent rapid expulsion).
- With intravenous use in children For intravenous injection, may be diluted in Glucose 5% or Sodium Chloride 0.5% and given over 3–5 minutes. For intravenous infusion, dilute injection solution with Glucose 5% or Sodium Chloride 0.9%.
- With intravenous use in adults For intravenous infusion (Epilim®[a], Episenta®[b]), give continuously or intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute Epilim® with solvent provided then dilute with infusion fluid.
EPIVAL® Tablets may be halved but not crushed or chewed.

EPISENTA® CAPSULES Contents of capsule may be mixed with cold soft food or drink and swallowed immediately without chewing.

EPISENTA® GRANULES Granules may be mixed with cold soft food or drink and swallowed immediately without chewing. 

EPILIM® ORAL SOLUTION May be diluted, preferably in Syrup BP; use within 14 days.

PRESCRIBING AND DISPENSING INFORMATION Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic oral sodium valproate product.

EPILIM CHRONOSPHERE® Prescribe dose to nearest whole 50 mg sachet.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Sodium valproate for preventing seizures 

Blood or hepatic disorders Patients or their carers should be told how to recognise signs and symptoms of blood or liver disorders and advised to seek immediate medical attention if symptoms develop.

Pancreatitis Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek immediate medical attention if symptoms such as abdominal pain, nausea, or vomiting develop; discontinue if pancreatitis is diagnosed.

Counselling advised on pregnancy.

Administration advice should be given for Epival®, Episenta®, capsules and granules, and Epilim® Chronosphere and Epilim® oral Solution

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: suppository, oral suspension, oral solution

Tablet

**INDICATIONS AND DOSE**
Adjunctive treatment for focal seizures with or without secondary generalisation that are not satisfactorily controlled by other antiepileptics (with enzyme-inducing drugs)

**BY MOUTH**
- Child 12-17 years: Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours every 1 week; maintenance 30–45 mg daily in 2–3 divided doses
- Adult: Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours every 1 week; maintenance 30–45 mg daily in 2–3 divided doses

Adjunctive treatment for focal seizures with or without secondary generalisation that are not satisfactorily controlled by other antiepileptics (without enzyme-inducing drugs)

**BY MOUTH**
- Child 12-17 years: Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours every 1 week; maintenance 15–30 mg daily in 2–3 divided doses
- Adult: Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours every 1 week; maintenance 15–30 mg daily in 2–3 divided doses

**SIDE-EFFECTS**
- Common or very common Diarrhoea; dizziness; emotional lability; impaired concentration; nervousness; speech impairment; tiredness; tremor
- Rare Bruising; confusion; depression; drowsiness; non-convulsive status epilepticus; psychosis; suicidal ideation; visual disturbances
- Frequency not known Leucopenia

**PREGNANCY** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**HEPATIC IMPAIRMENT** In mild to moderate impairment reduce dose, prolong the dose interval, or both. Avoid in severe impairment.

**PATIENT AND CARER ADVICE** May impair performance of skilled tasks (e.g. driving).

**CAUTIONS** Avoid in Acute porphyrias p. 864

**CAUTIONS, FURTHER INFORMATION**
Tiagabine should be avoided in absence, myoclonic, tonic and atonic seizures due to risk of seizure exacerbation.

**INTERACTIONS** → Appendix 1 (tiagabine).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Topiramate**

**INDICATIONS AND DOSE**
Monotherapy of generalised tonic-clonic seizures or focal seizures with or without secondary generalisation

**BY MOUTH**
- Child 6–17 years: Initially 0.5–1 mg/kg once daily (max. per dose 25 mg) for 1 week, dose to be taken at night, then increased in steps of 250–500 micrograms/kg twice daily, dose to be increased by a maximum of 25 mg twice daily at intervals of 1–2 weeks; usual dose 50 mg twice daily (max. per dose 7.5 mg/kg twice daily), if child cannot tolerate titration regimens recommended above then smaller steps or longer interval between steps may be used; maximum 500 mg per day
- Adult: Initially 25 mg once daily for 1 week, dose to be taken at night, then increased in steps of 25–50 mg every 1–2 weeks, dose to be taken in 2 divided doses; usual dose 100–200 mg daily in 2 divided doses, adjusted according to response, doses of 1 g daily have been used in refractory epilepsy; maximum 500 mg per day

Adjunctive treatment of generalised tonic-clonic seizures or focal seizures with or without secondary generalisation | Adjunctive treatment for seizures associated with Lennox-Gastaut syndrome

**BY MOUTH**
- Child 2–17 years: Initially 1–3 mg/kg once daily (max. per dose 25 mg) for 1 week, dose to be taken at night, then increased in steps of 0.5–1.5 mg/kg twice daily, dose to be increased by a maximum of 25 mg twice daily at intervals of 1–2 weeks; usual dose 2.5–4.5 mg/kg twice daily (max. per dose 7.5 mg/kg twice daily), if child cannot tolerate recommended titration regimen then smaller steps or longer interval between steps may be used; maximum 400 mg per day
- Adult: Initially 25–50 mg once daily for 1 week, dose to be taken at night, then increased in steps of 25–50 mg every 1–2 weeks, dose to be taken in 2 divided doses; usual dose 200–400 mg daily in 2 divided doses; maximum 400 mg per day

**Migraine prophylaxis**

**BY MOUTH**
- Adult: Initially 25 mg once daily for 1 week, dose to be taken at night, then increased in steps of 25 mg every 1 week; usual dose 50–100 mg daily in 2 divided doses; maximum 200 mg per day

**UNLICENSED USE** Not licensed for use in children for migraine prophylaxis.

**CAUTIONS** Avoid in Acute porphyrias p. 864 · risk of metabolic acidosis · risk of nephrolithiasis—ensure adequate hydration (especially in strenuous activity or warm environment)

**INTERACTIONS** → Appendix 1 (topiramate).

**SIDE-EFFECTS**
- Common or very common Abdominal pain; aggression; agitation; alopecia; anaemia; anxiety; appetite changes; arthralgia; cognitive impairment; confusion; constipation; depression; diarrhoea; dizziness; drowsiness; dry mouth; dyspepsia; dyspnoea; epistaxis; gastritis; impaired attention; impaired coordination; irritability; malaise; mood changes; movement disorders; muscle spasm; muscular weakness; myalgia; nausea; nephrolithiasis; nystagnus; paraesthesia; pruritus; rash; seizures; sleep disturbance; speech disorder; taste disturbance; tinnitus; tremor; urinary disorders; visual disturbances; vomiting
- Uncommon Abdominal distension; altered sense of smell; blepharospasm; blood disorders; bradycardia; dry eye;
Epilepsy 407

**INDICATIONS AND DOSE**

Adjunctive treatment of focal seizures with or without secondary generalisation not satisfactorily controlled with other antiepileptics (under expert supervision)

**BY MOUTH**

- **Child 1 month-2 years:** Initially 15–20 mg/kg twice daily (max. per dose 250 mg twice daily), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 75 mg/kg twice daily)
- **Child 2-11 years:** Initially 15–20 mg/kg twice daily (max. per dose 250 mg twice daily), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 1.5 g twice daily)
- **Child 12-17 years:** Initially 250 mg twice daily, to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 1–1.5 g twice daily
- **Adult:** Initially 1 g once daily, alternatively initially 1 g daily in 2 divided doses, then increased in steps of 500 mg every 1 week, adjusted according to response; usual dose 2–3 g daily; maximum 3 g per day

**BY RECTUM**

- **Child 1 month-1 year:** Initially 15–20 mg/kg twice daily (max. per dose 250 mg twice daily), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 75 mg/kg twice daily)
408 Seizures

- Child 2-11 years: Initially 15–20 mg/kg twice daily (max. per dose 250 mg twice daily), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 1.5 g twice daily).
- Child 12–17 years: Initially 250 mg twice daily, to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 1–1.5 g twice daily.

- UNLICENSED USE Granules not licensed for rectal use. Tablets not licensed to be crushed and dispersed in liquid. Vigabatrin doses in BNF publications may differ from those in product literature.
- CONTRA-INDICATIONS Visual field defects
- CAUTIONS Elderly - history of behavioural problems - history of depression - history of psychosis

CAUTIONS, FURTHER INFORMATION
Vigabatrin may worsen absence, myoclonic, tonic and atonic seizures.

Visual field defects Vigabatrin is associated with visual field defects. The onset of symptoms varies from 1 month to several years after starting. In most cases, visual field defects have persisted despite discontinuation, and further deterioration after discontinuation cannot be excluded. Product literature advises visual field testing before treatment and at 6-month intervals. Patients and their carers should be warned to report any new visual symptoms that develop and those with symptoms should be referred for an urgent ophthalmological opinion. Gradual withdrawal of vigabatrin should be considered.

- INTERACTIONS → Appendix 1 (vigabatrin).
- SIDE-EFFECTS
  - Common or very common Abdominal pain - aggression - agitation - blurred vision - depression - diplopia - dizziness - drowsiness - excitement (in children) - fatigue - headache - impaired concentration - impaired memory - irritability - nausea - nervousness -ystagmus - oedema - paraesthesia - paraesthesia - paraparesis - speech disorder - tremor - visual field defects - vomiting - weight gain
  - Uncommon Ataxia - mania - occasional increase in seizure frequency (especially if myoclonic) - psychosis - rash
  - Rare Peripheral retinal neuropathy - retinal disorders - suicidal ideation
  - Very rare Hepatitis - optic atrophy - optic neuritis
  - Frequency not known Movement disorders in infantile spasms

SIDE-EFFECTS, FURTHER INFORMATION
Visual field defects About one-third of patients treated with vigabatrin have suffered visual field defects; counselling and careful monitoring for this side-effect are required. Encephalopathic symptoms including marked sedation, stupor, and confusion with non-specific slow wave EEG can occur rarely—reduce dose or withdraw.

- PREGNANCY The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.
- BREAST FEEDING Present in milk—manufacturer advises avoid.

- RENAL IMPAIRMENT
  - In adults Consider reduced dose or increased dose interval if eGFR less than 60 mL/minute/1.73 m².
  - In children Consider reduced dose or increased dose interval if estimated glomerular filtration rate less than 60 mL/minute/1.73 m².

- MONITORING REQUIREMENTS Closely monitor neurological function.
- DIRECTIONS FOR ADMINISTRATION
  - With rectal use Dissolve contents of sachet in small amount of water and administer rectally [unlicensed use].

The contents of a sachet should be dissolved in water or a soft drink immediately before taking. Tablets may be crushed and dispersed in liquid.

- PATIENT AND CARER ADVICE
  - Medicines for Children leaflet: Vigabatrin for preventing seizures www.medicinesforchildren.org.uk/vigabatrin-for-preventing-seizures
  - Patients and their carers should be warned to report any new visual symptoms that develop.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution
  - Tablet CAUTIONARY AND ADVISORY LABELS 3, 8
    - Vigabatrin 500 mg Sabril 500mg tablets | 100 tablet £37.01 DT price = £37.01
  - Powder CAUTIONARY AND ADVISORY LABELS 3, 8, 13
    - Vigabatrin 500 mg Sabril 500mg oral powder sachets (sugar-free) | 50 sachet £20.50 DT price = £20.50

Zonisamide

INDICATIONS AND DOSE
Monotherapy for treatment of focal seizures with or without secondary generalisation in adults with newly diagnosed epilepsy

BY MOUTH
- Adult: Initially 100 mg once daily for 2 weeks, then increased in steps of 100 mg every 2 weeks, usual maintenance dose 300 mg once daily; maximum 500 mg per day

Adjunctive treatment for refractory focal seizures with or without secondary generalisation

BY MOUTH
- Child 6–17 years (body-weight 20–54 kg): Initially 1 mg/kg once daily for 7 days, then increased in steps of 1 mg/kg every 7 days (max. per dose 500 mg once daily), usual maintenance 6–8 mg/kg once daily, dose to be increased at 2-week intervals in patients who are not receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4.
- Child 6–17 years (body-weight 55 kg and above): Initially 1 mg/kg once daily for 7 days, then increased in steps of 1 mg/kg every 7 days, usual maintenance 300–500 mg once daily, dose to be increased at 2-week intervals in patients who are not receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4.
- Adult: Initially 50 mg daily in 2 divided doses for 7 days, then increased to 100 mg daily in 2 divided doses, then increased in steps of 100 mg every 7 days, usual maintenance 300–500 mg daily in 1–2 divided doses, dose to be increased at 2-week intervals in patients who are not receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4.

- CAUTIONS Elderly - low body-weight or poor appetite—monitor weight throughout treatment (fatal cases of weight loss reported in children) - metabolic acidosis—monitor serum bicarbonate concentration in children and those with other risk factors (consider dose reduction or discontinuation if metabolic acidosis develops) - risk factors for renal stone formation (particularly predisposition to nephrolithiasis)
CAUTIONS, FURTHER INFORMATION
Avoid overheating and ensure adequate hydration especially in children, during strenuous activity or if in a warm environment (fatal cases of heat stroke reported in children).

- INTERACTIONS → Appendix 1 (zonisamide).
- In adults Caution with concomitant use of drugs that increase risk of hyperthermia, metabolic acidosis, or nephrolithiasis.
- In children Caution with concomitant use of drugs that increase risk of nephrolithiasis. Contraindicated with use of drugs that increase risk of hyperthermia or metabolic acidosis.

- SIDE-EFFECTS
  - Uncommon Aggression - cholecystitis - cholelithiasis - dyspepsia - hypokalaemia - pneumonia - seizures - suicidal ideation - urinary calculus - urinary tract infection - vomiting

- ALLERGY AND CROSS-SENSITIVITY

- CONCEPTION AND CONTRACEPTION
  Manufacturer advises women of childbearing potential should use adequate contraception during treatment and for 4 weeks after last dose.

- PREGNANCY
  The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- BREAST FEEDING
  Manufacturer advises avoid for 4 weeks after last dose.

- HEPATIC IMPAIRMENT
  Initially increase dose at 2-week intervals if mild or moderate impairment. Avoid in severe impairment.

- RENAL IMPAIRMENT
  Initially increase dose at 2-week intervals; discontinue if renal function deteriorates.

- TREATMENT CESSATION
  Avoid abrupt withdrawal (consult product literature for recommended withdrawal regimens in children).

- PRESCRIBING AND DISPENSING INFORMATION
  Switching between formulations. Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.
  Patients may need to be maintained on a specific manufacturer’s branded or generic zonisamide product.

- PATIENT AND CARER ADVICE
  Medicines for Children leaflet: Zonisamide for preventing seizures www.medicinesforchildren.org.uk/zonisamide-for-preventing-seizures
  Children and their carers should be made aware of how to prevent and recognise overheating and dehydration.

- NATIONAL FUNDING/ACCESS DECISIONS
  Scottish Medicines Consortium (SMC) Decisions
  The Scottish Medicines Consortium has advised (February 2014) that zonisamide (Zonegran®) is accepted for restricted use within NHS Scotland as adjunctive treatment of focal seizures, with or without secondary generalisation, in adolescents and children aged 6 years and above. It is restricted to use on advice from specialists in paediatric neurology or epilepsy.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

  **Capsule**

  CAUTIONARY AND ADVISORY LABELS 3, 8, 10

  Zonisamide 25 mg Zonegran 25mg capsules | 14 capsule Pсте £8.82 DT price = £8.82
  Zonisamide 50 mg Zonegran 50mg capsules | 56 capsule Pсте £47.04 DT price = £47.04
  Zonisamide 100 mg Zonegran 100mg capsules | 56 capsule Pсте £62.72 DT price = £62.72

- BARBITURATES
  Phenobarbital (Phenobarbitalone)

  **INDICATIONS AND DOSE**

  All forms of epilepsy except typical absence seizures

  **BY MOUTH**

  - Child 1 month-11 years: Initially 1–1.5 mg/kg twice daily, then increased in steps of 2 mg/kg daily as required; maintenance 2.5–4 mg/kg 1–2 times a day
  - Child 12-17 years: 60–180 mg once daily, dose to be taken at night
  - Adult: 60–180 mg once daily, dose to be taken at night

  **Status epilepticus**

  **BY INTRAVENOUS INJECTION**

  - Adult: 10 mg/kg (max. per dose 1 g), dose to be administered at a rate not more than 100 mg/minute, injection to be diluted 1 in 10 with water for injections

  **BY SLOW INTRAVENOUS INJECTION**

  - Neonate: Initially 20 mg/kg, dose to be administered at a rate not faster than 1 mg/kg/minute, then 2.5–5 mg/kg 1–2 times a day
  - Child 1 month-11 years: Initially 20 mg/kg, dose to be administered at a rate not faster than 1 mg/kg/minute, then 2.5–5 mg/kg 1–2 times a day
  - Child 12-17 years: Initially 20 mg/kg (max. per dose 1 g), dose to be administered at a rate no faster than 1 mg/kg/minute, then 300 mg twice daily

  **Dose equivalence and conversion**

  For therapeutic purposes phenobarbital and phenobarbital sodium may be considered equivalent in effect.

- **CAUTIONS**
  Avoid in Acute porphyrias p. 654 - children - debilitated - elderly - history of alcohol abuse - history of drug abuse - respiratory depression (avoid if severe)

- **CAUTIONS, FURTHER INFORMATION**
  Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

- **INTERACTIONS → Appendix 1 (phenobarbital).**

- **SIDE-EFFECTS**
  - Common or very common Agranulocytosis - allergic skin reactions - ataxia - behavioural disturbances - cholestasis - depression - drowsiness - hallucinations - hepatitis - hyperactivity particularly in the elderly and in children - hypotension - impaired cognition - impaired memory -
irritability · lethargy · megaloblastic anaemia (may be treated with folic acid) · myasthenia · osteomalacia · paradoxical excitement (in adults) · respiratory depression · thrombocytopenia

▶ Very rare Antiepileptic Hypersensitivity Syndrome · Stevens-Johnson syndrome · suicidal ideation · toxic epidermal necrolysis

▶ Frequency not known Hyperkinesia (in children)

Οverdose For details on the management of poisoning, see Active elimination techniques, under Emergency treatment of poisoning p. 1123.

● ALLERGY AND CROSS-SENSITIVITY Antiepileptic hypersensitivity syndrome associated with phenobarbital. See under Epilepsy p. 383 for more information.

● PREGNANCY The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

● BREAST FEEDING Avoid if possible; drowsiness may occur.

● HEPATIC IMPAIRMENT May precipitate coma. Avoid in severe impairment.

● RENAL IMPAIRMENT Use with caution.

● MONITORING REQUIREMENTS

▶ Plasma–phenobarbital concentration for optimum response is 15–40 mg/litre (60–180 micrograms/ml); however, monitoring the plasma–drug concentration is less useful than with other drugs because tolerance occurs.

● TREATMENT CESSION Avoid abrupt withdrawal (dependence with prolonged use).

● DIRECTIONS FOR ADMINISTRATION Solution for injection must be diluted before intravenous administration.

▶ With intravenous use in children. For intravenous injection, dilute to a concentration of 20 mg/ml with Water for Injections; give over 20 minutes (no faster than 1 mg/kg/minute).

▶ With oral use in children. For administration by mouth, tablets may be crushed.

● PRESCRIBING AND DISPENSING INFORMATION

Switching between formulations. Different formulations of oral preparations may vary in bioavailability. Patients should be maintained on a specific manufacturer’s product. Some hospitals supply alcohol-free formulations of varying phenobarbital strengths.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Phenobarbital for preventing seizures www.medicinesforchildren.org.uk/phenobarbital-for-preventing-seizures

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, tablet, capsule

BENZODIAZEPINES

Clobazam

The properties listed below are those particular to the drug only. For properties common to the class, see Benzodiazepines, p. 266.

INDICATIONS AND DOSE

Adjunct in epilepsy

BY MOUTH

▶ Child 6–17 years: Initially 5 mg daily, dose to be increased if necessary at intervals of 5 days, maintenance 0.3–1 mg/kg daily, daily doses of up to 30 mg may be given as a single dose at bedtime; higher doses should be divided; maximum 60 mg per day

▶ Adult: 20–30 mg daily, then increased if necessary up to 60 mg daily

Anxiety (short-term use)

BY MOUTH

▶ Adult: 20–30 mg daily in divided doses, alternatively 20–30 mg once daily, dose to be taken at bedtime; increased if necessary up to 60 mg daily in divided doses, dose only increased in severe anxiety (in hospital patients), for debilitated patients, use elderly dose

▶ Elderly: 10–20 mg daily

● UNLICENSED USE Not licensed for use in children under 6 years. Not licensed as monotherapy.

● CONTRA-INDICATIONS Chronic psychosis (in adults) · hyperkinesia · not for use alone to treat anxiety associated with depression (in adults) · obsessive states · phobic states · respiratory depression

● CAUTIONS Muscle weakness · organic brain changes · personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence

CAUTIONS, FURTHER INFORMATION

The effectiveness of clobazam may decrease significantly after weeks or months of continuous therapy.

● SIDE-EFFECTS

▶ Common or very common Amnesia · ataxia (especially in the elderly) · confusion (especially in the elderly) · dependence · drowsiness the next day · lightheadedness the next day · muscle weakness · paradoxical increase in aggression

▶ Uncommon Changes in libido (in adults) · dizziness · dystarthisia · gastro-intestinal disturbances · gynaecomastia · headache (in adults) · hypotension (in adults) · incontinence · salivation changes · slurred speech (in adults) · tremor · urinary retention (in adults) · vertigo (in adults) · visual disturbances

▶ Rare Apnoea · blood disorders · changes in libido (in children) · headache (in children) · hypotension (in children) · jaundice · respiratory depression · skin reactions · urinary retention (in children) · vertigo (in children)

▶ Frequency not known Delusions (in children) · excitement (in children) · hallucinations (in children) · irritability (in children) · psychosis (in children) · restlessness (in children)

● BREAST FEEDING Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding. All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones.

● HEPATIC IMPAIRMENT Start with smaller initial doses or reduce dose. Can precipitate coma. Avoid in severe impairment.
■ RENAL IMPAIRMENT Start with small doses in severe impairment.

■ MONITORING REQUIREMENTS
>
• In children Routine measurement of plasma concentrations of antiepileptic drugs is not usually justified, because the target concentration ranges are arbitrary and often vary between individuals. However, plasma drug concentrations may be measured in children with worsening seizures, status epilepticus, suspected noncompliance, or suspected toxicity. Similarly, haematological and biochemical monitoring should not be undertaken unless clinically indicated.

■ TREATMENT CESSION
Antiepileptic drugs should be withdrawn under specialist supervision. Avoid abrupt withdrawal because this can precipitate severe rebound seizures. Reduction in dosage should be gradual.

The decision to withdraw antiepileptic drugs from a seizure-free patient, and its timing, is often difficult and depends on individual circumstances. Even in patients who have been seizure-free for several years, there is a significant risk of seizure recurrence on drug withdrawal. In patients receiving several antiepileptic drugs, only one drug should be withdrawn at a time.

• In children Drugs should be gradually withdrawn over at least 2–3 months by reducing the daily dose by 10–25% at intervals of 1–2 weeks. Benzodiazepines may need to be withdrawn over 6 months or longer.

■ PRESCRIBING AND DISPENSING INFORMATION
Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic clobazam product.

■ PATIENT AND CARER ADVICE
Medicines for Children leaflet: Clobazam for preventing seizures www.medicinesforchildren.org.uk/ clobazam-preventing-seizures-0

■ NATIONAL FUNDING/ACCESS DECISIONS
NHS restrictions Clobazam is not prescribable under the NHS except for epilepsy and endorsed ‘SLS’.

■ MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, capsule

- Tablet
  CAUTIONARY AND ADVISORY LABELS 2, 19, 8

  ▶ Brands may include Tapclob

Clonazepam

The properties listed below are those particular to the drug only. For properties common to the class, see Benzodiazepines, p. 266.

INDICATIONS AND DOSE
All forms of epilepsy

BY MOUTH
- Child 1-11 months: Initially 250 micrograms once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 0.5–1 mg daily, dose to be taken at night; may be given in 3 divided doses if necessary
- Child 1-4 years: Initially 250 micrograms once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 1–3 mg daily, dose to be taken at night; may be given in 3 divided doses if necessary
- Child 5-11 years: Initially 500 micrograms once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 4–8 mg daily, adjusted according to response, dose usually taken at night; may be given in 3–4 divided doses if necessary
- Child 12-17 years: Initially 1 mg once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 4–8 mg daily, adjusted according to response, dose usually taken at night; may be given in 3–4 divided doses if necessary
- Adult: Initially 1 mg once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 4–8 mg daily, adjusted according to response, dose usually taken at night; may be given in 3–4 divided doses if necessary
- Elderly: Initially 500 micrograms once daily for 4 nights, dose to be increased over 2–4 weeks, usual dose 4–8 mg daily, adjusted according to response, dose usually taken at night; may be given in 3–4 divided doses if necessary

■ UNLICENSED USE
- In children Clonazepam doses in BNFC may differ from those in product literature.
- In adults Clonazepam doses in BNF may differ from those in product literature.

■ CONTRA-INDICATIONS
Coma · current alcohol abuse · current drug abuse · respiratory depression

■ CAUTIONS
Acute porphyrias p. 864 · airways obstruction · brain damage · cerebellar ataxia · depression · spinal ataxia · suicidal ideation

CAUTIONS, FURTHER INFORMATION
The effectiveness of clonazepam may decrease significantly after weeks or months of continuous therapy.

■ SIDE-EFFECTS
- Common or very common Amnesia · bronchial hypersecretion in infants and small children · co-ordination disturbances · confusion · dependence · dizziness · drowsiness · fatigue · muscle hypotonia · nystagmus · poor concentration · restlessness · salivary hypersecretion in infants and small children · withdrawal symptoms (in children)
- Rare Aggression · anxiety · blood disorders · dysarthria · gastro-intestinal symptoms · headache · paradoxical effects · pruritus · respiratory depression · reversible hair loss · sexual dysfunction · skin pigmentation changes · suicidal ideation (in adults) · urinary incontinence · urticaria · visual disturbances on long-term treatment
- Very rare Increase in seizure frequency

■ BREAST FEEDING
Present in milk, and should be avoided if possible during breast-feeding. All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones.

■ HEPATIC IMPAIRMENT
Start with smaller initial doses or reduce dose. Can precipitate coma. Avoid in severe impairment.

■ RENAL IMPAIRMENT
Start with small doses in severe impairment.

■ MONITORING REQUIREMENTS
Routine measurement of plasma concentrations of antiepileptic drugs is not
6.2 Status epilepticus

<tr>
<td>Follow-up dose</td>
<td>100–150 mg after 0.5–1 minute if required, dose to be given in fit and premedicated adults; debilitated patients or adults over 65 years may require a lower dose or increased administration time, alternatively initially up to 4 mg/kg (max. per dose 500 mg)</td>
</tr>
</tbody>
</table>

#### Important safety information

Thiopental sodium should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CONTRA-INDICATIONS** Acute porphyrias p. 864 • myotonic dystrophy
- **CAUTIONS** Acute circulatory failure (shock) • avoid intra-arterial injection • cardiovascular disease • elderly • fixed cardiac output • hypovolaemia • reconstituted solution is highly alkaline (extravasation causes tissue necrosis and severe pain)
- **INTERACTIONS** → Appendix 1 (anaesthetics, general).
- **SIDE-EFFECTS** Arrhythmias • cough • headache • hypersensitivity reactions • hypotension • laryngeal spasm • myocardial depression • rash • sneezing
- **PREGNANCY** May depress neonatal respiration when used during delivery.
- **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- **HEPATIC IMPAIRMENT** Use with caution—reduce dose.
- **RENAL IMPAIRMENT** Caution in severe impairment.

**PATIENT AND CARER ADVICE**

Driving and skilled tasks

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

- **MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral drops, oral solution, orodispersible tablet

**Powder for solution for injection**

**MEDIATEA**

**Lorazepam**

The properties listed below are those particular to the drug only. For properties common to the class, see Benzodiazepines, p. 266.
INDICATIONS AND DOSE

Status epilepticus | Febrile convulsions | Convulsions caused by poisoning

- **BY SLOW INTRAVENOUS INJECTION INTO LARGE VEIN**
  - Child 1 month-11 years: 100 micrograms/kg (max. per dose 4 mg) for 1 dose, then 100 micrograms/kg after 10 minutes (max. per dose 4 mg) if required for 1 dose
  - Child 12-17 years: 4 mg for 1 dose, then 4 mg after 10 minutes if required for 1 dose
  - Adult: 4 mg for 1 dose, then 4 mg after 10 minutes if required for 1 dose

- **Short-term use in anxiety**
  - BY MOUTH
    - Adult: 1–4 mg daily in divided doses, for debilitated patients, use elderly dose
    - Elderly: 0.5–2 mg daily in divided doses

- **Short-term use in insomnia associated with anxiety**
  - BY MOUTH
    - Adult: 1–2 mg daily, to be taken at bedtime

- **Acute panic attacks**
  - BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION
    - Adult: 25–30 micrograms/kg every 6 hours if required; usual dose 1.5–2.5 mg every 6 hours if required, intravenous injection to be administered into a large vein, only use intramuscular route when oral and intravenous routes not possible

- **Conscious sedation for procedures**
  - BY MOUTH
    - Adult: 2–3 mg, to be taken the night before operation; 2–4 mg, to be taken 1–2 hours before operation
  - BY SLOW INTRAVENOUS INJECTION
    - Adult: 50 micrograms/kg, to be administered 30–45 minutes before operation
  - BY INTRAMUSCULAR INJECTION
    - Adult: 50 micrograms/kg, to be administered 60–90 minutes before operation

- **Premedication**
  - BY MOUTH
    - Adult: 2–3 mg, to be taken the night before operation; 2–4 mg, to be taken 1–2 hours before operation
  - BY SLOW INTRAVENOUS INJECTION
    - Adult: 50 micrograms/kg, to be administered 30–45 minutes before operation
  - BY INTRAMUSCULAR INJECTION
    - Adult: 50 micrograms/kg, to be administered 60–90 minutes before operation

- **UNLICENSED USE**

- **FURTHER INFORMATION**
  - **ANAESTHESIA**
    - Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

- **CONTRA-INDICATIONS**
  - Avoid injections containing benzyl alcohol in neonates; chronic psychosis (in adults); CNS depression; compromised airway; hyperkinesia; not for use alone to treat depression (or anxiety associated with depression) (in adults); obsessional states; phobic states; respiratory depression

- **CAUTIONS**
  - Muscle weakness; organic brain changes; parenteral administration; personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence

- **SIDE-EFFECTS**
  - Common or very common Amnesia - ataxia (in children) - ataxia (especially in the elderly) (in adults) - confusion (in children) - confusion (especially in the elderly) (in adults) - dependence - drowsiness the next day - lightheadedness - tremor - urinary retention (in adults) - vertigo (in adults) - visual disturbances
  - Rare - Apnoea - blood disorders - changes in libido (in children) - jaundice - marked respiratory depression, particularly with high dose and intravenous use (facilities for its treatment are essential) - pain (on intravenous injection) - psychosis (in children) - restlessness (in children) - thrombophlebitis (on intravenous injection)

- **PREGNANCY**
  - Women who have seizures in the second half of pregnancy should be assessed for eclampsia before any change is made to antiepileptic treatment. Status epilepticus should be treated according to the standard protocol. All pregnant women with epilepsy, whether taking medication or not, should be encouraged to notify the UK Epilepsy and Pregnancy Register (Tel: 0800 389 1248).

- **BREAST FEEDING**
  - Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

- **HEPATIC IMPAIRMENT**
  - Can precipitate coma. Start with smaller initial doses or reduce dose. If treatment is necessary, benzodiazepines with shorter half-lives are safer. Avoid in severe impairment.

- **RENAL IMPAIRMENT**
  - Start with small doses in severe impairment.

- **DIRECTIONS FOR ADMINISTRATION**
  - In children For intravenous injection, dilute with an equal volume of Sodium Chloride 0.9% (for neonates, dilute injection solution to a concentration of 100 micrograms/ml). Give over 3–5 minutes; max. rate 50 micrograms/kg over 3 minutes.
  - In adults For intramuscular injection, solution for injection should be diluted with an equal volume of water for injections or sodium chloride 0.9% (but only use when oral and intravenous routes not possible). For slow intravenous injection, solution for injection should preferably be diluted with an equal volume of water for injections or sodium chloride 0.9%.
Midazolam

The properties listed below are those particular to the drug only. For properties common to the class, see Benzodiazepines, p. 266.

**INDICATIONS AND DOSE**

**Status epilepticus | Febrile convulsions**

**BY BUCAL ADMINISTRATION**
- Child 1-2 months: 300 micrograms/kg (max. per dose 2.5 mg), then 300 micrograms/kg after 10 minutes (max. per dose 2.5 mg) if required
- Child 3-11 months: 2.5 mg, then 2.5 mg after 10 minutes if required
- Child 1-4 years: 5 mg, then 5 mg after 10 minutes if required
- Child 5-9 years: 7.5 mg, then 7.5 mg after 10 minutes if required
- Adult: 10 mg, then 10 mg after 10 minutes if required

**Conscious sedation for procedures**

**BY SLOW INTRAVENOUS INJECTION**
- Adult: Initially 2–2.5 mg, to be administered 5–10 minutes before procedure at a rate of approximately 2 mg/minute, increased in steps of 1 mg if required, usual total dose is 3.5–5 mg; maximum 7.5 mg per course
- Elderly: Initially 0.5–1 mg, to be administered 5–10 minutes before procedure at a rate of approximately 2 mg/minute, increased in steps of 0.5–1 mg if required; maximum 3.5 mg per course

**Sedative in combined anaesthesia**

**INITIALLY BY INTRAVENOUS INJECTION**
- Adult: 30–100 micrograms/kg, repeated if necessary, alternatively (by continuous intravenous infusion) 30–100 micrograms/kg/hour
- Elderly: Lower doses needed

**Premedication**

**BY DEEP INTRAVASCULAR INJECTION**
- Adult: 70–100 micrograms/kg, to be administered 20–60 minutes before induction, for debilitated patients, use elderly dose
- Elderly: 25–50 micrograms/kg, to be administered 20–60 minutes before induction

**BY INTRAVENOUS INJECTION**
- Adult: 1–2 mg, repeated if necessary, to be administered 5–30 minutes before procedure, for debilitated patients, use elderly dose
- Elderly: 0.5 mg, repeated if necessary, to be administered 5–30 minutes before procedure, repeat dose slowly as required

**Induction of anaesthesia (but rarely used)**

**BY SLOW INTRAVENOUS INJECTION**
- Adult: 150–200 micrograms/kg daily in divided doses (max. per dose 5 mg), dose to be given at intervals of 2 minutes, maximum total dose 600 micrograms/kg, for debilitated patients, use elderly dose
- Elderly: 50–150 micrograms/kg daily in divided doses (max. per dose 5 mg), dose to be given at intervals of 2 minutes, maximum total dose 600 micrograms/kg

**Sedation of patient receiving intensive care**

**INITIALLY BY SLOW INTRAVENOUS INJECTION**
- Adult: Initially 30–300 micrograms/kg, dose to be given in steps of 1–2.5 mg every 2 minutes, then (by slow intravenous injection or by continuous intravenous infusion) 30–200 micrograms/kg/hour, reduce dose (or reduce or omit initial dose) in hypovolaemia, vasoconstriction, or hypothermia, lower doses may be adequate if opioid analgesic also used

**Confusion and restlessness in palliative care**

**BY SUBCUTANEOUS INFUSION**
- Adult: Initially 10–20 mg/24 hours, adjusted according to response; usual dose 20–60 mg/24 hours

**Convolusions in palliative care**

**BY CONTINUOUS SUBCUTANEOUS INFUSION**
- Adult: Initially 20–40 mg/24 hours

**UNLICENSED USE** Oromucosal solution not licensed for use in children under 3 months. Oromucosal solution not licensed for use in adults over 18 years. Unlicensed oromucosal formulations are also available and may have different doses—refer to product literature. Injection not licensed for use in status epilepticus or febrile convulsions.

**Important safety information**

**ANAESTHESIA**

Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

**PRESCRIBING OF MIDAZOLAM IN PALLIATIVE CARE**

The use of high-strength midazolam (5 mg/mL in 2 mL and 10 mL ampoules, or 2 mg/mL in 5 mL ampoules) should be considered in palliative care and other situations where a higher strength may be more appropriate to administer the prescribed dose, and where the risk of overdosage has been assessed. It is advised that flumazenil is available when midazolam is used, to reverse the effects if necessary.

**CONTRA-INDICATIONS** CNS depression · compromised airway · severe respiratory depression
- **CAUTIONS** Cardiac disease - children (particularly if cardiovascular impairment) - concentration of midazolam in children under 15 kg not to exceed 1 mg/mL - debilitated patients (reduce dose) - hypothermia - hypovolaemia (risk of severe hypotension) - neonates - risk of airways obstruction and hypoventilation in children under 6 months (monitor respiratory rate and oxygen saturation) - vasoconstriction

**CAUTIONS, FURTHER INFORMATION**

**Recovery when used for sedation** Midazolam has a fast onset of action, recovery is faster than for other benzodiazepines such as diazepam, but may be significantly longer in the elderly, in patients with a low cardiac output, or after repeated dosing.

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Amnesia
- Anaphylaxis
- Ataxia
- Blood disorders
- Bronchospasm
- Cardiac arrest
- Changes in libido (in adults)
- Confusion
- Convulsions (more common in neonates)
- Depression of consciousness
- Dizziness
- Drowsiness
- Dry mouth
- Dysarthria
- Euphoria
- Fatigue (in children)
- Gastro-intestinal disturbances
- Hallucinations
- Headache
- Heart rate changes
- Hiccups
- Hypotension
- Incontinence
- Increased appetite
- Injection-site reactions
- Involuntary movements
- Jaundice
- Laryngospasm
- Muscle weakness
- Paradoxical aggression (especially in children and elderly)
- Paradoxical excitement (especially in children and elderly)
- Respiratory arrest (particularly with high doses or on rapid injection)
- Respiratory depression (may be severe with sedative and peri-operative use - facilities for its treatment are essential)
- Respiratory depression (particularly with high doses or on rapid injection)
- Restlessness (with sedative and peri-operative use) in children
- Salivation changes
- Sedation
- Seizures (afterwards).
- Side-effects of benzodiazepines such as diazepam, but may be significantly longer in the elderly, in patients with a low cardiac output, or after repeated dosing.
- **CAUTIONARY AND ADVISORY LABELS**

**SIDE-EFFECTS, FURTHER INFORMATION**

**Sedation** Midazolam is associated with profound sedation when high doses are given or when it is used with certain other drugs. Midazolam is not recommended for prolonged sedation in neonates; drug accumulation is likely to occur.

**Overdose** There have been reports of overdosage when high strength midazolam has been used for conscious sedation. The use of high-strength midazolam (5 mg/mL in 2 mL and 10 mL ampoules, or 2 mg/mL in 5 mL ampoules) should be restricted to general anaesthesia, intensive care, palliative care, or other situations where the risk has been assessed. It is advised that ifumazenil is available when midazolam is used, to reverse the effects if necessary.

**PREGNANCY** Women who have seizures in the second half of pregnancy should be assessed for eclampsia before any change is made to antiepileptic treatment. Status epilepticus should be treated according to the standard protocol. All pregnant women with epilepsy, whether taking medication or not, should be encouraged to notify the UK Epilepsy and Pregnancy Register (Tel: 0800 389 1248).

**BREAST FEEDING** Small amount present in milk—avoid breast-feeding for 24 hours after administration (although amount probably too small to be harmful after single doses).

**HEPATIC IMPAIRMENT** Use with caution particularly in sedative doses; can precipitate coma. For status epileptics and febrile convulsions: use with caution in mild to moderate impairment; avoid in severe impairment.

**RENAL IMPAIRMENT** Use with caution in chronic renal failure.

**DIRECTIONS FOR ADMINISTRATION**

**For intravenous infusion (Hynovel®)**, give continuously in Glucose 5% or Sodium Chloride 0.9%.

**For neonate and children under 15 kg** dilute to a concentration of 1 mg/mL.

**With intravenous use in children** For **intravenous injection** in status epilepticus and febrile convulsions, dilute with Glucose 5% or Sodium Chloride 0.9%; rapid intravenous injection (less than 2 minutes) may cause seizure-like myoclonus in preterm neonates.

**With intravenous use in neonates** Neonatal intensive care, dilute 15 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 30 micrograms/kg/hour.

**With oral use in children** For administration by mouth for sedation and premedication, injection solution may be diluted with apple or black currant juice, chocolate sauce, or cola.

**With rectal use in children** For **rectal administration** of the injection solution for sedation and premedication, attach a plastic applicator onto the end of a syringe; if the volume to be given rectally is too small, dilute with Water for Injections.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Midazolam for stopping seizures www.medicinesforchildren.org.uk/midazolam-for-stopping-seizures

Patients or carers should be given advice on how to administer midazolam oromucosal solution.

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. For intravenous benzodiazepines the risk extends to at least 24 hours after administration.

Responsible persons should be available to take patients home afterwards. The dangers of taking alcohol should be emphasised.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, solution for injection, oral suspension, solution for infusion, oral solution, oromucosal solution, infusion

**Oromucosal solution**

**CAUTIONARY AND ADVISORY LABELS**

- **Buccolam (VistPharma Ltd)**
  - Midazolam (as Midazolam hydrochloride) 2 mg per 1 mL
  - Midazolam (as Midazolam hydrochloride) 5 mg per 1 mL
  - Midazolam (as Midazolam hydrochloride) 10 mg per 1 mL

**Solution for injection**

**MIDAZOLAM (Non-proprietary)**

- Midazolam (as Midazolam hydrochloride) 1 mg per 1 mL
- Midazolam (as Midazolam hydrochloride) 5 mg per 1 mL
- Midazolam (as Midazolam hydrochloride) 10 mg per 1 mL
7 Sleep disorders

7.1 Insomnia

Hypnotics and anxiolytics

Most hypnotics (‘sedatives’) will induce sleep when given at night and most hypnotics will sedate when given during the day. Prescribing of these drugs is widespread but dependence (both physical and psychological) and tolerance occur. This may lead to difficulty in withdrawing the drug after the patient has been taking it regularly for more than a week. Hypnotics and anxiolytics should therefore be reserved for short courses to alleviate acute conditions after causative factors have been established.

Benzodiazepines are the most commonly used anxiolytics and hypnotics; they act at benzodiazepine receptors which are associated with gamma-aminobutyric acid (GABA) receptors. Older drugs such as meprobamate and hypnotics; they act at benzodiazepine receptors which occur. This may lead to difficulty in withdrawing the drug dependence (both physical and psychological) and tolerance may vary from several months to a year or more.

Withdrawal of a benzodiazepine should be gradual because abrupt withdrawal may produce confusion, toxic psychosis, convulsions, or a condition resembling delirium tremens.

The benzodiazepine withdrawal syndrome may develop at any time up to 3 weeks after stopping a long-acting benzodiazepine, but may occur within a day in the case of a short-acting one. It is characterised by insomnia, anxiety, loss of appetite and of body-weight, tremor, perspiration, tinnitus, and perceptual disturbances. Some symptoms may be similar to the original complaint and encourage further prescribing; some symptoms may continue for weeks or months after stopping benzodiazepines.

Benzodiazepine withdrawal should be flexible and carried out at a reduction rate that is tolerable for the patient. The rate should depend on the initial dose of benzodiazepine, duration of use, and the patient’s clinical response. Short-term users of benzodiazepines (2–4 weeks only) can usually taper off within 2–4 weeks. However, long-term users should be withdrawn over a much longer period of several months or more.

A suggested protocol for withdrawal for prescribed long-term benzodiazepine patients is as follows:

- Transfer patient stepwise, one dose at a time over about a week, to an equivalent daily dose of diazepam preferably taken at night.
- Reduce diazepam dose, usually by 1–2 mg every 2–4 weeks (in patients taking high doses of benzodiazepines, initially it may be appropriate to reduce the dose by up to one-tenth every 1–2 weeks). If uncomfortable withdrawal symptoms occur, maintain this dose until symptoms lessen.
- Reduce diazepam dose further, if necessary in smaller steps; steps of 500 micrograms may be appropriate towards the end of withdrawal. Then stop completely.
- For long-term patients, the period needed for complete withdrawal may vary from several months to a year or more.

Approximate equivalent doses, diazepam 5 mg
- alprazolam 250 micrograms
- clobazam 10 mg
- clonazepam 250 micrograms
- flurazepam 7.5–15 mg
- chlordiazepoxide 12.5 mg
- loprazolam 0.5–1 mg
- lorazepam 500 micrograms
- lormetazepam 0.5–1 mg
- nitrazepam 5 mg
- oxazepam 10 mg
- temazepam 10 mg

Withdrawal symptoms for long-term users usually resolve within 6–18 months of the last dose. Some patients will recover more quickly, others may take longer. The addition of beta-blockers, antidepressants and antipsychotics should be avoided where possible.

Counselling can be of considerable help both during and after the taper.

Hypnotics

Before a hypnotic is prescribed the cause of the insomnia should be established and, where possible, underlying factors should be treated. However, it should be noted that some patients have unrealistic sleep expectations, and others underestimate their alcohol consumption which is often the cause of the insomnia. Short-acting hypnotics are preferable in patients with sleep onset insomnia, when sedation the following day is undesirable, or when prescribing for elderly patients. Long-acting hypnotics are indicated in patients with poor sleep maintenance (e.g. early morning waking) that causes daytime effects, when an anxiolytic effect is needed during the day, or when sedation the following day is acceptable.

Transient insomnia may occur in those who normally sleep well and may be due to extraneous factors such as noise, shift work, and jet lag. If a hypnotic is indicated one that is rapidly eliminated should be chosen, and only one or two doses should be given.

Short-term insomnia is usually related to an emotional problem or serious medical illness. It may last for a few weeks and may recur; a hypnotic can be useful but should not be given for more than three weeks (preferably only one week). Intermittent use is desirable with omission of some doses. A short-acting drug is usually appropriate.
**Chronic insomnia** is rarely benefited by hypnotics and is sometimes due to mild dependence caused by injudicious prescribing of hypnotics. Psychiatric disorders such as anxiety, depression, and abuse of drugs and alcohol are common causes. Sleep disturbance is very common in depressive illness and early wakening is often a useful pointer. The underlying psychiatric complaint should be treated, adapting the drug regimen to alleviate insomnia. For example, clomipramine hydrochloride p. 294 or mirtazapine p. 291 prescribed for depression will also help to promote sleep if taken at night. Other causes of insomnia include daytime cat-napping and physical causes such as pain, pruritus, and dyspnoea.

Hypnotics should not be prescribed indiscriminately and routine prescribing is undesirable. They should be reserved for short courses in the acutely distressed. Tolerance to routine prescribing is undesirable. They should be reserved for patients because of its freedom from hangover but, as with drowsiness the following day. The sedative effect of their prolonged duration of action can often cause rebound insomnia and a withdrawal syndrome.

Where prolonged administration is unavoidable hypnotics should be discontinued as soon as feasible and the patient warned that sleep may be disturbed for a few days before normal rhythm is re-established; broken sleep with vivid dreams may persist for several weeks.

**Elderly**

Benzodiazepines and the Z drugs should be avoided in the elderly, because the elderly are at greater risk of becoming ataxic and confused, leading to falls and injury.

**Dental patients**

Some anxious patients may benefit from the use of hypnotics during dental procedures such as temazepam p. 420 or diazepam p. 267. Temazepam p. 420 is preferred when it is important to minimise any residual effect the following day.

**Benzodiazepines**

Benzodiazepines used as hypnotics include nitrazepam p. 419 and flurazepam p. 418 which have a prolonged action and may give rise to residual effects on the following day; repeated doses tend to be cumulative.

Lorazepam p. 418, lormetazepam p. 419, and temazepam p. 420 act for a shorter time and they have little or no hangover effect. Withdrawal phenomena are more common with the short-acting benzodiazepines.

If insomnia is associated with daytime anxiety then the use of a long-acting benzodiazepine anxiolytic such as diazepam p. 267 given as a single dose at night may effectively treat both symptoms.

**Zaleplon, zolpidem, and zopiclone**

Zaleplon p. 422, zolpidem tartrate p. 423 and zopiclone p. 423 are non-benzodiazepine hypnotics (sometimes referred to as Z drugs), but they act at the benzodiazepine receptor. They are not licensed for long-term use; dependence has been reported in a small number of patients. Zolpidem tartrate and zopiclone have a short duration of action; zaleplon is very short acting.

**Chloral and derivatives**

There is no convincing evidence that they are particularly useful in the elderly and their role as hypnotics is now very limited.

**Clomethiazole**

Clomethiazole p. 421 may be a useful hypnotic for elderly patients because of its freedom from hangover but, as with all hypnotics, routine administration is undesirable and dependence occurs.

**Antihistamines**

Some antihistamines such as promethazine hydrochloride p. 251 are on sale to the public for transient insomnia; their prolonged duration of action can often cause drowsiness the following day. The sedative effect of antihistamines may diminish after a few days of continued treatment; antihistamines are associated with headache, psychomotor impairment and antimuscarinic effects.

**Alcohol**

Alcohol is a poor hypnotic because the diuretic action interferes with sleep during the latter part of the night. Alcohol also disturbs sleep patterns, and so can worsen sleep disorders.

**Melatonin**

Melatonin p. 422 is a pineal hormone; it is licensed for the short-term treatment of insomnia in adults over 55 years.

**Anxiolytics**

Benzodiazepine anxiolytics can be effective in alleviating anxiety states. Although these drugs are sometimes prescribed for stress-related symptoms, unhappiness, or minor physical disease, their use in such conditions is inappropriate. Benzodiazepine anxiolytics should not be used as sole treatment for chronic anxiety, and they are not appropriate for treating depression or chronic psychosis. In bereavement, psychological adjustment may be inhibited by benzodiazepines.

Anxiolytic benzodiazepine treatment should be limited to the lowest possible dose for the shortest possible time. Dependence is particularly likely in patients with a history of alcohol or drug abuse and in patients with marked personality disorders.

Some antidepressant drugs are licensed for use in anxiety and related disorders. Some antipsychotic drugs, in low doses, are also sometimes used in severe anxiety for their sedative action, but long-term use should be avoided because of the risk of adverse effects. The use of antihistamines (e.g. hydroxyzine hydrochloride p. 248) for their sedative effect in anxiety is not appropriate.

**Beta-adrenoceptor blocking drugs**

These do not affect psychological symptoms of anxiety, such as worry, tension, and fear, but they do reduce autonomic symptoms, such as palpitation and tremor; they do not reduce non-autonomic symptoms, such as muscle tension. Beta-blockers are therefore indicated for patients with predominantly somatic symptoms; this, in turn, may prevent the onset of worry and fear.

**Benzodiazepines**

Benzodiazepines are indicated for the short-term relief of severe anxiety; long-term use should be avoided. Diazepam p. 267, alprazolam p. 266, clorazepate hydrochloride p. 267, and clobazam p. 410 have a sustained action. Shorter-acting compounds such as lorazepam p. 412 and oxazepam p. 420 may be preferred in patients with hepatic impairment but they carry a greater risk of withdrawal symptoms.

In panic disorders (with or without agoraphobia) resistant to antidepressant therapy, a benzodiazepine may be used; alternatively, a benzodiazepine may be used as short-term adjunctive therapy at the start of antidepressant treatment to prevent the initial worsening of symptoms.

Diazepam p. 267 or lorazepam p. 412 are very occasionally administered intravenously for the control of panic attacks. This route is the most rapid but the procedure is not without risk and should be used only when alternative measures have failed. The intramuscular route has no advantage over the oral route.

**Buspirone**

Buspirone hydrochloride p. 269 is thought to act at specific serotonin (5HT1A) receptors. Response to treatment may take up to 2 weeks. It does not alleviate the symptoms of benzodiazepine withdrawal. Therefore a patient taking a benzodiazepine still needs to have the benzodiazepine withdrawn gradually; it is advisable to do this before starting buspirone hydrochloride. The dependence and abuse potential of buspirone hydrochloride is low; it is,
however, licensed for short-term use only (but specialists occasionally use it for several months).

**Meprobamate**
Meprobamate p. 265 is less effective than the benzodiazepines, more hazardous in overdosage, and can also induce dependence. It is not recommended.

**Barbiturates**
The intermediate-acting barbiturates have a place only in the treatment of severe intractable insomnia in patients already taking barbiturates; they should be avoided in the elderly. Intermediate-acting barbiturate preparations containing amobarbital sodium, butobarbital, and secobarbital sodium are available on a named patient basis. The long-acting barbiturate phenobarbital is still sometimes of value in epilepsy but its use as a sedative is unjustified.

The very short-acting barbiturate thiopental sodium p. 412 is used in anaesthesia. Increased hostility and aggression after barbiturates and alcohol usually indicates intoxication.

**SIDE-EFFECTS**
- Common or very common: Amnesia, ataxia (especially in the elderly), confusion (especially in the elderly), drowsiness, headache, hypotension, incontinence, lightheadedness, sleep disturbance, tremor, urinary retention, vertigo, visual disturbances
- Uncommon: Changes in libido, dizziness, dysarthria, gastro-intestinal disturbances, gynaecomastia, headache, hyponatraemia, incontinence, salivation changes, slurred speech, tremor, urinary retention, vertigo, visual disturbances
- Rare: Anorexia, blood disorders, jaundice, respiratory depression, skin reactions
- **BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment. Start with smaller initial doses or reduce dose. Can precipitate coma. If treatment is necessary, benzodiazepines with shorter half-lives (such as temazepam or oxazepam) are safer.
- **RENAL IMPAIRMENT** Start with small doses in severe impairment.
- **PATIENT AND CARER ADVICE** May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.
- **NATIONAL FUNDING/ACCESS DECISIONS** Flurazepam capsules are not prescribable under the NHS.
- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Drugs used for Insomnia not listed below; Diazepam, p. 267 · Promethazine hydrochloride, p. 251**

### BENZODIAZEPINES

#### Flurazepam

The properties listed below are those particular to the drug only. For properties common to the class, see Benzodiazepines, p. 266.

**INDICATIONS AND DOSE**

**Insomnia (short-term use)**

**BY MOUTH**
- **Adult:** 15–30 mg once daily, dose to be taken at bedtime, for debilitated patients, use elderly dose
- **Elderly:** 15 mg once daily, dose to be taken at bedtime

**CONTRA-INDICATIONS**
- Not for use alone to treat chronic psychosis, not for use alone to treat depression (or anxiety associated with depression) · respiratory depression

**CAUTIONS**
- Acute porphyrias p. 864 · hypoaalbuminaemia · marked personality disorder · muscle weakness

**CAUTIONS, FURTHER INFORMATION**

**Paradoxical effects**

A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

**SIDE-EFFECTS**
- Common or very common: Amnesia, ataxia (especially in the elderly), confusion (especially in the elderly), drowsiness the next day, lightheadedness the next day, muscle weakness, paradoxical increase in aggression
- Uncommon: Changes in libido, dizziness, dysarthria, gastro-intestinal disturbances, gynaecomastia, headache, hypotension, incontinence, salivation changes, slurred speech, tremor, urinary retention, vertigo, visual disturbances
- Rare: Anorexia, blood disorders, jaundice, respiratory depression, skin reactions

**BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

**HEPATIC IMPAIRMENT**

If treatment is necessary, benzodiazepines with shorter half-lives (such as temazepam or oxazepam) are safer. Start with smaller...
initial doses or reduce dose. Can precipitate coma. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Start with small doses in severe impairment.

- **PATIENT AND CARER ADVICE** May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

- **MEDICINAL FORMS**

Oxazepam

The properties listed below are those particular to the drug only. For properties common to the class, see Benzodiazepines, p. 266.

**INDICATIONS AND DOSE**

***Anxiety (short-term use)***

**BY MOUTH**

- Adult: 15–30 mg 3–4 times a day, for debilitated patients, use elderly dose
- Elderly: 10–20 mg 3–4 times a day

***Insomnia associated with anxiety***

**BY MOUTH**

- Adult: 15–25 mg once daily (max. per dose 50 mg), dose to be taken at bedtime

**CONTRA-INDICATIONS**

Chronic psychosis · hyperkinesia · not for use alone to treat depression (or anxiety associated with depression) · obsessional states · phobic states · respiratory depression

**CAUTIONS**

Muscle weakness · organic brain changes · personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence

**CAUTIONS, FURTHER INFORMATION**

Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

**SIDE-EFFECTS**

- Common or very common Amnesia · ataxia (especially in the elderly) · confusion (especially in the elderly) · dependence · drowsiness the next day · lightheadedness the next day · muscle weakness · paradoxical increase in aggression
- Uncommon Changes in libido · dizziness · dysarthria · gastro-intestinal disturbances · gynaecomastia · headache · hypotension · incontinence · salivation changes · slurred speech · tremor · urinary retention · vertigo · visual disturbances
- Rare Apnoea · blood disorders · jaundice · respiratory depression · skin reactions

**BREAST FEEDING**

Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

**HEPATIC IMPAIRMENT**

If treatment is necessary, benzodiazepines with shorter half-lives are safer. Start with smaller initial doses or reduce dose. Can precipitate coma. Avoid in severe impairment.

**RENAL IMPAIRMENT**

Start with small doses in severe impairment.

**PATIENT AND CARER ADVICE**

May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 19**

- TEMAZEPAM (Non-proprietary)
  - Temazepam 15 mg Temazepam 15mg tablets | 28 tablet (PSt) £13.00
    - Schedule 4 (CD Benz)
  - Temazepam 20 mg Temazepam 20mg tablets | 28 tablet (PSt) £14.50
    - Schedule 4 (CD Benz)

Temazepam

The properties listed below are those particular to the drug only. For properties common to the class, see Benzodiazepines, p. 266.

**INDICATIONS AND DOSE**

***Insomnia (short-term use)***

**BY MOUTH**

- Adult: 10–20 mg once daily, alternatively 30–40 mg once daily, higher dose range only to be administered in exceptional circumstances, dose to be taken at bedtime, for debilitated patients, use elderly dose
- Elderly: 10 mg once daily, alternatively 20 mg once daily, higher dose only to be administered in exceptional circumstances, dose to be taken at bedtime

**Conscious sedation for dental procedures**

**BY MOUTH**

- Adult: 15–30 mg, to be administered 30–60 minutes before procedure

**Premedication before surgery or investigatory procedures**

**BY MOUTH**

- Adult: 10–20 mg, to be taken 1–2 hours before procedure, alternatively 30 mg, to be taken 1–2 hours before procedure, higher alternate dose only administered in exceptional circumstances
- Elderly: 10 mg, to be taken 1–2 hours before procedure, alternatively 20 mg, to be taken 1–2 hours before procedure, higher alternate dose only administered in exceptional circumstances

**UNLICENSED USE**

Temazepam doses in BNF may differ from those in product literature. Not licensed for conscious sedation for dental procedures.

**CONTRA-INDICATIONS**

CNS depression · compromised airway · hyperkinesia · not for use alone to treat chronic psychosis · not for use alone to treat depression (or anxiety associated with depression) · obsessional state · phobic state · respiratory depression

**CAUTIONS**

Hypoaalbuminaemia · muscle weakness · organic brain changes · personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive)—may increase risk of dependence

**CAUTIONS, FURTHER INFORMATION**

Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.
Medicinal forms

Common or very common
- Amnesia • ataxia (especially in the elderly) • confusion (especially in the elderly) • dependence • drowsiness the next day • lightheadedness the next day • muscle weakness • paradoxical increase in aggression

Uncommon
- Changes in libido • diziness • dysarthria • gastro-intestinal disturbances • gynaecomastia • headache • hypotension • incontinence • salivation changes • slurred speech • tremor • urinary retention • vertigo • visual disturbances

Rare
- Apnoea • blood disorders • jaundice • skin reactions

Frequency not known
- Respiratory depression (may be marked when used for sedation; facilities for its treatment are essential)

Breast feeding
- Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

Hepatic impairment
- If treatment is necessary, benzodiazepines with shorter half-lives are safer. Start with smaller initial doses or reduce dose. Can precipitate coma. Avoid in severe impairment.

Renal impairment
- Start with small doses in severe impairment.

Patient and carer advice
- May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair functioning on the following day.
- Patients given sedatives and analgesics during minor procedures should be emphasised.
- Avoid contact with mucous membranes.
- Avoid prolonged use (and abrupt withdrawal thereafter).

Cautionary and advisory labels
- There can be variation in the licensing of different medicines manufactured by different companies. Forms available from special-order manufacturers include: oral solution, oral suspension, elixir.

Contra-indications
- Acute porphyrias
- Gastritis
- Severe cardiac disease

Caution
- Avoid contact with mucous membranes.
- Avoid contact with skin.
- Avoid prolonged use (and abrupt withdrawal thereafter).
- Reduce dose in debilitated/reduce dose in elderly

Interactions
- Appendix 1 (anxiolytics and hypnotics).

Side-effects
- Abdominal distention • delirium (especially on abrupt withdrawal) • dependence • excitement • flatulence • gastric irritation • headache • ketonuria • nausea • rash • tolerance • vomiting

Pregnancy
- Avoid.

Breast feeding
- Risk of sedation in infant—avoid.

Hepatic impairment
- Reduce dose in mild to moderate impairment.
- Can precipitate coma. Avoid in severe impairment.

Renal impairment
- Avoid in severe impairment.

Directions for administration
- With oral use for administration by mouth dilute liquid with plenty of water or juice to mask unpleasant taste.

Prescribing and dispensing information
- Flavours of oral liquid formulations may include blackcurrant. When prepared extemporaneously, the BP states Chloral Mixture, BP 2000 consists of chloral hydrate 500 mg/5 ml in a suitable vehicle.

Patient and carer advice
- Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

Less suitable for prescribing
- Chloral hydrate is less suitable for prescribing in insomnia.

Medicinal forms
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: suppository, oral suspension, oral solution, enema.

Tablet
- CAUTIONARY AND ADVISORY LABELS 19
  - TEMAZEPAM (Non-proprietary)
    - Temazepam 10 mg: 28 tablets
      - E5.05 (100) Schedule 3 (CD No Register)
    - 500 tablet: £6.24 (28) Schedule 3 (CD No Register)
    - Temazepam 20 mg: 28 tablets
      - E5.35 (100) Schedule 3 (CD No Register)
      - 250 tablet: £3.07 (150) Schedule 3 (CD No Register)

Oral solution
- CAUTIONARY AND ADVISORY LABELS 19
  - TEMAZEPAM (Non-proprietary)
    - Temazepam 2 mg per 5 ml: 300 ml sugar-free (sugar-free)
      - E8.45 (300) Schedule 3 (CD No Register)

CNS depressants

Chloral hydrate

Indications and dose
- Insomnia (short-term use)
  - BY MOUTH USING ORAL SOLUTION
    - Adult: 0.5–2 g daily, dose to be taken at bedtime
  - WELLDOM® ELIXIR
  - Insomnia (short-term use)
  - BY MOUTH
    - Adult: 15–45 ml, alternatively 0.4–1.3 g, dose to be taken with water or milk at bedtime; maximum 70 ml per day; maximum 2 g per day

Contra-indications
- Severe insomnia
- Approach the elderly with caution

Caution
- Avoid contact with mucous membranes
- Avoid contact with skin
- Avoid prolonged use (and abrupt withdrawal thereafter)
- Reduce dose in debilitated/reduce dose in elderly

Interactions
- Appendix 1 (anxiolytics and hypnotics)

Side-effects
- Abdominal distention • delirium (especially on abrupt withdrawal) • dependence • excitement • flatulence • gastric irritation • headache • ketonuria • nausea • rash • tolerance • vomiting

Pregnancy
- Avoid

Breast feeding
- Risk of sedation in infant—avoid

Hepatic impairment
- Reduce dose in mild to moderate impairment
- Can precipitate coma. Avoid in severe impairment

Renal impairment
- Avoid in severe impairment

Directions for administration
- With oral use for administration by mouth dilute liquid with plenty of water or juice to mask unpleasant taste

Prescribing and dispensing information
- Flavours of oral liquid formulations may include blackcurrant. When prepared extemporaneously, the BP states Chloral Mixture, BP 2000 consists of chloral hydrate 500 mg/5 ml in a suitable vehicle

Patient and carer advice
- Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Less suitable for prescribing
- Chloral hydrate is less suitable for prescribing in insomnia

Medicinal forms
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: suppository, oral suspension, oral solution, enema

Tablet
- CAUTIONARY AND ADVISORY LABELS 19
  - CHLORAL HYDRATE (Non-proprietary)
    - Chloral betaine 707 mg: 30 tablets £68.00–£123.03 DT price = £110.06

Oral solution
- CAUTIONARY AND ADVISORY LABELS 19
  - CHLORAL HYDRATE (Non-proprietary)
    - Chloral hydrate 28.66 mg per 1 ml: 150 ml £120.00–£126.74 DT price = £194.06

Crystals
- CHLORAL HYDRATE (Non-proprietary)
  - Chloral hydrate 1 mg per 1 mg: 100 gram £11.14 DT price = £11.14

Clomethiazole (Chloromethiazole)

Indications and dose
- Severe insomnia (short-term use)
  - BY MOUTH USING CAPSULES
    - Elderly: 192–384 mg daily, dose to be taken at bedtime
  - BY MOUTH USING ORAL SOLUTION
    - Elderly: 5–10 mL daily, dose to be taken at bedtime

Restlessness and agitation
- BY MOUTH USING CAPSULES
  - Elderly: 192 mg 3 times a day
  - BY MOUTH USING ORAL SOLUTION
  - Elderly: 5 mL 3 times a day

Alcohol withdrawal
- Initially by mouth using capsules
  - Adult: Initially 2–4 capsules, to be repeated if necessary after some hours, then by mouth continued →
422 Sleep disorders

9–12 capsules daily in 3–4 divided doses for day 1 (first 24 hours), then (by mouth) 6–8 capsules daily in 3–4 divided doses for day 2, then (by mouth) 4–6 capsules daily in 3–4 divided doses for day 3, dose then to be gradually reduced over days 4–6, total treatment for not more than 9 days

BY MOUTH USING ORAL SOLUTION
- Adult: Initially 10–20 mL, to be repeated if necessary after some hours, then 45–60 mL daily in 3–4 divided doses for day 1 (first 24 hours), then 30–40 mL daily in 3–4 divided doses for day 2, then 20–30 mL daily in 3–4 divided doses for day 3, dose then to be gradually reduced over days 4–6, total treatment for not more than 9 days

Dose equivalence and conversion
1 capsule contains 192 mg of clomethiazole base.

- CONTRA-INDICATIONS Acute pulmonary insufficiency - alcohol-dependent patients who continue to drink
- CAUTIONS Avoid prolonged use (and abrupt withdrawal therapy) - cardiac disease (confusional state may indicate hypoxia) - chronic pulmonary insufficiency - elderly - excessive sedation may occur (particularly with higher doses) - history of drug abuse - marked personality disorder - respiratory disease (confusional state may indicate hypoxia) - sleep apnoea syndrome
- INTERACTIONS ➔ Appendix 1 (anxiolytics and hypnotics).
- SIDE-EFFECTS
  - Common or very common Conjunctival irritation - headache - increased bronchial secretions - increased nasopharyngeal secretions - nasal congestion - nasal irritation
  - Rare Alterations in liver enzymes - anaphylaxis - bullous eruption - confusion - dependence - gastro-intestinal disturbances - paradoxical excitement - rash - urticaria
- PREGNANCY Avoid if possible—especially during the first and third trimesters.
- BREAST FEEDING Use only if benefit outweighs risk—present in breast milk but effects unknown.
- HEPATIC IMPAIRMENT Reduce dose. Can precipitate coma.
- RENAL IMPAIRMENT Increased cerebral sensitivity. Start with small doses in severe impairment.
- PATIENT AND CARER ADVICE Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.
  Capsule
  CAUTIONARY AND ADVISORY LABELS 19
  - CLOMETHIAZOLE (Non-proprietary)
    Clomethiazole 192 mg Clomethiazole 192mg capsules | 60 capsule [PO] £23.00 DT price = £20.00
  Oral solution
  CAUTIONARY AND ADVISORY LABELS 19
  EXCIPIENTS: May contain Alcohol
  - CLOMETHIAZOLE (Non-proprietary)
    Clomethiazole (as Clomethiazole edisilate) 50 mg per 1 ml Clomethiazole 31.5mg/ml oral solution sugar free (sugar-free) | 300 ml [PO] £20.00–£22.00

Melatonin

INDICATIONS AND DOSE
Insomnia (short-term use)

BY MOUTH USING MODIFIED-RELEASE TABLETS
- Adult 55 years and over: 2 mg once daily for up to 13 weeks, dose to be taken 1–2 hours before bedtime

- CAUTIONS Autoimmune disease (manufacturer advises avoid—no information available)
- INTERACTIONS ➔ Appendix 1 (melatonin).
- SIDE-EFFECTS
- Frequency not known Galactorrhoea - mouth oedema - tongue oedema
- PREGNANCY No information available—avoid.
- BREAST FEEDING Present in milk—avoid.
- HEPATIC IMPAIRMENT Clearance reduced—avoid.
- RENAL IMPAIRMENT No information available—use with caution.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, modified-release capsule, oral solution, capsule, orodispersible tablet

Modified-release tablet
CAUTIONARY AND ADVISORY LABELS 2, 21, 25
- Circadin (Flynn Pharma Ltd)
  Melatonin 2 mg Circadin 2mg modified-release tablets | 30 tablet [PO] £15.39 DT price = £15.39

Zaleplon

INDICATIONS AND DOSE
Insomnia (short-term use)

BY MOUTH
- Adult: 10 mg daily for up to 2 weeks, dose to be taken at bedtime or after going to bed if difficulty falling asleep
- Elderly: 5 mg daily for up to 2 weeks, dose to be taken at bedtime or after going to bed if difficulty falling asleep

- CONTRA-INDICATIONS Marked neuromuscular respiratory weakness - sleep apnoea syndrome - unstable myasthenia gravis
- CAUTIONS Avoid prolonged use (risk of tolerance and withdrawal symptoms) - depression (risk of suicidal ideation) - history of alcohol abuse - history of drug abuse - muscle weakness - myasthenia gravis - respiratory insufficiency (avoid if severe)
- INTERACTIONS ➔ Appendix 1 (anxiolytics and hypnotics).
- SIDE-EFFECTS
  - Common or very common Annesia - drowsiness - dysmenorrhea - paraesthesia
  - Uncommon Anorexia - asthenia - confusion - depersonalisation - depression - disturbances of hearing - disturbances of smell - disturbances of speech - disturbances of vision - dizziness - hallucinations - impaired concentration - incoordination - nausea - photosensitivity
- Frequency not known Paradoxical effects - sleep-walking

SIDE-EFFECTS, FURTHER INFORMATION
Paradoxical effects A paradoxical increase in hostility and aggression may be reported. The effects range from...
talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects. Increased hostility and aggression after barbiturates and alcohol usually indicates intoxication.

- **PREGNANCY** Use only if necessary and restrict to occasional short-term use. Risk of withdrawal symptoms in neonate if used in late pregnancy.
- **BREAST FEEDING** Present in milk but amount probably too small to be harmful.
- **HEPATIC IMPAIRMENT** Reduce dose to 5 mg. Can precipitate coma. Avoid if severe impairment.
- **RENAI IMPAIRMENT** Avoid in severe impairment.
- **PATIENT AND CARER ADVICE** Patients should be advised not to take a second dose during a single night.

### NATIONAL FUNDING/ACCESS DECISIONS

- **NICE technology appraisals (TAs)**
  - Zaleplon, zolpidem, and zopiclone for the short-term management of insomnia (April 2004) NICE TA77

Zaleplon is recommended for the short-term management of severe insomnia that interferes with normal daily life, and should be prescribed for short periods of time only. [www.nice.org.uk/TA77](http://www.nice.org.uk/TA77)

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- CAUTIONARY AND ADVISORY LABELS 2
  - Sonata (Meda Pharmaceuticals Ltd)
    - Zaleplon 5 mg: Sonata 5 mg capsules | 14 capsule £3.12 DT price = £3.12 Schedule 4 (CD Benz)
    - Zaleplon 10 mg: Sonata 10 mg capsules | 14 capsule £3.76 DT price = £3.76 Schedule 4 (CD Benz)

### Zolpidem tartrate

#### INDICATIONS AND DOSE

**Insomnia (short-term use)**

**BY MOUTH**

- Adult: 10 mg daily for up to 4 weeks, dose to be taken at bedtime, for debilitated patients, use elderly dose
- Elderly: 5 mg daily for up to 4 weeks, dose to be taken at bedtime

- **CONTRA-INDICATIONS** Acute respiratory depression - marked neuromuscular respiratory weakness - obstructive sleep apnoea - psychotic illness - severe respiratory depression - unstable myasthenia gravis
- **CAUTIONS** Avoid prolonged use (and abrupt withdrawal thereafter) - depression - elderly - history of alcohol abuse - history of drug abuse - muscle weakness - myasthenia gravis
- **INTERACTIONS** → Appendix 1 (anxiolytics and hypnotics).

**SIDE-EFFECTS, FURTHER INFORMATION**

**Paradoxical effects** A paradoxical increase in hostility and aggression may be reported. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects. Increased hostility and aggression after barbiturates and alcohol usually indicates intoxication.

- **PREGNANCY** Avoid regular use (risk of neonatal withdrawal symptoms); high doses during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression.
- **BREAST FEEDING** Small amounts present in milk—avoid.
- **HEPATIC IMPAIRMENT** Reduce dose to 5 mg. Can precipitate coma. Avoid if severe impairment.
- **RENAI IMPAIRMENT** Use with caution.
- **PATIENT AND CARER ADVICE** Drowsiness may persist the next day—leave at least 8 hours between taking zolpidem and performing skilled tasks (e.g. driving, or operating machinery); effects of alcohol and other CNS depressants enhanced.

### NATIONAl FUNDING/ACCESS DECISIONS

7.2 Narcolepsy

Drugs used for Narcolepsy not listed below:
- Dexamfetamine sulphate, p. 270 · Methylphenidate hydrochloride, p. 273

CNS STIMULANTS

Modafinil

INDICATIONS AND DOSE
Excessive sleepiness associated with narcolepsy with or without cataplexy

BY MOUTH
- Adult: Initially 200 mg daily in 2 divided doses, dose to be taken in the morning and at noon, alternatively initially 200 mg once daily, dose to be taken in the morning, adjusted according to response to 200–400 mg daily in 2 divided doses, alternatively adjusted according to response to 200–400 mg once daily
- Elderly: Initially 100 mg daily

- CONTRA-INDICATIONS Arrhythmia · history of clinically significant signs of CNS stimulant-induced mitral valve prolapse (including ischaemic ECG changes, chest pain and arrhythmias) · history of cor pulmonale · history of left ventricular hypertrophy · moderate uncontrolled hypertension · severe uncontrolled hypertension
- CAUTIONS History of alcohol abuse · history of depression · history of drug abuse · history of mania · history of psychosis · possibility of dependence
- INTERACTIONS → Appendix 1 (modafinil).
- SIDE-EFFECTS
  - Common or very common Abdominal pain · anxiety · appetite changes · asthenia · chest pain · confusion · constipation · depression · diarrhea · dizziness · drowsiness · dry mouth · dyspepsia · gastrointestinal disturbances · headache · nausea · palpititation · paraesthesia · sleep disturbances · tachycardia · vasodilatation · visual disturbances
  - Uncommon Abnormal dreams · acne · aggression · agitation · amnesia · arrhythmia · arthralgia · bradycardia · decreased libido · dry eye · dyskinesia · dysphagia · dysphoria · emotional lability · eosinophilia · epistaxis · flatulence · glossitis · hypercholesterolaemia · hyperglycaemia · hypertension · hypertonia · hypotension · leucopenia · menstrual disturbances · migraine · mouth ulcers · muscle cramps · myalgia · myasthenia · peripheral oedema · pruritus · rash · reflux · rhabdomyolysis · somnolence · suicidal ideation · sweating · tachycardia · tremor · urinary frequency · vomiting · weight changes
  - Rare Hallucinations · mania · psychosis
  - Frequency not known Multi-organ hypersensitivity reaction · psychiatric symptoms · Stevens-Johnson syndrome · toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION
Rash Discontinue treatment if rash develops. Psychiatric symptoms Discontinue treatment if psychiatric symptoms develop.
- PREGNANCY Avoid.
- BREAST FEEDING Avoid—present in milk in animal studies.
- HEPATIC IMPAIRMENT Halve dose in severe impairment.
- RENAL IMPAIRMENT Use with caution—limited information available.
- PRE-TREATMENT SCREENING ECG required before initiation.
- MONITORING REQUIREMENTS Monitor blood pressure and heart rate in hypertensive patients.

- MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension
CNS DEPRESSANTS

Sodium oxybate

**INDICATIONS AND DOSE**

**Narcolepsy with cataplexy (under expert supervision)**

*BY MOUTH*

- **Adult:** Initially 2.25 g daily, dose to be taken on retiring and 2.25 g after 2.5–4 hours, then increased in steps of 1.5 g daily in 2 divided doses, dose adjusted according to response at intervals of 1–2 weeks; dose titration should be repeated if restarting after interval of more than 14 days, maximum 9 g daily in 2 divided doses

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain - anorexia - anxiety - arthralgia - asthma - back pain - blurred vision - confusion - depression - diarrhoea - disorientation - dizziness - drowsiness - dysphonia - headache - hypertension - hypoaesthesia - impaired attention - muscle spasm - nasal congestion - nausea - nocturnal enuresis - palpitation - paraesthesia - peripheral oedema - rash - sleep disorders - sleep paralysis - sleep walking - sweating - taste disturbance - tremor - urinary incontinence - vertigo - vomiting
- **Uncommon** Agitation - amnesia - faecal incontinence - hallucination - myoclonus - paranoia - psychosis - restless legs syndrome - suicidal behaviour
- **Frequency not known** Dependence - euphoria - respiratory depression - seizures - sleep apnoea - suicidal ideation - urticaria

**PREGNANCY** Avoid.

**HEPATIC IMPAIRMENT** Halve initial dose.

**RENAL IMPAIRMENT** Caution—contains 3.96 mmol Na⁺ per mL.

**DIRECTIONS FOR ADMINISTRATION** Dilute each dose with 60 mL water; prepare both doses before retiring. Observe the same time interval (2–3 hours) each night between the last meal and the first dose.

**PATIENT AND CARER ADVICE** Leave at least 6 hours between taking sodium oxybate and performing skilled tasks (e.g. driving or operating machinery); effects of alcohol and other CNS depressants enhanced.

Patients or carers should be given advice on how to administer sodium oxybate oral solution.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**

*CAUTIONARY AND ADVISORY LABELS 13, 19 ELECROLYTES: May contain Sodium*

- **Xyrem (UCB Pharma Ltd)**
  - Sodium oxybate 500 mg per 1 ml Xyrem 500mg/ml oral solution (sugar-free) | 180 ml (PO) £360.00 Schedule 2 (CD)

**8 Substance dependence**

**Substance dependence**

**Alcohol dependence**

Excessive drinking of alcoholic beverages over a prolonged period of time can result in an alcohol withdrawal syndrome on abrupt cessation of, or marked reduction in, drinking. The presence and severity of alcohol dependence can be assessed by *The Severity of Alcohol Dependence Questionnaire (SADQ)*; other assessment questionnaires are also available.

**Acute alcohol withdrawal**

People with moderate dependence can generally be treated in a community setting unless they are under 18 years of age, or are at high-risk of severe reactions or treatment failure. People with severe dependence should undergo withdrawal in an inpatient setting; withdrawal in severely dependent patients without medical support may lead to seizures, delirium tremens, and death. Long-acting benzodiazepines, usually clonazepam hydrochloride p. 267, are used to attenuate alcohol withdrawal symptoms. In primary care, fixed-dose reducing regimens are usually used, whilst a symptom-triggered flexible regimen is used in hospital or other settings where continued assessment and monitoring is carried out for 24–48 hours, usually followed by a fixed 5-day reducing dose schedule (sometimes it may be necessary to continue treatment for up to 10 days). Patients with compensated liver disease should be treated under specialist supervision.

Carbamazepine p. 387 [unlicensed indication] is sometimes used as an alternative treatment in acute alcohol withdrawal when benzodiazepines are contra-indicated or not tolerated. Clomethiazole p. 421 is licensed for use in acute alcohol withdrawal, but benzodiazepines are preferred. It should only be used in an inpatient setting and should not be prescribed if the patient is liable to continue drinking alcohol.

Patients with marked agitation or hallucinations and those at risk of delirium tremens (characterised by delirium, hallucinations, tremor, and disorientation) may be prescribed antipsychotic drugs, such as haloperidol p. 306 or olanzapine p. 315 [unlicensed indication], as adjunctive therapy to benzodiazepines; antipsychotics should not be used alone because they do not treat alcohol withdrawal and may lower the seizure threshold. Delirium tremens is a medical emergency that requires specialist inpatient care.

If a patient taking a benzodiazepine as part of a withdrawal regimen develops alcohol withdrawal seizures, a fast-acting benzodiazepine (such as intravenous lorazepam p. 412 [unlicensed indication] or rectal diazepam p. 267) should be prescribed; thereafter an increase in the dose of...
oral benzodiazepine should be considered to prevent further seizures from occurring.

Alcohol dependence

Acamprosate calcium p. 429 and naltrexone hydrochloride p. 430 are effective treatments for relapse prevention in patients with alcohol dependence; disulfiram p. 428 is an alternative. Disulfiram should only be used in patients in whom acamprosate calcium and naltrexone hydrochloride are not suitable, or if the patient prefers disulfiram. Nalmefene p. 429 is licensed for the reduction of alcohol consumption in patients with alcohol dependence who have a high drinking risk level, without physical withdrawal symptoms, and who do not require immediate detoxification.

Patients with alcohol dependence are at risk of developing Wernicke’s encephalopathy; patients at high-risk are those who are malnourished, at risk of malnourishment, or have decompensated liver disease. Parenteral thiamine p. 882 (as Pabrinex®) should be prescribed for treatment of suspected or confirmed Wernicke’s encephalopathy, and for prophylaxis in alcohol dependent patients attending hospital for acute treatment (including treatment unrelated to alcohol dependence); parenteral prophylaxis may also be considered for high-risk patients being treated in primary care. High-dose oral thiamine p. 882 should be prescribed following parenteral treatment until cognitive function is maximised. In primary care, prophylactic high-dose oral thiamine should be prescribed during acute withdrawal of alcohol, before planned withdrawal, and for patients not undergoing withdrawal but who are at high-risk of developing Wernicke’s encephalopathy.

Patients with chronic alcohol-related pancreatitis who have symptoms of steatorrhoea or who have poor nutritional status due to exocrine pancreatic insufficiency should be prescribed pancreatic enzyme supplements; supplements are not indicated when pain is the only symptom.

Corticosteroids are used in patients with severe acute alcohol-related hepatitis.

Drugs used in alcohol dependence

Acamprosate

Acamprosate calcium p. 429, in combination with counselling, may be helpful for maintaining abstinence in alcohol-dependent patients. It is useful for patients who are concerned that strong cravings will result in relapse. It should be initiated as soon as possible after abstinence has been achieved and continued for 1 year. Treatment should be maintained if the patient has a temporary relapse but stopped if the patient returns to regular or excessive drinking that persists 4–6 weeks after starting treatment. Acamprosate calcium p. 429 is not effective in all patients, so efficacy should be regularly assessed.

Disulfiram

Disulfiram p. 428 gives rise to an extremely unpleasant systemic reaction after the ingestion of even a small amount of alcohol because it causes accumulation of acetaldehyde in the body; it is only effective if taken daily. Symptoms can occur within 10 minutes of ingesting alcohol and include flushing of the face, throbbing headache, palpitation, tachycardia, nausea, vomiting, and, with large doses of alcohol, arrhythmias, hypotension, and collapse; these reactions can last several hours. Small amounts of alcohol such as those included in many oral medicines may be sufficient to precipitate a reaction—even toiletries and mouthwashes that contain alcohol should be avoided.

Nalmefene

Nalmefene p. 429 should only be prescribed in conjunction with continuous psychosocial support focused on treatment adherence and reducing alcohol consumption. Nalmefene p. 429 is not recommended for patients aiming to achieve immediate abstinence.

Naltrexone

Naltrexone hydrochloride p. 430 is an opioid-receptor antagonist, but is useful as an adjunct in the treatment of alcohol dependence after a successful withdrawal. Treatment should be initiated by a specialist and continued under specialist supervision. Naltrexone hydrochloride p. 430 should be stopped if drinking continues for 4–6 weeks after starting treatment.

Nicotine dependence

Smoking cessation interventions are a cost-effective way of reducing ill health and prolonging life. Smokers should be advised to stop and offered help with follow-up when appropriate. If possible, smokers should have access to smoking cessation services for behavioural support.

Therapy to aid smoking cessation is chosen according to the smoker’s likely adherence, availability of counselling and support, previous experience of smoking-cessation aids, contra-indications and adverse effects of the preparations, and the smoker’s preferences. Nicotine replacement therapy, bupropion hydrochloride p. 433, and varenicline p. 432 are effective aids to smoking cessation. The use of nicotine replacement therapy in an individual who is already accustomed to nicotine introduces few new risks and it is widely accepted that there are no circumstances in which it is safer to smoke than to use nicotine replacement therapy.

Some patients benefit from having more than one type of nicotine replacement therapy prescribed, such as a combination of transdermal and oral preparations. The combination of nicotine replacement therapy with varenicline or bupropion hydrochloride is not recommended.

Concomitant medication

Cigarette smoking increases the metabolism of some medicines by stimulating the hepatic enzyme CYP1A2. When smoking is discontinued, the dose of these drugs, in particular theophylline, cinacalcet, ropinirole, and some antidepressants (including clozapine, olanzapine, chlorpromazine hydrochloride, and haloperidol), may need to be reduced. Regular monitoring for adverse effects is advised.

Bupropion hydrochloride p. 433 has been used as an antidepressant. Its mode of action in smoking cessation is not clear and may involve an effect on noradrenaline and dopamine neurotransmission.

Nicotine replacement therapy

Nicotine replacement therapy can be used in place of cigarettes after abrupt cessation of smoking, or alternatively to reduce the amount of cigarettes used in advance of making a quit attempt. Nicotine replacement therapy can also be used to minimise passive smoking, and to treat cravings and reduce compensatory smoking after enforced abstinence in smoke-free environments. Smokers who find it difficult to achieve abstinence should consult a healthcare professional for advice.

Choice

Nicotine patches are a prolonged-release formulation and are applied for 16 hours (with the patch removed overnight) or for 24 hours. If patients experience strong cravings for cigarettes on waking, a 24-hour patch may be more suitable. Immediate-release nicotine preparations (gum, lozenges, sublingual tablets, inhalator, nasal spray, and oral spray) are used whenever the urge to smoke occurs or to prevent cravings.

The choice of nicotine replacement preparation depends largely on patient preference, and should take into account what preparations, if any, have been tried before. Patients with a high level of nicotine dependence, or who have failed with nicotine replacement therapy previously, may benefit...
from using a combination of an immediate-release preparation and patches to achieve abstinence. **Side-effects of specific nicotine preparations** Mild local reactions at the beginning of treatment are common because of the irritant effect of nicotine. Oral preparations and **inhalation cartridges** can cause irritation of the throat, **gum, lozenges**, and **oral spray** can cause increased salivation, and **patches** can cause minor skin irritation. The nasal spray commonly causes coughing, nasal irritation, epistaxis, sneezing, and watery eyes; the **oral spray** can cause watery eyes and blurred vision. Gastro-intestinal disturbances are common and may be caused by swallowed nicotine. Nausea, vomiting, dyspepsia, and hiccup occur most frequently. Ulcerative stomatitis has also been reported. Dry mouth is a common side-effect of **lozenges, patches, oral spray, and sublingual tablets**. Lozenges cause diarrhoea, constipation, dysphagia, oesophagitis, gastritis, mouth ulcers, bloating, flatulence, and less commonly, taste disturbance, thirst, gingival bleeding, and halitosis. The **oral spray** may also cause abdominal pain, flatulence, and taste disturbance. Palpitations may occur with nicotine replacement therapy, and rarely **patches** and **oral spray** can cause arrhythmia. **Patches, lozenges**, and **oral spray** can cause chest pain. The **inhalator** can very rarely cause reversible atrial fibrillation. Parasthesia is a common side-effect of **oral spray**. Abnormal dreams can occur with **patches**; removal of the patch before bed may help. **Lozenges** and **oral spray** may cause rash and hot flushes. Sweating and myalgia can occur with **patches** and **oral spray**; the patches can also cause arthralgia.

**Opioid dependence**

The management of opioid dependence requires medical, social, and psychological treatment; access to a multidisciplinary team is recommended. Treatment for opioid dependence should be initiated under the supervision of an appropriately qualified prescriber. **Untreated heroin dependence shows early withdrawal symptoms within 8 hours, with peak symptoms at 36–72 hours; symptoms subside substantially after 5 days.** Methadone hydrochloride p. 436 or buprenorphine p. 434 withdrawal occurs later, with longer-lasting symptoms.

**Opioid substitution therapy**

Methadone hydrochloride and buprenorphine are used as substitution therapy in opioid dependence. Substitute medication should be commenced with a short period of stabilisation, followed by either a withdrawal regimen or by maintenance treatment. Maintenance treatment enables patients to achieve stability, reduces drug use and crime, and improves health; it should be regularly reviewed to ensure the patient continues to derive benefit. The prescriber should monitor for signs of toxicity, and the patient should be told to be aware of warning signs of toxicity on initiation and during titration. A withdrawal regimen after stabilisation with methadone hydrochloride or buprenorphine should be attempted only after careful consideration. Enforced withdrawal is ineffective for sustained abstinence, and it increases the risk of patients relapsing and subsequently overdosing because of loss of tolerance. Complete withdrawal from opioids usually takes up to 4 weeks in an inpatient or residential setting, and up to 12 weeks in a community setting. If abstinence is not achieved, illicit drug use is resumed, or the patient cannot tolerate withdrawal, the withdrawal regimen should be stopped and maintenance therapy should be resumed at the optimal dose. Following successful withdrawal treatment, further support and monitoring to maintain abstinence should be provided for a period of at least 6 months.

**Missed doses**

Patients who miss 3 days or more of their regular prescribed dose of opioid maintenance therapy are at risk of overdose because of loss of tolerance. Consider reducing the dose in these patients. If the patient misses 5 or more days of treatment, an assessment of illicit drug use is also recommended before restarting substitution therapy; this is particularly important for patients taking buprenorphine p. 434 because of the risk of precipitated withdrawal.

**Buprenorphine**

Buprenorphine p. 434 is preferred by some patients because it is less sedating than methadone hydrochloride p. 436; for this reason it may be more suitable for employed patients or those undertaking other skilled tasks such as driving. Buprenorphine is safer than methadone hydrochloride when used in conjunction with other sedating drugs, and has fewer drug interactions. Dose reductions may be easier than with methadone hydrochloride because the withdrawal symptoms are milder, and patients generally require fewer adjunctive medications; there is also a lower risk of overdose. Buprenorphine can be given on alternate days in higher doses and it requires a shorter drug-free period than methadone hydrochloride before induction with naltrexone hydrochloride p. 430 for prevention of relapse.

Patients dependent on high doses of opioids may be at increased risk of precipitated withdrawal. Precipitated withdrawal can occur in any patient if buprenorphine is administered when other opioid agonist drugs are in circulation. Precipitated opioid withdrawal, if it occurs, starts within 1–3 hours of the first buprenorphine dose and peaks at around 6 hours. Non-opioid adjunctive therapy, such as lofexidine hydrochloride, may be required if symptoms are severe.

To reduce the risk of precipitated withdrawal, the first dose of buprenorphine should be given when the patient is exhibiting signs of withdrawal, or 6–12 hours after the last use of heroin (or other short-acting opioid), or 24–48 hours after the last dose of methadone hydrochloride. It is possible to titrate the dose of buprenorphine within one week—more rapidly than with methadone hydrochloride therapy—but care is still needed to avoid toxicity or precipitated withdrawal; dividing the dose on the first day may be useful.

A combination preparation containing buprenorphine with naloxone p. 436 (Suboxone®) can be prescribed for patients when there is a risk of dose diversion for parenteral administration; the naloxone hydrochloride p. 1133 component precipitates withdrawal if the preparation is injected, but it has little effect when the preparation is taken sublingually.

**Methadone**

Methadone hydrochloride p. 436, a long-acting opioid agonist, is usually administered in a single daily dose as methadone hydrochloride oral solution 1 mg/mL. Patients with a long history of opioid misuse, those who typically abuse a variety of sedative drugs and alcohol, and those who experience increased anxiety during withdrawal of opioids may prefer methadone hydrochloride to buprenorphine because it has a more pronounced sedative effect.

Methadone hydrochloride is initiated at least 8 hours after the last heroin dose, provided that there is objective evidence of withdrawal symptoms. A supplementary dose on the first day may be considered if there is evidence of persistent opioid withdrawal symptoms. Because of the long half-life, plasma concentrations progressively rise during initial treatment even if the patient remains on the same daily dose (it takes 3–10 days for plasma concentrations to reach steady-state in patients on a stable dose); a dose tolerated on the first day of treatment may become a toxic dose on the third day as cumulative toxicity develops. Thus,
tivation to the optimal dose in methadone hydrochloride maintenance treatment may take several weeks.

**Opioid substitution during pregnancy**

Acute withdrawal of opioids should be avoided in pregnancy because it can cause fetal death. Opioid substitution therapy is recommended during pregnancy because it carries a lower risk to the fetus than continued use of illicit drugs. If a woman who is stabilised on methadone hydrochloride or buprenorphine for treatment of opioid dependence becomes pregnant, therapy should be continued (buprenorphine is not licensed for use in pregnancy). Many pregnant patients choose a withdrawal regimen, but withdrawal during the first trimester should be avoided because it is associated with an increased risk of spontaneous miscarriage. Withdrawal of methadone hydrochloride or buprenorphine should be undertaken gradually during the second trimester, with dose reductions made every 3–5 days. If illicit drug use occurs, the patient should be re-stabilised at the optimal maintenance dose and consideration should be given to stopping the withdrawal regimen.

Further withdrawal of methadone hydrochloride or buprenorphine in the third trimester is not recommended because maternal withdrawal, even if mild, is associated with fetal distress, stillbirth, and the risk of neonatal mortality. Drug metabolism can be increased in the third trimester; it may be necessary to either increase the dose of methadone hydrochloride or change to twice-daily consumption (or a combination of both strategies) to prevent withdrawal symptoms from developing.

The neonate should be monitored for respiratory depression and signs of withdrawal if the mother is prescribed high doses of opioid substitute.

Signs of neonatal withdrawal from opioids usually develop 24–72 hours after delivery but symptoms may be delayed for up to 14 days, so monitoring may be required for several weeks. Symptoms include a high-pitched cry, rapid breathing, hungry but ineffective suckling, and excessive wakefulness; severe, but rare symptoms include hypertonicity and convulsions.

**Opioid substitution during breastfeeding**

Doses of methadone and buprenorphine should be kept as low as possible in breast-feeding mothers. Increased sleepiness, breathing difficulties, or limpness in breast-fed babies of mothers taking opioid substitutes should be reported urgently to a healthcare professional.

**Adjunctive therapy and symptomatic treatment**

Adjunctive therapy may be required for the management of opioid withdrawal symptoms. Loperamide hydrochloride p. 56 may be used for the control of diarrhoea; mebeverine hydrochloride p. 75 for controlling stomach cramps; paracetamol p. 354 and non-steroidal anti-inflammatory drugs for musculoskeletal pain and headaches; metoclopramide hydrochloride p. 347 or prochlorperazine p. 309 may be useful for nausea or vomiting. Topical rufecainals can be helpful for relieving muscle pain associated with methadone hydrochloride p. 436 withdrawal. If a patient is suffering from insomnia, short-acting benzodiazepines or zopiclone p. 423 may be prescribed, but because of the potential for abuse, prescriptions should be limited to a short course of a few days only. If anxiety or agitation is severe, specialist advice should be sought.

**Lorazepam**

Lorazepam hydrochloride p. 434 may alleviate some of the physical symptoms of opioid withdrawal by attenuating the increase in adrenergic neurotransmission that occurs during opioid withdrawal. Lorazepam hydrochloride can be prescribed as an adjuvant to opioid substitution therapy, initiated either at the same time as the opioid substitute or during withdrawal of the opioid substitute. Alternatively, lofexidine hydrochloride may be prescribed instead of an opioid substitute in patients who have mild or uncertain dependence (including young people), and those with a short history of illicit drug use.

**Opioid-receptor antagonists**

Patients dependant on opioids can be given a supply of naloxone hydrochloride p. 1133 to be used in case of accidental overdose.

Naltrexone hydrochloride p. 430 precipitates withdrawal symptoms in opioid-dependent subjects. Because the effects of opioid-receptor agonists are blocked by naltrexone hydrochloride, it is prescribed as an aid to prevent relapse in formerly opioid-dependent patients.

**Opioid dependence in children**

In younger patients (under 18 years), the harmful effects of drug misuse are more often related to acute intoxication than to dependence, so substitution therapy is usually inappropriate. Maintenance treatment with opioid substitution therapy is therefore controversial in young people; however, it may be useful for the older adolescent who has a history of opioid use to undergo a period of stabilisation with buprenorphine or methadone hydrochloride before starting a withdrawal regimen.

### 8.1 Alcohol dependence

**ALDEHYDE DEHYDROGENASE INHIBITORS**

**Disulfiram**

**INDICATIONS AND DOSE**

Adjunct in the treatment of alcohol dependence (under expert supervision)

BY MOUTH

- Adult: 200 mg daily, increased if necessary up to max. 500 mg daily

- **UNLICENSED USE** Disulfiram doses in BNF may differ from those in product literature.

- **CONTRA-INDICATIONS** Cardiac failure - coronary artery disease - history of cerebrovascular accident - hypertension - psychosis - severe personality disorder - suicide risk

- **CAUTIONS** Alcohol challenge not recommended on routine basis (if considered essential—specialist units only with resuscitation facilities) - avoid in Acute porphyrias p. 864 - diabetes mellitus - epilepsy - respiratory disease

- **INTERACTIONS** → Appendix 1 (disulfiram).

Disulfiram gives rise to an extremely unpleasant systemic reaction after the ingestion of even a small amount of alcohol. Ensure that alcohol is not consumed for at least 24 hours before initiating treatment and should be avoided for at least 1 week after stopping treatment.

- **SIDE-EFFECTS**
  - **Common or very common** Drowsiness - fatigue - halitosis - nausea - reduced libido - vomiting
  - **Rare** Allergic dermatitis - depression - hepatic cell damage - mania - paranoia - peripheral neuritis - psychotic reactions - schizophrenia

- **PREGNANCY** High concentrations of acetaldehyde which occur in presence of alcohol may be teratogenic; avoid in first trimester.

- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** Use with caution.

- **RENAI IMPAIRMENT** Use with caution.
PRE-TREATMENT SCREENING  Before initiating disulfiram, prescribers should evaluate the patient’s suitability for treatment, because some patient factors, for example memory impairment or social circumstances, make compliance to treatment or abstinence from alcohol difficult.

MONITORING REQUIREMENTS  During treatment with disulfiram, patients should be monitored at least every 2 weeks for the first 2 months, then each month for the following 4 months, and at least every 6 months thereafter.

PATIENT AND CARER ADVICE  Patient counselling is advised (alcohol reaction).

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

Table

CAUTIONARY AND ADVISORY LABELS

▶ Antabuse (Actavis UK Ltd)
Disulfiram 200 mg  Antabuse 200mg tablets | 50 tablet pack | £31.00 DT price = £31.00

GAMMA-AMINOBUTYRIC ACID ANALOGUES AND DERIVATIVES

Acamprosate calcium

INDICATIONS AND DOSE

Maintenance of abstinence in alcohol-dependent patients

BY MOUTH
▶ Adult 18-65 years (body-weight up to 60 kg): 666 mg once daily, dose to be taken with breakfast and 333 mg twice daily, dose to be taken at midday and at night
▶ Adult 18-65 years (body-weight 60 kg and above): 666 mg 3 times a day

CAUTIONS  Continued alcohol abuse (risk of treatment failure)

SIDE-EFFECTS
▶ Common or very common  Abdominal pain · diarrhoea · fluctuation in libido · maculopapular rash · nausea · pruritus · vomiting
▶ Rare  Bullous skin reactions

PREGNANCY  Avoid.

BREAST FEEDING  Avoid.

HEPATIC IMPAIRMENT  Avoid if severe.

RENAL IMPAIRMENT  Avoid if serum-creatinine greater than 120 micromol/litre.

PRESCRIBING AND DISPENSING INFORMATION

Acamprosate sodium has been used for the maintenance of abstinence in alcohol-dependent patients aged 18 years and over (unlicensed).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Table

CAUTIONARY AND ADVISORY LABELS 21, 25

ELECTROLYTES: May contain Calcium
▶ Campral EC (Merck Serono Ltd)
Acamprosate calcium 333 mg  Campral EC 333mg tablets | 168 tablet pack | £28.80 DT price = £28.80

OPIOID RECEPTOR ANTAGONISTS

Nalmefene

INDICATIONS AND DOSE

Reduction of alcohol consumption in patients with alcohol dependence who have a high drinking risk level without physical withdrawal symptoms, and who do not require immediate detoxification

BY MOUTH
▶ Adult: 18 mg daily if required, taken on each day there is a risk of drinking alcohol, preferably taken 1–2 hours before the anticipated time of drinking, if a dose has not been taken before drinking alcohol, 1 dose should be taken as soon as possible; maximum 18 mg per day

CONTRA-INDICATIONS  Recent history of acute alcohol withdrawal syndrome · recent or current opioid use

CAUTIONS  Continued treatment for more than 1 year · history of seizure disorders (including alcohol withdrawal seizures) · psychiatric illness

INTERACTIONS  → Appendix 1 (nalmefene). Avoid concomitant use of opioids—discontinue treatment 1 week before anticipated use of opioids; if emergency analgesia is required during treatment, an increased dose of opioid analgesic may be necessary (monitor for opioid intoxication).

SIDE-EFFECTS
▶ Common or very common  Confusion · decreased appetite · decreased libido · disturbance in attention · dizziness · dry mouth · headache · hyperhidrosis · hypoaesthesia · malaise · muscle spasms · nausea · palpitation · paraesthesia · restlessness · sleep disorders · somnolence · tachycardia · tremor · vomiting · weight loss
▶ Frequency not known  Dissociation · hallucinations

PREGNANCY  Manufacturer advises avoid—toxicity in animal studies.

BREAST FEEDING  Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT  Use with caution—avoid in severe impairment.

RENAL IMPAIRMENT  Use with caution—avoid in severe impairment.

PRE-TREATMENT SCREENING  Before initiating treatment, prescribers should evaluate the patient’s clinical status, alcohol dependence, and level of alcohol consumption. Nalmefene should only be prescribed for patients who continue to have a high drinking risk level two weeks after the initial assessment.

MONITORING REQUIREMENTS  During treatment, patients should be monitored regularly and the need for continued treatment assessed.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

▶ Nalmefene for reducing alcohol consumption in people with alcohol dependence (November 2014) NICE TA325

Nalmefene is recommended within its marketing authorisation, as an option for reducing alcohol consumption, for patients with alcohol dependence:
▶ who have a high drinking risk level (defined as alcohol consumption of more than 60 g per day for men and more than 40 g per day for women, according to the World Health Organization’s drinking risk levels) without physical withdrawal symptoms, and
▶ who do not require immediate detoxification.

The marketing authorisation states that nalmefene should:
Naltrexone hydrochloride

**Drug action**

Naltrexone is an opioid-receptor antagonist.

**Indications and dose**

Adjunct to prevent relapse in formerly opioid-dependent patients (who have remained opioid-free for at least 7-10 days) (initiated under specialist supervision)

**By mouth**

- Adult: Initially 25 mg daily, then increased to 50 mg daily, total weekly dose may be divided and given on 3 days of the week for improved compliance (e.g. 100 mg on Monday and Wednesday, and 150 mg on Friday); maximum 350 mg per week

Adjunct to prevent relapse in formerly alcohol-dependent patients (initiated under specialist supervision)

**By mouth**

- Adult: 25 mg once daily on the first day, then increased if tolerated to 50 mg daily

**Unlicensed use**

Unlicensed for use in children under 18 years. 25 mg dose for adjunct to prevent relapse in formerly alcohol-dependent patients is an unlicensed dose.

**Contra-indications**

Patients currently dependent on opioids

**Interactions**

Avoid concomitant use of opioids but increased dose of opioid analgesic may be required for pain (monitor for opioid intoxication).

**Side-effects**

- Common or very common: joint and muscle pain, abdominal pain, anxiety, chest pain, chills, constipation, decreased potency, delayed ejaculation, diarrhoea, dizziness, headache, increased energy, increased lacrimation, increased sweating, increased thirst, irritability, mood swings, nausea, rash, reduced appetite, sleep disorders, urinary retention, vomiting

- Rare: Depression, hepatic dysfunction, speech disorders, suicidal ideation, tinnitus

- Very rare: Exanthema, hallucinations, idiopathic thrombocytopenia, tremor

**Pregnancy**

Use only if benefit outweighs risk.

**Breast feeding**

Avoid—potential toxicity.

**Hepatic impairment**

Avoid in acute hepatitis, hepatic failure, or severe impairment.

**Renal impairment**

Avoid in severe impairment.

**Pre-treatment screening**

Test for opioid dependence with naloxone before treatment.

**Monitoring requirements**

Liver function tests needed before and during treatment.

**Patient and carer advice**

Patients should be warned that an attempt to overcome the blockade of opioid receptors by overdosing could result in acute opioid intoxication.

**National funding/access decisions**

NICE technology appraisals (TAs)

- Naltrexone for the management of opioid dependence (January 2007) NICE TA115

Naltrexone is recommended for the prevention of relapse in formerly opioid-dependent patients who are motivated to remain in a supportive care abstinence programme. Naltrexone should be administered under supervision and its effectiveness in preventing opioid misuse reviewed regularly. www.nice.org.uk/TA115

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

### 8.2 Nicotine dependence

**Nicotine**

**Indications and dose**

Nicotine replacement therapy in individuals who smoke fewer than 20 cigarettes each day

**By mouth using chewing gum**

- Adult: 2 mg as required, chew 1 piece of gum when the urge to smoke occurs or to prevent cravings, if attempting smoking cessation, treatment should continue for up to 3 months before reducing the dose

**By sublingual administration using sublingual tablets**

- Adult: 1 tablet every 1 hour, increased to 2 tablets every 1 hour if required, if attempting smoking cessation, treatment should continue for up to 3 months before reducing the dose; maximum 40 tablets per day

Nicotine replacement therapy in individuals who smoke more than 20 cigarettes each day or who require more than 15 pieces of 2-mg strength gum each day

**By mouth using chewing gum**

- Adult: 4 mg as required, chew 1 piece of gum when the urge to smoke occurs or to prevent cravings, if attempting smoking cessation, treatment should not exceed 15 pieces of 4-mg strength gum daily, if attempting smoking cessation, treatment should continue for 3 months before reducing the dose

Nicotine replacement therapy in individuals who smoke more than 20 cigarettes each day

**By sublingual administration using sublingual tablets**

- Adult: 2 tablets every 1 hour, if attempting smoking cessation, treatment should continue for up to 3 months before reducing the dose; maximum 40 tablets per day

Nicotine replacement therapy

**By inhalation using inhalator**

- Adult: As required, the cartridges can be used when the urge to smoke occurs or to prevent cravings, patients should not exceed 12 cartridges of the 10-mg
strength daily, or 6 cartridges of the 15-mg strength daily.

BY MOUTH USING LOZENGES

- Adult: 1 lozenge every 1–2 hours as required, one lozenge should be used when the urge to smoke occurs, individuals who smoke less than 20 cigarettes each day should usually use the lower-strength lozenges; individuals who smoke more than 20 cigarettes each day and those who fail to stop smoking with the low-strength lozenges should use the higher-strength lozenges; if attempting smoking cessation, treatment should continue for 6–12 weeks before attempting a reduction in dose; maximum 15 lozenges per day.

BY MOUTH USING OROMUCOSAL SPRAY

- Adult: 1–2 sprays as required, patients can spray in the mouth when the urge to smoke occurs or to prevent cravings, individuals should not exceed 2 sprays per episode (up to 4 sprays every hour); maximum 64 sprays per day.

BY INTRANASAL ADMINISTRATION USING NASAL SPRAY

- Adult: 1 spray as required, patients can spray into each nostril when the urge to smoke occurs, up to twice every hour for 16 hours daily, if attempting smoking cessation, treatment should continue for 8 weeks before reducing the dose; maximum 64 sprays per day.

BY TRANSDERMAL APPLICATION USING PATCHES

- Adult: Individuals who smoke more than 10 cigarettes daily should apply a high-strength patch daily for 6–8 weeks, followed by the medium-strength patch for 2 weeks, and then the low-strength patch for the final 2 weeks; individuals who smoke fewer than 10 cigarettes daily can usually start with the medium-strength patch for 6–8 weeks, followed by the low-strength patch for 2–4 weeks; a slower titration schedule can be used in patients who are not ready to quit but want to reduce cigarette consumption before a quit attempt; if abstinence is not achieved, if withdrawal symptoms are experienced, the strength of the patch used should be maintained or increased until the patient is stabilised; patients using the high-strength patch who experience excessive side-effects, that do not resolve within a few days, should change to a medium-strength patch for the remainder of the initial period and then use the low-strength patch for 2–4 weeks.

• UNLICENSED USE All preparations are licensed for adults and children over 12 years (with the exception of Nicotinell™ lozenges which are licensed for children under 18 years only when recommended by a doctor).

• CAUTIONS

GENERAL CAUTIONS

Diabetes mellitus—blood-glucose concentration should be monitored closely when initiating treatment - haemodynamically unstable patients hospitalised with cerebrovascular accident - haemodynamically unstable patients hospitalised with myocardial infarction - haemodynamically unstable patients hospitalised with severe arrhythmias - phaeochromocytoma - uncontrolled hyperthyroidism

SPECIFIC CAUTIONS

- With oral (topical) use gum may also stick to and damage dentures.
- With intranasal use bronchial asthma (may exacerbate).
- With oral use gastritis (can be aggravated by swallowed nicotine) - oesophagitis (can be aggravated by swallowed nicotine) - peptic ulcers (can be aggravated by swallowed nicotine).
- With transdermal use patches should not be placed on broken skin - patients with skin disorders.

• When used by inhalation bronchospastic disease - chronic throat disease - obstructive lung disease.

CAUTIONS, FURTHER INFORMATION

Most warnings for nicotine replacement therapy also apply to continued cigarette smoking, but the risk of continued smoking outweighs any risks of using nicotine preparations.

Specific cautions for individual preparations are usually related to the local effect of nicotine.

• INTERACTIONS → Appendix 1 (nicotine).

• SIDE-EFFECTS

- Common or very common Bloating - blurred vision - constipation - coughing - diarrhoea - dry mouth - dyspepsia - dysphagia - epistaxis - flatulence - gastritis - gastro-intestinal disturbances (may be caused by swallowed nicotine) - hiccup - increased salivation - irritation of the throat - mild local reactions at the beginning of treatment are common because of the irritant effect of nicotine - minor skin irritation - mouth ulcers - nasal irritation - nausea - oesophagitis - paraesthesia - sneezing - vomiting - watery eyes

- Uncommon Gingival bleeding - halitosis - thirst

- Rare Arrhythmia

- Very rare Reversible atrial fibrillation

- Frequency not known Abdominal pain - abnormal dreams (may occur with patches, removal of the patch before bed may help) - arthralgia - chest pain - flatulence - hot flushes - myalgia - palpitations - rash - sweating - taste disturbance - ulcerative stomatitis

SIDE-EFFECTS, FURTHER INFORMATION

Side-effects listed have been reported with use of various nicotine replacement therapy preparations. See Substances dependence p. 425, Nicotine replacement therapy for specific side-effects of individual preparations.

Nicotine withdrawal: Some systemic effects occur on initiation of therapy, particularly if the patient is using high-strength preparations; however, the patient may confuse side-effects of the nicotine-replacement preparation with nicotine withdrawal symptoms. Common symptoms of nicotine withdrawal include malaise, headache, dizziness, sleep disturbance, coughing, influenza–like symptoms, depression, irritability, increased appetite, weight gain, restless-ness, anxiety, drowsiness, aphantus ulcers, decreased heart rate, and impaired concentration.

• PREGNANCY

The use of nicotine replacement therapy in pregnancy is preferable to the continuation of smoking, but should be used only if smoking cessation without nicotine replacement fails. Intermittent therapy is preferable to patches but avoid liquorice–flavoured nicotine products. Patches are useful, however, if the patient is experiencing pregnancy-related nausea and vomiting. If patches are used, they should be removed before bed.

• BREAST FEEDING

Nicotine is present in milk; however, the amount to which the infant is exposed is small and less hazardous than second-hand smoke. Intermittent therapy is preferred.

• HEPATIC IMPAIRMENT

Use with caution in moderate to severe hepatic impairment.

• RENAL IMPAIRMENT

Use with caution in severe renal impairment.

• DIRECTIONS FOR ADMINISTRATION

Acidic beverages, such as coffee or fruit juice, may decrease the absorption of nicotine through the buccal mucosa and should be avoided for 15 minutes before the use of oral nicotine replacement therapy. Administration by transdermal patch: Patches should be applied on waking to dry, non-hairy skin on the hip, trunk, or upper arm and held in position for 10–20 seconds to ensure...
adhesion; place next patch on a different area and avoid using the same site for several days.

Administration by nasal spray. Initially 1 spray should be used in both nostrils but when withdrawing from therapy, the dose can be gradually reduced to 1 spray in 1 nostril.

Administration by oral spray. The oral spray should be released into the mouth, holding the spray as close to the mouth as possible and avoiding the lips. The patient should not inhale while spraying and avoid swallowing for a few seconds after use. If using the oral spray for the first time, or if unit not used for 2 or more days, prime the unit before administration.

Administration by sublingual tablet. Each tablet should be placed under the tongue and allowed to dissolve. Administration by lozenge. Slowly allow each lozenge to dissolve in the mouth; periodically move the lozenge from one side of the mouth to the other. Lozenges last for 10–30 minutes, depending on their size.

Administration by inhalation. Insert the cartridge into the device and draw in air through the mouthpiece; each session can last for approximately 5 minutes. The amount of nicotine from 1 puff of the cartridge is less than that from a cigarette, therefore it is necessary to inhale more often than when smoking a cigarette. A single 10 mg cartridge lasts for approximately 20 minutes of intense use; a single 15 mg cartridge lasts for approximately 40 minutes of intense use. Administration by medicated chewing gum. Chew the gum until the taste becomes strong, then rest it between the cheek and gum; when the taste starts to fade, repeat this process. One piece of gum lasts for approximately 30 minutes.

PRESCRIBING AND DISPENSING INFORMATION

- Flavours of chewing gum and lozenges may include mint, freshfruit, freshmint, icy white, or cherry.
- Patient or carers should be given advice on how to administer nicotine chewing gum, inhalators, lozenges, sublingual tablets, oral spray, nasal spray and patches.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Sublingual tablet

CAUTIONARY AND ADVISORY LABELS 26

- Nicorette Microtab (McNeil Products Ltd)

- Nicorette QuickMist (McNeil Products Ltd)

Nicotine 1 mg per 1 actuation Nicorette QuickMist 1mg/dose mouthspray (sugar-free) | 12.3 ml GSK £12.12 DT price = £12.12 (sugar-free) | 26.4 ml GSK £13.14

Varenicline

DRUG ACTION Varenicline is a selective nicotine-receptor partial agonist.

INDICATIONS AND DOSE

To aid smoking cessation

BY MOUTH

Adult: Initially 500 micrograms once daily for 3 days, increased to 500 micrograms twice daily for 4 days, then 1 mg twice daily for 11 weeks; reduced if not tolerated to 500 micrograms twice daily, usually to be started 1–2 weeks before target stop date but can be started up to a maximum of 5 weeks before target stop date, 12-week course can be repeated in abstinent individuals to reduce risk of relapse

Important safety information

MRHA/CHM ADVICE: SUICIDAL BEHAVIOUR AND VARENICLINE

Patients should be advised to discontinue treatment and seek prompt medical advice if they develop agitatio,
depressed mood, or suicidal thoughts. Patients with a history of psychiatric illness should be monitored closely while taking varenicline.

- **CAUTIONS** Conditions that may lower seizure threshold - history of cardiovascular disease - history of psychiatric illness (may exacerbate underlying illness including depression) - predisposition to seizures

- **SIDE-EFFECTS**
  - **Common or very common** taste disturbance - abnormal dreams - appetite changes - dizziness - drowsiness - dry mouth - gastro-intestinal disturbances - headache - sleep disorders
  - **Rare** Cerebrovascular accident
  - **Frequency not known** Aggression - diabetes mellitus - hyperglycaemia - irrational behaviour - myocardial infarction - psychosis - sleep-walking - Stevens-Johnson syndrome - suicidal ideation

- **PREGNANCY** Avoid - toxicity in animal studies.

- **BREAST FEEDING** Avoid - present in milk in animal studies.

- **RENAI L IMPAIRMENT** If eGFR less than 30 mL/minute/1.73 m², initial dose 500 micrograms once daily, increased after 3 days to 1 mg once daily.

- **TREATMENT CESSATION** Risk of relapse, irritability, depression, and insomnia on discontinuation; consider dose tapering on completion of 12-week course.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - **Varenicline for smoking cessation (July 2007)** NICE TA123 Varenicline is recommended, within its licensed indications, as an option for smokers who have expressed a desire to quit smoking; it should normally be prescribed only as part of a programme of behavioural support.
    - www.nice.org.uk/TA123

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - **CAUTIONARY AND ADVISORY LABELS** 3
      - **Varenicline (as Varenicline tartrate) 500 microgram** Champix 0.5mg tablets | 11 tablet | no price available | 56 tablet | £54.60 DT price = £54.60
      - **Varenicline (as Varenicline tartrate) 1 mg** Champix 1mg tablets | 14 tablet | no price available | 28 tablet | £27.30 DT price = £27.30 | 56 tablet | £54.60
      - **Champix (Pfizer Ltd)**▼ Champix titration pack | 25 tablet | £27.30

- **SEROTONIN AND NORADRENA LINE RE-UPTAKE INHIBITORS**
  - **Bupropion hydrochloride**
    - (Amfebutamone hydrochloride)

- **INDICATIONS AND DOSE**
  - To aid smoking cessation in combination with motivational support in nicotine-dependent patients
  - **BY MOUTH**
    - **Adult:** Initially 150 mg daily for 6 days, then 150 mg twice daily (max. per dose 150 mg), minimum 8 hours between doses; period of treatment 7–9 weeks, start treatment 1–2 weeks before target stop date, discontinue if abstinence not achieved at 7 weeks, consider maximum 150 mg daily in patients with risk factors for seizures; maximum 300 mg per day
    - **Elderly:** 150 mg daily for 7–9 weeks, start treatment 1–2 weeks before target stop date, discontinue if abstinence not achieved at 7 weeks; maximum 150 mg per day

- **CONTRA-INDICATIONS** Acute alcohol withdrawal - acute benzodiazepine withdrawal - bipolar disorder - CNS tumour - eating disorders - history of seizures - severe hepatic cirrhosis

- **CAUTIONS** Alcohol abuse - diabetes - elderly - history of head trauma - predisposition to seizures (prescribe only if benefit clearly outweighs risk)

- **INTERACTIONS** ▶ Appendix 1 (bupropion).

  Contraindication with concomitant use of drugs that lower seizure threshold.

- **SIDE-EFFECTS**
  - **Common or very common** Agitation - anxiety - depression - dizziness - dry mouth - fever - gastro-intestinal disturbances - headache - impaired concentration - insomnia (reduced by avoiding dose at bedtime) - pruritus - rash - swelling - taste disturbance - tremor
  - **Uncommon** Anorexia - asthenia - chest pain - confusion - flushing - hypertension - tachycardia - tinnitus - visual disturbances
  - **Very rare** Aggression - delusions - paranoid ideation - restlessness
  - **Frequency not known** Suicidal ideation
  - **PREGNANCY** Avoid - no information available.
  - **BREAST FEEDING** Present in milk - avoid.
  - **HEPATIC IMPAIRMENT** Reduce dose to 150 mg daily. Avoid in severe hepatic cirrhosis.
  - **RENAI L IMPAIRMENT** Reduce dose to 150 mg daily.
  - **MONITORING REQUIREMENTS** Measure blood pressure before and during treatment.
  - **PATIENT AND CARER ADVICE** May impair performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Modified-release tablet**
    - **CAUTIONARY AND ADVISORY LABELS** 25
      - **Zyban** (GlaxoSmithKline UK Ltd)
        - **Bupropion hydrochloride 150 mg** Zyban 150mg modified-release tablets | 60 tablet | £41.76 DT price = £41.76
8.3 Opioid dependence

**ALPHA₂ ADRENOCEPTOR AGONISTS**

**Lofexidine hydrochloride**

*DRUG ACTION* Lofexidine is an alpha₂-adrenergic agonist.

**INDICATIONS AND DOSE**

Management of symptoms of opioid withdrawal

**BY MOUTH**

- **Adult:** Initially 800 micrograms daily in divided doses, increased in steps of 400–800 micrograms daily (max. per dose 800 micrograms) as required for 7–10 days if no opioid use (but longer may be required); maximum 2.4 mg per day

**CAUTIONS** Bradycardia, cerebrovascular disease, depression, history of QT prolongation, hypotension (monitor pulse rate and blood pressure), metabolic disturbances, recent myocardial infarction, severe coronary insufficiency

**INTERACTIONS** Appendix 1 (lofexidine).

Caution with concomitant administration of drugs that prolong QT interval.

**SIDE-EFFECTS** Bradycardia, dizziness, drowsiness, dry mucous membranes, hypotension, QT-interval prolongation

**PREGNANCY** Use only if benefit outweighs risk—no information available.

**BREAST FEEDING** Use only if benefit outweighs risk—no information available.

**RENAI IMPAIRMENT** Caution in chronic impairment.

**MONITORING REQUIREMENTS** Monitoring of blood pressure and pulse rate is recommended on initiation, for at least 72 hours or until a stable dose is achieved, and on discontinuation.

**PRESCRIBING AND DISPENSING INFORMATION** Lofexidine has been used in children over 12 years for the management of symptoms of opioid withdrawal

**TREATMENT CESSATION** Treatment should be withdrawn gradually over 2–4 days (or longer) to reduce the risk of rebound hypertension and associated symptoms.

**PATIENT AND CARER ADVICE** The patient should take part of the dose at bedtime to offset insomnia associated with opioid withdrawal.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

| CAUTIONARY AND ADVISORY LABELS | 2 |
|BritLofex (Britainia Pharmaceuticals Ltd) | 300 micrograms tablets | 6 tablet | £1.79 |

**OPIOIDS**

**Buprenorphine**

The properties listed below are those particular to the drug only. For properties common to the class, see opioids, p. 357.

*DRUG ACTION* Buprenorphine is an opioid-receptor partial agonist (it has opioid agonist and antagonist properties).

**INDICATIONS AND DOSE**

Moderate to severe pain

**BY SUBLINGUAL ADMINISTRATION**

- **Child (body-weight 16–25 kg):** 100 micrograms every 6–8 hours
- **Child (body-weight 25–37.5 kg):** 100–200 micrograms every 6–8 hours
- **Adult:** 800 micrograms every 6–8 hours

**BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION**

- **Child 6 months–11 years:** 3–6 micrograms/kg every 6–8 hours (max. per dose 9 micrograms/kg)
- **Child 12–17 years:** 300–600 micrograms every 6–8 hours
- **Adult:** 300–600 micrograms every 6–8 hours

**PREMEDICATION**

**BY SUBLINGUAL ADMINISTRATION**

- **Adult:** 400 micrograms

**Intra-operative analgesia**

**BY SUBLINGUAL ADMINISTRATION**

- **Adult:** Initially 0.8–4 mg for 1 dose on the first day, adjusted in steps of 2–4 mg daily if required; usual dose 12–24 mg daily; maximum 32 mg per day

**Dose equivalence and conversion**

For opioid substitution therapy, in patients taking methadone who want to switch to buprenorphine, the dose of methadone should be reduced to a maximum of 20 mg daily before starting buprenorphine treatment. If the dose of methadone is over 10 mg daily, buprenorphine can be started at a dose of 4 mg daily and titrated according to requirements; if the methadone dose is below 10 mg daily, Buprenorphine can be started at a dose of 2 mg daily.

**HAPOCTASIN**

Moderate to severe chronic cancer pain | Severe pain unresponsive to non-opioid analgesics

**BY TRANSDERMAL APPLICATION USING PATCHES**

- **Adult:** Patients who have not previously received strong opioid analgesics initially 35 micrograms/hour up to every 72 hours; patients who have received strong opioid analgesic, initial dose based on previous 24-hour opioid requirement, consult product literature, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 72 hours using a patch of the next strength or using 2 patches of the same strength (applied at same time to avoid confusion). Maximum 2 patches can be used at any one time, for breakthrough pain, consider 200–400 micrograms buprenorphine sublingually

**PHARMACOKINETICS**

It may take approximately 25 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

**TRANSTEC**

Moderate to severe chronic cancer pain | Severe pain unresponsive to non-opioid analgesics

**BY TRANSDERMAL APPLICATION USING PATCHES**

- **Adult:** Patients who have not previously received strong opioid analgesics, initially 35 micrograms/hour up to every 96 hours; patients who have received strong opioid analgesic, initial dose based on previous 24-hour opioid requirement, consult product literature, dose adjustment—when starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase
in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches of the same strength (applied at same time to avoid confusion). Maximum 2 patches can be used at any one time, for breakthrough pain, consider 200—400 micrograms buprenorphine sublingually.

**PHARMACOKINETICS**

It may take approximately 30 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed.

**BUTRANS®**

Moderate, non-malignant pain unresponsive to non-opioid analgesics

**BY TRANSDERMAL APPLICATION USING PATCHES**

- Adult: Initially 5 micrograms/hour up to every 7 days, dose adjustments—when starting, analgesic effect should not be evaluated until the system has been worn for 72 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of at least 3 days using a patch of the next strength or a combination of 2 patches applied in different places (applied at same time to avoid confusion). Maximum 2 patches can be used at any one time.

- **UNLICENSED USE** Sublingual tablets not licensed for use in children under 6 years. Injection not licensed for use in children under 6 months.

- **CAUTIONS**
  - **GENERAL CAUTIONS**
    - Impaired consciousness
  - **SPECIFIC CAUTIONS**
    - With transdermal use other opioids should not be administered within 24 hours of patch removal (long duration of action) (in adults)
    - When used for adjunct in the treatment of opioid dependence hepatitis B infection (in adults) · hepatitis C infection (in adults) · pre-existing liver enzyme abnormalities (in adults)
  - **INTERACTIONS**
    - Caution with concomitant use of hepatotoxic drugs.
  - **SIDE-EFFECTS**
    - **Common or very common** Abdominal pain · agitation · anorexia · anxiety · asthenia · diarrhoea · dyspepsia · dry skin · fatigue · mild withdrawal symptoms in patients dependent on opioids · paraesthesia · vasodilatation
    - **Uncommon** Angina (in adults) · cough · depersonalisation · dry eye · dry skin · dysarthria · flatulence · hypertension · hypoaesthesia · hypoxia · impaired memory · influenza-like symptoms · muscle cramp · myalgia · pyrexia · restlessness · rhinitis · rigors · syncope · taste disturbance · tinnitus · tremor · wheezing
    - **Rare** Diureticulitis (in children) · dysphagia · impaired concentration · paralytic ileus · psychosis
    - **Very rare** Hiccups · hyperventilation · muscle fasciculation · retching
    - **Frequency not known** Hepatic necrosis · hepatitis

  - **SIDE-EFFECTS, FURTHER INFORMATION**
    - Fever or external heat
      - Monitor patients using patches for increased side-effects if fever present (increased absorption possible); avoid exposing application site to external heat (may also increase absorption).
    - **Overdose**
      - The effects of buprenorphine are only partially reversed by naloxone.
  - **HAPOCATASIN®**
    - In view of the long duration of action, patients who have severe side-effects should be monitored for up to 25 hours after removing patch.

**TRANSTECA®**

In view of the long duration of action, patients who have severe side-effects should be monitored for up to 30 hours after removing patch.

- **BREAST FEEDING** Present in low levels in breast milk. Neonates should be monitored for drowsiness, adequate weight gain, and developmental milestones.
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **PRE-TREATMENT SCREENING** Documentation of viral hepatitis status is recommended before commencing therapy for opioid dependence.
- **MONITORING REQUIREMENTS** Monitor liver function; when used in opioid dependence baseline liver function test is recommended before commencing therapy, and regular liver function tests should be performed throughout treatment.
- **DIRECTIONS FOR ADMINISTRATION**
  - With sublingual use in children For administration by mouth, tablets may be halved.
  - **HAPOCATASIN®**
    - Apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after no longer than 72 hours and siting replacement patch on a different area (avoid same area for at least 7 days).
  - **TRANSTECA®**
    - Apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after no longer than 96 hours and siting replacement patch on a different area (avoid same area for at least 6 days).
  - **BUTRANS®**
    - Apply patch to dry, non-irritated, non-hairy skin on upper torso, removing after 7 days and siting replacement patch on a different area (avoid same area for at least 3 weeks).
  - **PRESCRIBING AND DISPENSING INFORMATION**
    - Transdermal buprenorphine patches are not suitable for acute pain or in those patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose.
  - **PATIENT AND CARER ADVICE**
    - **HAPOCATASIN® TRANSTECA® BUTRANS®**
      - Patients or carers should be given advice on how to administer buprenorphine transdermal patches.
  - **NATIONAL FUNDING/ACCESS DECISIONS**
    - **NICE technology appraisals (TAs)**
      - Methadone and buprenorphine for the management of opioid dependence (January 2007) NICE TA114
      - Oral methadone and buprenorphine are recommended for maintenance therapy in the management of opioid dependence. Patients should be committed to a supportive care programme including a flexible dosing regimen administered under supervision for at least 3 months, until compliance is assured. Selection of methadone or buprenorphine should be made on a case-by-case basis, but methadone should be prescribed if both drugs are equally suitable. www.nice.org.uk/TA114

Buprenorphine 70 microgram per 1 hour Transnec 70micrograms/hour transdermal patches | 4 patch (P) £31.60 DT price = £31.60 Schedule 3 (CD No Register)

Buprenorphine with naxalone

The properties listed below are those particular to the combination only. For the properties of the components please consider, buprenorphine p. 434, naloxone hydrochloride p. 1133.

INDICATIONS AND DOSE

Adjunct in the treatment of opioid dependence (dose expressed as buprenorphine)

BY SUBLINGUAL ADMINISTRATION

▶ Adult: Initially 2–4 mg once daily, an additional dose of 2–4 mg may be administered on day 1 depending on the individual patient’s requirement, increased in steps of 2–8 mg, adjusted according to response, total weekly dose may be divided and given on alternate days or 3 times weekly; maximum 24 mg per day

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (February 2007) that Suboxone® should be restricted for use in patients in whom methadone is not suitable.

SUBLINGUAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Methadone hydrochloride

The properties listed below are those particular to the drug only. For properties common to the class, see opioids, p. 357.

INDICATIONS AND DOSE

Severe pain

BY MOUTH OR BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

▶ Adult: 5–10 mg every 6–8 hours, adjusted according to response, on prolonged use not to be given more frequently than every 12 hours

Adjunct in treatment of opioid dependence

BY MOUTH USING ORAL SOLUTION

▶ Adult: Initially 10–30 mg daily, increased in steps of 5–10 mg daily if required until no signs of withdrawal nor evidence of intoxication, dose to be increased in the first week, then increased every few days as necessary up to usual dose, maximum weekly dose increase of 30 mg; usual dose 60–120 mg daily

Adjunct in treatment of opioid dependence if tolerance low or not known

BY MOUTH USING ORAL SOLUTION

▶ Adult: Initially 10–20 mg daily, increased in steps of 5–10 mg daily if required until no signs of withdrawal nor evidence of intoxication, dose to be increased in
**Opioid dependence**

The first week, then increased every few days as necessary up to usual dose, maximum weekly dose increase of 30 mg; usual dose 60–120 mg daily

Adjunct in treatment of opioid dependence if tolerance high (under expert supervision)

**DIRECTIONS FOR ADMINISTRATION**

**TREATMENT CESSATION**

Avoid abrupt withdrawal.

**DIRECTIONS FOR ADMINISTRATION**

Syrup preserved with hydroxybenzoate (parabens) esters may be incompatible with methadone hydrochloride.

**SIDE-EFFECTS**

- **Dry eyes**
- **Hyperprolactinaemia**
- **Hypothermia**
- **Restlessness**
- **Dysmenorrhoea**
- **Cough in terminal disease**

**UNLICENSED USE**

Methadone hydrochloride doses for opioid dependence in the BNF may differ from those in the product literature.

**CONTRA-INDICATIONS**

Phaeochromocytoma

**CAUTIONS**

Family history of sudden death (ECG monitoring recommended) - history of cardiac conduction abnormalities

**CAUTIONS, FURTHER INFORMATION**

QT-interval prolongation Patients with the following risk factors for QT-interval prolongation should be carefully monitored while taking methadone: heart or liver disease, electrolyte abnormalities, or concomitant treatment with drugs that can prolong QT interval; patients requiring more than 100 mg daily should also be monitored.

**SIDE-EFFECTS**

Dry eyes - dysmenorrhea - hyperprolactinaemia - hypothermia - QT-interval prolongation - raised intracranial pressure - restlessness - torsade de pointes

**SIDE-EFFECTS, FURTHER INFORMATION**

Methadone is a long-acting opioid therefore effects may be cumulative. Methadone, even in low doses is a special hazard for children; non-dependent adults are also at risk of toxicity; dependent adults are at risk if tolerance is incorrectly assessed during induction.

**Overdose** Methadone has a very long duration of action; patients may need to be monitored for long periods following large overdoses.

**BREAST FEEDING** Withdrawal symptoms in infant; breast-feeding permissible during maintenance but dose should be as low as possible and infant monitored to avoid sedation (high doses of methadone can carry an increased risk of sedation and respiratory depression in the neonate).

**RENAL IMPAIRMENT**

Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**TREATMENT CESSATION**

Avoid abrupt withdrawal.

**DIRECTIONS FOR ADMINISTRATION**

Syrup preserved with hydroxybenzoate (parabens) esters may be incompatible with methadone hydrochloride.

**PRESCRIBING AND DISPENSING INFORMATION**

Flavours of oral liquid formulations may include tolu.

**METHADOSE® ORAL SOLUTION**

The final strength of the methadone mixture to be dispensed to the patient must be specified on the prescription.

**Important**—care is required in prescribing and dispensing the correct strength since any confusion could lead to an overdose; this preparation should be dispensed only after dilution as appropriate with Methadose® Diluent (life of diluted solution 3 months) and is for drug dependent persons.

**NICE TECHNOLOGY APPRAISALS (TAs)**

Methadone and buprenorphine for the management of opioid dependence (January 2007) NICE TA114

Oral methadone and buprenorphine are recommended for maintenance therapy in the management of opioid dependence. Patients should be committed to a supportive care programme including a flexible dosing regimen administered under supervision for at least 3 months, until compliance is assured. Selection of methadone or buprenorphine should be made on a case-by-case basis, but methadone should be prescribed if both drugs are equally suitable. www.nice.org.uk/TA114

**LESS SUITABLE FOR PRESCRIBING** Methadone linctus is less suitable for prescribing for cough in terminal disease (has a tendency to accumulate).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, suppository, solution for injection, oral suspension, oral solution, capsule, impregnated cigarette

**Tablet**

1 Amoebic infection

Drugs used for Amoebic infection not listed below: Metronidazole, p. 475; Tinidazole, p. 476

Diloxanide furoate

INDICATIONS AND DOSE
Chronic amoebiasis | Acute amoebiasis as adjunct to metronidazole or tinidazole
BY MOUTH
- Child 12-17 years: 500 mg 3 times a day for 10 days
- Adult: 500 mg 3 times a day for 10 days

SIDE-EFFECTS Flatulence, pruritus, urticaria, vomiting

PREGNANCY Manufacturer advises avoid—no information available.

BREAST FEEDING Manufacturer advises avoid.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet
CAUTIONARY AND ADVISORY LABELS 9
- DILOXANIDE FUROATE (Non-proprietary)
- Diloxanide furoate 500 mg Diloxanide 500mg tablets | 30 tablet £93.50

Mepacrine hydrochloride

INDICATIONS AND DOSE
Giardiasis
BY MOUTH
- Adult: 100 mg every 8 hours for 5–7 days

UNLICENSED USE Not licensed for use in giardiasis.

CAUTIONS Avoid in psoriasis, elderly, history of psychosis

INTERACTIONS → Appendix 1 (mepacrine).

SIDE-EFFECTS Aplastic anaemia (on prolonged treatment) - blue/black discoloration of nails - blue/black discoloration of palate - chronic dermatoses (on prolonged treatment) - CNS stimulation (with large doses) - corneal deposits with visual disturbances - dizziness - gastrointestinal disturbances - headache - hepatitis (on prolonged treatment) - nausea (with large doses) - severe exfoliative dermatitis (on prolonged treatment) - transient acute toxic psychosis (with large doses) - vomiting (with large doses) - yellow discoloration of skin (on prolonged treatment) - yellow discoloration of urine (on prolonged treatment)

- HEPATIC IMPAIRMENT Use with caution.

- MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

2 Bacterial infection

Antibacterials, principles of therapy

Choice of a suitable drug

Before selecting an antibacterial the clinician must first consider two factors—the patient and the known or likely causative organism. Factors related to the patient which must be considered include history of allergy, renal and hepatic function, susceptibility to infection (i.e. whether immunocompromised), ability to tolerate drugs by mouth, severity of illness, ethnic origin, age, whether taking other medication and, if female, whether pregnant, breast-feeding or taking an oral contraceptive.

The known or likely organism and its antibacterial sensitivity, in association with the above factors, will suggest one or more antibacterials, the final choice depending on the microbiological, pharmacological, and toxicological properties.

An example of a rational approach to the selection of an antibacterial is treatment of a urinary-tract infection in a patient complaining of nausea and symptoms of a urinary-tract infection in early pregnancy. The organism is reported as being resistant to ampicillin p. 483 but sensitive to
nitrofurantoin p. 512 (can cause nausea), gentamicin p. 450 (can be given only by injection and best avoided in pregnancy), tetracycline p. 498 (causes dental discoloration) and trimethoprim p. 462 (folate antagonist therefore theoretical teratogenic risk), and cefalexin p. 456. The safest antibiotics in pregnancy are the penicillins and cephalosporins; therefore, cefalexin p. 456 would be indicated for this patient.

The principles involved in selection of an antibacterial must allow for a number of variables including changing renal and hepatic function, increasing bacterial resistance, and information on side-effects. Duration of therapy, dosage, and route of administration depend on site, type and severity of infection and response.

**Antibacterial policies**

Local policies often limit the antibacterials that may be used to achieve reasonable economy consistent with adequate cover, and to reduce the development of resistant organisms. A policy may indicate a range of drugs for general use, and permit other drugs only on the advice of the microbiologist or physician responsible for the control of infectious diseases.

**Before starting therapy**

The following precepts should be considered before starting:

- **Viral infections should not be treated with antibacterials.** However, antibacterials may be used to treat secondary bacterial infection (e.g. bacterial pneumonia secondary to influenza);
- **Samples should be taken for culture and sensitivity testing;** 'blind' antibacterial prescribing for unexplained pyrexia usually leads to further difficulty in establishing the diagnosis;
- **Knowledge of prevalent organisms** and their current sensitivity is of great help in choosing an antibacterial before bacteriological confirmation is available. Generally, narrow-spectrum antibacterials are preferred to broad-spectrum antibacterials unless there is a clear clinical indication (e.g. life-threatening sepsis);
- **The dose of an antibacterial varies according to a number of factors including age, weight, hepatic function, renal function, and severity of infection.** The prescribing of the so-called 'standard' dose in serious infections may result in failure of treatment or even death of the patient; therefore it is important to prescribe a dose appropriate to the condition. An inadequate dose may also increase the likelihood of antibacterial resistance. On the other hand, for an antibacterial with a narrow margin between the toxic and therapeutic dose (e.g. an aminoglycoside) it is also important to avoid an excessive dose and the concentration of the drug in the plasma may need to be monitored;
- **The route of administration of an antibacterial often depends on the severity of the infection.** Life-threatening infections require intravenous therapy. Antibacterials that are well absorbed may be given by mouth even for some serious infections. Parenteral administration is also appropriate when the oral route cannot be used (e.g. because of vomiting) or if absorption is inadequate. Whenever possible, painful intramuscular injections should be avoided in children;
- **Duration of therapy depends on the nature of the infection and the response to treatment.** Courses should not be unduly prolonged because they encourage resistance, they may lead to side-effects and they are costly. However, in certain infections such as tuberculosis or osteomyelitis it may be necessary to treat for prolonged periods. Conversely a single dose of an antibacterial may cure uncomplicated urinary-tract infections. The prescription for an antibacterial should specify the duration of treatment or the date when treatment is to be reviewed.

**Superinfection**

In general, broad-spectrum antibacterial drugs such as the cephalosporins are more likely to be associated with adverse reactions related to the selection of resistant organisms e.g. *fungal infections* or antibiotic-associated colitis (pseudomembranous colitis); other problems associated with superinfection include vaginitis and pruritus ani.

**Therapy**

When the pathogen has been isolated treatment may be changed to a more appropriate antibacterial if necessary. If no bacterium is cultured the antibacterial can be continued or stopped on clinical grounds.

**Notifiable diseases**

Doctors must notify the Proper Officer of the local authority (usually the consultant in communicable disease control) when attending a patient suspected of suffering from any of the diseases listed below; a form is available from the Proper Officer.

<table>

It is good practice for doctors to also inform the consultant in communicable disease control of instances of other infections (e.g. psittacosis) where there could be a public health risk.

**Antibacterials, use for prophylaxis**

**Prevention of recurrence of rheumatic fever**

Phenoxyphthenilpenicillin p. 481 or sulfadiazine p. 495.

**Prevention of secondary case of invasive group A streptococcal infection**

Phenoxyphthenilpenicillin p. 481.

Patients who are penicillin allergic, *either* erythromycin p. 471 or azithromycin p. 469 [unlicensed indication].

For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England Laboratory).

**Prevention of secondary case of meningococcal meningitis**

Ciprofloxacin p. 490 *or* rifampicin p. 508 *or* i/m ceftriaxone p. 459 [unlicensed indication].

For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England Laboratory).
Infection

Infection

Infection

Prevention of secondary case of Haemophilus influenzae type b disease
Rifampicin p. 508 or (if rifampicin cannot be used) i/m or i/v ceftriaxone p. 459 [unlicensed indication].

For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England laboratory). Unless there has been direct exposure of the mouth or nose to infectious droplets from a patient with meningococcal disease who has received less than 24 hours of antibacterial treatment, healthcare workers do not generally require chemoprophylaxis.

Prevention of secondary case of Haemophilus influenzae type b disease

Within 4 weeks of illness onset in the index case with confirmed or suspected invasive *Haemophilus influenzae* type b disease, give antibacterial prophylaxis to all household contacts if there is a vulnerable individual in the household. Also, give antibacterial prophylaxis to the index case if they are in contact with vulnerable household contacts or if they are under 10 years of age. Vulnerable individuals include the immunocompromised, those with HIV, or if the infant is less than 3 months of age. Give rifampicin or azithromycin or (if the infant is over 3 months of age) i/v cefuroxime or amoxiclav. If there is a vulnerable individual in the household, give antibacterial prophylaxis to the index case if they are in contact with vulnerable household contacts or if they are under 10 years of age. Vulnerable individuals include the immunocompromised, those with meningococcal disease or with asplenia, or children under 10 years of age. If there are 2 or more cases of invasive *Haemophilus influenzae* type b disease within 120 days in a pre-school or primary school, antibacterial prophylaxis should also be given to all room contacts (including staff).

Prevention of secondary case of diphtheria in non-immune patient
Erythromycin p. 471 (or azithromycin p. 469 or clarithromycin p. 470).

Treat for further 10 days if nasopharyngeal swabs positive after first 7 days’ treatment.

Prevention of pertussis
Claritromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471).

Within 3 weeks of onset of cough in the index case, give antibacterial prophylaxis to all close contacts if amongst them there is at least one unimmunised or partially immunised child under 1 year of age, or if there is at least one individual who has not received a pertussis-containing vaccine more than 1 week and less than 5 years ago (so long as that individual lives or works with children under 4 months of age, is pregnant at over 20 weeks gestation, or is a healthcare worker who works with children under 1 year of age or with pregnant women).

Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease
Phenoxymethylpenicillin p. 481.

If penicillin-allergic, erythromycin p. 471.

Antibacterial prophylaxis is not fully reliable. Antibacterial prophylaxis may be discontinued in children over 5 years of age with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection.

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive
Isoniazid p. 506 or isoniazid + rifampicin p. 508 or (if isoniazid-resistant tuberculosis in patients under 35 years) rifampicin.

For details of those who should receive chemoprophylaxis contact the lead clinician for local tuberculosis services (or a consultant in communicable disease control).

Prevention of infection from animal and human bites

Co-amoxiclav p. 484 alone (or doxycycline p. 496 + metronidazole p. 475 if penicillin-allergic). Cleanse wound thoroughly. For tetanus-prone wound, give human tetanus immunoglobulin p. 1065 (with a tetanus-containing vaccine if necessary, according to immunisation history and risk of infection).

Consider rabies prophylaxis for bites from animals in endemic countries. Assess risk of blood-borne viruses (including HIV, hepatitis B and C) and give appropriate prophylaxis to prevent viral spread.

Antibacterial prophylaxis recommended for wounds less than 48–72 hours old when the risk of infection is high (e.g. bites from humans or cats; bites to the hand, foot, face, or genitai area; bites involving oedema, crush or puncture injury, or other moderate to severe injury; wounds that cannot be debrided adequately; patients with diabetes mellitus, cirrhosis, asplenia, prosthetic joints or valves, or those who are immunocompromised). Give antibacterial prophylaxis for up to 5 days.

Prevention of early-onset neonatal infection
i/v benzylpenicillin sodium p. 480 (or i/v clindamycin p. 467 if history of allergy to penicillins).

Give intrapartum prophylaxis to women with group B streptococcal colonisation, bacteriuria, or infection in the current pregnancy, or to women who had a previous baby with an invasive group B streptococcal infection. Consider prophylaxis for women in preterm labour if there is prelabour rupture of membranes or if intrapartum rupture of membranes lasting more than 18 hours is suspected.

Prevention of infection in gastro-intestinal procedures
Operations on stomach or oesophagus
Single dose of i/v gentamicin p. 450 or i/v cefuroxime p. 460 or i/v co-amoxiclav p. 484 (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Add i/v teicoplanin p. 464 (or vancomycin p. 465) if high risk of meticillin-resistant *Staphylococcus aureus*.

Open biliary surgery
Single dose of i/v cefuroxime p. 460 + i/v metronidazole p. 475 or i/v gentamicin p. 450 + i/v metronidazole or i/v co-amoxiclav p. 484 alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Add i/v teicoplanin p. 464 (or vancomycin p. 465) if high risk of meticillin-resistant *Staphylococcus aureus*.

Resections of colon and rectum for carcinoma, and resections in inflammatory bowel disease, and appendicectomy
Single dose of i/v gentamicin p. 450 + i/v metronidazole p. 475 or i/v cefuroxime p. 460 + i/v metronidazole or i/v co-amoxiclav p. 484 alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.
Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Add i/v teicoplanin p. 464 (or vancomycin p. 465) if high risk of meticillin-resistant *Staphylococcus aureus*.

**Endoscopic retrograde cholangiopancreatography**

Single dose of i/v gentamicin p. 450 or oral or i/v ciprofloxacin p. 490.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Prophylaxis recommended if pancreatic pseudocyst, immunocompromised, history of liver transplantation, or risk of incomplete biliary drainage. For biliary complications following liver transplantation, add i/v amoxicillin p. 482 or i/v teicoplanin p. 464 (or vancomycin p. 465).

**Percutaneous endoscopic gastrostomy or jejunostomy**

Single dose of i/v co-amoxiclav p. 484 or i/v cefuroxime p. 460.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v teicoplanin p. 464 (or vancomycin p. 465) if history of allergy to penicillins or cephalosporins, or if high risk of meticillin-resistant *Staphylococcus aureus*.

**Prevention of infection in orthopaedic surgery**

**Joint replacement including hip and knee**

Single dose of i/v cefuroxime p. 460 alone or i/v flucloxacillin p. 486 + i/v gentamicin p. 450 (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

If history of allergy to penicillins or to cephalosporins or if high risk of meticillin-resistant *Staphylococcus aureus*, use single dose of i/v teicoplanin p. 464 (or vancomycin p. 465) + i/v gentamicin (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

**Closed fractures**

Single dose of i/v cefuroxime p. 460 or i/v flucloxacillin p. 486 (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

If history of allergy to penicillins or to cephalosporins or if high risk of meticillin-resistant *Staphylococcus aureus*, use single dose of i/v teicoplanin p. 464 (or vancomycin p. 465) + i/v gentamicin (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

**Open fractures**

Use i/v co-amoxiclav p. 484 alone or i/v cefuroxime p. 460 + i/v metronidazole p. 475 (or i/v clindamycin p. 467 alone if history of allergy to penicillins or to cephalosporins).

Add i/v teicoplanin p. 464 (or vancomycin p. 465) if high risk of meticillin-resistant *Staphylococcus aureus*. Start prophylaxis within 3 hours of injury and continue until soft tissue closure (max. 72 hours).

At first debridement also use a single dose of i/v cefuroxime + i/v metronidazole + i/v gentamicin or i/v co-amoxiclav + i/v gentamicin (or i/v clindamycin + i/v gentamicin if history of allergy to penicillins or to cephalosporins).

At time of skeletal stabilisation and definitive soft tissue closure use a single dose of i/v gentamicin + i/v teicoplanin (or vancomycin) (intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure).

**High lower-limb amputation**

Use i/v co-amoxiclav p. 484 alone or i/v cefuroxime p. 460 + i/v metronidazole p. 475.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Continue antibacterial prophylaxis for at least 2 doses after procedure (max. duration of prophylaxis 5 days). If history of allergy to penicillins or to cephalosporins, or if high risk of meticillin-resistant *Staphylococcus aureus*, use i/v teicoplanin p. 464 (or vancomycin p. 465) + i/v gentamicin p. 450 + i/v metronidazole.

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

**Prevention of infection in urological procedures**

**Transrectal prostate biopsy**

Single dose of oral ciprofloxacin p. 490 or oral metronidazole p. 475 or i/v gentamicin p. 450 + i/v metronidazole (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v gentamicin + i/v metronidazole if high risk of meticillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses of antibacterial may be given for prolonged procedures or if there is major blood loss).

Where i/v metronidazole p. 475 is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

**Transurethral resection of prostate**

Single dose of oral ciprofloxacin p. 490 or i/v gentamicin p. 450 or i/v cefuroxime p. 460 (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v gentamicin p. 450 if high risk of meticillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

**Prevention of infection in obstetric and gynaecological surgery**

**Caesarean section**

Single dose of i/v cefuroxime p. 460 (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Substitute i/v clindamycin p. 467 if history of allergy to penicillins or cephalosporins. Add i/v teicoplanin p. 464 (or vancomycin p. 465) if high risk of meticillin-resistant *Staphylococcus aureus*.

**Hysterectomy**

Single dose of i/v cefuroxime p. 460 + i/v metronidazole p. 475 or i/v gentamicin p. 450 + i/v metronidazole or i/v co-amoxiclav p. 484 alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v gentamicin + i/v metronidazole or add i/v teicoplanin p. 464 (or vancomycin p. 465) to other regimens if high risk of meticillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).
Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

**Termination of pregnancy**

Single dose of oral metronidazole p. 475 (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

If genital chlamydial infection cannot be ruled out, give doxycycline p. 496 postoperatively.

**Prevention of infection in cardiologic procedures**

**Cardiac pacemaker insertion**

Single dose of i/v cefuroxime p. 460 alone or i/v flucloxacinil p. 466 + i/v gentamicin p. 450 or i/v teicoplanin p. 464 (or vancomycin p. 465) + i/v gentamicin (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v teicoplanin (or vancomycin) + i/v cefuroxime or i/v teicoplanin (or vancomycin) + i/v gentamicin if high risk of meticillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

**Prevention of infection in vascular surgery**

**Reconstructive arterial surgery of abdomen, pelvis or legs**

Single dose of i/v cefuroxime p. 460 alone or i/v flucloxacinil p. 466 + i/v gentamicin p. 450 (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Add i/v metronidazole p. 475 for patients at risk from anaerobic infections including those with diabetes, gangrene, or undergoing amputation. Use single dose of i/v teicoplanin (or vancomycin) + i/v cefuroxime or i/v teicoplanin (or vancomycin) + i/v gentamicin if history of allergy to penicillins or cephalosporins, or if high risk of meticillin-resistant *Staphylococcus aureus* (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

**Prevention of endocarditis**

NICE guidance: Antimicrobial prophylaxis against infective endocarditis in adults and children undergoing interventional procedures (March 2008)

Antibacterial prophylaxis and chlorhexidine mouthwash are **not** recommended for the prevention of endocarditis in patients undergoing dental procedures.

Antibacterial prophylaxis is **not** recommended for the prevention of endocarditis in patients undergoing procedures of the:

- upper and lower respiratory tract (including ear, nose, and throat procedures and bronchoscopy);
- genito-urinary tract (including urological, gynaecological, and obstetric procedures);
- upper and lower gastro-intestinal tract.

Whilst these procedures can cause bacteraemia, there is no clear association with the development of infective endocarditis. Prophylaxis may expose patients to the adverse effects of antimicrobials when the evidence of benefit has not been proven.

Any infection in patients at risk of endocarditis should be investigated promptly and treated appropriately to reduce the risk of endocarditis.

If patients at risk of endocarditis are undergoing a gastro-intestinal or genito-urinary tract procedure at a site where infection is suspected, they should receive appropriate antibacterial therapy that includes cover against organisms that cause endocarditis.

Patients at risk of endocarditis should be:

- advised to maintain good oral hygiene;
- told how to recognise signs of infective endocarditis, and advised when to seek expert advice.

Patients at risk of endocarditis include those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endotheallised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis.

**Dermatological procedures**

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who undergo dermatological procedures do not require antibacterial prophylaxis against endocarditis.

The British Association of Dermatologists Therapy Guidelines and Audit Subcommittee advise that such dermatological procedures include skin biopsies and excision of moles or of malignant lesions.

**Joint prostheses and dental treatment**

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients with prosthetic joint implants (including total hip replacements) do not require antibiotic prophylaxis for dental treatment. The Working Party considers that it is unacceptable to expose patients to the adverse effects of antibiotics when there is no evidence that such prophylaxis is of any benefit, but that those who develop any intercurrent infection require prompt treatment with antibiotics to which the infecting organisms are sensitive.

The Working Party has commented that joint infections have rarely been shown to follow dental procedures and are even more rarely caused by oral streptococci.

**Immunosuppression and indwelling intraperitoneal catheters**

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who are immunosuppressed (including transplant patients) and patients with indwelling intraperitoneal catheters do not require antibiotic prophylaxis for dental treatment provided there is no other indication for prophylaxis.

The Working Party has commented that there is little evidence that dental treatment is followed by infection in immunosuppressed and immunodeficient patients nor is there evidence that dental treatment is followed by infection in patients with indwelling intraperitoneal catheters.

**Blood infections, bacterial**

**Antibacterial therapy for septicaemia: community-acquired**

- A broad-spectrum antipseudomonal penicillin (e.g. piperacillin with tazobactam p. 479, ticarcillin with clavulanic acid p. 480) or a broad-spectrum cephalosporin (e.g. cefuroxime p. 460)

  - If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin p. 465 (or teicoplanin p. 464).

  - If anaerobic infection suspected, add metronidazole p. 475 to broad-spectrum cephalosporin.

  - If other resistant micro-organisms suspected, use a more broad-spectrum beta-lactam antibiotic (e.g. meropenem p. 454).
Antibacterial therapy for septicaemia: hospital-acquired

- A broad-spectrum antipseudomonal beta-lactam antibiotic (e.g. piperacillin with tazobactam p. 479, ticarcillin with clavulanic acid p. 480, ceftazidime p. 458, imipenem with cilastatin p. 454, or meropenem p. 454)
  - If meticillin-resistant \textit{Staphylococcus aureus} suspected, add vancomycin p. 465 (or teicoplanin p. 464).
  - If anaerobic infection suspected, add metronidazole p. 475 to broad-spectrum cephalosporin

Septicaemia related to vascular catheter

- Vancomycin p. 465 (or teicoplanin p. 464)
  - If Gram-negative sepsis suspected, especially in the immunocompromised, add a broad-spectrum antipseudomonal beta-lactam.
  - Consider removing vascular catheter, particularly if infection caused by \textit{Staphylococcus aureus}, pseudomonas, or \textit{Candida} species.

Meningococcal septicaemia

If meningococcal disease suspected, a single dose of benzylpenicillin sodium p. 480 should be given before urgent transfer to hospital, so long as this does not delay the transfer; cefotaxime p. 457 may be an alternative in penicillin allergy; chloramphenicol p. 452 may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins.

- Benzylpenicillin sodium or cefotaxime (or ceftriaxone p. 459)
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol

To eliminate nasopharyngeal carriage, ciprofloxacin p. 490, or rifampicin p. 508, or ceftriaxone may be used.

**Cardiovascular system infections, bacterial**

Antibacterial therapy for endocarditis: initial ‘blind’ therapy

- Native valve endocarditis, amoxicillin p. 482 (or ampicillin p. 483)
  - Consider adding low-dose gentamicin p. 450
  - If penicillin-allergic, or if meticillin-resistant \textit{Staphylococcus aureus} suspected, or if severe sepsis, use vancomycin p. 465 + low-dose gentamicin
  - If severe sepsis with risk factors for Gram-negative infection, use vancomycin + meropenem p. 454
- If prosthetic valve endocarditis, vancomycin + rifampicin p. 508 + low-dose gentamicin

Antibacterial therapy for native-valve endocarditis caused by staphylococci

- Flucloxacillin p. 486
  - \textit{Suggested duration of treatment} 4 weeks (at least 6 weeks if secondary lung abscess or osteomyelitis also present)
- If \textit{penicillin-allergic} or \textit{if meticillin-resistant Staphylococcus aureus}, vancomycin p. 465 + rifampicin
  - \textit{Suggested duration of treatment} 4 weeks (at least 6 weeks if secondary lung abscess or osteomyelitis also present)

Antibacterial therapy for prosthetic valve endocarditis caused by \textit{staphylococci}

- Flucloxacillin p. 486 + rifampicin p. 508 + low-dose gentamicin
  - \textit{Suggested duration of treatment} at least 6 weeks; review need to continue gentamicin p. 450 at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks
- If \textit{penicillin-allergic} or if \textit{meticillin-resistant Staphylococcus aureus}, vancomycin p. 465 + rifampicin + low-dose gentamicin
  - \textit{Suggested duration of treatment} at least 6 weeks; review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks

Antibacterial therapy for endocarditis caused by fully-sensitive \textit{streptococci}

- Benzylpenicillin sodium p. 480
  - \textit{Suggested duration of treatment} 4–6 weeks (6 weeks for prosthetic valve endocarditis)
- If \textit{penicillin-allergic}, vancomycin p. 465 (or teicoplanin p. 464) + low-dose gentamicin
  - \textit{Suggested duration of treatment} 4–6 weeks (stop gentamicin p. 450 after 2 weeks)

Antibacterial therapy for endocarditis caused by less-sensitive \textit{streptococci}

- Benzylpenicillin sodium p. 480 + low-dose gentamicin
  - \textit{Suggested duration of treatment} 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin p. 450 at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks; stop gentamicin at 2 weeks if micro-organisms moderately sensitive to penicillin
- If \textit{penicillin-allergic} or \textit{highly penicillin-resistant}, vancomycin p. 465 (or teicoplanin p. 464) + low-dose gentamicin
  - \textit{Suggested duration of treatment} 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks; stop gentamicin at 2 weeks if micro-organisms moderately sensitive to penicillin

Antibacterial therapy for endocarditis caused by \textit{enterococci}

- Amoxicillin p. 482 (or ampicillin p. 483) + low dose gentamicin p. 450 or benzylpenicillin sodium p. 480 + low-dose gentamicin
  - \textit{Suggested duration of treatment} 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks
- If \textit{penicillin-allergic} or \textit{penicillin-resistant}, vancomycin p. 465 (or teicoplanin p. 464) + low-dose gentamicin
  - \textit{Suggested duration of treatment} 4–6 weeks (6 weeks for prosthetic valve endocarditis); review need to continue gentamicin at 2 weeks—seek specialist advice if gentamicin considered necessary beyond 2 weeks
- If gentamicin resistant, amoxicillin (or ampicillin)
  - Add streptomycin p. 451 (if susceptible) for 2 weeks
  - \textit{Suggested duration of treatment} at least 6 weeks
Antibacterial therapy for endocarditis caused by Haemophilus, Actinobacillus, Cardiobacterium, Eikenella, and Kingella species (‘HACEK’ micro-organisms)

- Amoxicillin p. 482 (or ampicillin p. 483) + low-dose gentamicin
  
  Suggested duration of treatment 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin p. 450 after 2 weeks
- If amoxicillin-resistant, ceftriaxone p. 459 (or cefotaxime p. 457) + low-dose gentamicin
  
  Suggested duration of treatment 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin after 2 weeks

Central nervous system infections, bacterial

Antibacterial therapy for meningitis: initial empirical therapy

- Transfer patient to hospital urgently.
- If meningococcal disease (meningitis with non-blanching rash or meningococcal septicemia) suspected, benzylpenicillin sodium p. 480 should be given before transfer to hospital, so long as this does not delay the transfer. If a patient with suspected bacterial meningitis without non-blanching rash cannot be transferred to hospital urgently, benzylpenicillin sodium should be given before the transfer. Cefotaxime p. 457 may be an alternative in penicillin allergy; chloramphenicol p. 452 may be used if history of immediate hypersensitivity reaction to penicillin or cephalosporins.
- In hospital, consider adjunctive treatment with dexamethasone p. 581 (particularly if pneumococcal meningitis suspected in adults), preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial; avoid dexamethasone in septic shock, meningococcal septicemia, or if immunocompromised, or in meningitis following surgery.
- Adult and child: 3 months–50 years, cefotaxime (or ceftriaxone p. 459)
  
  Consider adding vancomycin p. 465 if prolonged or multiple use of other antibacterials in the last 3 months, or if travelled, in the last 3 months, to areas outside the UK with highly penicillin- and cephalosporin-resistant pneumococci.
  
  Suggested duration of treatment at least 10 days
- Adult over 50 years: cefotaxime (or ceftriaxone) + amoxicillin p. 482 (or ampicillin p. 483)
  
  Consider adding vancomycin if prolonged or multiple use of other antibacterials in the last 3 months, or if travelled, in the last 3 months, to areas outside the UK with highly penicillin- and cephalosporin-resistant pneumococci.
  
  Suggested duration of treatment at least 10 days

Antibacterial therapy for meningitis caused by meningococci

- Benzylpenicillin sodium p. 480 or cefotaxime p. 457 (or ceftriaxone p. 459)
  
  Suggested duration of treatment 7 days.
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol
  
  Suggested duration of treatment 7 days.

Antibacterial therapy for meningitis caused by pneumococci

- Cefotaxime p. 457 (or ceftriaxone p. 459)
  
  Consider adjunctive treatment with dexamethasone p. 581, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial (may reduce penetration of vancomycin p. 465 into cerebrospinal fluid).
  
  If micro-organism penicillin-sensitive, replace cefotaxime with benzylpenicillin sodium p. 480. If micro-organism highly penicillin- and cephalosporin-resistant, add vancomycin and if necessary rifampicin p. 508.
  
  Suggested duration of antibacterial treatment 14 days

Antibacterial therapy for meningitis caused by Haemophilus influenzae

- Cefotaxime p. 457 (or ceftriaxone p. 459)
  
  Consider adjunctive treatment with dexamethasone p. 581, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial.
  
  Suggested duration of antibacterial treatment 10 days.
  
  For H. influenzae type b give rifampicin for 4 days before hospital discharge to those under 10 years of age or to those in contact with vulnerable household contacts
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, or if micro-organism resistant to cefotaxime, chloramphenicol
  
  Consider adjunctive treatment with dexamethasone, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial.
  
  Suggested duration of antibacterial treatment 10 days.
  
  For H. influenzae type b give rifampicin p. 508 for 4 days before hospital discharge to those under 10 years of age or to those in contact with vulnerable household contacts

Antibacterial therapy for meningitis caused by Listeria

- Amoxicillin p. 482 (or ampicillin p. 483) + gentamicin
  
  Suggested duration of treatment 21 days.
  
  Consider stopping gentamicin p. 450 after 7 days.
- If history of immediate hypersensitivity reaction to penicillin, co-trimoxazole
  
  Suggested duration of treatment 21 days.

Ear infections, bacterial

Antibacterial therapy for otitis externa

For topical treatments, consider Otitis externa, under Ear p. 976.

Consider systemic antibacterial if spreading cellulitis or patient systemically unwell.

- Flucloxacillin
  
  If penicillin-allergic, clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471)
  
  If pseudomonas suspected, ciprofloxacin p. 490 (or an aminoglycoside)

Antibacterial therapy for otitis media

Many infections caused by viruses. Most uncomplicated cases resolve without antibacterial treatment. In children without systemic features, antibacterial treatment may be started after 72 hours if no improvement. Consider earlier treatment if deterioration, if systemically unwell, if at high risk of serious complications (e.g. in immunosuppression,
cystic fibrosis), if mastoiditis present, or in children under 2 years of age with bilateral otitis media.

- Amoxicillin p. 482 (or ampicillin p. 483)
  Consider co-amoxiclav p. 484 if no improvement after 48 hours.
  In severe infection, initial parenteral therapy with co-amoxiclav or cefuroxime p. 460.
  Suggested duration of treatment 5 days (longer if severely ill).
- If penicillin-allergic, clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471)
  Suggested duration of treatment 5 days (longer if severely ill)

**Eye infections, bacterial**

**Antibacterial therapy for purulent conjunctivitis**
- Chloramphenicol eye drops p. 955.

**Gastro-intestinal system infections, bacterial**

**Antibacterial therapy for gastro-enteritis**
Frequently self-limiting and may not be bacterial.
- Antibacterial not usually indicated

**Antibacterial therapy for campylobacter enteritis**
Frequently self-limiting; treat if immunocompromised or if severe infection.
- Clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471)
- Alternative, ciprofloxacin
  Strains with decreased sensitivity to ciprofloxacin p. 490 isolated frequently

**Antibacterial therapy for salmonella (non-typhoid)**
Treat invasive or severe infection. Do not treat less severe infection unless there is a risk of developing invasive infection (e.g., immunocompromised patients, those with haemoglobinopathy, or children under 6 months of age).
- Ciprofloxacin p. 490 or cefotaxime p. 457

**Antibacterial therapy for shigellosis**
Antibacterial not indicated for mild cases.
- Ciprofloxacin p. 490 or azithromycin p. 469
- Alternatives if micro-organism sensitive, amoxicillin p. 482 or trimethoprim p. 462

**Antibacterial therapy for typhoid fever**
Infections from Middle-East, South Asia, and South-East Asia may be multiple-antibacterial-resistant and sensitivity should be tested.
- Cefotaxime p. 457 (or ceftriaxone p. 459)
  Azithromycin p. 469 may be an alternative in mild or moderate disease caused by multiple-antibacterial-resistant organisms.
- Alternative if micro-organism sensitive, ciprofloxacin p. 490

**Antibacterial therapy for Clostridium difficile infection**
- For first episode of mild to moderate infection, oral metronidazole
  Suggested duration of treatment 10–14 days
- For second or subsequent episode of infection, for severe infection, for infection not responding to metronidazole p.
  475, or in patients intolerant of metronidazole, oral vancomycin
  For severe infection in patients with multiple co-morbidities who are receiving treatment with other antibacterials, or for second or subsequent episode of infection, fidaxomicin p. 468 can replace vancomycin p. 465
  Suggested duration of treatment 10–14 days
- For infection not responding to vancomycin or fidaxomicin, for life-threatening infection, or in patients with ileus, oral vancomycin + i/v metronidazole
  For infection not responding to vancomycin in patients without life-threatening infection or ileus, fidaxomicin can be used instead of vancomycin + metronidazole
  Suggested duration of treatment 10–14 days

**Antibacterial therapy for biliary-tract infection**
- Ciprofloxacin p. 490 or gentamicin p. 450 or a cephalosporin

**Antibacterial therapy for perforitis**
- A cephalosporin + metronidazole p. 1008 or gentamicin p. 450 + metronidazole or gentamicin + clindamycin p. 467 or piperacillin with tazobactam p. 479 alone

**Antibacterial therapy for perforitis: peritoneal dialysis-associated**
- Vancomycin p. 465 (or teicoplanin p. 464) + ceftazidime p. 458 added to dialysis fluid or vancomycin added to dialysis fluid + ciprofloxacin p. 490 by mouth
  Suggested duration of treatment 14 days or longer

**Genital system infections, bacterial**

**Antibacterial therapy for bacterial vaginosis**
- Oral metronidazole
  Suggested duration of treatment 5–7 days (or high-dose metronidazole p. 475 as a single dose)
- Alternatively, topical metronidazole for 5 days or topical clindamycin p. 467 for 7 days

**Antibacterial therapy for uncomplicated genital chlamydial infection, non-gonococcal urethritis, and non-specific genital infection**
Contact tracing recommended.
- Azithromycin or doxycycline
  Suggested duration of treatment azithromycin p. 469 as a single dose or doxycycline p. 496 for 7 days
- Alternatively, erythromycin p. 471.
  Suggested duration of treatment 14 days

**Antibacterial therapy for gonorrhoea: uncomplicated**
Contact tracing recommended. Consider chlamydia co-infection. Choice of alternative antibacterial regimen depends on locality where infection acquired.
- Azithromycin p. 469 + i.m ceftriaxone
  Suggested duration of treatment is a single-dose of each antibacterial
- Alternatively, when parenteral administration is not possible, cefixime p. 457 + azithromycin
  Suggested duration of treatment is a single-dose of each antibacterial
- Alternatively, if micro-organism is sensitive to a quinolone, ciprofloxacin p. 490 + azithromycin
  Suggested duration of treatment is a single-dose of each antibacterial
Antibacterial therapy for pelvic inflammatory disease

Contact tracing recommended.
- Doxycycline p. 496 + metronidazole p. 475 + single-dose of i/m ceftriaxone p. 459 or oloxacan p. 494 + metronidazole
  *Suggested duration of treatment* 14 days (except i/m ceftriaxone p. 459).
- In severely ill patients, initial treatment with doxycycline p. 496 + i/v ceftriaxone p. 459 + i/v metronidazole p. 475, then switch to oral treatment with doxycycline + metronidazole to complete 14 days’ treatment

Antibacterial therapy for early syphilis (infection of less than 2 years)

Contact tracing recommended.
- Benzathine benzylpenicillin [unlicensed]
  *Suggested duration of treatment* single-dose (repeat dose after 7 days for women in the third trimester of pregnancy).
- Alternatively, doxycycline p. 496 or erythromycin
  *Suggested duration of treatment* 14 days

Antibacterial therapy for late latent syphilis (asymptomatic infection of more than 2 years)

Contact tracing recommended.
- Benzathine benzylpenicillin [unlicensed]
  *Suggested duration of treatment* once weekly for 2 weeks
- Alternatively, doxycycline p. 496
  *Suggested duration of treatment* 28 days

Asymptomatic contacts of patients with infectious syphilis
- Doxycycline p. 496
  *Suggested duration of treatment* 14 days

Musculoskeletal system infections, bacterial

Antibacterial therapy for osteomyelitis

Seek specialist advice if chronic infection or prostheses present.
- Flucloxacillin p. 486
  Consider adding fusidic acid p. 463 or rifampicin p. 508 for initial 2 weeks.
  *Suggested duration of treatment* 6 weeks for acute infection
- If penicillin-allergic, clindamycin p. 467
  Consider adding fusidic acid or rifampicin for initial 2 weeks.
  *Suggested duration of treatment* 6 weeks for acute infection
- If meticillin-resistant Staphylococcus aureus suspected, vancomycin p. 465 (or teicoplanin p. 464)
  Consider adding fusidic acid or rifampicin for initial 2 weeks.
  *Suggested duration of treatment* 6 weeks for acute infection

Antibacterial therapy for septic arthritis

Seek specialist advice if prostheses present.
- Flucloxacillin p. 486
  *Suggested duration of treatment* 4–6 weeks (longer if infection complicated).
- If penicillin-allergic, clindamycin p. 467
  *Suggested duration of treatment* 4–6 weeks (longer if infection complicated).
- If meticillin-resistant Staphylococcus aureus suspected, vancomycin p. 465 (or teicoplanin p. 464)
  *Suggested duration of treatment* 4–6 weeks (longer if infection complicated).
- If gonococcal arthritis or Gram-negative infection suspected, cefotaxime p. 457 (or ceftriaxone p. 459)
  *Suggested duration of treatment* 4–6 weeks (longer if infection complicated; treat gonococcal infection for 2 weeks).

Nose infections, bacterial

Antibacterial therapy for sinusitis

Antibacterial should usually be used only for persistent symptoms and purulent discharge lasting at least 7 days or if severe symptoms. Also, consider antibacterial for those at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis).
- Amoxicillin p. 482 (or ampicillin p. 483) or doxycycline p. 496 or clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471)
  *Suggested duration of treatment* 7 days.
- Consider oral co-amoxiclav p. 484 if no improvement after 48 hours.
- In severe infection, initial parenteral therapy with co-amoxiclav or cefuroxime p. 460 may be required.

Oral bacterial infections

Antibacterial drugs should only be prescribed for the treatment of oral infections on the basis of defined need. They may be used in conjunction with (but not as an alternative to) other appropriate measures, such as providing drainage or extracting a tooth. The ‘blind’ prescribing of an antibacterial for unexplained pyrexia, cervical lymphadenopathy, or facial swelling can lead to difficulty in establishing the diagnosis. In severe oral infections, a sample should always be taken for bacteriology.

Oral infections which may require antibacterial treatment include acute periapical or periodontal abscess, cellulitis, acutely created oral-antral communication, and acute necrotising ulcerative gingivitis, and destructive forms of chronic periodontal disease. Most of these infections are readily resolved by the early establishment of drainage and removal of the cause (typically an infected necrotic pulp). Antibacterials may be required if treatment has to be delayed, in immunocompromised patients, or in those with conditions such as diabetes or Paget’s disease. Certain rarer infections including bacterial sialadenitis, osteomyelitis, actinomycosis, and infections involving fascial spaces such as Ludwig’s angina, require antibiotics and specialist hospital care.

Antibacterial drugs may also be useful after dental surgery in some cases of spreading infection. Infection may spread to involve local lymph nodes, to fascial spaces (where it can cause airway obstruction), or into the bloodstream (where it can lead to cavernous sinus thrombosis and other serious complications). Extension of an infection can also lead to...
maxillary sinusitis; osteomyelitis is a complication, which usually arises when host resistance is reduced.

If the oral infection fails to respond to antibacterial treatment within 48 hours the antibacterial should be changed, preferably on the basis of bacteriological investigation. Failure to respond may also suggest an incorrect diagnosis, lack of essential additional measures (such as drainage), poor host resistance, or poor patient compliance.

Combination of a penicillin (or a macrolide) with metronidazole p. 475 may sometimes be helpful for the treatment of severe oral infections or oral infections that have not responded to initial antibacterial treatment.

**Penicillins**

Phenoxymethylpenicillin p. 481 is effective for dentoalveolar abscess.

**Broad-spectrum penicillins**

Amoxicillin p. 482 is as effective as phenoxymethylpenicillin p. 481 but is better absorbed; however, it may encourage emergence of resistant organisms.

Like phenoxymethylpenicillin, amoxicillin is ineffective against bacteria that produce beta-lactamases.

Amoxicillin may be useful for short course oral regimens. Co-amoxiclav p. 484 is active against beta-lactamase-producing bacteria that are resistant to amoxicillin. Co-amoxiclav may be used for severe dental infection with spreading cellulitis or dental infection not responding to first-line antibacterial treatment.

**Cephalosporins**

The cephalosporins offer little advantage over the penicillins in dental infections, often being less active against anaerobes. Infections due to oral streptococci (often termed viridans streptococci) which become resistant to penicillin are usually also resistant to cephalosporins. This is of importance in the case of patients who have had rheumatic fever and are on long-term penicillin therapy. Cefalexin p. 456 and cefradine p. 458 have been used in the treatment of oral infections.

**Tetracyclines**

In adults, tetracyclines can be effective against oral anaerobes but the development of resistance (especially by oral streptococci) has reduced their usefulness for the treatment of acute oral infections; they may still have a role in the treatment of destructive (refractory) forms of periodontal disease. Doxycycline p. 498 has a longer duration of action than tetracycline p. 498 or oxytetracycline p. 498 and need only be given once daily; it is reported to be more active against anaerobes than some other tetracyclines.

Doxycycline may have a role in the treatment of recurrent aphthous ulceration, or as an adjunct to gingival scaling and root planing for periodontitis.

**Macrolides**

The macrolides are an alternative for oral infections in penicillin-allergic patients or where a beta-lactamase producing organism is involved. However, many organisms are now resistant to macrolides or rapidly develop resistance; their use should therefore be limited to short courses.

**Clindamycin**

Clindamycin p. 467 should not be used routinely for the treatment of oral infections because it may be no more effective than penicillins against anaerobes and there may be cross-resistance with erythromycin-resistant bacteria. Clindamycin can be used for the treatment of dentoalveolar abscess that has not responded to penicillin or to metronidazole p. 475.

**Metronidazole and tinidazole**

Metronidazole p. 475 is an alternative to a penicillin for the treatment of many oral infections where the patient is allergic to penicillin or the infection is due to beta-lactamase-producing anaerobes. It is the drug of first choice for the treatment of acute necrotising ulcerative gingivitis (Vincent’s infection) and pericoronitis; amoxicillin p. 482 is a suitable alternative. For these purposes metronidazole for 3 days is sufficient, but the duration of treatment may need to be longer in pericoronitis. Tinidazole p. 476 is licensed for the treatment of acute ulcerative gingivitis.

**Respiratory system infections, bacterial**

**Antibacterial therapy for haemophilus influenzae epiglottitis**

- Cefotaxime p. 457 (or ceftriaxone p. 459)
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol p. 452

**Antibacterial therapy for chronic bronchitis: acute exacerbations**

Treat if increase in sputum purulence accompanied by an increase in sputum volume or increase in dyspnoea.

- Amoxicillin p. 482 (or ampicillin p. 483) or a tetracycline p. 496
  - Some pneumococci and Haemophilus influenzae strains tetracycline-resistant; approx. 20% H. influenzae strains amoxicillin-resistant
  - Suggested duration of treatment 5 days; longer treatment may be necessary in severely ill patients
- Alternative, clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471)
  - Suggested duration of treatment 5 days; longer treatment may be necessary in severely ill patients

**Antibacterial therapy for pneumonia: low-severity community-acquired**

- Amoxicillin p. 482 (or ampicillin p. 483)
  - Pneumococci with decreased penicillin sensitivity being isolated, but not yet common in UK.
  - If atypical pathogens suspected, add clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471). If staphylococci suspected (e.g. in influenza or measles), add flucloxacillin p. 486. 
  - Suggested duration of treatment 7 days (14–21 days for infections caused by staphylococci)
- Alternatives, doxycycline p. 496 or clarithromycin (or azithromycin or erythromycin)
  - Suggested duration of treatment 7 days (14–21 days for infections caused by staphylococci)

**Antibacterial therapy for pneumonia: moderate-severity community-acquired**

- Amoxicillin p. 482 (or ampicillin p. 483) + clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471) or doxycycline p. 496 alone
  - Pneumococci with decreased penicillin sensitivity being isolated, but not yet common in UK.
  - If meticillin-resistant Staphylococcus aureus suspected, add vancomycin p. 465 (or teicoplanin p. 464).
  - Suggested duration of treatment 7 days (14–21 days for infections caused by staphylococci)
Antibacterial therapy for pneumonia: high-severity community-acquired
- Benzylpenicillin sodium p. 480 + clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471) or benzylpenicillin sodium + doxycycline
  If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin p. 465 (or teicoplanin p. 464).
  *Suggested duration of treatment* 7–10 days (may extend treatment to 14–21 days in some cases e.g. if staphylococci suspected)
- If life-threatening infection, or if Gram-negative infection suspected, or if co-morbidities present, or if living in long-term residential or nursing home
  *Suggested duration of treatment* 7–10 days (may extend treatment to 14–21 days in some cases e.g. if staphylococci or Gram-negative enteric bacilli suspected)
- Alternatives if life-threatening infection, or if Gram-negative infection suspected, or if co-morbidities present, or if living in long-term residential or nursing home, cefuroxime p. 460 + clarithromycin (or azithromycin or erythromycin) or cefotaxime (or ceftriaxone p. 459) + clarithromycin (or azithromycin or erythromycin)
  If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin (or teicoplanin).
  *Suggested duration of treatment* 7–10 days (may extend treatment to 14–21 days in some cases e.g. if staphylococci or Gram-negative enteric bacilli suspected)
- Alternatives if life-threatening infection, or if Gram-negative infection suspected, or if co-morbidities present, or if living in long-term residential or nursing home, co-amoxiclav p. 484 + clarithromycin (or azithromycin or erythromycin) or benzylpenicillin sodium + doxycycline
  If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin p. 465 (or teicoplanin).
  *Suggested duration of treatment* 7–10 days (may extend treatment to 14–21 days in some cases e.g. if staphylococci suspected)
  - Clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471)
    - If high-severity Legionella infection, add rifampicin p. 508 for the first few days.
    - *Suggested duration of treatment* 14 days (usually 7–10 days for Legionella)
  - *Alternative if Legionella infection suspected*, a quinolone
    - If high-severity Legionella infection, add clarithromycin (or azithromycin or erythromycin) or rifampicin for the first few days.
    - *Suggested duration of treatment usually* 7–10 days
  - *Alternative for chlamydial or mycoplasma infections*, doxycycline p. 496
    - *Suggested duration of treatment* 14 days

Antibacterial therapy for pneumonia: hospital-acquired
- Early-onset infection less than 5 days after admission to hospital, co-amoxiclav p. 484 or cefuroxime
  If life-threatening infection, or if history of antibacterial treatment in the last 3 months, or if resistant micro-organisms suspected, treat as for late-onset hospital-acquired pneumonia.
  *Suggested duration of treatment* 7 days
- Late-onset infection (more than 5 days after admission to hospital), an antipseudomonal penicillin (e.g. piperacillin with tazobactam p. 479) or a broad-spectrum cephalosporin (e.g. ceftazidime p. 458) or another antipseudomonal beta-lactam or a quinolone (e.g. ciprofloxacin p. 490)
  If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin p. 465.
  For severe illness caused by *Pseudomonas aeruginosa*, consider adding an aminoglycoside.
  *Suggested duration of treatment* 7 days (longer if *Pseudomonas aeruginosa* confirmed)

Skin infections, bacterial

Antibacterial therapy for impetigo: small areas of skin infected
Seek local microbiology advice before using topical treatment in hospital.
- Topical fusidic acid p. 1008
  - *Suggested duration of treatment* 7 days is usually adequate (max. 10 days).
- Alternatively, if meticillin-resistant *Staphylococcus aureus*, topical mupirocin p. 1009
  - *Suggested duration of treatment* 7 days is usually adequate (max. 10 days).

Impetigo: widespread infection
- Oral flucloxacillin p. 486
  - If streptococci suspected in severe infection, add phenoxymethylpenicillin p. 481.
  - *Suggested duration of treatment* 7 days.
- If penicillin-allergic, oral clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471)
  - *Suggested duration of treatment* 7 days.

Antibacterial therapy for erysipelas
- Phenoxymethylpenicillin p. 481 or benzylpenicillin sodium
  - If severe infection, replace phenoxymethylpenicillin or benzylpenicillin sodium with high-dose flucloxacillin p. 486
  - *Suggested duration of treatment* at least 7 days.
- If penicillin-allergic, clindamycin p. 467 or clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471)
  - *Suggested duration of treatment* at least 7 days

Antibacterial therapy for cellulitis
- Flucloxacillin p. 486 (high-dose)
  - If streptococcal infection confirmed, replace flucloxacillin with phenoxymethylpenicillin p. 481 or benzylpenicillin sodium p. 480
  - If Gram-negative bacteria or anaerobes suspected, use broad-spectrum antibacterials.
- If penicillin-allergic, clindamycin p. 467 or clarithromycin p. 470 (or azithromycin p. 469 or erythromycin p. 471) or vancomycin p. 465 (or teicoplanin p. 464)
  - If Gram-negative bacteria suspected, use broad-spectrum antibacterials.

Antibacterial therapy for animal and human bites
Cleanse wound thoroughly. For tetanus-prone wound, give human tetanus immunoglobulin p. 1065 (with a tetanus-containing vaccine if necessary, according to immunisation history and risk of infection). Consider rabies prophylaxis for bites from animals in endemic countries. Assess risk of blood-borne viruses (including HIV, hepatitis B and C) and give appropriate prophylaxis to prevent viral spread.
Co-amoxiclav p. 484.
- If penicillin-allergic, doxycycline p. 496 + metronidazole p. 475

Antibacterial therapy for mastitis during breast-feeding
Treat if severe, if systemically unwell, if nipple fissure present, if symptoms do not improve after 12–24 hours of effective milk removal, or if culture indicates infection.

- Flucloxacillin p. 486, if *penicillin-allergic*, erythromycin

Continue breast-feeding or expressing milk during treatment.

Suggested duration of treatment 10–14 days.

AMINOGLYCOSIDES

Aminoglycosides
These include amikacin p. 450, gentamicin p. 450, neomycin sulfate p. 451, streptomycin p. 451, and tobramycin p. 452. All are bactericidal and active against some Gram-positive and many Gram-negative organisms. Amikacin, gentamicin, and tobramycin are also active against *Pseudomonas aeruginosa*; streptomycin is active against *Mycobacterium tuberculosis* and is now almost entirely reserved for tuberculosis.

The aminoglycosides are not absorbed from the gut (although there is a risk of absorption in inflammatory bowel disease and liver failure) and must therefore be given by injection for systemic infections.

Gentamicin is the aminoglycoside of choice in the UK and is used widely for the treatment of serious infections. It has a broad spectrum but is inactive against anaerobes and has poor activity against haemolytic streptococci and pneumococci. When used for the ‘blind’ therapy of undiagnosed serious infections it is usually given in conjunction with a penicillin or metronidazole p. 475 (or both). Gentamicin is used together with another antibiotic for the treatment of endocarditis. Streptomycin may be used as an alternative in gentamicin-resistant enterococcal endocarditis.

Loading and maintenance doses of gentamicin may be calculated on the basis of the patient’s weight and renal function (e.g. using a nomogram); adjustments are then made according to serum-gentamicin concentrations. High doses are occasionally indicated for serious infections, especially in the neonate, in the patient with cystic fibrosis, or in the immunocompromised patient. Whenever possible treatment should not exceed 7 days.

Amikacin is more stable than gentamicin to enzyme inactivation. Amikacin is used in the treatment of serious infections caused by gentamicin-resistant Gram-negative bacilli.

Tobramycin has similar activity to gentamicin. It is slightly more active against *Ps. aeruginosa* but shows less activity against certain other Gram-negative bacteria. Tobramycin can be administered by nebuliser or by inhalation of powder on a cyclical basis (28 days of tobramycin followed by a 28-day tobramycin-free interval) for the treatment of chronic pulmonary *Ps. aeruginosa* infection in cystic fibrosis; however, resistance may develop and some patients do not respond to treatment.

Neomycin sulfate is too toxic for parenteral administration and can only be used for infections of the skin or mucous membranes or to reduce the bacterial population of the colon prior to bowel surgery or in hepatic failure. Oral administration may lead to malabsorption. Small amounts of neomycin sulfate may be absorbed from the gut in patients with hepatic failure and, as these patients may also be uremic, cumulation may occur with resultant ototoxicity.

Once daily dosage
Once daily administration of aminoglycosides is more convenient, provides adequate serum concentrations, and in many cases has largely superseded *multiple daily dose regimens* (given in 2–3 divided doses during the 24 hours). Local guidelines on dosage and serum concentrations should be consulted. A once-daily, high-dose regimen of an aminoglycoside should be avoided in patients with endocarditis due to Gram-positive bacteria, HACEK endocarditis, burns of more than 20% of the total body surface area, or creatinine clearance less than 20 mL/minute. There is insufficient evidence to recommend a once daily, high-dose regimen of an aminoglycoside in pregnancy.

Serum concentrations
Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy. Serum-aminoglycoside concentrations should be monitored in patients receiving parenteral aminoglycosides and must be determined in the elderly, in obesity, and in cystic fibrosis, or if high doses are being given, or if there is renal impairment.

Aminoglycosides (by injection)

CONTRA-INDICATIONS
Myasthenia gravis
(aminoglycosides may impair neuromuscular transmission)

CAUTIONS
GENERAL CAUTIONS
Care must be taken with dosage (the main side-effects of the aminoglycosides are dose-related) - conditions characterised by muscular weakness (aminoglycosides may impair neuromuscular transmission) - if possible, dehydration should be corrected before starting an aminoglycoside

SPECIFIC CAUTIONS
Whenever possible, parenteral treatment should not exceed 7 days

INTERACTIONS → Appendix 1 (aminoglycosides).
If possible, aminoglycosides should not be given with potentially ototoxic drugs (e.g. cisplatin). Administration of an aminoglycoside and of an ototoxic diuretic (e.g. furosemide) should be separated by as long a period as practicable.

SIDE-EFFECTS

- Rare Antibiotic-associated colitis - electrolyte disturbances - hypocalcaemia - hypokalaemia - hypomagnesaemia on prolonged therapy - nausea - peripheral neuropathy - stomatitis - vomiting
- Very rare Blood disorders - CNS effects - convulsions - encephalopathy - headache
- Frequency not known Auditory damage - impaired neuromuscular transmission - irreversible ototoxicity - nephrotoxicity - transient myasthenic syndrome in patients with normal neuromuscular function with large doses given during surgery - vestibular damage

SIDE-EFFECTS, FURTHER INFORMATION

Nephrotoxicity Occurs most commonly in the elderly; therefore, monitoring is particularly important in these patients, who may require reduced doses.

PREGNANCY
There is a risk of auditory or vestibular nerve damage in the infant when aminoglycosides are used in the second and third trimesters of pregnancy. The risk is greatest with streptomycin. The risk is probably very small with gentamicin and tobramycin, but their use should be avoided unless essential.
If given during pregnancy, serum-aminoglycoside concentration monitoring is essential.

- **RENAL IMPAIRMENT** If there is impairment of renal function, the interval between doses must be increased; if the renal impairment is severe, the dose itself should be reduced as well. Excretion of aminoglycosides is principally via the kidney and accumulation occurs in renal impairment. Otoxicity and nephrotoxicity occur commonly in patients with renal failure. A once-daily, high-dose regimen of an aminoglycoside should be avoided in patients with a creatinine clearance less than 20 mL/minute.

  Serum-aminoglycoside concentrations must be monitored in patients with renal impairment; earlier and more frequent measurement of aminoglycoside concentration may be required.

- **MONITORING REQUIREMENTS**
  - Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy.
  - Serum-aminoglycoside concentrations should be measured in all patients receiving parenteral aminoglycosides and must be determined in the elderly, obesity, if high doses are being given and in cystic fibrosis.
  - In patients with normal renal function, aminoglycoside concentrations should be measured after 3 or 4 doses of a multiple daily dose regimen and after a dose change. For multiple daily dose regimens, blood samples should be taken approximately 1 hour after intramuscular or intravenous administration (‘peak’ concentration) and also just before the next dose (‘trough’ concentration). If the pre-dose (‘trough’) concentration is high, the interval between doses must be increased. If the post-dose (‘peak’) concentration is high, the dose must be decreased. For once daily dose regimens, consult local guidelines on serum concentration monitoring.
  - Renal function should be assessed before starting an aminoglycoside and during treatment.
  - Auditory and vestibular function should also be monitored during treatment.

- **SIDE-EFFECTS**
  - Uncommon Rash

- **MONITORING REQUIREMENTS**
  - **Multiple daily dose regimen:** one-hour (‘peak’) serum concentration should not exceed 30 mg/litre; pre-dose (‘trough’) concentration should be less than 10 mg/litre.
  - **Once daily dose regimen:** pre-dose (‘trough’) concentration should be less than 5 mg/litre.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Amikin®); intermittent in Glucose 5% or Sodium chloride 0.9%. To be given over 30 minutes.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Once daily dose regime not to be used for endocarditis, febrile neutropenia, or meningitis. Consult local guidelines.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **AMIKACIN (Non-proprietary)**
  - Amikacin (as Amikacin sulfate) 250 mg per 1 ml
  - Amikacin 500mg/2ml solution for injection vials | 5 vial | £60.00
  - Amikin (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Amikacin (as Amikacin sulfate) 50 mg per 1 ml
  - Amikin 100mg/2ml solution for injection vials | 5 vial | £10.33

---

**Gentamicin**

**INDICATIONS AND DOSE**

Gram-positive bacterial endocarditis or HACEK endocarditis (in combination with other antibacterials)

- **BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**
  - Adult: 1 mg/kg every 12 hours, intravenous injection to be administered over at least 3 minutes, to be given in a multiple daily dose regimen

- **Septicaemia | Meningitis and other CNS infections | Biliary-tract infection | Acute pyelonephritis | Endocarditis | Pneumonia in hospital patients | Adjunct in listerial meningitis | Prostatitis**
  - **BY INTRAVENOUS INFUSION OR BY SLOW INTRAVENOUS INJECTION OR BY INTRAMUSCULAR INJECTION**
  - Adult: 3–5 mg/kg daily in 3 divided doses, to be given in a multiple daily dose regimen, divided doses to be given every 8 hours, intravenous injection to be administered over at least 3 minutes
  - **BY INTRAVENOUS INFUSION**
  - Adult: Initially 5–7 mg/kg, subsequent doses adjusted according to serum-gentamicin concentration, to be given in a once daily dose regimen

- **CNS infections (administered on expert advice)**
  - **BY INTRATHECAL INJECTION**
  - Adult: 1 mg daily, increased if necessary to 5 mg daily, seek specialist advice

- **Surgical prophylaxis (including joint replacement surgery)**
  - **BY SLOW INTRAVENOUS INJECTION**
  - Adult: 1.5 mg/kg, intravenous injection to be administered over at least 3 minutes, administer dose up to 30 minutes before the procedure, dose may be repeated every 8 hours for high-risk procedures and joint replacement surgery; up to 3 further doses may be given
  - **BY INTRAVENOUS INFUSION**
  - Adult: 5 mg/kg for 1 dose, administer dose up to 30 minutes before the procedure

**Doses at extremes of body-weight**

To avoid excessive dosage in obese patients, use ideal weight for height to calculate dose and monitor serum-gentamicin concentration closely.

- **SIDE-EFFECTS**
  - Uncommon Rash

- **MONITORING REQUIREMENTS**
  - For multiple daily dose regimen, one-hour (‘peak’) serum concentration should be 5–10 mg/litre; pre-dose (‘trough’) concentration...
should be less than 2 mg/litre. For multiple daily dose regimens in endocarditis, one-hour (‘peak’) serum concentration should be 3–5 mg/litre; pre-dose (‘trough’) concentration should be less than 1 mg/litre. Serum-gentamicin concentration should be measured after 3 or 4 doses, then at least every 3 days and after a dose change (more frequently in renal impairment). For once-daily dose regimen, consult local guidelines on monitoring serum-gentamicin concentration.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Cidomycin®); Gentamicin paediatric injection, Beacon; Gentamicin injection Hospira), give intermittently or via drip tubing in Glucose 5% or Sodium Chloride 0.9%. Suggested volume for intermittent infusion 50–100 ml given over 20–30 minutes (given over 60 minutes for once daily dose regimen).

**PRESCRIBING AND DISPENSING INFORMATION** Local guidelines may vary in the dosing advice provided for once daily administration.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, oral suspension, oral solution, cream, injection.

**Solution for injection**

- **GENTAMICIN (Non-proprietary)**
  - Gentamicin (as Gentamicin sulfate) 5 mg per 1 ml Gentamicin Intrathecal 5mg/1ml solution for injection ampoules | 5 ampoule (£50) £22.50 (Hospital only)
  - Gentamicin (as Gentamicin sulfate) 10 mg per 1 ml Gentamicin Paediatric 20mg/2ml solution for injection vials | 5 vial (£50) £11.25
  - Gentamicin (as Gentamicin sulfate) 40 mg per 1 ml Gentamicin 80mg/2ml solution for injection vials | 5 vial (£50) £20.00
  - Gentamicin 80mg/2ml solution for injection ampoules | 10 ampoule (£50) £30.00
- **Cidomycin**
  - Gentamicin (as Gentamicin sulfate) 40 mg per 1 ml Cidomycin Adult injectable 80mg/2ml solution for injection vials | 5 vial (£50) £6.88
  - Cidomycin Adult Injectable 80mg/2ml solution for injection ampoules | 5 ampoule (£50) £6.88

**Neomycin sulfate**

**INDICATIONS AND DOSE**

- **Bowel sterilisation before surgery**
  - **BY MOUTH**
    - Adult: 1 g every 1 hour for 4 hours, then 1 g every 4 hours for 2–3 days
  - **Hepatic coma**
    - Adult: Up to 4 g daily in divided doses usually for 5–7 days

- **CONTRA-INDICATIONS** Intestinal obstruction - myasthenia gravis (aminoglycosides may impair neuromuscular transmission).

- **CAUTIONS** Avoid prolonged use

**CAUTIONS, FURTHER INFORMATION**

Although neomycin is associated with the same cautions as other aminoglycosides it is generally considered too toxic for systemic use.

**INTERACTIONS**

- **Appendix 1 (aminoglycosides).**

**SIDE-EFFECTS**

- **Common or very common** Rash
- **Frequency not known** Impaired intestinal absorption with steatorrhea and diarrhoea - increased salivation

**SIDE-EFFECTS, FURTHER INFORMATION**

Although neomycin is associated with the same side effects as other aminoglycosides it is generally considered too toxic for systemic use and is poorly absorbed after oral administration.

**PREGNANCY**

There is a risk of auditory or vestibular nerve damage in the infant when aminoglycosides are used in the second and third trimesters of pregnancy.

**HEPATIC IMPAIRMENT** Absorbed from gastro-intestinal tract in liver disease—increased risk of ototoxicity.

**RENAI IMPAIRMENT** Adjust dose according to individual patient monitoring. Increased potential for systemic side effects, notably ototoxicity and nephrotoxicity in renal impairment.

**MONITORING REQUIREMENTS**

- Renal function should be assessed before starting an aminoglycoside and during treatment.
- Auditory and vestibular function should also be monitored during treatment.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, cream, injection.

**Tablet**

- **NEOMYCIN SULFATE (Non-proprietary)**
  - Neomycin sulfate 500 mg Neomycin 500mg tablets | 100 tablet (£50) £34.69

**Streptomycin**

**INDICATIONS AND DOSE**

Tuberculosis, resistant to other treatment, in combination with other drugs

**BY DEEP INTRAMUSCULAR INJECTION**

- Adult: 15 mg/kg daily (max. per dose 1 g), reduce dose in those under 50 kg and those over 40 years

**Adjunct to doxycycline in brucellosis (administered on expert advice)**

**BY DEEP INTRAMUSCULAR INJECTION**

- Adult: (consult local protocol)

**Enterococcal endocarditis**

- Adult: (consult local protocol)

**UNLICENSED USE**

Use in tuberculosis is an unlicensed indication.

**Important safety information**

Side-effects increase after a cumulative dose of 100 g, which should only be exceeded in exceptional circumstances.

**SIDE-EFFECTS**

- **Common or very common** Rash
- **Frequency not known** Hypersensitivity reactions - paraesthesia of mouth

**RENAI IMPAIRMENT** Should preferably be avoided. If essential, use with great care and consider dose reduction.

**MONITORING REQUIREMENTS**

- One-hour (‘peak’) concentration should be 15–40 mg/litre; pre-dose (‘trough’) concentration should be less than 5 mg/litre (less than 1 mg/litre in renal impairment or in those over 50 years).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: powder for solution for injection.
Tobramycin

**INDICATIONS AND DOSE**

- Septicaemia | Meningitis and other CNS infections | Biliary tract infection | Acute pyelonephritis or prostatitis | Pneumonia in hospital patients
  - BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION
    - Adult: 3 mg/kg daily in 3 divided doses; increased if necessary up to 5 mg/kg daily in 3–4 divided doses, increased dose used in severe infection; dose to be reduced back to 3 mg/kg as soon as clinically indicated

- Urinary-tract infection
  - BY INTRAMUSCULAR INJECTION
  - Adult: 112 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin nebuliser solution

  - BY INHALATION OF POWDER
  - Adult: 112 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin inhalation powder

**CAUTIONS**

- When used by inhalation | Severe haemoptysis—risk of further haemorrhage
- **SIDE-EFFECTS**
  - Uncommon
  - With intramuscular use | Rash
  - With intravenous use | Rash
  - Frequency not known
  - When used by inhalation | Bronchospasm | cough (more frequent by inhalation of powder) | dysphonia | epistaxis | haemoptysis | laryngitis | mouth ulcers | pharyngitis | salivary hypersecretion | taste disturbances

**MONITORING REQUIREMENTS**

- With intramuscular use or intravenous use | One-hour (‘peak’) serum concentration should not exceed 10 mg/litre; pre-dose (‘trough’) concentration should be less than 2 mg/litre.
- When used by inhalation | Measure lung function before and after initial dose of tobramycin and monitor for bronchospasm; if bronchospasm occurs in a patient not using a bronchodilator, repeat test using bronchodilator. Monitor renal function before treatment and then annually.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use | For intravenous infusion (Nebcin®); intermittent or via drip tubing in Glucose 5% or Sodium chloride 0.9%. For adult intermittent infusion suggested volume 50–100 mL given over 20–60 minutes.
- When used by inhalation | Other inhaled drugs should be administered before tobramycin.

**PATIENT AND CARER ADVICE**

Patient counselling is advised for Tobramycin dry powder for inhalation (administration).

**NATIONAL FUNDING/ACCESS DECISIONS**

- **NICE technology appraisals (TAs)**
  - Tobramycin by dry powder inhalation for pseudomonal lung infection in cystic fibrosis (March 2013) NICE TA276
  - Tobramycin dry powder for inhalation is recommended for chronic pulmonary infection caused by *Pseudomonas aeruginosa* in patients with cystic fibrosis only if there is an inadequate response to colistimethate sodium, or if colistimethate sodium cannot be used because of contra-indications or intolerance. The manufacturer must provide tobramycin dry powder for inhalation at the discount agreed as part of the patient access scheme to primary, secondary and tertiary care in the NHS. Patients currently receiving tobramycin dry powder for inhalation can continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA276

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Solution for injection**

- **TOBRAMYCIN (Non-proprietary)**
  - Tobramycin (as Tobramycin sulfate) 40 mg per 1 ml Tobramycin 40mg/1ml solution for injection vials | 10 vial (PMS) £37.00 | 10 vial (PMS) £37.00 (Hospital only)
  - Tobramycin 80mg/2ml solution for injection vials | 5 vial (PMS) £20.80 | 10 vial (PMS) £37.72 | 10 vial (PMS) £47.00 (Hospital only)
  - Tobramycin 240mg/6ml solution for injection vials | 1 vial (PMS) £19.20

- **Brands** may include Nebcin

**Inhalation powder**

- **Tobi Podhaler** (Novartis Pharmaceuticals UK Ltd)

**Nebuliser liquid**

- **Bramitob** (Chiesi Ltd)
  - Tobramycin 75 mg per 1 ml Bramitob 300mg/4ml nebuliser solution 4ml ampoules | 56 ampoule (PMS) £1.187.00

- **TOBI** (Novartis Pharmaceuticals UK Ltd)
  - Tobramycin 60 mg per 1 ml Tobi 300mg/5ml nebuliser solution 5ml ampoules | 56 ampoule (PMS) £1.187.20 DT price + £1.187.20

**Brands** may include Tymbrel

**BACTERIAL TRANSEPITIDATION INHIBITORS**

**Chloramphenicol**

**INDICATIONS AND DOSE**

- Life threatening infections particularly those caused by *Haemophilus influenzae* | Typhoid fever
  - BY MOUTH OR BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION
  - Adult: 12.5 mg/kg every 6 hours, in exceptional cases dose can be doubled for severe infections such as sepsicaemia and meningitis, providing high doses reduced as soon as clinically indicated

**DRUG ACTION**

Chloramphenicol is a potent broad-spectrum antibiotic.

**CONTRA-INDICATIONS**

Acute porphyrias p. 864

**CAUTIONS**

Avoid repeated courses and prolonged treatment

**INTERACTIONS** → Appendix 1 (chloramphenicol).

**SIDE-EFFECTS**

- Blood disorders - depression - diarrhoea - dry mouth - erythema multiforme - glossitis - headache - nausea - nocturnal haemoglobinuria - optic neuritis - peripheral neuritis - reversible and irreversible aplastic anaemia (with reports of resulting leukaemia) - stomatitis - urticaaria - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

Associated with serious haematological side-effects when given systemically and should therefore be reserved for the treatment of life-threatening infections.

**PREGNANCY**

Manufacturer advises avoid; neonatal ‘grey-baby syndrome’ if used in third trimester.

**BREAST FEEDING**

Manufacturer advises avoid; use another antibiotic; may cause bone-marrow toxicity in infant;
Concentration in milk usually insufficient to cause ‘grey syndrome’.

- **HEPATIC IMPAIRMENT**
  Avoid if possible—increased risk of bone-marrow depression. Reduce dose and monitor plasma-chloramphenicol concentration in hepatic impairment.

- **RENAL IMPAIRMENT**
  Avoid in severe renal impairment unless no alternative; dose-related depression of haematopoiesis.

- **MONITORING REQUIREMENTS**
  Plasma concentration monitoring preferred in the elderly.

- **Recommended peak plasma concentration** (approx. 2 hours after administration by mouth, intravenous injection or infusion) 10–25 mg/litre; pre-dose (‘trough’) concentration should not exceed 15 mg/litre.

- **Blood counts required** before and periodically during treatment.

- **DIRECTIONS FOR ADMINISTRATION**
  For *intravenous infusion* *(Kemicetine®)*, give intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  **Capsule**
  - **Chloramphenicol (Non-proprietary)**
    - Chloramphenicol 250 mg
    - 60 capsule (Pfizer) £37.00

  **Powder for solution for injection**
  - **Electrolytes: May contain Sodium**
  - **Kemicetine (Pfizer Ltd)**
    - Chloramphenicol (as Chloramphenicol sodium succinate) 1 gram
    - 1 vial (Pfizer) £1.39

### CARBAPENEMES

#### Carbapenems

The carbapenems are beta-lactam antibacterials with a broad-spectrum of activity which includes many Gram-positive and Gram-negative bacteria, and anaerobes; *imipenem* *(imipenem with cilastatin p. 454)* and meropenem p. 454 have good activity against *Pseudomonas aeruginosa*. The carbapenems are not active against meticillin-resistant *Staphylococcus aureus* and *Enterococcus faecium*.

Imipenem (imipenem with cilastatin) and meropenem are used for the treatment of severe hospital-acquired infections and polymicrobial infections including septicaemia, hospital-acquired pneumonia, intra-abdominal infections, skin and soft-tissue infections, and complicated urinary-tract infections.

Ertapenem below is licensed for treating abdominal and gynaecological infections and for community-acquired pneumonia, but it is not active against atypical respiratory pathogens and it has limited activity against penicillin-resistant pneumococci. It is also licensed for treating foot infections of the skin and soft tissue in patients with diabetes. Unlike the other carbapenems, ertapenem is not active against *Pseudomonas* or against *Acinetobacter spp*.

Imipenem is partially inactivated in the kidney by enzymatic activity and is therefore administered in combination with cilastatin (imipenem with cilastatin), a specific enzyme inhibitor, which blocks its renal metabolism. Meropenem and ertapenem are stable to the renal enzyme which inactivates imipenem and therefore can be given without cilastatin.

Side-effects of imipenem with cilastatin are similar to those of other beta-lactam antibiotics. Meropenem has less seizure-inducing potential and can be used to treat central nervous system infection.

### Ertapenem

#### INDICATIONS AND DOSE

<table>
<thead>
<tr>
<th>Abdominal infections</th>
<th>Acute gynaecological infections</th>
</tr>
</thead>
<tbody>
<tr>
<td>Community-acquired pneumonia</td>
<td></td>
</tr>
</tbody>
</table>

- **BY INTRAVENOUS INFUSION**
  - Adult: 1 g once daily

- **Diabetic foot infections of the skin and soft tissue**
  - **BY INTRAVENOUS INFUSION**
  - Adult: 1 g once daily

- **Surgical prophylaxis, colorectal surgery**
  - **BY INTRAVENOUS INFUSION**
  - Adult: 1 g for 1 dose; dose to be completed within 1 hour before surgery

- **CAUTIONS**
  - CNS disorders—risk of seizures • elderly

- **INTERACTIONS**
  - → Appendix 1 (ertapenem).

- **SIDE-EFFECTS**
  - **Common or very common**
    - Diarrhoea • headache • injection-site reactions • nausea • pruritus • raised platelet count • rash (also reported with eosinophilia and systemic symptoms) • vomiting
  - **Uncommon**
    - Abdominal pain • anorexia • antibiotic-associated colitis • asthenia • bradycardia • chest pain • confusion • constipation • dizziness • dry mouth • dyspepsia • dysphoria • hypotension • melaena • oedema • petechiae • pharyngeal discomfort • raised glucose • seizures • sleep disturbances • taste disturbances
  - **Rare**
    - Agitation • anxiety • arrhythmia • blood disorders • cholecystitis • cough • depression • dysphagia • electrolyte disturbances • haemorrhage • hypoglycaemia • increase in blood pressure • jaundice • liver disorder • muscle cramp • nasal congestion • neutropenia • pelvic peritonitis • renal impairment • scleral disorder • syncope • thrombocytopenia • tremor • wheezing

- **Frequency not known**
  - Dyskinesia • hallucinations

- **ALLERGY AND CROSS-SENSITIVITY**
  - Avoid if history of immediate hypersensitivity reaction to beta-lactam antibacterials. Use with caution in patients with sensitivity to beta-lactam antibacterials.

- **PREGNANCY**
  - Manufacturer advises avoid unless potential benefit outweighs risk.

- **BREAST FEEDING**
  - Present in milk—manufacturer advises avoid.

- **RENAL IMPAIRMENT**
  - Risk of seizures; max. 500 mg daily if eGFR less than 30 mL/minute/1.73 m².

- **DIRECTIONS FOR ADMINISTRATION**
  - **FOR INTRAVENOUS INFUSION** *(Invanz®)*, give intermittently in Sodium chloride 0.9%. Reconstitute 1 g with 10 mL Water for injections or Sodium chloride 0.9%; dilute requisite dose in infusion fluid to a final concentration not exceeding 20 mg/mL; give over 30 minutes; incompatible with glucose solutions.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Powder for solution for infusion**
  - **Electrolytes: May contain Sodium**
  - **Invanz** *(Merck Sharp & Dohme Ltd)*
    - Ertapenem (as Ertapenem sodium) 1 gram Invanz 1g powder for solution for infusion vials | 1 vial (Pfizer) £31.65
Imipenem with cilastatin

INDICATIONS AND DOSE
Aerobic and anaerobic Gram-positive and Gram-negative infections (not indicated for CNS infections) | Hospital-acquired septicemia

BY INTRAVENOUS INFUSION
- Adult: 500 mg every 6 hours, alternatively 1 g every 8 hours
Infection caused by Pseudomonas or other less sensitive organisms
Empirical treatment of infection in febrile patients with neutropenia | Life-threatening infection
BY INTRAVENOUS INFUSION
- Adult: 1 g every 6 hours

- CAUTIONS CNS disorders - epilepsy
- INTERACTIONS → Appendix 1 (imipenem with cilastatin).
- SIDE-EFFECTS
  - Common or very common Diarrhoea - eosinophilia - nausea (may reduce rate of infusion) - rash - vomiting
  - Rare Acute renal failure - anaphylactic reactions - antibiotic-associated colitis - encephalopathy - hearing loss - hepatitis - paraesthesia - polyuria - Stevens-Johnson syndrome - taste disturbances - tooth, tongue or urine discoloration - toxic epidermal necrolysis - tremor
  - Frequency not known Neurotoxicity (at high dose, renal failure, CNS disease)
- ALLERGY AND CROSS-SENSITIVITY Avoid if history of immediate hypersensitivity reaction to beta-lactam antibacterials. Use with caution in patients with sensitivity to beta-lactam antibacterials.
- PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk (toxicity in animal studies).
- BREAST FEEDING Present in milk but unlikely to be absorbed.
- RENAL IMPAIRMENT Risk of CNS side-effects; reduce dose if eGFR less than 70 mL/minute/1.73 m² – consult product literature.
- EFFECT ON LABORATORY TESTS Positive Coombs’ test.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion dilute to a concentration of 5 mg (as imipenem) in Sodium chloride 0.9%: give up to 500 mg of imipenem over 20–30 minutes, give dose greater than 500 mg (as imipenem) over 40–60 minutes.
- PRESCRIBING AND DISPENSING INFORMATION Dose expressed in terms of imipenem.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.
  - Powder for solution for infusion
    ELECTROLYTES: May contain Sodium
    - IMIPENEM WITH CILASTATIN (Non-proprietary)
      Cilastatin (as Cilastatin sodium) 500 mg, Imipenem (as Imipenem monohydrate) 500 mg | Cilastatin 500mg powder for solution for infusion vials | 1 vial (P05) £10.00
      - 5 vial (P05) £60.00 (Hospital only) | 10 vial (P05) £55.45–65.45
      - Primaxin IV (Merk Sharp & Dohme Ltd) Cilastatin (as Cilastatin sodium) 500 mg, Imipenem (as Imipenem monohydrate) 500 mg | Primaxin IV 500mg powder for solution for infusion vials | 1 vial (P05) £12.00

Meropenem

INDICATIONS AND DOSE
Aerobic and anaerobic Gram-positive and Gram-negative infections | Hospital acquired septicemia

BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION
- Adult: 0.5–1 g every 8 hours
Exacerbations of chronic lower respiratory-tract infection in cystic fibrosis
BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION
- Adult: 2 g every 8 hours
Meningitis
BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION
- Adult: 2 g every 8 hours
Endocarditis (in combination with another antibacterial)
BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION
- Adult: 2 g every 8 hours

- UNLICENSED USE Not licensed for use in endocarditis.
- INTERACTIONS → Appendix 1 (meropenem).
- SIDE-EFFECTS
  - Common or very common Abdominal pain - diarrhoea - disturbances in liver function tests - headache - nausea - pruritus - rash - thrombocytopenia - vomiting
  - Uncommon Eosinophilia - leucopenia - paraesthesia - thrombocytopenia
  - Rare Convulsions
  - Frequency not known Antibiotic-associated colitis - haemolytic anaemia - Stevens-Johnson syndrome - toxic epidermal necrolysis
- ALLERGY AND CROSS-SENSITIVITY Avoid if history of immediate hypersensitivity reaction to beta-lactam antibacterials. Use with caution in patients with sensitivity to beta-lactam antibacterials.
- PREGNANCY Use only if potential benefit outweighs risk – no information available.
- BREAST FEEDING Unlikely to be absorbed (however, manufacturer advises avoid).
- HEPATIC IMPAIRMENT Monitor liver function in hepatic impairment.
- RENAL IMPAIRMENT Use normal dose every 12 hours if eGFR 26–50 mL/minute/1.73 m². Use half normal dose every 12 hours if eGFR 10–25 mL/minute/1.73 m². Use half normal dose every 24 hours if eGFR less than 10 mL/minute/1.73 m².
- EFFECT ON LABORATORY TESTS Positive Coombs’ test.
- DIRECTIONS FOR ADMINISTRATION Intravenous injection to be administered over 5 minutes. For intravenous infusion (Meropenem®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Dilute dose in infusion fluid to a final concentration of 1–20 mg/mL; give over 15–30 minutes.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.
  - Powder for solution for injection
    ELECTROLYTES: May contain Sodium
    - MEROPENEM (Non-proprietary)
      Meropenem (as Meropenem trihydrate) 500 mg | Meropenem 500mg powder for solution for injection vials | 10 vial (P06) £92.70–88.00
      - Meropenem (as Meropenem trihydrate) 1 gram | Meropenem 1g powder for solution for injection vials | 10 vial (P06) £139.20–171.90 | 10 vial (P06) £171.90 (Hospital only)
      - Meronem (AstraZeneca UK Ltd) Meropenem (as Meropenem trihydrate) 500 mg | Meropenem 500mg powder for solution for injection vials | 10 vial (P06) £103.14
      - Meropenem (as Meropenem trihydrate) 1 gram | Meropenem 1g powder for solution for injection vials | 10 vial (P06) £206.28
CEPHALOSPORINS

Cephalosporins

The cephalosporins are broad-spectrum antibiotics which are used for the treatment of septicema, pneumonia, meningitis, biliary-tract infections, peritonitis, and urinary-tract infections. The pharmacology of the cephalosporins is similar to that of the penicillins, excretion being principally renal. Cephalosporins penetrate the cerebrospinal fluid poorly unless the meninges are inflamed; cefotaxime p. 457 and ceftriaxone p. 459 are suitable cephalosporins for infections of the CNS (e.g. meningitis).

The principal side-effect of the cephalosporins is hypersensitivity and about 0.5–6.5% of penicillin-sensitive patients will also be allergic to the cephalosporins. If a cephalosporin is essential in patients with a history of alternative antibacterial is not available, then cefixime p. 457, cefotaxime, ceftazidime p. 458, ceftriaxone, or cefuroxime p. 450 can be used with caution; cefaclor below, cefadroxil p. 456, cefalexin p. 456, cefradine p. 458, and cefotaxime fosamil p. 458 should be avoided.

The orally active 'first generation' cephalosporins, cefalexin, cefadroxil, and cefuroxime and the 'second generation' cephalosporin, cefaclor below, have a similar antimicrobial spectrum. They are useful for urinary-tract infections which do not respond to other drugs or which occur in pregnancy, respiratory-tract infections, otitis media, sinusitis, and skin and soft-tissue infections. Cefaclor below has good activity against *H. influenzae*.

Cefadroxil has a long duration of action and can be given twice daily; it has poor activity against *H. influenzae*.

Cefuroxime axetil, an ester of the 'second generation' cephalosporin cefuroxime, has the same antibacterial spectrum as the parent compound; it is poorly absorbed and needs to be given with food to maximise absorption.

Cefixime is an orally active 'third generation' cephalosporin. It has a longer duration of action than the other cephalosporins that are active by mouth. It is only licensed for acute infections.

Cefuroxime is a 'second generation' cephalosporin that is less susceptible than the earlier cephalosporins to inactivation by beta-lactamases. It is, therefore, active against certain bacteria which are resistant to the other drugs and has greater activity against *Haemophilus influenzae*.

Cefotaxime, ceftazidime and ceftriaxone are 'third generation' cephalosporins with greater activity than the 'second generation' cephalosporins against certain Gram-negative bacteria. However, they are less active than cefuroxime against Gram-positive bacteria, most notably *Staphylococcus aureus*. Their broad antibacterial spectrum may encourage superinfection with resistant bacteria or fungi.

Ceftazidime has good activity against pseudomonas. It is also active against other Gram-negative bacteria.

Ceftriaxone has a longer half-life and therefore needs to be given only once daily. Indications include serious infections such as septicema, pneumonia, and meningitis. The calcium salt of ceftriaxone forms a precipitate in the gall bladder which may rarely cause symptoms but these usually resolve when the antibiotic is stopped.

Cefadroxil fosamil is a 'fifth generation' cephalosporin with bactericidal activity similar to cefotaxime; however, cefadroxil fosamil has an extended spectrum of activity against Gram-positive bacteria that includes meticillin-resistant *Staphylococcus aureus* and multi-drug resistant *Streptococcus pneumoniae*. Cefadroxil fosamil is licensed for the treatment of community-acquired pneumonia and complicated skin and soft-tissue infections, but there is no experience of its use in pneumonia caused by meticillin-resistant *S. aureus*.

Cephalosporins

- **INTERACTIONS** → Appendix 1 (cephalosporins).
- **SIDE-EFFECTS**
  - Rare Antibiotic-associated colitis
  - **Frequency not known** Abdominal discomfort, agranulocytosis, allergic reactions, anaphylaxis, aplastic anaemia, blood disorders, confusion, diarrhoea, disturbances in liver enzymes, dizziness, eosinophilia, haemolytic anaemia, hallucinations, headache, hyperactivity, hypertension, leucopenia, nausea, nervousness, pruritus, rashes, reversible interstitial nephritis, serum sickness-like reactions with rashes, fever and arthralgia, sleep disturbances, Stevens-Johnson syndrome, thrombocytopenia, toxic epidermal necrolysis, transient cholestatic jaundice, transient hepatitis, urticaria, vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION** Antibiotic-associated colitis Antibiotic-associated colitis may occur more commonly with second- and third-generation cephalosporins.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with cephalosporin hypersensitivity. Cross-sensitivity with other beta-lactam antibacterials About 0.5–6.5% of penicillin-sensitive patients will also be allergic to the cephalosporins. Patients with a history of immediate hypersensitivity to penicillin and other beta-lactams should not receive a cephalosporin. Cephalosporins should be used with caution in patients with sensitivity to penicillin and other beta-lactams.
- **EFFECT ON LABORATORY TESTS** False positive urinary glucose (if tested for reducing substances). False positive Coombs’ test.

Cefaclor

**INDICATIONS AND DOSE**

Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

**INITIALLY BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- **Child 1-11 months:** 20 mg/kg daily in 3 divided doses, alternatively (by mouth) 62.5 mg 3 times a day
- **Child 1-4 years:** 20 mg/kg daily in 3 divided doses, alternatively (by mouth) 125 mg 3 times a day
- **Child 5-11 years:** 20 mg/kg daily in 3 divided doses, usual max. 1 g daily, alternatively (by mouth) 250 mg 3 times a day
- **Child 12-17 years:** 250 mg 3 times a day; maximum 4 g per day
- **Adult:** 250 mg 3 times a day; maximum 4 g per day

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- **Child 12-17 years:** 375 mg every 12 hours, dose to be taken with food
- **Adult:** 375 mg every 12 hours, dose to be taken with food

Severe susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

**BY MOUTH**

- **Child 1-11 months:** 40 mg/kg daily in 3 divided doses, usual max. 1 g daily, alternatively 125 mg 3 times a day
- **Child 1-4 years:** 40 mg/kg daily in 3 divided doses, usual max. 1 g daily, alternatively 250 mg 3 times a day

---

**BNF 70**

Bacterial infection **455**
### Cefadroxil

#### INDICATIONS AND DOSE

Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

- **BY MOUTH**
  - Child 6-17 years (body-weight up to 40 kg): 0.5 g twice daily
  - Child 6-17 years (body-weight 40 kg and above): 0.5–1 g twice daily
  - Adult: 0.5–1 g twice daily

#### Skin infections | Soft-tissue infections | Uncomplicated urinary-tract infections

- **BY MOUTH**
  - Child 6-17 years (body-weight 40 kg and above): 1 g once daily
  - Adult: 1 g daily

#### CONTRAINDICATIONS

- Not known to be harmful.

#### BREAST FEEDING

Present in milk in low concentration, but appropriate to use.

#### RENAL IMPAIRMENT

- In adults: 1 g initially, then 500 mg every 12 hours if eGFR 26–50 mL/minute/1.73 m². 1 g initially, then 500 mg every 24 hours if eGFR 11–26 mL/minute/1.73 m². 1 g initially, then 500 mg every 36 hours if eGFR less than 11 mL/minute/1.73 m².
- In children: Reduce dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

- **Capsule**
  - **CAUTIONARY AND ADVISORY LABELS 9**
  - **CEFADROXIL (Non-proprietary)**
    - Cefadroxil (as Cefadroxil monohydrate) 500 mg
      - Cefadroxil 500mg capsules | 20 capsule [PoD] £22.36 DT price = £22.36 | 100 capsule [PoD] £111.90

### Cefalexin

(Cephalexin)

#### INDICATIONS AND DOSE

Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

- **BY MOUTH**
  - Child 1-11 years: 12.5 mg/kg twice daily, alternatively 125 mg twice daily
  - Child 1-4 years: 12.5 mg/kg twice daily, alternatively 125 mg 3 times a day
  - Child 5-11 years: 12.5 mg/kg twice daily, alternatively 250 mg 3 times a day
  - Child 12-17 years: 500 mg 2–3 times a day
  - Adult: 250 mg every 6 hours, alternatively 500 mg every 8–12 hours; increased to 1–1.5 g every 6–8 hours, increased dose to be used for severe infections

#### Serious susceptible infections due to sensitive Gram-positive and Gram-negative bacteria

- **BY MOUTH**
  - Child 1 month-11 years: 25 mg/kg 2–4 times a day (max. per dose 1 g 4 times a day)
  - Child 12-17 years: 1–1.5 g 3–4 times a day

#### Prophylaxis of recurrent urinary-tract infection

- **BY MOUTH**
  - Child: 12.5 mg/kg once daily (max. per dose 125 mg), dose to be taken at night
  - Adult: 125 mg once daily, dose to be taken at night
PATIENT AND CARER ADVICE

In children

▶ Reducing dose in moderate impairment.

In adults

▶ Reduce dose in moderate impairment.

PATIENT AND CARER ADVICE

Cefalexin 25 mg per 1 ml Keflex 125mg/5ml oral suspension | 100 ml [POM] £0.84 DT price = £1.40

Cefalexin 50 mg per 1 ml Keflex 250mg/5ml oral suspension | 100 ml [POM] £1.40 DT price = £1.81

Cefixime

INDICATIONS AND DOSE

Acute infections due to sensitive Gram-positive and Gram-negative bacteria

BY MOUTH

▶ Child 6-11 months: 75 mg daily

▶ Child 1-4 years: 100 mg daily

▶ Child 4-10 years: 200 mg daily

▶ Child 10-17 years: 200–400 mg daily, alternatively 100–200 mg twice daily

▶ Adult: 200–400 mg daily in 1–2 divided doses

Uncomplicated gonorrhoea

BY MOUTH

▶ Adult: 400 mg for 1 dose

UNLICENSED USE

Use of cefixime for uncomplicated gonorrhoea is an unlicensed indication.

PREGNANCY

Not known to be harmful.

BREAST FEEDING

Manufacturer advises avoid unless essential—no information available.

RENAL IMPAIRMENT

▶ In adults Reduce dose if eGFR less than 20 mL/minute/1.73 m² (max. 200 mg once daily).

▶ In children Reduce dose if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².

MEDIcINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 9

▶ Suprax (Sanofi)

Cefixime 200 mg Suprax 200mg tablets | 7 tablet [POM] £13.23 DT price = £13.23

Cefotaxime

INDICATIONS AND DOSE

Uncomplicated gonorrhoea

BY INTRAMUSCULAR INJECTION

▶ Adult: 500 mg for 1 dose

Infections due to sensitive Gram-positive and Gram-negative bacteria | Surgical prophylaxis | Haemophilus epiglottitis

BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

▶ Adult: 1 g every 12 hours

Severe susceptible infections due to sensitive Gram-positive and Gram-negative bacteria | Meningitis

BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

▶ Adult: 8 g daily in 4 divided doses, increased if necessary to 12 g daily in 3–4 divided doses, intramuscular doses over 1 g should be divided between more than one site

Emergency treatment of suspected bacterial meningitis or meningococcal disease, before urgent transfer to hospital, in patients who cannot be given benzylpenicillin (e.g. because of an allergy)

BY INTRAVENOUS INJECTION OR BY INTRAMUSCULAR INJECTION

▶ Child 1 month-11 years: 50 mg/kg for 1 dose

▶ Child 12-17 years: 1 g for 1 dose

▶ Adult: 1 g for 1 dose
**INDICATIONS AND DOSE**

**Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria | Surgical prophylaxis**

**BY MOUTH**

- Child 7-11 years: 25–50 mg/kg daily in 2–4 divided doses
- Child 12-17 years: 250–500 mg 4 times a day, alternatively 0.5–1 g twice daily; increased if necessary up to 1 g 4 times a day, increased dose may be used in severe infections
- Adult: 250–500 mg 4 times a day, alternatively 0.5–1 g twice daily; increased if necessary up to 1 g 4 times a day, increased dose may be used in severe infections

**Powder for solution for injection**

- Cefotaxime (as Cefotaxime sodium) 500 mg: £1.50
- Cefotaxime (as Cefotaxime sodium) 1 gram: £3.00
- Cefotaxime (as Cefotaxime sodium) 2 gram: £8.00

**Cefradine (Cephradine)**

**INDICATIONS AND DOSE**

Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria | Surgical prophylaxis

**BY MOUTH**

- Child 7-11 years: 25–50 mg/kg daily in 2–4 divided doses
- Child 12-17 years: 250–500 mg 4 times a day, alternatively 0.5–1 g twice daily; increased if necessary up to 1 g 4 times a day, increased dose may be used in severe infections
- Adult: 250–500 mg 4 times a day, alternatively 0.5–1 g twice daily; increased if necessary up to 1 g 4 times a day, increased dose may be used in severe infections

**CAUTIONS**

- Seizure disorders
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** 400 mg every 12 hours if eGFR 30–50 mL/minute/1.73 m². Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION**

For intravenous injection, give intermittently in Glucose 5% or Sodium chloride 0.9%. Suggested volume 40–100 mL given over 20–60 minutes; incompatible with alkaline solutions.

**CEFOTAXIME (Non-proprietary)**

- Cefotaxime 250 mg: £6.00 DT price = £2.25
- Cefotaxime 500 mg: £12.00 DT price = £3.41
- Brands may include Nicef

**Ceftaroline fosamil**

**INDICATIONS AND DOSE**

Community-acquired pneumonia

**BY INTRAVENOUS INFUSION**

- Adult: 600 mg every 12 hours for 5–7 days

Complicated skin and soft-tissue infections

**BY INTRAVENOUS INFUSION**

- Adult: 600 mg every 12 hours for 5–14 days

**CAUTIONS**

- Seizure disorders
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** 400 mg every 12 hours if eGFR 30–50 mL/minute/1.73 m². Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION**

For intravenous infusion, give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute 600 mg with 20 mL water for injections, then dilute with 250 mL infusion fluid (in fluid restriction, may be diluted with 50–100 mL infusion fluid); give over 60 minutes.

**SCOTTISH MEDICINES CONSORTIUM (SMC) DECISIONS**

The Scottish Medicines Consortium, has advised (Dec 2012) that ceftaroline fosamil (Zinforo®) is accepted for restricted use within NHS Scotland when meticillin-resistant S. aureus is suspected in complicated skin and soft-tissue infection and vancomycin cannot be used.

**UNLICENSED USE**

Not licensed for use in children for prevention of Staphylococcus aureus lung infection in cystic fibrosis.

**PREGNANCY** Not known to be harmful.

**BREAST FEEDING** Present in milk in low concentration, but appropriate to use.

**RENAL IMPAIRMENT**

- In adults Use half normal dose if eGFR 5–20 mL/minute/1.73 m². Use one-quarter normal dose if eGFR less than 5 mL/minute/1.73 m².
- In children Reduce dose if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners’ formulary Cefradine Capsules may be prescribed.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- **CEFTRADINE (Non-proprietary)**
  - Cefradine 500 mg: £6.00 DT price = £2.25
  - Cefradine 1000 mg: £12.00 DT price = £3.41
  - Brands may include Nicef

**Ceftaroline fosamil**

**INDICATIONS AND DOSE**

Community-acquired pneumonia

**BY INTRAVENOUS INFUSION**

- Adult: 600 mg every 12 hours for 5–7 days

Complicated skin and soft-tissue infections

**BY INTRAVENOUS INFUSION**

- Adult: 600 mg every 12 hours for 5–14 days

**CAUTIONS**

- Seizure disorders
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** 400 mg every 12 hours if eGFR 30–50 mL/minute/1.73 m². Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION**

For intravenous infusion, give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute 600 mg with 20 mL water for injections, then dilute with 250 mL infusion fluid (in fluid restriction, may be diluted with 50–100 mL infusion fluid); give over 60 minutes.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium, has advised (Dec 2012) that ceftaroline fosamil (Zinforo®) is accepted for restricted use within NHS Scotland when meticillin-resistant S. aureus is suspected in complicated skin and soft-tissue infection and vancomycin cannot be used.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

- Zinforo (AstraZeneca UK Ltd)

**Ceftaroline fosamil (as Ceftaroline fosamil acetic acid solvate monohydrate) 600 mg**: £375.00
Pseudomonal lung infection in cystic fibrosis
By intravenous infusion or by intravenous injection or by deep intramuscular injection
- Adult: 100–150 mg/kg daily in 3 divided doses; maximum 9 g per day

Septicaemia | Hospital-acquired pneumonia
By intravenous infusion or by intravenous injection or by deep intramuscular injection
- Adult 18–79 years: 2 g every 8 hours
- Adult 80 years and over: 2 g every 8 hours; usual maximum 3 g per day

Febrile neutropenia
By intravenous infusion or by intravenous injection or by deep intramuscular injection
- Adult 18–79 years: 2 g every 8 hours
- Adult 80 years and over: 2 g every 8 hours; usual maximum 3 g per day

Meningitis
By intravenous infusion or by intravenous injection or by deep intramuscular injection
- Adult 18–79 years: 2 g every 8 hours
- Adult 80 years and over: 2 g every 8 hours; usual maximum 3 g per day

Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria
By intravenous infusion or by intravenous injection or by deep intramuscular injection
- Adult 18–79 years: 1–2 g every 8 hours
- Adult 80 years and over: 1–2 g every 8 hours; usual maximum 3 g per day

SIDE-EFFECTS
Paraesthesia - taste disturbances
Pregnancy
Not known to be harmful.
Breast feeding
Present in milk in low concentration, but appropriate to use.
Hepatic impairment
Manufacturer advises caution in severe impairment.
Renal impairment
Reduce dose if eGFR less than 50 mL/minute/1.73 m²—consult product literature.

DIRECTIONS FOR ADMINISTRATION
Intramuscular administration used when intravenous administration not possible; single doses over 1 g by intravenous route only. For intravenous infusion give intermittently or via drip tubing in Glucose 5% or 10% or Sodium chloride 0.9%. Dissolve 2 g initially in 10 mL (3 g in 15 mL) infusion fluid. For Fortum® dilute further to a concentration of 40 mg/mL. For Kefadim® dilute further to a concentration of 20 mg/mL. Give over up to 30 minutes.

Medicinal forms
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion, eye drops

Powder for solution for injection
Electrolytes: May contain Sodium

Ceftazidime (Non-proprietary)
Ceftazidime (as Ceftazidime pentahydrate) 500 mg Ceftazidime 500mg powder for solution for injection vials | 1 vial (PMP) £4.33–£4.70
Ceftazidime (as Ceftazidime pentahydrate) 1 gram Ceftazidime 1g powder for solution for injection vials | 1 vial (PMP) £7.90–£11.80 | 5 vial (PMP) £39.55 | 10 vial (PMP) £13.90
Ceftazidime (as Ceftazidime pentahydrate) 2 gram Ceftazidime 2g powder for solution for injection vials | 1 vial (PMP) £17.75–£22.10 | 5 vial (PMP) £79.15 | 10 vial (PMP) £21.90
Fortum (GlaxoSmithKline UK Ltd)
Ceftazidime (as Ceftazidime pentahydrate) 3 gram Fortum 500mg powder for solution for injection vials | 1 vial (PMP) £4.40 (Hospital only)
Ceftazidime (as Ceftazidime pentahydrate) 1 gram Fortum 1g powder for solution for injection vials | 1 vial (PMP) £8.79 (Hospital only)

Ceftriaxone

INDICATIONS AND DOSE
Surgical prophylaxis
By deep intramuscular injection or by intravenous injection
- Adult: 1 g for 1 dose, to be administered up to 30 minutes before procedure

Prophylaxis before colorectal surgery
By deep intramuscular injection or by intravenous infusion
- Adult: 2 g for 1 dose, to be administered up to 30 minutes before procedure, intramuscular doses over 1 g divided between more than one site

Uncomplicated gonorrhoea | Pelvic inflammatory disease
By deep intramuscular injection
- Adult: 500 mg for 1 dose

Early syphilis
By deep intramuscular injection
- Adult: 500 mg daily for 10 days

Endocarditis caused by haemophilus, actinobacillus, cardiobacterium, eikenella, and kingella species ('HACEK organisms') (in combination with another antibacterial)
By intravenous infusion
- Adult: 2–4 g daily

Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria
By deep intramuscular injection or by intravenous injection or by intravenous infusion
- Adult: 1 g daily; increased to 2–4 g daily, increased dose to be used for severe infections, intramuscular doses over 1 g divided between more than one site, single intravenous doses above 1 g to be administered by intravenous infusion only

Meningitis
By intravenous infusion
- Child 1 month–11 years (body-weight up to 50 kg): 50–80 mg/kg daily, doses of 50 mg/kg and over to be administered by intravenous infusion only
- Deep intramuscular injection or by intravenous infusion
- Child 1 month–11 years (body-weight 50 kg and above): 2–4 g daily, intramuscular doses over 1 g divided between more than one site, single intravenous doses above 1 g to be administered by intravenous infusion only
- Child 12–17 years: 2–4 g daily, intramuscular doses over 1 g divided between more than one site, single intravenous doses above 1 g to be administered by intravenous infusion only

Prevention of secondary case of meningococcal meningitis
By intramuscular injection
- Adult: 250 mg for 1 dose

Prevention of secondary case of Haemophilus influenzae type b disease
By intramuscular injection or by intravenous injection
- Adult: 1 g daily for 2 days

UNLICENSED USE
Not licensed for prophylaxis of meningococcal meningitis or Haemophilus influenzae type b disease.
In adults Not licensed for early syphilis. Not licensed for endocarditis caused by haemophilus, actinobacillus, cardio bacterium, eikenella, and kingella species (HACEK organisms) (in combination with another antibacterial). Dose not licensed for treatment of uncomplicated gonorrhea or pelvic inflammatory disease.

**CONTRA-INDICATIONS** Concomitant treatment with intravenous calcium (including total parenteral nutrition containing calcium) in neonates over 41 weeks corrected gestational age—risk of precipitation in urine and lungs—neonates less than 41 weeks corrected gestational age—neonates over 41 weeks corrected gestational age with jaundice, hyperalbuminaemia, acidosis, unconjugated hyperbilirubinaemia, or impaired bilirubin binding

**CAUTIONS** Dehydration (risk of ceftriaxone precipitation in gall bladder) - may displace bilirubin from serum albumin, administer over 60 minutes in neonates - treatment longer than 14 days - use with caution in neonates

**SIDE-EFFECTS**
- **Common or very common** Calcium ceftriaxone precipitates in gall bladder—consider discontinuation if symptomatic - calcium ceftriaxone precipitates in urine (particularly in very young, dehydrated or those who are immobilised)—consider discontinuation if symptomatic
- **Rare** Pancreatitis - prolongation of prothrombin time
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.
- **HEPATIC IMPAIRMENT** Reduce dose if both hepatic and severe renal impairment. Monitor plasma concentration if both hepatic and severe renal impairment.
- **RENAL IMPAIRMENT** Use with caution in renal failure. Monitor plasma concentration if both hepatic and severe renal impairment.
- **In adults** Reduce dose if eGFR less than 10 mL/minute/1.73 m² (max. 2 g daily).
- **In children** Max. 50 mg/kg/day (max. 2 g daily) in severe renal impairment.

**DIRECTIONS FOR ADMINISTRATION** For intravenous injection, give over at least 2–4 minutes.
- With intravenous use in children For intravenous infusion, dilute reconstituted solution with Glucose 5% or 10% or Sodium Chloride 0.9%; give over at least 30 minutes (60 minutes in neonates). Not to be given simultaneously with parenteral nutrition or infusion fluids containing calcium, even by different infusion lines; may be infused sequentially with infusion fluids containing calcium if flush with sodium chloride 0.9% between infusions or give infusions by different infusion lines at different sites. Displacement value may be significant, consult local guidelines.
- With intramuscular use in children For intramuscular injection ceftriaxone may be mixed with 1% Lidocaine Hydrochloride Injection to reduce pain at intramuscular injection site; final concentration 250–350 mg/mL. Displacement value may be significant, consult local guidelines.
- With intravenous use in adults For intravenous infusion (Rocephin®; Ceftriaxone Injection, Genus), give intermittently or via drip tubing in Glucose 5% or 10% or Sodium chloride 0.9%. Reconstitute 2-g vial with 40 mL infusion fluid. Give by intermittent infusion over at least 30 minutes (60 minutes in neonates). Not to be given simultaneously with total parenteral nutrition or infusion fluids containing calcium, even by different infusion lines. May be infused sequentially with infusion fluids containing calcium if flush with sodium chloride 0.9% between infusions or give infusions by different infusion lines at different sites.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

**Powder for solution for injection**
- **ELECTROLYTES:** May contain Sodium

| Ceftriaxone (as Ceftriaxone sodium) 250 mg | Ceftriaxone 250 mg powder for solution for injection vials | 1 vial (POM) £1.80–£2.30 DT price = £2.40 |
| Ceftriaxone (as Ceftriaxone sodium) 1 gram | Ceftriaxone 1 g powder for solution for injection vials | 1 vial (POM) £3.58 DT price = £3.58 | 5 vial (POM) £45.75 | 10 vial (POM) £110.00 |

**Cefuroxime**

**INDICATIONS AND DOSE**

Susceptible infections due to Gram-positive and Gram-negative bacteria

**BY MOUTH**
- Child 3 months–1 year: 10 mg/kg twice daily (max. per dose 125 mg)
- Child 2–11 years: 15 mg/kg twice daily (max. per dose 250 mg)
- Child 12–17 years: 250 mg twice daily, dose may be doubled in severe lower respiratory-tract infections or if pneumonia is suspected
- Adult: 250 mg twice daily, dose may be doubled in severe lower respiratory-tract infections or if pneumonia is suspected

**BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION OR BY INTRAMUSCULAR INJECTION**
- Child: 20 mg/kg every 8 hours (max. per dose 750 mg); increased to 50–60 mg/kg every 6–8 hours (max. per dose 1.5 g), increased dose used for severe infection and cystic fibrosis
- Adult: 750 mg every 6–8 hours; increased if necessary up to 1.5 g every 6–8 hours, increased dose used for severe infections

**Lyme disease**

**BY MOUTH**
- Adult: 500 mg twice daily for 14–21 days (for 28 days in Lyme arthritis)

**LOWER URINARY-TRACT INFECTION**

**BY MOUTH**
- Child 12–17 years: 125 mg twice daily
- Adult: 125 mg twice daily

**Pyelonephritis**

**BY MOUTH**
- Adult: 250 mg twice daily

**Surgical prophylaxis**

**INITIALLY BY INTRAVENOUS INJECTION**
- Adult: 1.5 g, to be administered up to 30 minutes before the procedure, then (by intravenous injection or by intramuscular injection) 750 mg every 8 hours if required for up to 3 doses (in high risk procedures)
Co-trimoxazole is the drug of choice in the prophylaxis and treatment of Pneumocystis jirovecii (Pneumocystis carinii) pneumonia; it is also indicated for nocardiosis, Stenotrophomonas maltophilia infection [unlicensed indication], and toxoplasmosis. It should only be considered for use in acute exacerbations of chronic bronchitis and infections of the urinary tract when there is bacteriological evidence of sensitivity to co-trimoxazole and good reason to prefer this combination to a single antibacterial; similarly it should only be used in acute otitis media in children when there is good reason to prefer it. Co-trimoxazole is also used for the treatment of infections caused by Burkholderia cepacia in cystic fibrosis [unlicensed indication].

**CONTRA-INDICATIONS**

Acute porphyrias p. 864

**CAUTIONS**

Asthma - avoid in blood disorders (unless under specialist supervision) - avoid in infants under 6 weeks (except for treatment or prophylaxis of pneumocystis pneumonia) because of the risk of kernicterus - elderly (increased risk of serious side-effects) (in adults) - G6PD deficiency (risk of haemolytic anaemia) - maintain adequate fluid intake - predisposition to folate deficiency - predisposition to hyperkalaemia (in adults)

**INTERACTIONS** → Appendix 1 (trimethoprim, sulfamethoxazole).
■ SIDE-EFFECTS
  ▶ Common or very common Diarrhoea · headache · hyperkalaemia · nausea · rash
  ▶ Uncommon Vomiting
  ▶ Rare Agranulocytosis · bone marrow depression
  ▶ Very rare Anorexia · antibiotic-associated colitis · arthralgia · aseptic meningitis · ataxia · blood disorders · convulsions · cough · depression · eosinophilia · glossitis · hallucinations · hepatic necrosis · hypoglycaemia · hyponatraemia · interstitial nephritis · jaundice · leucopenia · liver damage · megaloblastic anaemia · myalgia · myocarditis · pancreatitis · peripheral neuropathy · photosensitivity · pulmonary infiltrates · renal disorders · shortness of breath · Stevens-Johnson syndrome · stomatitis · systemic lupus erythematosus · thrombocytopenia · tinnitus · toxic epidermal necrolysis · uveitis · vasculitis · vertigo
  ▶ Frequency not known Rhabdomyolysis reported in HIV-infected patients

■ MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

EXCIPIENTS: May contain Alcohol, propylene glycol, sulphites
ELECTROLYTES: May contain Sodium

■ Trimethoprim

INDICATIONS AND DOSE

Urinary-tract infections | Respiratory tract infections

BY MOUTH

▶ Child 4–5 weeks: 4 mg/kg twice daily (max. per dose 200 mg)
▶ Child 6–11 years: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 25 mg twice daily
▶ Child 11–17 years: 800 mg twice daily
▶ Adult: 200 mg twice daily

Prophylaxis of urinary-tract infection (considered for recurrent infection, significant urinary-tract anomalies, or significant kidney damage)

BY MOUTH

▶ Child 4–5 weeks: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night
▶ Child 6–11 years: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 12.5 mg once daily, dose to be taken at night
▶ Child 6–11 years: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 50 mg once daily, dose to be taken at night
▶ Child 12–17 years: 100 mg once daily, dose to be taken at night
▶ Adult: 100 mg once daily, dose to be taken at night

Flavours of oral liquid formulations may include banana, or vanilla.

Co-trimoxazole is a mixture of trimethoprim and sulfamethoxazole (sulfamethoxazole) in the proportions of 1 part to 5 parts.
Treatment of mild to moderate *Pneumocystis jirovecii* (Pneumocystis carinii) pneumonia in patients who cannot tolerate co-trimoxazole (in combination with dapsone)

**BY MOUTH**
- Child: 5 mg/kg every 6–8 hours
- Adult: 5 mg/kg every 6–8 hours

Acne resistant to other antibacterials

**BY MOUTH**
- Adult: 300 mg twice daily

**Prostatitis**

**BY MOUTH**
- Adult: (consult product literature)

**Shigellosis | Invasive salmonella infection**

**BY MOUTH**
- Adult: (consult product literature)

- **CONTRA-INDICATIONS** Blood dyscrasias

- **CAUTIONS** Elderly · acute porphyrias p. 864 · neonates (specialist supervision required) · predisposition to folate deficiency

- **INTERACTIONS** → Appendix 1 (trimethoprim).

- **SIDE-EFFECTS**
  - Rare: Allergic reactions · anaphylaxis · angioedema · erythema multiforme · photosensitivity · toxic epidermal necrolysis
  - Frequency not known: Aseptic meningitis · depression of haematopoiesis · gastrointestinal disturbances · hyperkalaemia · nausea · pruritus · rashes · uveitis (in adults) · vomiting

- **INDICATIONS AND DOSE**

  **Tablet**
  - CAUTIONARY AND ADVISORY LABELS 9
  - **TRIMETHOPRIM (Non-proprietary)**

    - Trimethoprim 200 mg Trimethoprim 200 mg tablets | 6 tablet (POST) £3.60 DT price = £0.56 | 14 tablet (POST) £9.99 DT price = £1.31
  - **Oral suspension**
    - CAUTIONARY AND ADVISORY LABELS 9
    - **TRIMETHOPRIM (Non-proprietary)**
      - Trimethoprim 10 mg per 1 ml Trimethoprim 50 mg/5 ml oral suspension sugar free (sugar-free) | 100 ml (POST) £15.00 DT price = £2.11
    - Brands may include Monotrim

- **FUSIDATES**

  **Fusidic acid**

  - **DRUG ACTION** Fusidic acid and its salts are narrow-spectrum antibiotics used for staphylococcal infections.

  - **INDICATIONS AND DOSE**
    - Staphylococcal skin infection
      - **BY MOUTH USING TABLETS**
        - Child 12–17 years: 250 mg every 12 hours for 5–10 days
        - Adult: 250 mg every 12 hours for 5–10 days
    - Penicillin-resistant staphylococcal infection including osteomyelitis | Staphylococcal endocarditis in combination with other antibiotics
      - **BY MOUTH USING ORAL SUSPENSION**
        - Child 1–11 months: 15 mg/kg 3 times a day
        - Child 1–4 years: 250 mg 3 times a day
        - Child 5–11 years: 500 mg 3 times a day
        - Child 12–17 years: 750 mg 3 times a day
        - Adult: 750 mg 3 times a day
      - **BY MOUTH USING TABLETS**
        - Child 12–17 years: 500 mg every 8 hours, increased to 1 g every 8 hours, increased dose can be used for severe infections
        - Adult: 500 mg every 8 hours, increased to 1 g every 8 hours, increased dose can be used for severe infections

  - **Dose equivalence and conversion**
    - Fusidic acid is incompletely absorbed and doses recommended for suspension are proportionately higher than those for sodium fusidate tablets.

  - **INTERACTIONS** → Appendix 1 (fusidic acid).

  - **SIDE-EFFECTS**
    - Common or very common: Abdominal pain · diarrhoea · dizziness · drowsiness · dyspepsia · nausea · vomiting
    - Uncommon: Anorexia · headache · malaise · pruritus · rash
    - Frequency not known: Acute renal failure (usually with jaundice) · blood disorders · reversible jaundice especially after high dosage (withdraw therapy if persistent)

  - **PREGNANCY** Not known to be harmful; manufacturer advises use only if potential benefit outweighs risk.

  - **BREAST FEEDING** Present in milk—manufacturer advises caution.

  - **HEPATIC IMPAIRMENT** Impaired biliary excretion; possibly increased risk of hepatotoxicity; avoid or reduce dose; monitor liver function in hepatic impairment.

  - **MONITORING REQUIREMENTS** Monitor liver function with caution.

  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug.

  - **MEDICATIONS**
    - There can be variation in the licensing of different medicines containing the same drug.
Teicoplanin

**DRUG ACTION** The glycopeptide antibiotic teicoplanin has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides and increasing reports of glycopeptide-resistant enterococci. Teicoplanin is similar to vancomycin, but has a significantly longer duration of action, allowing once daily administration after the loading dose.

**INDICATIONS AND DOSE**

**Clostridium difficile infection**

**BY MOUTH**

- Adult: 100–200 mg twice daily for 10–14 days

**Serious infections caused by Gram-positive bacteria (e.g. complicated skin and soft tissue infections, pneumonia)**

**BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION OR BY INTRAMUSCULAR INJECTION**

- Adult (body-weight up to 70 kg): Initially 400 mg every 12 hours for 3 doses, followed by 400 mg once daily
- Adult (body-weight 70 kg and above): Initially 6 mg/kg every 12 hours for 3 doses, then 6 mg/kg once daily

**Streptococcal or enterococcal endocarditis (in combination with another antibacterial)**

- Adult: Initially 10 mg/kg every 12 hours for 3–5 doses, then 10 mg/kg once daily, subsequent doses can be given by intramuscular injection

**Bone and joint infections**

**BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION**

- Adult: Initially 12 mg/kg every 12 hours for 3–5 doses, then 12 mg/kg once daily subsequent doses can be given by intramuscular injection, increased risk of fever and rash with doses of 12 mg/kg

**Surgical prophylaxis**

**BY INTRAVENOUS INJECTION**

- Adult: 400 mg, to be administered up to 30 minutes before the procedure

**Surgical prophylaxis in open fractures**

**BY INTRAVENOUS INFUSION**

- Adult: 800 mg, to be administered up to 30 minutes before skeletal stabilisation and definitive soft-tissue closure

**Peritonitis associated with peritoneal dialysis (added to dialysis fluid)**

**BY INTRAPERITONEAL INFUSION**

- Adult: (consult local protocol)

**PHARMACOKINETICS**

Teicoplanin should not be given by mouth for systemic infections because it is not absorbed significantly.

---

**UNLICENSED USE** Teicoplanin doses in BNF may differ from those in product literature. Not licensed for surgical prophylaxis.

**INTERACTIONS** → Appendix 1 (teicoplanin).

If other nephrotoxic or neurotoxic drugs given, monitor renal and auditory function on prolonged administration.

**SIDE-EFFECTS**

- **Common or very common** Pruritus - rash

**Frequency not known** Exfoliative dermatitis - nephrotoxicity - renal failure - Stevens-Johnson syndrome - toxic epidermal necrolysis

**SIDE-EFFECTS, FURTHER INFORMATION**

**Nephrotoxicity** Teicoplanin is associated with a lower incidence of nephrotoxicity than vancomycin.

**ALLERGY AND CROSS-SENSITIVITY** Caution if history of vancomycin sensitivity.

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING** No information available.

**RENAL IMPAIRMENT** Use normal dose regimen on days 1–4, then use normal maintenance dose every 48 hours if eGFR 30–80 ml/minute/1.73 m² and use normal maintenance dose every 72 hours if eGFR less than 30 ml/minute/1.73 m². Plasma-teicoplanin concentration should be monitored during parenteral maintenance treatment. Also monitor renal and auditory function during prolonged treatment in renal impairment.

**MONITORING REQUIREMENTS**

- Blood counts and liver and kidney function tests required.
- With intramuscular use or intravenous use Plasma-teicoplanin concentration is not measured routinely because a relationship between plasma concentration and toxicity has not been established. However, the plasma-teicoplanin concentration can be used to optimise parenteral treatment in severe sepsis or burns, deep-seated staphylococcal infection (including bone and joint infection), endocarditis and in intravenous drug abusers. Pre-dose (‘trough’) concentrations should be greater than 15 mg/litre (greater than 20 mg/litre in endocarditis or deep-seated infection such as bone and joint infection), but less than 60 mg/litre. Plasma-teicoplanin concentration should be measured in elderly patients.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use For intravenous infusion (Targocid®), give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute initially with water for injections provided; infuse over 30 minutes. Continuous infusion not usually recommended.
- With oral use Injection can be used to prepare solution for oral administration.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Powder and solvent for solution for injection**

**ELECTROLYTES:** May contain Sodium

- Targocid (Sanofi) ▼
  - Teicoplanin 200 mg Targocid 200mg powder and solvent for solution for injection vials | 1 vial (£3.93)
  - Teicoplanin 400 mg Targocid 400mg powder and solvent for solution for injection vials | 1 vial (£7.32)

Vancomycin

**DRUG ACTION** The glycopeptide antibiotic vancomycin has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides. There are increasing reports of glycopeptide-resistant enterococci. Penetration into cerebrospinal fluid is poor.

**INDICATIONS AND DOSE**

**Clostridium difficile infection**

**BY MOUTH**

- Adult: 125 mg 4 times a day for 10–14 days, dose may be increased if infection fails to respond or is life-threatening, increased if necessary up to 500 mg 4 times a day

**Infections due to Gram-positive bacteria including endocarditis, osteomyelitis, septicaemia and soft-tissue infections**

**BY INTRAVENOUS INFUSION**

- Adult: 1–1.5 g every 12 hours
- Elderly: 500 mg every 12 hours, alternatively 1 g once daily

**Surgical prophylaxis (when high risk of MRSA)**

**BY INTRAVENOUS INFUSION**

- Adult: 1 g

**Peritonitis associated with peritoneal dialysis**

**BY INTRAPERITONEAL ADMINISTRATION**

- Adult: (consult local protocol)

**PHARMACOKINETICS**

Vancomycin should not be given by mouth for systemic infections because it is not absorbed significantly.

**UNLICENSED USE** Vancomycin doses in BNF publications may differ from those in product literature. Use of vancomycin (added to dialysis fluid) for the treatment of peritonitis associated with peritoneal dialysis is an unlicensed route.

**CAUTIONS**

**GENERAL CAUTIONS**

Avoid if history of deafness • elderly

**SPECIFIC CAUTIONS**

- With oral use: Systemic absorption may follow oral administration especially in inflammatory bowel disorders or following multiple doses

**INTERACTIONS**

- Appendix 1 (vancomycin).

**SIDE-EFFECTS**

- Common or very common
- With intravenous use: Blood disorders, including neutropenia (usually after 1 week or cumulative dose of 25 g); interstitial nephritis • nephrotoxicity • ototoxicity (discontinue if tinnitus occurs) • renal failure
- Rare
- With intravenous use: Agranulocytosis • thrombocytopenia
- Frequency not known
- With intravenous use: Anaphylaxis • cardiac arrest on rapid infusion • chills • dyspnoea • eosinophilia • exfoliative
dermatitis · fever · flushing of the upper body (‘red man’ syndrome) · nausea · pain and muscle spasm of back and chest · plebitis (irritant to tissue) · pruritus · rash · severe hypotension on rapid infusion · shock on rapid infusion · Stevens-Johnson syndrome · toxic epidermal necrolysis · urticaria · vasculitis · wheezing

SIDE-EFFECTS, FURTHER INFORMATION

Nephrotoxicity Vancomycin is associated with a higher incidence of nephrotoxicity than teicoplanin.

- ALLERGY AND CROSS-SENSITIVITY  Caution if teicoplanin sensitivity.

- PREGNANCY  Manufacturer advises use only if potential benefit outweighs risk. Plasma-vancomycin concentration monitoring essential to reduce risk of fetal toxicity.

- BREAST FEEDING  Present in milk—significant absorption following oral administration unlikely.

- RENAL IMPAIRMENT  Reduce dose. In renal impairment monitor plasma-vancomycin concentration and renal function regularly. Also monitor auditory function regularly.

- MONITORING REQUIREMENTS
  - All patients require plasma-vancomycin measurement (after 3 or 4 doses if renal function normal, earlier if renal impairment).
  - Pre-dose (‘trough’) concentration should be 10–15 mg/litre (15–20 mg/litre for endocarditis or less sensitive strains of meticillin-resistant Staphylococcus aureus or for complicated infections caused by S. aureus). An initial loading dose, by intravenous infusion, may be considered—consult local guidelines.
  - All patients require blood counts, urinalysis, and renal function tests.
  - Monitor auditory function in elderly.

- DIRECTIONS FOR ADMINISTRATION
  - With intravenous use Avoid rapid infusion (risk of anaphylactoid reactions and reactions) and rotate infusion sites.
    For intravenous infusion (Vancomycin®), give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute each 500 mg with 10 mL water for injections and dilute with infusion fluid to a concentration of up to 5 mg/mL (10 mg/mL in fluid restriction but increased risk of infusion-related effects); give over at least 60 minutes (rate not to exceed 10 mg/minute for doses over 500 mg); use continuous infusion only if intermittent not feasible.
  - With oral use Injection can be used to prepare solution for oral administration; flavouring syrups may be added to the solution at the time of administration.

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, solution for injection, oral suspension, oral solution, pastille, infusion

Capsule

CAUTIONARY AND ADVISORY LABELS 9

- VANCOMYCIN (Non-proprietary)
  - Vancomycin (as Vancomycin hydrochloride) 125 mg Vancomycin 125mg capsules | 28 capsule [PPh] £132.47 DT price = £132.47
  - Vancomycin (as Vancomycin hydrochloride) 250 mg Vancomycin 250mg capsules | 28 capsule [PPh] £140.08 DT price = £140.08
  - Brands may include Vancocin Matrigel

- POWDER FOR SOLUTION FOR INJECTION

- VANCOMYCIN (Non-proprietary)
  - Vancomycin (as Vancomycin hydrochloride) 500 mg Vancomycin 500mg powder for solution for infusion vials | 1 vial [PPh] £6.25–£7.25 (Hospital only) | 1 vial [PPh] £6.50–£6.50

- Vancomycin (as Vancomycin hydrochloride) 1 gram Vancomycin 1g powder for solution for infusion vials | 1 vial [PPh] £13.50–£14.50 (Hospital only) | 1 vial [PPh] £17.25

- Vancomycin 1g powder for concentrate for solution for infusion vials | 1 vial [PPh] £17.25

GLYCICYLCYCLINE ANTIMICROBIALS

Tigecycline

- DRUG ACTION  Tigecycline is a glycyclcline antibacterial structurally related to the tetracyclines. Tigecycline is active against Gram-positive and Gram-negative bacteria, including tetracycline-resistant organisms, and some anaerobes. It is also active against meticillin-resistant Staphylococcus aureus and vancomycin-resistant enterococci, but Pseudomonas aeruginosa and many strains of Proteus spp are resistant to tigecycline.

- INDICATIONS AND DOSE  Treatment of complicated skin and soft-tissue infections and complicated abdominal infections caused by multiple-antibacterial resistant organisms when other antibacterials cannot be used

- BY INTRAVENOUS INFUSION
  - Adult: Initially 100 mg, then 50 mg every 12 hours for 5–14 days, not recommended for the treatment of foot infections in patients with diabetes

- CAUTIONS  Cholestasis

- INTERACTIONS  → Appendix 1 (tigecycline).

- SIDE-EFFECTS
  - Common or very common  Abdominal pain · anorexia · bilirubinaemia · diarrhoea · dizziness · dyspepsia · headache · hypoglycaemia · injection-site reactions · nausea · prolonged activated partial thromboplastin time · prolonged prothrombin time · pruritus · rash · vomiting
  - Uncommon  Cholestasis jaundice · hypoproteinaemia · pancreatitis
  - Frequency not known  Antibiotic-associated colitis · hepatic failure · Stevens-Johnson syndrome · thrombocytopenia

- SIDE-EFFECTS, FURTHER INFORMATION

SIDE-effects similar to those of the tetracyclines can potentially occur.

- ALLERGY AND CROSS-SENSITIVITY  Contra-indicated in patients hypersensitive to tetracyclines.

- PREGNANCY  Tetracyclines should not be given to pregnant women; effects on skeletal development have been documented in the first trimester in animal studies. Administration during the second or third trimester may cause discoloration of the child’s teeth, and maternal hepatotoxicity has been reported with large parental doses.

- BREAST FEEDING  Manufacturer advises caution—present in milk in animal studies.

- HEPATIC IMPAIRMENT  Initially 100 mg then 25 mg every 12 hours in severe hepatic impairment.

- DIRECTIONS FOR ADMINISTRATION  For intravenous infusion (Tygacil®), give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute each vial with 5.3 mL infusion fluid to produce a 10 mg/mL solution; dilute requisite dose in 100 mL infusion fluid; give over 30–60 minutes.

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.
**LINCOksamide Antibacterials**

**Clindamycin**

- **Drug Action** Clindamycin is active against Gram-positive cocci, including streptococci and penicillin-resistant staphylococci, and also against many anaerobes, especially *Bacteroides fragilis*. It is well concentrated in bone and excreted in bile and urine.

- **Indications and Dose**
  - **Staphyloccocal bone and joint infections such as osteomyelitis** | **Peritonitis** | **Intra-abdominal sepsis** | **Metastatic-Resistant Staphylococcus Aureus (MRSA)** in bronchiectasis, bone and joint infections, and skin and soft-tissue infections
  - **Erysipelas or Cellulitis in Penicillin-Allergic Patients** (alternative to macrolides)

- **Contraindications**
  - **Diarrhoeal states**
  - **Children** | **Polyarthritis**

- **Side-Effects**
  - **General Side-Effects**
  - **Specific Side-Effects**
    - With intramuscular use Induration (after intramuscular injection) · abscess (after intramuscular injection) · pain (after intramuscular injection)
    - With intravenous use Thrombophlebitis (after intravenous injection)

- **Antibiotic-Associated Colitis** Clindamycin has been associated with antibiotic-associated colitis, which may be fatal. Although antibiotic-associated colitis can occur with most antibacterials, it occurs more frequently with clindamycin. Patients should therefore discontinue treatment immediately if diarrhoea develops.

- **Pregnancy** Not known to be harmful.

- **Breastfeeding** Amount probably too small to be harmful but bloody diarrhoea reported in 1 infant.

- **Monitoring Requirements**
  - Monitor liver and renal function if treatment exceeds 10 days.
  - In children Monitor liver and renal function in infants.

- **Directions for Administration** Avoid rapid intravenous administration.

- **With intravenous use** in children For **intravenous infusion**, dilute to a concentration of not more than 18 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 10–60 minutes at a max. rate of 20 mg/kg/hour.

- **With intravenous use** in adults For **intravenous infusion** (Dalacin® C Phosphate), give continuously or intermittently in Glucose 5% or Sodium Chloride 0.9%; dilute to not more than 18 mg/mL and give over 10–60 minutes at a rate not exceeding 30 mg/minute (1.2 g over at least 60 minutes; higher doses by continuous infusion).

- **Patient and Carer Advice** Patients and their carers should be advised to discontinue immediately and contact doctor if diarrhoea develops. Capsules should be swallowed with a glass of water.

- **Profession Specific Information** Dental practitioners’ formulary Clindamycin Capsules may be prescribed.

- **Medicinal Forms** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

- **Capsule**
  - **Cautionary and Advisory Labels** 9, 27
  - **Clindamycin (Non-proprietary)**
    - Clindamycin (as Clindamycin hydrochloride) 150 mg Clindamycin 150 mg capsules | 24 capsule (P) £48.00 DT price = £3.38 | 100 capsule (P) £55.08
    - Clindamycin (as Clindamycin hydrochloride) 300 mg Clindamycin 300 mg capsules | 30 capsule (P) £31.20 DT price = £31.19
  - **Dalacin C (Pfizer Ltd)**
    - Clindamycin (as Clindamycin hydrochloride) 75 mg Dalacin C 75 mg capsules | 24 capsule (P) £7.45 DT price = £7.45
    - Clindamycin (as Clindamycin hydrochloride) 150 mg Dalacin C 150 mg capsules | 24 capsule (P) £11.72 DT price = £3.38 | 100 capsule (P) £55.08

- **Solution for Injection**
  - **Excipients**: May contain Benzyl alcohol
  - **Clindamycin (Non-proprietary)**
    - Clindamycin (as Clindamycin phosphate) 150 mg per 1 ml Clindamycin 600 mg/mL for injection ampoules | 5 ampoule (P) £5.75-£61.75
    - Clindamycin 300 mg/mL solution for injection ampoules | 5 ampoule (P) £28.50-£31.01
  - **Dalacin C (Pfizer Ltd)**
    - Clindamycin (as Clindamycin phosphate) 150 mg per 1 ml Dalacin C Phosphate 300 mg/mL solution for injection ampoules | 5 ampoule (P) £31.01
    - Dalacin C Phosphate 600 mg/mL solution for injection ampoules | 5 ampoule (P) £61.75

- **Liquid**
  - **Excipients**: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), propylene glycol
Daptomycin

**DRUG ACTION** Daptomycin is a lipopeptide antibacterial with a spectrum of activity similar to vancomycin but its efficacy against enterococci has not been established. It needs to be given with other antibacterials for mixed infections involving Gram-negative bacteria and some anaerobes.

**INDICATIONS AND DOSE**
Complicated skin and soft-tissue infections caused by Gram-positive bacteria, including meticillin-resistant *Staphylococcus aureus* (MRSA) by slow intravenous injection or by intravenous infusion
- Adult: 4 mg/kg once daily; increased to 6 mg/kg once daily, increase dose only if associated with *Staphylococcus aureus* bacteraemia

Staphylococcal endocarditis caused by organisms resistant to vancomycin or in patients intolerant of vancomycin (in combination with other antibacterials) by slow intravenous injection or by intravenous infusion
- Adult: 6 mg/kg once daily

- **UNLICENSED USE** Not licensed for use in left-sided endocarditis.
- **INTERACTIONS** → Appendix 1 (daptomycin).
  Monitor creatine kinase more frequently than weekly during treatment if receiving another drug known to cause myopathy (preferably avoid concomitant use).
- **SIDE-EFFECTS**
  - Common or very common Abdominal pain - anaemia - anxiety - arthralgia - asthenia - constipation - diarrhoea - dizziness - flatulence - headache - hypertension - hypotension - injection-site reactions - insomnia - nausea - pruritus - rash - vomiting
  - Rare Jaundice - rhabdomyolysis
  - Frequency not known Antibiotic-associated colitis - elevated creatine kinase - esoinophilic pneumonia - peripheral neuropathy - syncope - wheezing

**SIDE-EFFECTS, FURTHER INFORMATION**
Muscle effects If unexplained muscle pain, tenderness, weakness, or cramps develop during treatment, measure creatine kinase every 2 days; discontinue if unexplained muscular symptoms and creatine elevated markedly.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Present in milk in small amounts, but absorption from gastrointestinal tract negligible.

- **HEPATIC IMPAIRMENT**Manufacturer advises caution in severe hepatic impairment—no information available.

- **RENAL IMPAIRMENT** Use normal dose every 48 hours if eGFR less than 30 mL/minute/1.73 m². If eGFR less than 80 mL/minute/1.73 m², monitor renal function, and monitor creatine kinase before treatment and then at least weekly during treatment.

- **MONITORING REQUIREMENTS** Monitor creatine kinase before treatment and then weekly during treatment (more frequently if creatine kinase elevated more than 5 times upper limit of normal before treatment).
- **EFFECT ON LABORATORY TESTS** Interference with assay for prothrombin time and INR—take blood sample immediately before daptomycin dose.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Cubicin®), give intermittently in Sodium chloride 0.9%; reconstitute with sodium chloride 0.9% (350 mg in 7 mL, 500 mg in 10 mL); gently rotate vial without shaking; allow to stand for at least 10 minutes then rotate gently to dissolve; dilute requisite dose in 50 mL infusion fluid and give over 30 minutes. For intravenous injection, give over 2 minutes.
- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions The Scottish Medicines Consortium has advised (February 2008) that daptomycin (Cubicin®) is accepted for restricted use within NHS Scotland for the treatment of MRSA bacteraemia associated with right-sided endocarditis or with complicated skin and soft-tissue infections.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**
- Cubicin (Novartis Pharmaceuticals UK Ltd)
  Daptomycin 350 mg (Cubicin 350 mg powder for concentrate for solution for infusion vials | 1 vial [Posm] £62.00)
  Daptomycin 500 mg (Cubicin 500 mg powder for concentrate for solution for infusion vials | 1 vial [Posm] £88.57 (Hospital only)

MACROCYCLIC ANTIBACTERIALS

Fidaxomicin

**DRUG ACTION** Fidaxomicin is a macrocyclic antibacterial that is poorly absorbed from the gastro-intestinal tract, and, therefore, it should not be used to treat systemic infections.

**INDICATIONS AND DOSE**
*Clostridium difficile* infection
**BY MOUTH**
- Adult: 200 mg every 12 hours for 10 days, limited clinical data is available on the use of fidaxomicin in severe or life-threatening *Clostridium difficile* infection

**CAUTIONS** Inflammatory bowel disease - severe or life-threatening *C. difficile* infection
**INTERACTIONS** → Appendix 1 (fidaxomicin).

**SIDE-EFFECTS**
- Common or very common Constipation - nausea - vomiting
- Uncommon Abdominal distension - decreased appetite - dizziness - dry mouth - flatulence - headache - taste disturbance

**ALLERGY AND CROSS-SENSITIVITY** Use with caution in macrolide hypersensitivity.

- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment—no information available.

- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
MACROLIDES AND RELATED DRUGS

### Macrolides

The macrolides have an antibacterial spectrum that is similar but not identical to that of penicillin; they are thus an alternative in penicillin-allergic patients. They are active against many penicillin-resistant staphylococci, but some are now also resistant to the macrolides. Indications for the macrolides include campylobacter enteritis, respiratory infections (including pneumonia, whooping cough, Legionella, chlamydia, and mycoplasma infection), and skin infections.

Erythromycin p. 471 is also used in the treatment of early syphilis, uncomplicated genital chlamydia infection, and non-gonococcal urethritis. Erythromycin has poor activity against *Haemophilus influenzae*. Erythromycin causes nausea, vomiting, and diarrhoea in some patients; in mild to moderate infections this can be avoided by giving a lower dose, but if a more serious infection, such as Legionella pneumonia, is suspected higher doses are needed.

Azithromycin below is a macrolide with slightly less activity than erythromycin against Gram-positive bacteria, but enhanced activity against some Gram-negative organisms including *H. influenzae*. Plasma concentrations are very low, but tissue concentrations are much higher. It has a long tissue half-life and once daily dosage is recommended. Azithromycin is also used in the treatment of uncomplicated genital chlamydia infection, non-gonococcal urethritis, uncomplicated gonorrhoea, typhoid [unlicensed indication], and trachoma [unlicensed indication].

Clarithromycin p. 470 is an erythromycin derivative with slightly greater activity than the parent compound. Tissue concentrations are higher than with erythromycin. It is given twice daily. Clarithromycin is also used in regimens for *Helicobacter pylori* eradication.

Telithromycin p. 473 is a ketolide derivative of erythromycin with an antibacterial spectrum similar to that of other macrolides and it is also active against penicillin- and erythromycin-resistant *Streptococcus pneumoniae*.

Erythromycin, azithromycin, and clarithromycin have a role in the treatment of Lyme disease p. 500. Spiramycin is also a macrolide which is used for the treatment of toxoplasmosis.

#### Cautions

- Electrolyte disturbances (predisposition to QT interval prolongation) - may aggravate myasthenia gravis - predisposition to QT interval prolongation

### Azithromycin

**Indications and dose**

Prevention of secondary case of invasive group A streptococcal infection in patients who are allergic to penicillin

**By mouth**

- Child 6 months–11 years: 12 mg/kg once daily (max. per dose 500 mg) for 5 days
- Child 12–17 years: 500 mg once daily for 5 days
- Adult: 500 mg once daily for 5 days

**Respiratory-tract infections, otitis media, skin and soft-tissue infections**

**By mouth**

- Child 6 months–17 years: 10 mg/kg once daily (max. per dose 500 mg) for 3 days
- Child 6 months–17 years (body-weight 15–25 kg): 200 mg once daily for 3 days
- Child 6 months–17 years (body-weight 26–35 kg): 300 mg once daily for 3 days
- Child 6 months–17 years (body-weight 36–45 kg): 400 mg once daily for 3 days
- Child 6 months–17 years (body-weight 46 kg and above): 500 mg once daily for 3 days
- Adult: 500 mg once daily for 3 days, alternatively initially 500 mg once daily for 1 day, then 250 mg once daily for 4 days

**Uncomplicated genital chlamydial infections**

**By non-gonococcal urethritis**

**By mouth**

- Child 12–17 years: 1 g for 1 dose
- Adult: 1 g for 1 dose

**Lyme disease**

**By mouth**

- Adult: 500 mg daily for 7–10 days

**Mild to moderate typhoid due to multiple-antibacterial resistant organisms**

**By mouth**

- Adult: 500 mg daily for 7 days

**Community-acquired pneumonia, low to moderate severity**

**By mouth**

- Adult: 500 mg once daily for 3 days, alternatively initially 500 mg once daily for 1 day, then 250 mg once daily for 4 days
Community-acquired pneumonia, high severity
INITIALLY BY INTRavenous INFUSION
▶ Adult: Initially 500 mg once daily for at least 2 days, then (by mouth) 500 mg once daily for a total duration of 7–10 days
Antibacterial prophylaxis for insertion of intra-uterine device
BY MOUTH
▶ Adult: 1 g for 1 dose

● UNLICENSED USE Not licensed for uncomplicated gonorrhoea, mild or moderate typhoid due to multiple-antibacterial-resistant organisms, Lyme disease, or prophylaxis of group A streptococcal infection. Not licensed for community-acquired pneumonia (high severity) when oral treatment continues for more than 3 days.

● INTERACTIONS → Appendix 1 (macrolides).
Caution with concomitant use of drugs that prolong the QT interval.

● SIDE-EFFECTS
▶ Common or very common Anorexia · arthralgia · arthralgia · disturbances in taste · disturbances in vision · dizziness · dyspepsia · flatulence · headache · malaise · paraesthesia · reversible hearing loss (sometimes with tinnitus) after long-term therapy ·
▶ Uncommon Anxiety · chest pain · constipation · gastritis · hypoaesthesia · leucopenia · oedema · photosensitivity · sleep disturbances
▶ Rare Agitation
▶ Frequency not known Acute renal failure · convulsions · haemolytic anaemia · interstitial nephritis · smell disturbances · syncope · thrombocytopenia · tongue discoloration

● PREGNANCY Manufacturers advise use only if adequate alternatives not available.

● BREAST FEEDING Present in milk; use only if no suitable alternatives.

● HEPATIC IMPAIRMENT Manufacturers advise avoid in severe liver disease—no information available.

● RENAL IMPAIRMENT
▶ In adults Use with caution if eGFR less than 10 mL/minute/1.73 m².
▶ In children Use with caution if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

● DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Zedbac®), give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute 500 mg with 4.8 mL water for injections to produce a 100 mg/mL solution, then dilute 5 mL of solution with infusion fluid to a final concentration of 1 or 2 mg/mL; give the 1 mg/mL solution over 3 hours or give the 2 mg/mL solution over 1 hour.

● PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include cherry or banana.

● PATIENT AND CARER ADVICE
Medicines for Children leaflet: Azithromycin for bacterial infections www.medicinesforchildren.org.uk/aizithromycin-bacterial-infections-0

● PROFESSION SPECIFIC INFORMATION
Dental practitioners’ formulary Azithromycin Capsules may be prescribed. Azithromycin Tablets may be prescribed. Azithromycin Oral Suspension 200 mg/5 mL may be prescribed.

● EXCEPTIONS TO LEGAL CATEGORY Azithromycin tablets can be sold to the public for the treatment of confirmed, asymptomatic Chlamydia trachomatis genital infection in those over 16 years of age, and for the epidemiological treatment of their sexual partners, subject to maximum single dose of 1 g, maximum daily dose 1 g, and a pack size of 1 g.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension
Tablet
CAUTIONARY AND ADVISORY LABELS 5, 9

Indications and dose
Respiratory-tract infections | Mild to moderate skin and soft-tissue infections | Otitis media
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
▶ Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily
▶ Child 1 month–11 years (body-weight 8–11 kg): 6.25 mg twice daily
▶ Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily
▶ Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily
▶ Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily
▶ Child 12–17 years: 250 mg twice daily usually for 7–14 days, increased to 500 mg twice daily, if required in severe infections (e.g. pneumonia)
▶ Adult: 250 mg twice daily usually for 7–14 days, increased to 500 mg twice daily, if required in severe infections (e.g. pneumonia)
BY MOUTH USING MODIFIED-RELEASE MEDICINES
▶ Child 12–17 years: 500 mg once daily usually for 7–14 days, increased to 1 g once daily, if required in severe infections (e.g. pneumonia)
▶ Adult: 500 mg once daily usually for 7–14 days, increased to 1 g once daily, if required in severe infections (e.g. pneumonia)
BY INTRAVENOUS INFUSION
Adult: 500 mg every 12 hours maximum duration 5 days, switch to oral route when appropriate, to be administered into a large proximal vein
 Lyme disease

BY MOUTH
- Child 12-17 years: 500 mg twice daily for 14–21 days
- Adult: 500 mg twice daily for 14–21 days

Prevention of pertussis

BY MOUTH
- Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 7 days
- Child 1 month–11 years (body-weight 8-11 kg): 62.5 mg twice daily for 7 days
- Child 1 month–11 years (body-weight 12-19 kg): 125 mg twice daily for 7 days
- Child 1 month–11 years (body-weight 20-29 kg): 187.5 mg twice daily for 7 days
- Child 1 month–11 years (body-weight 30-40 kg): 250 mg twice daily for 7 days
- Child 12-17 years: 500 mg twice daily for 7 days
- Adult: 500 mg twice daily for 7 days

Helicobacter pylori eradication in combination with a proton pump inhibitor and amoxicillin

BY MOUTH
- Adult: 500 mg twice daily

Helicobacter pylori eradication in combination with a proton pump inhibitor and metronidazole

BY MOUTH
- Adult: 250 mg twice daily

- **UNLICENSED USE** Tablets not licensed for use in children under 12 years; oral suspension not licensed for use in infants under 6 months. Intravenous infusion not licensed for use in children under 12 years.

- **INTERACTIONS** → Appendix 1 (macrolides).
  Caution with concomitant use of drugs that prolong the QT interval.

- **SIDE-EFFECTS**
  - **Common or very common** Dyspepsia · headache · hyperhidrosis · insomnia · taste disturbances
  - **Uncommon** Anorexia · anxiety · blood disorders · chest pain · constipation · dizziness · dry mouth · flatulence · gastritis · glossitis · hepatic dysfunction including jaundice · leucopenia · malaise · myalgia · stomatitis · tinnitus · tremor
  - **Frequency not known** Abnormal dreams · confusion · convulsions · depression · hypoglycaemia · interstitial nephritis · myopathy · paraesthesia · psychotic disorders · renal failure · smell disturbances · tongue discolouration · tooth discoloration

- **PREGNANCY** Manufacturer advises avoid, particularly in the first trimester, unless potential benefit outweighs risk.

- ** BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risks—present in milk.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment if renal impairment also present.

- **RENAL IMPAIRMENT** Avoid if severe hepatic impairment also present.
  - In adults Use half normal dose if eGFR less than 30 mL/minute/1.73 m², max. duration 14 days. Avoid Klaricid XL® or clarithromycin m/t preparations if eGFR less than 30 mL/minute/1.73 m².
  - In children Use half normal dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m², max. duration 14 days. Avoid Klaricid XL® or clarithromycin m/t preparations if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use in children. For intermittent intravenous infusion dilute reconstituted solution further in Glucose 5% or Sodium chloride 0.9% to a concentration of 2 mg/mL; give into large proximal vein over 60 minutes.

- **With intravenous use in adults** For intravenous infusion (Klaricid® i.v.), give intermittently in Glucose 5% or Sodium Chloride 0.9%; dissolve initially in water for injections (500 mg in 10 mL) then dilute to a concentration of 2 mg/mL; give over 60 minutes.

**Erythromycin**

**INDICATIONS AND DOSE**

Susceptible infections in patients with penicillin hypersensitivity (e.g. respiratory–tract infections (including Legionella infection), skin and oral infections, and campylobacter enteritis)

**BY MOUTH**
- Child 1 month–1 year: 125 mg 4 times a day, total daily dose may alternatively be given in two divided doses. Increased to 250 mg 4 times a day in severe infections
- Child 2–7 years: 250 mg 4 times a day, total daily dose may alternatively be given in two divided doses. Increased to 500 mg 4 times a day in severe infections continued→
**472 Bacterial infection**

**Chronic prostatitis**
- **Child 2**
- **Child 1 month**

**Uncomplicated genital chlamydia | Non-gonococcal urethritis**
- **BY MOUTH**
  - **Adult:** 500 mg 4 times a day for 14–21 days

**Prevention and treatment of pertussis**
- **BY MOUTH**
  - **Child 1 month-1 year:** 125 mg 4 times a day, total daily dose may alternatively be given in two divided doses. Increased to 250 mg 4 times a day in severe infections
  - **Child 1 year:** 125 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days’ treatment
  - **Child 2-7 years:** 250 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days’ treatment
  - **Child 8-17 years:** 500 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days’ treatment

**Prevention of secondary case of diphtheria in non-immune patient**
- **BY MOUTH**
  - **Child 1 month-1 year:** 125 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days’ treatment
  - **Child 2-7 years:** 250 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days’ treatment
  - **Child 8-17 years:** 500 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days’ treatment

**Prevention of secondary case of invasive group A streptococcal infection in penicillin allergic patients**
- **BY MOUTH**
  - **Child 1 month-1 year:** 125 mg every 6 hours for 10 days
  - **Child 2-7 years:** 250 mg every 6 hours for 10 days
  - **Child 8-17 years:** 500 mg every 6 hours for 10 days
  - **Adult:** 500–1000 mg 4 times a day in severe infections

**Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease, and who are penicillin allergic**
- **BY MOUTH**
  - **Child 1 month-1 year:** 125 mg twice daily, antibiotic prophylaxis is not fully reliable
  - **Child 2-7 years:** 125 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those over 5 years of age with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection
  - **Child 8-17 years:** 500 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those over 5 years of age with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection
  - **Adult:** 500 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those over 5 years of age with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection

**Prevention of recurrence of rheumatic fever**
- **BY MOUTH**
  - **Child 1 month-1 year:** 125 mg twice daily
  - **Child 2-17 years:** 250 mg twice daily

**Rosacea**
- **BY MOUTH**
  - **Adult:** 500 mg twice daily courses usually last 6–12 weeks and are repeated intermittently

**Acne**
- **BY MOUTH**
  - **Adult:** 500 mg twice daily

---

**UNLICENSED USE**
- With intravenous use or oral use in children. Not licensed for use in gastro-intestinal stasis.

**CAUTIONS**
- Avoid in Acute porphyrias p. 864. Neonate under 2 weeks (risk of hypertrophic pyloric stenosis) (in neonates)

**STIEMYCIN®**
- Some manufacturers advise preparations containing alcohol are not suitable for use with benzoyl peroxide

**INTERACTIONS** → See Appendix 1 (macrolides). Caution with concomitant use of drugs that prolong the QT interval.

**PREGNANCY**
- Not known to be harmful.

**BREAST FEEDING**
- Only small amounts in milk—not known to be harmful.

**HEPATIC IMPAIRMENT**
- May cause idiosyncratic hepatotoxicity.

**RENAL IMPAIRMENT**
- In adults Max. 1.5 g daily in severe renal impairment (ototoxicity).
- In children Reduce dose in severe renal impairment (ototoxicity).

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use in children. Dilute reconstituted solution further in glucose 5% (neutralised with Sodium bicarbonate) or sodium chloride 0.9% to a concentration of 1–5 mg/mL; give over 20–60 minutes. Concentration of up to 10 mg/mL may be used in fluid-restriction if administered via a central venous catheter.
- With intravenous use in adults. For intravenous infusion (as lactobionate), give intermittently in Glucose 5% (neutralised with sodium bicarbonate) or Sodium chloride 0.9%; dissolve initially in water for injections (1 g in 20 mL) then dilute to a concentration of 1–5 mg/mL; give over 20–60 minutes.
### Prescribing and Dispensing Information
Flavours of oral liquid formulations may include banana.

### Patient and Carer Advice
Medicines for Children leaflet: Erythromycin for bacterial infections www.medicinesforchildren.org.uk/erythromycin-for-bacterial-infections

### Profession Specific Information
Dental practitioners’ formulary Erythromycin tablets e/c may be prescribed. Erythromycin ethyl succinate oral suspension may be prescribed. Erythromycin stearate tablets may be prescribed. Erythromycin ethyl succinate tablets may be prescribed.

### Medicinal Forms
There can be variation in the licensing of different medicines containing the same drug.

#### Tablet
**Cautionary and Advisory Labels**
- **ERYTHROMYCIN (Non-proprietary)**
  - Erythromycin 250 mg Erythromycin 250mg gastro-resistant tablets | 28 tablet | £3.00 DT price £1.88 | 500 tablet | £3.37

#### Gastro-resistant capsule
**Cautionary and Advisory Labels**
- **ERYTHROMYCIN (Non-proprietary)**
  - Erythromycin 250 mg Erythromycin 250mg gastro-resistant capsules | 28 capsule | £23.53 DT price £5.61 | 30 capsule no price available

#### Oral suspension
**Cautionary and Advisory Labels**
- **ERYTHROMYCIN (Non-proprietary)**
  - Erythromycin (as Erythromycin ethyl succinate) 100 mg per 1 ml Erythromycin ethyl succinate 100mg/5ml oral suspension | 100 ml | £5.54 DT price £5.53
  - Erythromycin ethyl succinate 250mg/5ml oral suspension sugar free (sugar-free) | 100 ml | £4.00 DT price £3.21
  - Erythromycin ethyl succinate 50 mg | 1 ml Erythromycin ethyl succinate 50mg/5ml oral suspension sugar free (sugar-free) | 100 ml | £0.63 DT price £0.63

#### Powder for solution for infusion
- **ERYTHROMYCIN (Non-proprietary)**
  - Erythromycin lactobionate 1g powder for solution for infusion vials | 1 vial | £0.90

### Interactions
- **ERYTHROMYCIN**
  - Treatment is contra-indicated if conventional treatment is contra-indicated

### Contra-indications
- **ERYTHROMYCIN**
  - Erythromycin 250 mg Erythromycin 250mg gastro-resistant tablets | 28 tablet | £3.00 DT price £1.88 | 500 tablet | £3.37

### Medication History
- **ERYTHROMYCIN**
  - Erythromycin ethyl succinate 250mg/5ml oral suspension sugar free (sugar-free) | 100 ml | £7.99 DT price £4.48

### Contra-indications
- **ERYTHROMYCIN**
  - Erythromycin ethyl succinate 100mg/5ml oral suspension | 100 mg | £12.99 DT price £12.99

### Drug Action
The ketolide telithromycin is a derivative of erythromycin. The antibacterial spectrum of telithromycin is similar to that of macrolides and it is also active against penicillin- and erythromycin-resistant Streptococcus pneumoniae.

### Indications and Dose
**Treatment of sinusitis or exacerbations of chronic bronchitis if caused by organisms resistant to beta-lactam antibacterials and other macrolides, or if conventional treatment is contra-indicated**
- **By Mouth**
  - Adult: 800 mg once daily for 5 days

**Treatment of community-acquired pneumonia if caused by organisms resistant to beta-lactam antibacterials and other macrolides, or if conventional treatment is contra-indicated**
- **By Mouth**
  - Adult: 800 mg once daily for 7–10 days

**Treatment of beta-haemolytic streptococcal pharyngitis if caused by organisms resistant to beta-lactam antibacterials and other macrolides, or if conventional treatment is contra-indicated**
- **By Mouth**
  - Child 12–17 years: 800 mg once daily for 5 days
  - Adult: 800 mg once daily for 5 days

### CONTRA-INDICATIONS
- **ERYTHROMYCIN**
  - Congenital history of QT interval prolongation (if not excluded by ECG) • Family history of QT interval prolongation (if not excluded by ECG) • History of telithromycin-associated hepatitis • History of telithromycin-associated jaundice • Hypersensitivity • Prolongation of QT interval

### Caution
- **erythromycin**
  - Avoid in Acute porphyrias p. 864 • Bradycardia—risk of QT interval prolongation • Coronary heart disease—risk of QT interval prolongation • Hypokalaemia—risk of QT interval prolongation • Hypomagnesaemia—risk of QT interval prolongation • Ventricular arrhythmias—risk of QT interval prolongation

### Interactions
  - **ERYTHROMYCIN**
    - Appendix 1 (telithromycin)

### Side-effects
- **ERYTHROMYCIN**
  - Common or very common: Abdominal pain • Diarrhoea • Dizziness • Flatulence • Headache • Nausea • Taste disturbances • Vomiting

### Pregnancy
- **ERYTHROMYCIN**
  - Toxicity in animal studies—manufacturer advises use only if potential benefit outweighs risk.

### Breast Feeding
- **ERYTHROMYCIN**
  - Manufacturer advises avoid—present in milk in animal studies

### Hepatic Impairment
- **ERYTHROMYCIN**
  - Manufacturer advises caution.

### Renal Impairment
- **ERYTHROMYCIN**
  - Manufacturer advises avoid if possible if eGFR less than 30 mL/minute/1.73 m²—If no
alternative, use alternating daily doses of 800 mg and 400 mg, starting with 800 mg dose.

**PATIENT AND CARER ADVICE** Visual disturbances or transient loss of consciousness may affect performance of skilled tasks (e.g. driving); effects may occur after the first dose. Administration at bedtime may reduce these side-effects. Patients should be advised not to drive or operate machinery if affected. Hepatic disorders Counselling on hepatic disorders is advised. Patients should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, abdominal pain, jaundice, or dark urine develop.

**MEDICINAL FORMS** Medicines not identified.

### MONOCYCLIC BETA-LACTAM ANTIBACTERIALS

**Aztreonam**

- **DRUG ACTION** Aztreonam is a monocular beta-lactam (‘monobactam’) antibiotic with an antibacterial spectrum limited to Gram-negative aerobic bacteria including *Pseudomonas aeruginosa*, *Neisseria meningitidis*, and *Haemophilus influenzae*; it should not be used alone for ‘blind’ treatment since it is not active against Gram-positive organisms. Aztreonam is also effective against *Neisseria gonorrhoeae* (but not against concurrent chlamydial infection).

#### INDICATIONS AND DOSE

Gram-negative infections including *Pseudomonas aeruginosa, Haemophilus influenzae*, and *Neisseria meningitidis*

BY DEEP INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION

- Adult: 1 g every 8 hours, alternatively 2 g every 12 hours, single doses over 1 g by intravenous route only
- Severe gram-negative infections including *Pseudomonas aeruginosa, Haemophilus influenzae*, *Neisseria meningitidis*, and lung infections in cystic fibrosis

BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION

- Adult: 2 g every 6–8 hours
- Gonorrhoea / Cystitis
  - BY INTRAMUSCULAR INJECTION
    - Adult: 1 g for 1 single dose
- Urinary-tract infections

BY DEEP INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION

- Adult: 0.5–1 g every 8–12 hours
- Chronic pulmonary *Pseudomonas aeruginosa* infection in patients with cystic fibrosis

BY INHALATION OF NEBULISED SOLUTION

- Adult: 75 mg 3 times a day for 28 days, doses to be administered at least 4 hours apart, subsequent courses repeated after 28-day interval without aztreonam nebuliser solution

**CAUTIONS**

- When used by inhalation Haemoptysis—risk of further haemorrhage

**INTERACTIONS** → Appendix 1 (aztreonam).

**SIDE-EFFECTS**

- **SPECIFIC SIDE-EFFECTS**
  - Rare
  - With systemic use Antibiotic-associated colitis · asthenia · blood disorders · breast tenderness · chest pain · confusion · diplopia · dizziness · dysphonia · gastro-intestinal bleeding · halitosis · headache · hepatitis · hypotension · insomnia · jaundice · myalgia · neutropenia · paraesthesia · seizures · thrombocytopenia · tinnitus
  - Frequency not known Bronchospasm · rash
  - When used by inhalation Arthralgia · cough · haemoptysis · pharyngolaryngeal pain · pyrexia · rhinorrhea · wheezing
  - With systemic use Abdominal pain · diarrhoea · erythema multiforme · flushing · mouth ulcers · nausea · taste disturbances · toxic epidermal necrolysis · vomiting

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in aztreonam hypersensitivity. Use with caution in patients with hypersensitivity to other beta-lactam antibiotics (although aztreonam may be less likely than other beta-lactams to cause hypersensitivity in penicillin-sensitive patients).

**PREGNANCY**

- With systemic use No information available; manufacturer of injection advises avoid.

- When used by inhalation No information available; manufacturer of powder for nebuliser solution advises avoid unless essential.

**BREAST FEEDING** Amount in milk probably too small to be harmful.

**HEPATIC IMPAIRMENT**

- With systemic use Use injection with caution. Monitor liver function.

**RENAL IMPAIRMENT**

- With systemic use If eGFR 10–30 mL/minute/1.73 m², usual initial dose of injection, then half normal dose. If eGFR less than 10 mL/minute/1.73 m², usual initial dose of injection, then one-quarter normal dose.

**MONITORING REQUIREMENTS**

- When used by inhalation Measure lung function before and after initial dose of aztreonam and monitor for bronchospasm.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use For intravenous injection, give over 3–5 minutes. For intravenous infusion (Azactam®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Dissolve initially in water for injections (1 g per 3 mL) then dilute to a concentration of less than 20 mg/mL; to be given over 20–60 minutes.

- When used by inhalation Other inhaled drugs should be administered before aztreonam; a bronchodilator should be administered before each dose.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (December 2014) that aztreonam powder for nebuliser solution (Cayston®) is accepted for restricted use within NHS Scotland when inhaled colistimethate sodium and inhaled tobramycin are not tolerated or are not providing satisfactory therapeutic benefit (measured as >2% decline in forced expiratory volume in 1 second).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- **Azactam** (Bristol-Myers Squibb Pharmaceuticals Ltd)
- **Aztreonam**
  - **1 gram** Azactam 1g powder for solution for injection vials | 1 vial £0.90 (Hospital only)
  - **2 gram** Azactam 2g powder for solution for injection vials | 1 vial £13.82 (Hospital only)

**Powder and solvent for nebuliser solution**

- **Cayston** (Gilead Sciences International Ltd)
- **Aztreonam (as Aztreonam lysine)** 75 mg Cayston 75mg powder and solvent for nebuliser solution vials with Altera Nebuliser Handset | 84 vial £2,181.53
5-NITROIMIDAZOLE DERIVATIVES

Metronidazole

**DRUG ACTION** Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa.

**INDICATIONS AND DOSE**

- **Anaerobic infections**
  - **BY MOUTH**
    - Child 1 month: 7.5 mg/kg every 12 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)
    - Child 2 months–11 years: 7.5 mg/kg every 8 hours (max. per dose 400 mg) usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)
    - Child 12–17 years: 400 mg every 8 hours
    - Adult: 400 mg every 8 hours, alternatively 500 mg every 8 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)

- **BY RECTUM**
  - Child 1–11 months: 125 mg 3 times a day for 3 days, then 125 mg twice daily, for usual total treatment duration of 7 days
  - Child 1–4 years: 250 mg 3 times a day for 3 days, then 250 mg twice daily, for usual total treatment duration of 7 days
  - Child 5–9 years: 500 mg 3 times a day for 3 days, then 500 mg twice daily, for usual total treatment duration of 7 days
  - Child 10–17 years: 1 g 3 times a day for 3 days, then 1 g twice daily, for usual total treatment duration of 7 days
  - Adult: 1 g 3 times a day for 3 days, then 1 g twice daily, for usual total treatment duration of 7 days

- **BY INTRAVENOUS INFUSION**
  - Adult: 500 mg every 8 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection), to be given over 20 minutes

**Helicobacter pylori eradication; in combination with clarithromycin and esomeprazole; or in combination with amoxicillin and lansoprazole; or in combination with clarithromycin and omeprazole; or in combination with clarithromycin and pantoprazole; or in combination with clarithromycin and rabeprazole**

- **BY MOUTH**
  - Adult: 400 mg twice daily

- **Helicobacter pylori eradication; in combination with amoxicillin and omeprazole**

- **BY MOUTH**
  - Adult: 400 mg 3 times a day

**Helicobacter pylori eradication failure (two-week regimen comprising a proton pump inhibitor plus tripotassium dichromatobisulfate plus tetracycline)**

- **BY MOUTH**
  - Adult: 400–500 mg 3 times a day for 2 weeks

**Fistulating Crohn’s disease**

- **BY MOUTH**
  - Adult: 10–20 mg/kg daily in divided doses, usual dose 400–500 mg 3 times a day usually given for 1 month but no longer than 3 months because of concerns about peripheral neuropathy

**Leg ulcers and pressure sores**

- **BY MOUTH**
  - Adult: 400 mg every 8 hours for 7 days

**Bacterial vaginosis (notably *Gardnerella vaginalis* infection)**

- **BY MOUTH**
  - Adult: 400–500 mg twice daily for 5–7 days, alternatively 2 g for 1 dose

**Bacterial vaginosis**

- **BY VAGINA USING VAGINAL GEL**
  - Adult: 1 applicatorful daily for 5 days, dose to be administered at night

**Pelvic inflammatory disease**

- **BY MOUTH**
  - Adult: 400 mg twice daily for 14 days

**Acute ulcerative gingivitis**

- **BY MOUTH**
  - Child 1–2 years: 50 mg every 8 hours for 3–7 days
  - Child 3–6 years: 100 mg every 12 hours for 3–7 days
  - Child 7–9 years: 100 mg every 8 hours for 3–7 days
  - Child 10–17 years: 200–250 mg every 8 hours for 3 days
  - Adult: 200–250 mg every 8 hours for 3 days

**Acute oral infections**

- **BY MOUTH**
  - Child 1–2 years: 50 mg every 8 hours for 3–7 days
  - Child 3–6 years: 100 mg every 12 hours for 3–7 days
  - Child 7–9 years: 100 mg every 8 hours for 3–7 days
  - Adult: 200 mg every 8 hours for 3–7 days

**Surgical prophylaxis**

- **BY MOUTH**
  - Adult: 400–500 mg, to be administered 2 hours before surgery, then 400–500 mg every 8 hours if required for up to 3 doses (in high-risk procedures)

- **BY RECTUM**
  - Adult: 1 g, to be administered 2 hours before surgery, then 1 g every 8 hours if required for up to 3 doses (in high-risk procedures)

- **BY INTRAVENOUS INFUSION**
  - Adult: 500 mg, to be administered up to 30 minutes before the procedure (if rectal administration inappropriate), then 500 mg every 8 hours if required for up to 3 doses (in high-risk procedures)

**Invasive intestinal amoebiasis / Extra-intestinal amoebiasis (including liver abscess)**

- **BY MOUTH**
  - Child 1–2 years: 200 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
  - Child 3–6 years: 200 mg 4 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
  - Child 7–9 years: 400 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
  - Child 10–17 years: 800 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
  - Adult: 800 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)

**Urogenital trichomoniasis**

- **BY MOUTH**
  - Child 1–2 years: 50 mg 3 times a day for 7 days
  - Child 3–6 years: 100 mg twice daily for 7 days
  - Child 7–9 years: 100 mg 3 times a day for 7 days
  - Child 10–17 years: 200 mg 3 times a day for 7 days, alternatively 400–500 mg twice daily for 5–7 days, alternatively 2 g for 1 dose
  - Adult: 200 mg 3 times a day for 7 days, alternatively 400–500 mg twice daily for 5–7 days, alternatively 2 g for 1 dose

**Giardiasis**

- **BY MOUTH**
  - Child 1–2 years: 500 mg once daily for 3 days

**continued**
**Child 3–6 years:** 600–800 mg once daily for 3 days  
**Child 7–9 years:** 1 g once daily for 3 days  
**Child 10–17 years:** 2 g once daily for 3 days, alternatively 400 mg 3 times a day for 5 days, alternatively 500 mg twice daily for 7–10 days  
**Adult:** 2 g once daily for 3 days, alternatively 400 mg 3 times a day for 5 days, alternatively 500 mg twice daily for 7–10 days  
**Established case of tetanus**  
**By intravenous infusion**  
**Adult:** (consult product literature)  

**UNLICENSED USE** Metronidazole doses in the BNF may differ from those in product literature.  

**CAUTIONS**  
With vaginal use Not recommended during menstruation, some systemic absorption may occur with vaginal gel  

**INTERACTIONS**  
With systemic use → Appendix 1 (metronidazole). Caution—disulfiram-like reaction with alcohol.  

**SIDE-EFFECTS**  
Very rare  
**With systemic use** Arthralgia - ataxia - darkening of urine - dizziness - drowsiness - erythema multiforme - headache - hepatitis - jaundice - leucopenia (on prolonged or intensive therapy) - myalgia - pancreatitis - pancytopenia - peripheral neuropathy (on prolonged or intensive therapy) - pruritus - psychotic disorders - rash - thrombocytopenia - transient epileptiform seizures (on prolonged or intensive therapy) - visual disturbances  
**Frequency not known**  
**With systemic use** Anorexia - aseptic meningitis - furred tongue - gastro-intestinal disturbances - nausea - optic neuropathy - oral mucositis - taste disturbances - vomiting  
**With vaginal use** Abnormal vaginal discharge - local irritation - pelvic discomfort - vaginal candidiasis  

**PREGNANCY**  
With systemic use Manufacturer advises avoidance of high-dose regimens; use only if potential benefit outweighs risk.  

**BREAST FEEDING**  
With systemic use Significant amount in milk; manufacturer advises avoid large single doses though otherwise compatible; may give milk a bitter taste.  

**HEPATIC IMPAIRMENT**  
With systemic use In severe liver disease reduce total daily dose to one-third, and give once daily. Use with caution in hepatic encephalopathy.  

**MONITORING REQUIREMENTS**  
With systemic use Clinical and laboratory monitoring advised if treatment exceeds 10 days.  

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, give over 20–30 minutes.  

**PRESCRIBING AND DISPENSING INFORMATION**  
With systemic use Metronidazole is well absorbed orally and the intravenous route is normally reserved for severe infections. Metronidazole by the rectal route is an effective alternative to the intravenous route when oral administration is not possible.  

**PATIENT AND CARER ADVICE**  
Medicines for Children leaflet: Metronidazole for bacterial infections www.medicinesforchildren.org.uk/metronidazole-for-bacterial-infections  

**PROFESSION SPECIFIC INFORMATION**  
Dental practitioners’ formulary Metronidazole Tablets may be prescribed. Metronidazole Oral Suspension may be prescribed.  

**MEDICINAL FORMS**  
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, gel, cream.

Metronidazole 1 gram Flagyl 1g suppositories | 10 suppository (PO) £23.06  

**Vaginal gel**  
**EXCIPIENTS:** May contain Disodium edetate, hydroxybenzoates (parabens), propylene glycol  
**METRONIDAZOLE (Non-proprietary)**  
Metronidazole 7.5 mg per 1 g Metronidazole 0.75% vaginal gel | 40g (PO) no price available  
**Zidoval (Meda Pharmaceuticals Ltd)**  
Metronidazole 7.5 mg per 1 g Zidoval 0.75% vaginal gel | 40g (PO) £4.31  

**Tinidazole**  
**DRUG ACTION** Tinidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa; it has a longer duration of action than metronidazole.  

**INDICATIONS AND DOSE**  
**Anaerobic infections**  
**By mouth**  
**Adult:** Initially 2 g, followed by 1 g daily usually for 5–6 days, alternatively 500 mg twice daily usually for 5–6 days  

**Bacterial vaginosis | Acute ulcerative gingivitis**  
**By mouth**  
**Adult:** 2 g for 1 single dose  

**Abdominal surgery prophylaxis**  
**By mouth**  
**Adult:** 2 g for 1 single dose, to be administered approximately 12 hours before surgery  

**Intestinal amoebiasis**  
**By mouth**  
**Child 1 month–11 years:** 50–60 mg/kg once daily (max. per dose 2 g) for 3 days  
**Child 12–17 years:** 2 g once daily for 2–3 days  
**Adult:** 2 g once daily for 2–3 days
Amoebic involvement of liver

**BY MOUTH**
- Child 1 month–11 years: 50–60 mg/kg once daily (max. per dose 2 g) for 5 days
- Child 12–17 years: 1.5–2 g once daily for 3–6 days
- Adult: 1.5–2 g once daily for 3–6 days

Urogenital trichomoniasis | Giardiasis

**BY MOUTH**
- Child 1 month–11 years: 50–75 mg/kg (max. per dose 2 g) for 1 single dose, dose may be repeated once if necessary
- Child 12–17 years: 2 g for 1 single dose, dose may be repeated once if necessary
- Adult: 2 g for 1 single dose

**HELICOBACTER PYLORI ERADICATION**

**BY MOUTH**
- Adult: (consult local protocol)

### DRUG ACTION
Linezolid, an oxazolidinone antibacterial, is active against Gram-positive bacteria including meticillin-resistant *Staphylococcus aureus* (MRSA), and glycopeptide-resistant enterococci. Resistance to linezolid can develop with prolonged treatment or if the dose is less than that recommended. Linezolid is not active against common Gram-negative organisms; it must be given in combination with other antibacterials for mixed infections that also involve Gram-negative organisms.

### INDICATIONS AND DOSE

**Pneumonia (when other antibacterials e.g. a glycopetide, such as vancomycin, cannot be used) (initiated under specialist supervision)** | Complicated skin and soft-tissue infections caused by Gram-positive bacteria, when other antibacterials cannot be used (initiated under specialist supervision)

**BY MOUTH**
- Adult: 600 mg every 12 hours usually for 10–14 days (maximum duration of treatment 28 days)

**BY INTRAVENOUS INFUSION**
- Adult: 600 mg every 12 hours

### CAUTIONS

- **Avoid in Acute porphyrias**. p. 864
- **INTERACTIONS** → Appendix 1 (tinidazole).
- **SIDE-EFFECTS**
  - **Common or very common** Anorexia - furred tongue - gastro-intestinal disturbances - nausea - oral mucositis - taste disturbances - vomiting
  - **Very rare** Arthralgia - ataxia - darkening of urine - dizziness - drowsiness - erythema multiforme - headache - hepatitis - jaundice - leukopenia (on prolonged or intensive therapy) - myalgia - pancreatitis - pancytopenia - peripheral neuropathy (on prolonged or intensive therapy) - pruritus - psychotic disorders - rash - thrombocytopenia - transient epileptiform seizures (on prolonged or intensive therapy) - visual disturbances
- **Frequency not known** Aseptic meningitis - optic neuropathy
- **PREGNANCY** Manufacturer advises avoid in first trimester.
- **BREAST FEEDING** Present in milk—manufacturer advises avoid breast-feeding during and for 3 days after stopping treatment.
- **MONITORING REQUIREMENTS** Clinical and laboratory monitoring advised if treatment exceeds 10 days.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

### OXAZOLIDINONE ANTIBACTERIALS

**Linezolid**

- **DRUG ACTION** Linezolid, an oxazolidinone antibacterial, is active against Gram-positive bacteria including meticillin-resistant *Staphylococcus aureus* (MRSA), and glycopeptide-resistant enterococci. Resistance to linezolid can develop with prolonged treatment or if the dose is less than that recommended. Linezolid is not active against common Gram-negative organisms; it must be given in combination with other antibacterials for mixed infections that also involve Gram-negative organisms.

**INDICATIONS AND DOSE**

**Pneumonia (when other antibacterials e.g. a glycopetide, such as vancomycin, cannot be used) (initiated under specialist supervision)** | Complicated skin and soft-tissue infections caused by Gram-positive bacteria, when other antibacterials cannot be used (initiated under specialist supervision)

**BY MOUTH**
- Adult: 600 mg every 12 hours usually for 10–14 days (maximum duration of treatment 28 days)

**BY INTRAVENOUS INFUSION**
- Adult: 600 mg every 12 hours

### CAUTIONS

- **Acute confusional states** | **bipolar depression** | **carcinoid tumour** | **elderly (increased risk of blood disorders)** | **history of seizures** | **phaeochromocytoma** | **schizophrenia** | **thyrotoxicosis** | **uncontrolled hypertension**

### CAUTIONS, FURTHER INFORMATION

**Close observation** Unless close observation and blood pressure monitoring possible, linezolid should be avoided in uncontrolled hypertension, phaeochromocytoma, carcinoid tumour, thyrotoxicosis, bipolar depression, schizophrenia, or acute confusional states.

### INTERACTIONS

- **→ Appendix 1 (linezolid, MAOIs).**
  - **Monoamine oxidase inhibition** Linezolid is a reversible, non-selective monoamine oxidase inhibitor (MAOI). Patients should avoid consuming large amounts of tyramine-rich foods (such as mature cheese, yeast extracts, undistilled alcoholic beverages, and fermented soybean products). In addition, linezolid should not be given with another MAOI or within 2 weeks of stopping another MAOI. Unless close observation and blood pressure monitoring is possible, avoid in those receiving SSRI s, 5HT, agonists (‘triptans’), tricyclic antidepressants, sympathomimetics, dopaminergics, buspirone, pethidine and possibly other opioid analgesics.
Penicillins

**Benzylpenicillin and phenoxyethylpenicillin**

Benzylpenicillin sodium p. 480 (Penicillin G) remains an important and useful antibiotic but is inactivated by bacterial beta-lactamases. It is effective for many streptococcal (including pneumococcal), gonococcal, and meningococcal infections and also for anthrax, diphtheria, gas-gangrene, leptospirosis, and treatment of Lyme disease.

Pneumococci, meningococci, and gonococci which have decreased sensitivity to penicillin have been isolated; benzylpenicillin sodium is no longer the drug of first choice for pneumococcal meningitis. Although benzylpenicillin sodium is effective in the treatment of tetanus, metronidazole p. 1008 is preferred. Benzylpenicillin is inactivated by gastric acid and absorption from the gastrointestinal tract is low; therefore it must be given by injection.

**Benzathine benzylpenicillin** is used for the treatment of early syphils and late latent syphilis; it is given by intramuscular injection.

Phenoxyethylpenicillin p. 481 (Penicillin V) has a similar antibacterial spectrum to benzylpenicillin sodium, but is less active. It is gastric acid-stable, so is suitable for oral administration. It should not be used for serious infections because absorption can be unpredictable and plasma concentrations variable. It is indicated principally for respiratory-tract infections in children, for streptococcal tonsillitis, and for continuing treatment after one or more injections of benzylpenicillin sodium when clinical response has begun. It should not be used for meningococcal or gonococcal infections. Phenoxyethylpenicillin is used for prophylaxis against streptococcal infections following rheumatic fever and against pneumococcal infections following splenectomy or in sickle-cell disease.

**Penicillin-resistant penicillins**

Most staphylococci are now resistant to benzylpenicillin because they produce penicillinases. Flucloxacillin p. 486, however, is not inactivated by these enzymes and is thus effective in infections caused by penicillin-resistant staphylococci, which is the sole indication for its use. Flucloxacillin is acid-stable and can, therefore, be given by mouth as well as by injection. Flucloxacillin is well absorbed from the gut.

Temocillin p. 487 is active against Gram-negative bacteria and is stable against a wide range of beta-lactamases. It should be reserved for the treatment of infections caused by beta-lactamase-producing strains of Gram-negative bacteria, including those resistant to third-generation cephalosporins. Temocillin is not active against *Pseudomonas aeruginosa* or *Acinetobacter spp*.

**Broad-spectrum penicillins**

Ampicillin p. 483 is active against certain Gram-positive and Gram-negative organisms but is inactivated by penicillinases including those produced by *Staphylococcus aureus* and by common Gram-negative bacilli such as *Escherichia coli*. Almost all staphylococci, approx. 60% of *E. coli* strains and approx. 20% of *Haemophilus influenzae* strains are now resistant. The likelihood of resistance should therefore be considered before using ampicillin for the ‘blind’ treatment of infections; in particular, it should not be used for hospital patients without checking sensitivity.

Ampicillin is well excreted in the bile and urine. It is principally indicated for the treatment of exacerbations of chronic bronchitis and middle ear infections, both of which may be due to *Streptococcus pneumoniae* and *H. influenzae*, and for urinary-tract infections.

Ampicillin can be given by mouth but less than half the dose is absorbed, and absorption is further decreased by the presence of food in the gut.

Maculopapular rashes commonly occur with ampicillin (and amoxicillin p. 482) but are not usually related to true penicillin allergy. They almost always occur in patients with glandular fever; broad-spectrum penicillins should not therefore be used for ‘blind’ treatment of a sore throat. The risk of rash is also increased in patients with acute or chronic lymphocytic leukaemia or in cytomegalovirus infection.
Amoxicillin is a derivative of ampicillin and has a similar antibacterial spectrum. It is better absorbed than ampicillin when given by mouth, producing higher plasma and tissue concentrations; unlike ampicillin, absorption is not affected by the presence of food in the stomach. Amoxicillin may also be used for the treatment of Lyme disease [not licensed].

Co-amoxiclav p. 484 consists of amoxicillin with the betalactamase inhibitor clavulanic acid. Clavulanic acid itself has no significant antibacterial activity but, by inactivating beta-lactamases, it makes the combination active against beta-lactamase-producing bacteria that are resistant to amoxicillin. These include resistant strains of *Staph. aureus*, *E. coli*, and *H. influenzae*, as well as many *Bacteroides* and *Klebsiella* spp. Co-amoxiclav should be reserved for infections likely, or known, to be caused by amoxicillin-resistant beta-lactamase-producing strains. A combination of ampicillin with flucloxacillin p. 486 (as co-fluampicil) p. 485 is available to treat infections involving either streptococci or staphylococci (e.g. cellulitis).

**Antipseudomonal penicillins**

**Piperacillin**, a ureidopenicillin, is only available in combination with the beta-lactamase inhibitor tazobactam. **Ticarcillin**, a carboxypenicillin, is only available in combination with the beta-lactamase inhibitor clavulanic acid. Both preparations have a broad spectrum of activity against a range of Gram-positive and Gram-negative bacteria, and anaerobes. Piperacillin with tazobactam below has activity against a wider range of Gram-negative organisms than ticarcillin with clavulanic acid p. 480 and it is more active against *Pseudomonas aeruginosa*. These antibacterials are not active against MRSA. They are used in the treatment of septicaemia, hospital-acquired pneumonia, and complicated infections involving the urinary tract, skin and soft tissues, or intra-abdomen. For severe pseudomonas infections these antipseudomonal penicillins can be given with an aminoglycoside (e.g. gentamicin p. 450) since they have a synergistic effect.

**Mecillinams**

Pivmecillinam hydrochloride p. 486 has significant activity against many Gram-negative bacteria including *Escherichia coli*, *klebsiella*, enterobacter, and salmonellae. It is not active against *Pseudomonas aeruginosa* or enterococci. Pivmecillinam hydrochloride p. 486 is hydrolysed to mecillinam, which is the active drug.

**Penicillins**

**DRUG ACTION** The penicillins are bactericidal and act by interfering with bacterial cell wall synthesis. They diffuse well into body tissues and fluids, but penetration into the cerebrospinal fluid is poor except when the meninges are inflamed. They are excreted in the urine in therapeutic concentrations.

**CAUTIONS** History of allergy

**INTERACTIONS** Appendix 1 (penicillins).

**SIDE-EFFECTS**

- **Common or very common** Anaphylaxis - angioedema - diarrhoea - fever - hypersensitivity reactions - joint pains - rashes - serum sickness-like reaction - urticaria
- **Rare** Cerebral irritation - CNS toxicity (including convulsions) - coagulase disorders - encephalopathy - haemolytic anaemia - interstitial nephritis - leucopenia - thrombocytopenia
- **Frequency not known** Antibiotic-associated colitis

**SIDE-EFFECTS, FURTHER INFORMATION**

- **CNS toxicity** A rare but serious toxic effect of the penicillins is encephalopathy due to cerebral irritation. This may result from excessively high doses or in patients with severe renal failure. The penicillins should **not** be given by intrathecal injection because they can cause encephalopathy which may be fatal.
- **Diarrhoea** Diarrhoea frequently occurs during oral penicillin therapy. It is most common with broad-spectrum penicillins, which can also cause antibiotic-associated colitis.

- **ALLERGY AND CROSS-SENSITIVITY** The most important side-effect of the penicillins is hypersensitivity which causes rashes and anaphylaxis and can be fatal. Allergic reactions to penicillins occur in 1–10% of exposed individuals; anaphylactic reactions occur in fewer than 0.05% of treated patients. Patients with a history of atopic allergy (e.g. asthma, eczema, hay fever) are at a higher risk of anaphylactic reactions to penicillins. Individuals with a history of anaphylaxis, urticaria, or rash immediately after penicillin administration are at risk of immediate hypersensitivity to a penicillin; these individuals should not receive a penicillin. Individuals with a history of a minor rash (i.e. non-confluent, non-pruritic rash restricted to a small area of the body) or a rash that occurs more than 72 hours after penicillin administration are probably not allergic to penicillin and in these individuals a penicillin should not be withheld unnecessarily for serious infections; the possibility of an allergic reaction should, however, be borne in mind. Other beta-lactam antibiotics (including cephalosporins) can be used in these patients.

Patients who are allergic to one penicillin will be allergic to all because the hypersensitivity is related to the basic penicillin structure. Patients with a history of immediate hypersensitivity to penicillins may also react to the cephalosporins and other beta-lactam antibiotics, they should not receive these antibiotics. If a penicillin (or another beta-lactam antibiotic) is essential in an individual with immediate hypersensitivity to penicillin then specialist advice should be sought on hypersensitivity testing or using a beta-lactam antibiotic with a different structure to the penicillin that caused the hypersensitivity.

- **Penicillins (antipseudomonal)**
  - **Piperacillin with tazobactam**

**INDICATIONS AND DOSE**

**Hospital-acquired pneumonia** | **Septicaemia** | **Complicated infections involving the urinary-tract or skin and soft tissues**
---|---|---
**BY INTRAVENOUS INFUSION**
- Adult: 4.5 g every 8 hours; increased if necessary to 4.5 g every 6 hours, increased frequency may be used for severe infections
- **Complicated intra-abdominal infections**
  - **BY INTRAVENOUS INFUSION**
    - Adult 18 years: 4.5 g every 8 hours; increased if necessary to 4.5 g every 6 hours, increased frequency may be used for severe infections
  - **Infections in neutropenic patients**
    - **BY INTRAVENOUS INFUSION**
      - Adult: 4.5 g every 6 hours

**CAUTIONS** High doses may lead to hypernatraemia (owing to sodium content of preparations)

**SIDE-EFFECTS**
- **Common or very common** Nausea - vomiting
- **Uncommon** Constipation - dyspepsia - headache - hypotension - injection-site reactions - insomnia - jaundice - stomatitis
- **Rare** Abdominal pain - eosinophilia - hepatitis
Ticarcillin with clavulanic acid

**INDICATIONS AND DOSE**

Infections due to Pseudomonas and Proteus spp

**BY INTRAVENOUS INFUSION**

- **Adult:** 3.2 g every 6–8 hours; increased if necessary to 3.2 g every 4 hours, increased frequency used for more severe infections

**CAUTIONS**

High doses may lead to hypernatraemia (owing to sodium content of preparations)

**CAUTIONS, FURTHER INFORMATION**

**Cholestatic jaundice**

Cholestatic jaundice is possibly associated with clavulanic acid. An epidemiological study has shown that the risk of acute liver toxicity was about 6 times greater with co-amoxiclav (amoxicillin, clavulanic acid) than with amoxicillin. Cholestatic jaundice is more common in patients above the age of 65 years and in men; these reactions have only rarely been reported in children. Jaundice is usually self-limiting and very rarely fatal. The duration of treatment should be appropriate to the indication and should not usually exceed 14 days.

**SIDE-EFFECTS**

Eosinophilia; haemorrhagic cystitis (more frequent in children); hypokalaemia; injection-site reactions; nausea; Stevens-Johnson syndrome; toxic epidermal necrolysis; vomiting

**PREGNANCY**

Not known to be harmful.

**BREAST FEEDING**

Trace amounts in milk, but appropriate to use.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in severe impairment.

**RENAL IMPAIRMENT**

Reduce dose to 3.2 g every eight hours if eGFR 30–60 mL/minute/1.73 m²; 1.6 g every eight hours if eGFR 10–30 mL/minute/1.73 m²; 1.6 g every twelve hours if eGFR less than 10 mL/minute/1.73 m². Accumulation of electrolytes contained in preparation can occur in patients with renal failure.

**EFFECT ON LABORATORY TESTS**

False-positive urinary glucose (if tested for reducing substances).

**DIRECTIONS FOR ADMINISTRATION**

For intravenous infusion, give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute initially (2.25 g in 10 mL, 4.5 g in 20 mL) with water for injections, or glucose 5% (Tazocin® brand only), or sodium chloride 0.9%, then dilute to 50–150 mL with infusion fluid; give over 30 minutes.

**PRESCRIBING AND DISPENSING INFORMATION**

Dose expressed as a combination of ticarcillin and tazobactam (both as sodium salts).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

**Powder for solution for injection**

**ELECTROLYTES:** May contain Sodium, Potassium.

**Tazocin (Pfizer Ltd)**

- Ticarcillin (as Ticarcillin sodium) 2 gram, Tazobactam (as Tazobactam sodium) 250 mg Ticarcillin 2g / Tazobactam 250mg powder for solution for injection vials | 1 vial (PO) £7.91; 5 vials £39.55; 10 vials £79.10

**Tazocin (Timentin GlaxoSmithKline UK Ltd)**

- Ticarcillin (as Ticarcillin sodium) 3 gram Timentin 3.2g powder for solution for infusion vials | 4 vial (PO) £21.32

**BENZYL Penicillin sodium (Penicillin G)**

**INDICATIONS AND DOSE**

Mild to moderate susceptible infections | Throat infections | Otitis media | Cellulitis | Pneumonia

- **BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**
  - **Adult:** 0.6–1.2 g every 6 hours, dose may be increased if necessary in more serious infections (consult product literature), single doses over 1.2 g to be given by intravenous route only

**Endocarditis (in combination with other antibacterial if necessary)**

- **BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**
  - **Adult:** 1.2 g every 4 hours, increased if necessary to 2.4 g every 4 hours, dose may be increased in infections such as enterococcal endocarditis

**Anthrax (in combination with other antibacterials)**

- **BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**
  - **Adult:** 2.4 g every 4 hours

**Intrapartum prophylaxis against group B streptococcal infection**

- **BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**
  - **Adult:** Initially 3 g for 1 dose, then 1.5 g every 8 hours until delivery

**Meningitis | Meningococcal disease**

- **BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**
  - **Adult:** 2.4 g every 4 hours

**BY INTRAVENOUS INFUSION**

- **Neonate up to 6 days:** 50 mg/kg every 12 hours.
  - **Neonate 7-28 days:** 50 mg/kg every 8 hours.
Phenoxymethylpenicillin (Penicillin V)

  - Benzylpenicillin sodium 600 mg Benzylpenicillin 600mg powder for solution for injection vials | 2 vial PD £4.67 DT price + £4.67 | 25 vial PD £58.37-£58.38
  - Benzylpenicillin sodium 1.2 gram Benzylpenicillin 1.2g powder for solution for injection vials | 25 vial PD £78.64 DT price + £78.64

**Phenoxymethylpenicillin**

**UNLICENSED USE** Phenoxymethylpenicillin doses in the BNF may differ from product literature.

**Important safety information**

Intrathecal injection of benzylpenicillin is **not** recommended.

**CAUTIONS** Accumulation of sodium from injection can occur with high doses.

**PREGNANCY** Not known to be harmful.

**BREAST FEEDING** Trace amounts in milk, but inappropriate to use.

**RENAL IMPAIRMENT** Accumulation of sodium from injection can occur in renal failure. High doses may cause neurotoxicity, including cerebral irritation, convulsions, or coma.

- **In adults** Reduce dose—consult product literature.
- **In children** Estimated glomerular filtration rate 10–50 mL/minute/1.73 m², use normal dose every 8–12 hours. Estimated glomerular filtration rate less than 10 mL/minute/1.73 m² use normal dose every 12 hours.

**EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).

**DIRECTIONS FOR ADMINISTRATION**

- **With intravenous use in children** Intravenous route recommended in neonates and infants. For **intravenous infusion**, dilute with Glucose 5% or Sodium Chloride 0.9%; give over 15–30 minutes. Longer administration time is particularly important when using doses of 50 mg/kg (or greater) to avoid CNS toxicity.
- **With intravenous use in adults** For **intravenous infusion** (Crystapen®), give intermittently in Glucose 5% or Sodium chloride 0.9%; suggested volume 100 mL given over 30–60 minutes. Continuous infusion not usually recommended.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, eye drops.
Infection

Amoxicillin

**INDICATIONS AND DOSE**

Susceptible infections (including urinary-tract infections, otitis media, sinusitis, uncomplicated community acquired pneumonia, salmonellosis, oral infections)

**BY MOUTH**

- Child 1-11 months: 125 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day
- Child 1-4 years: 250 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day
- Child 5-11 years: 500 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day (max. per dose 1 g)
- Child 12-17 years: 500 mg 3 times a day; increased if necessary up to 1 g 3 times a day, use increased dose in severe infections
- Adult: 500 mg every 8 hours, increased if necessary to 1 g every 8 hours, increased dose used in severe infections

**BY INTRAMUSCULAR INJECTION**

- Adult: 500 mg every 8 hours

**BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**

- Adult: 500 mg every 8 hours, increased to 1 g every 6 hours, use increased dose in severe infections

**Lyme disease (under expert supervision)**

- Child 5-17 years: 500 mg 3 times a day for 14–21 days (for 28 days in Lyme arthritis)
- Adult: 500 mg 3 times a day for 14–21 days (for 28 days in Lyme arthritis)

**Anthrax (treatment and post-exposure prophylaxis)**

- Child (body-weight up to 20 kg): 80 mg/kg daily in 3 divided doses
- Child (body-weight 20 kg and above): 500 mg 3 times a day
- Adult: 500 mg 3 times a day

**Dental abscess (short course)**

- Adult: 3 g, then 3 g after 8 hours

**Urinary-tract infections (short course)**

- Adult: 3 g, then 3 g after 10–12 hours

**Listerial meningitis (in combination with another antibiotic)**

**BY INTRAVENOUS INFUSION**

- Adult: 2 g every 4 hours

**Endocarditis (in combination with another antibiotic if necessary)**

**BY INTRAVENOUS INFUSION**

- Adult: 2 g every 4 hours

Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease— if cover also needed for Haemophilus influenzae

- **BY MOUTH**
  - Child 1 month–4 years: 125 mg twice daily
  - Child 5–11 years: 250 mg twice daily
  - Child 12–17 years: 500 mg twice daily

**Helicobacter pylori eradication in combination with metronidazole and omeprazole**

- **BY MOUTH**
  - Adult: 500 mg 3 times a day

**Helicobacter pylori eradication; in combination with clarithromycin and esomeprazole; or in combination with clarithromycin and lansoprazole; or in combination with metronidazole and lansoprazole; or in combination with clarithromycin and omeprazole; or in combination with clarithromycin and pantoprazole; or in combination with clarithromycin and rabeprazole**

**BY MOUTH**

- Adult: 1 g twice daily

**SIDE-EFFECTS**

- With intravenous use Accumulation of sodium can occur with high parenteral doses

**GENERAL CAUTIONS**

- Acute lymphocytic leukaemia (increased risk of erythematous rashes) · chronic lymphocytic leukaemia (increased risk of erythematous rashes) · cytomegalovirus infection (increased risk of erythematous rashes) · glandular fever (erythematous rashes common) · maintain adequate hydration with high doses (particularly during parenteral therapy)

**SPECIFIC CAUTIONS**

- With intravenous use Amoxicillin doses in BNF Publications may differ from those in product literature. Amoxicillin is not licensed for use for treatment of Lyme disease.

**CAUTIONS**

- Unlikely to cause diarrhoea

**SIDE-EFFECTS, FURTHER INFORMATION**

If rash occurs, discontinue treatment.

**PREGNANCY**

- Not known to be harmful.

**MILK**

- Trace amount in milk, but appropriate to use.

**RENAL IMPAIRMENT**

- Reduce dose in severe impairment; rashes more common. Risk of crystalluria with high doses (particularly during parenteral therapy). Accumulation of sodium from injection can occur in patients with renal failure.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use in children Displacement value may be significant when reconstituting injection, consult local guidelines. Dilute intravenous injection to a concentration of 50 mg/mL (100 mg/mL for neonates). May be further diluted with Glucose 5% or Glucose 10% or Sodium chloride 0.9% or 0.45% for intravenous infusion. Give intravenous infusion over 30 minutes when using doses over 30 mg/kg.

- With intravenous use in adults For intravenous infusion (Amoxicillin®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes or give via drip tubing in Glucose 5% or Sodium chloride 0.9%; continuous infusion not usually recommended.
PATIENT AND CARER ADVICE

Patient counselling is advised for Amoxicillin (Amoxil®) paediatric suspension (use of pipette).

Medicines for Children leaflet: Amoxicillin for bacterial infections www.medicinesforchildren.org.uk/amoxicillin-bacterial-infections-0

PROFESSION SPECIFIC INFORMATION

Dental practitioners’ formulation Amoxicillin capsules may be prescribed. Amoxicillin sachets may be prescribed as Amoxicillin Oral Powder. Amoxicillin Oral Suspension may be prescribed.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

INDICATIONS AND DOSE

SUSCEPTIBLE INFECTIONS (INCLUDING URINARY-TRACT INFECTIONS, OTITIS MEDIA, SINUSITIS, UNCOMPLICATED COMMUNITY-ACQUIRED PNEUMONIA, SALMONELLOSIS)

BY MOUTH

• Child 1-11 months: 125 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day
• Child 1-4 years: 250 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day
• Child 5-11 years: 500 mg 4 times a day; increased if necessary up to 30 mg/kg 4 times a day (max. per dose 1 g)
• Child 12-17 years: 500 mg 4 times a day; increased if necessary up to 1 g 4 times a day, use increased dose in severe infection

• Adult: 0.5–1 g every 6 hours

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

• Adult: 500 mg every 4–6 hours

BY INTRAMUSCULAR INJECTION

• Adult: 500 mg every 4–6 hours

ENDOTRANCID (IN COMBINATION WITH ANOTHER ANTIBIOTIC IF NECESSARY) | LISTERIAL MENINGITIS (IN COMBINATION WITH ANOTHER ANTIBIOTIC) | By intravenous infusion

• Adult: 2 g every 4 hours

UNLICENSED USE Amoxicillin doses in BNF may differ from those in product literature.

CAUTIONS

GENERAL CAUTIONS

Acute lymphocytic leukaemia (increased risk of erythematous rashes) • Chronic lymphocytic leukaemia (increased risk of erythematous rashes) • Cytomegalovirus infection (increased risk of erythematous rashes) • Glandular fever (erythematous rashes common)

SPECIFIC CAUTIONS

• With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur with high doses

SIDE-EFFECTS

• Common or very common: Nausea, vomiting

SIDE-EFFECTS, FURTHER INFORMATION

If rash occurs, discontinue treatment.

PREGNANCY

Not known to be harmful.

BREAST FEEDING

Trace amounts in milk, but inappropriate to use.

RENAI IMPAIRMENT

Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.

• In adults Reduce dose if eGFR less than 10 mL/minute/1.73 m²; rashes more common.

• In children If estimated glomerular filtration rate less than 10 mL/minute/1.73 m² reduce dose or frequency; rashes more common.

DIRECTIONS FOR ADMINISTRATION

• With oral use Administer at least 30 minutes before food.

• With intravenous use in children Displacement value may be significant when reconstituting injection, consult local guidelines. Dilute intravenous injection to a concentration of 50–100 mg/mL. May be further diluted with glucose 5% or 10% or sodium chloride 0.9% or 0.45% for infusion. Give over 30 minutes when using doses of greater than 50 mg/kg to avoid CNS toxicity including convulsions.

• With intravenous use in adults For intravenous infusion (Penbritin®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstituted solutions diluted and given without delay; suggested volume 100 mL given over 30–60 minutes via drip tubing in Glucose 5% or Sodium.
Infection

Co-amoxiclav

INDICATIONS AND DOSE

Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate), including respiratory tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis and animal bites

INITIALLY BY MOUTH USING TABLETS

• Child 12-17 years: 250/125 mg every 8 hours; (by mouth) increased to 500/125 mg every 8 hours, increased dose used for severe infection
• Adult: 250/125 mg every 8 hours; (by mouth) increased to 500/125 mg every 8 hours, increased dose used for severe infection

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

• Adult: 1.2 g every 8 hours, intravenous injection to be administered over 3–4 minutes

Severe dental infection with spreading cellulitis | Dental infection not responding to first-line bacterial

BY MOUTH USING TABLETS

• Child 12-17 years: 250/125 mg every 8 hours for 5 days
• Adult: 250/125 mg every 8 hours for 5 days

Surgical prophylaxis

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

• Adult: 1.2 g, to be administered up to 30 minutes before the procedure, then 1.2 g every 8 hours for up to 2–3 further doses in high risk procedures

Dose equivalence and conversion

Doses are expressed as co-amoxiclav.

A mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form x/y where x and y are the strengths in milligrams of amoxicillin and clavulanic acid respectively.

CONTRA-INDICATIONS

History of co-amoxiclav-associated jaundice or hepatic dysfunction - history of penicillin-associated jaundice or hepatic dysfunction

CAUTIONS

GENERAL CAUTIONS

Acute lymphocytic leukaemia (increased risk of erythematous rashes) · chronic lymphocytic leukaemia (increased risk of erythematous rashes) · cytomegalovirus infection (increased risk of erythematous rashes) · glandular fever (erythematous rashes common) - maintain adequate hydration with high doses (particularly during parental therapy)

SPECIFIC CAUTIONS

• With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur with high doses

CAUTIONS, FURTHER INFORMATION

Cholestatic jaundice Cholestatic jaundice can occur either during or shortly after the use of co-amoxiclav. An epidemiological study has shown that the risk of acute liver toxicity was about 6 times greater with co-amoxiclav than with amoxicillin. Cholestatic jaundice is more common in patients above the age of 65 years and in men; these reactions have only rarely been reported in children. Jaundice is usually self-limiting and very rarely fatal. The duration of treatment should be appropriate to the indication and should not usually exceed 14 days.

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

• Common or very common Cholestatic jaundice - hepatitis - nausea - vomiting
• Rare Dizziness - headache - prolongation of bleeding time
• Frequency not known Exfoliative dermatitis - Steven-Johnson syndrome - toxic epidermal necrolysis - vasculitis

SPECIFIC SIDE-EFFECTS

• Rare
• With intravenous use phlebitis at injection site
• With oral use superficial staining of teeth with suspension

SIDE-EFFECTS, FURTHER INFORMATION

Rash If rash occurs, discontinue treatment.

PREGNANCY

Not known to be harmful.

BREAST FEEDING

Trace amount in milk, but appropriate to use.

HEPATIC IMPAIRMENT

Monitor liver function in liver disease.

RENAL IMPAIRMENT

Risk of crystalluria with high doses (particularly during parenteral therapy).

• With oral use in adults Co-amoxiclav 250/125 tablets or 500/125 tablets: if eGFR 10–30 mL/minute/1.73 m², one 250/125 strength tablet every 12 hours or one 500/125 strength tablet every 12 hours; if eGFR less than 10 mL/minute/1.73 m², one 250/125 strength tablet every 24 hours or one 500/125 strength tablet every 24 hours.

Co-amoxiclav 400/57 suspension: avoid if eGFR less than 30 mL/minute/1.73 m².

• With intravenous use in adults Co-amoxiclav injection (expressed as co-amoxiclav): if eGFR 10–30 mL/minute/1.73 m², 1.2 g initially, then 600 mg every 12 hours; if eGFR less than 10 mL/minute/1.73 m², 1.2 g initially, then 600 mg every 24 hours. Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.

• With oral use in children Co-amoxiclav 125/31 suspension, 250/62 suspension, 250/125 suspension, or 500/125 tablets: use normal dose every 12 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m². Use the normal dose recommended for mild or moderate infections every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m². Co-amoxiclav 400/57 suspension: avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

Co-fluampicil

INDICATIONS AND DOSE
Mixed infections involving beta-lactamase-producing staphylococci
BY MOUTH
- Child 1 month-9 years: 125/125 mg every 6 hours
- Child 10-17 years: 250/250 mg every 6 hours
- Adult: 250/250 mg every 6 hours
BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION
- Adult: 250/250 mg every 6 hours
Severe mixed infections involving beta-lactamase-producing staphylococci
BY MOUTH
- Child 1 month-9 years: 250/250 mg every 6 hours
- Child 10-17 years: 500/500 mg every 6 hours
- Adult: 500/500 mg every 6 hours
BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION
- Adult: 500/500 mg every 6 hours

Important safety information
HEPATIC DISORDERS
Cholestatic jaundice and hepatitis may occur very rarely, up to two months after treatment with fluclouxacin has been stopped. Administration for more than 2 weeks and increasing age are risk factors.
Healthcare professionals are reminded that:
- fluclouxacin should not be used in patients with a history of hepatic dysfunction associated with fluclouxacin;
- fluclouxacin should be used with caution in patients with hepatic impairment;
PENICILLINS (MECILLINAM-TYPE)

Pivmecillinam hydrochloride

**INDICATIONS AND DOSE**
Acute uncomplicated cystitis

**BY MOUTH**
- Child (body-weight 40 kg and above): Initially 400 mg for 1 dose, then 200 mg every 8 hours for 3 days
- Adult (body-weight 40 kg and above): Initially 400 mg for 1 dose, then 200 mg every 8 hours for 3 days

**Chronic or recurrent bacteriuria**

**BY MOUTH**
- Child (body-weight 40 kg and above): 400 mg every 6–8 hours
- Adult (body-weight 40 kg and above): 400 mg every 6–8 hours

**Urinary-tract infections**

**BY MOUTH**
- Child (body-weight up to 40 kg): 5–10 mg/kg every 6 hours, alternatively 20–40 mg/kg daily in 3 divided doses

**UNLICENSED USE**
Not licensed for use in children under 3 months.

**CONTRA-INDICATIONS**
Carnitine deficiency · gastro-intestinal obstruction · infants under 3 months · oesophageal strictures

**CAUTIONS**
Avoid in Acute porphyrias p. 864

**SIDE-EFFECTS**
- Common or very common Abdominal pain · dizziness · headache · nausea · vomiting
- Frequency not known Mouth ulcers · oesophagitis · reduced serum and total body carnitine (especially with long-term or repeated use)

**PREGNANCY**
Not known to be harmful, but manufacturer advises avoid.

**BREAST FEEDING**
Trace amount in milk, but appropriate to use.

**MONITORING REQUIREMENTS**
Liver and renal function tests required in long-term use.

**EFFECT ON LABORATORY TESTS**
False-positive urinary glucose (if tested for reducing substances).

**DIRECTIONS FOR ADMINISTRATION**
Tablets should be swallowed whole with plenty of fluid during meals while sitting or standing.

**PATIENT AND CARER ADVICE**
Patient counselling is advised on administration of pivmecillinam hydrochloride tablets (posture).

**MEDI C I N A L F O R M S**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- Pivmecillinam hydrochloride 200 mg | 10 tablet | £4.50
- Selexid 200mg tablets | 10 tablet | £4.50

| Flucloxacillin (as Flucloxacillin sodium) 500 mg capsules | 20 capsule £7.50 | 28 capsule £10.50 |
| DT price = £2.60 | 100 capsule £37.50 |
| **Flucloxacillin-for-bacterial-infections** www.medicinesforchildren.org.uk/ flucloxacillin-for-bacterial-infections

**Temocillin**

**INDICATIONS AND DOSE**

Septicaemia | Urinary-tract infections | Lower respiratory-tract infections caused by susceptible Gram-negative bacteria

**BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**

| Adult | Adult: 1–2 g every 12 hours, give over 3–4 minutes when administered by intravenous injection |

**HEPATIC IMPAIRMENT** Use with caution.

**RENAL IMPAIRMENT**

| In adults | Reduce dose if eGFR less than 10 mL/minute/1.73 m². Accumulation of electrolytes can occur in patients with renal failure. |
| In children | Use normal dose every 8 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m². |

**EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).

**DIRECTIONS FOR ADMINISTRATION**

For intravenous infusion (Fluxapen®), give intermittently in Glucose 5% or Sodium chloride 0.9%; suggested volume 100 mL given over 30–60 minutes, via drip tubing in Glucose 5% or Sodium chloride 0.9%; continuous infusion not usually recommended.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Flucloxacillin for bacterial infections www.medicinesforchildren.org.uk/ flucloxacillin-for-bacterial-infections

**UNLICENSED USE** Flucloxacillin doses in the BNF may differ from those in product literature.

**Important safety information**

**HEPATIC DISORDERS**

Cholestatic jaundice and hepatitis may occur very rarely, up to two months after treatment with flucloxacillin has been stopped. Administration for more than 2 weeks and increasing age are risk factors. Healthcare professionals are reminded that:

- **flucloxacillin should not be used in patients with a history of hepatic dysfunction associated with flucloxacillin**
- **flucloxacillin should be used with caution in patients with hepatic impairment**
- **careful enquiry should be made about hypersensitivity reactions to beta-lactam antibacterials**

**CAUTIONS**

- With intravenous use Accumulation of electrolytes can occur with high doses
- **SIDE-EFFECTS**
  - **Common or very common** Gastrointestinal disturbances
  - **Very rare** Cholestatic jaundice, hepatitis
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Trace amounts in milk, but appropriate to use.
PHOSPHONIC ACID ANTIBACTERIALS

Fosfomycin

**DRUG ACTION** Fosfomycin, a phosphonic acid antibacterial, is active against a range of Gram-positive and Gram-negative bacteria including *Staphylococcus aureus* and Enterobacteriaceae.

**INDICATIONS AND DOSE** Uncomplicated lower urinary-tract infections caused by multiple-antibacterial resistant organisms when other antibacterials cannot be used

**BY MOUTH**
- Adult (female): 3 g for 1 dose.
- Adult (male): 3 g for 1 dose, then 3 g after 3 days.

Osteomyelitis when first-line treatments are inappropriate or ineffective
- Hospital-acquired lower respiratory-tract infections when first-line treatments are inappropriate or ineffective

**BY INTRAVENOUS INFUSION**
- Adult: 12–24 g once daily in 2–3 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection suspected or known to be caused by less sensitive organisms

Complicated urinary-tract infections when first-line treatment ineffective or inappropriate

**BY INTRAVENOUS INFUSION**
- Adult: 12–16 g daily in 2–3 divided doses (max. per dose 8 g)

Bacterial meningitis when first-line treatment ineffective or inappropriate

**BY INTRAVENOUS INFUSION**
- Adult: 16–24 g daily in 3–4 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection suspected or known to be caused by less sensitive organisms

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
- Common or very common Gastro-intestinal disturbances • rash
- Uncommon Diarrhoea • nausea • vomiting
- Frequency not known Abdominal pain

**SPECIFIC SIDE-EFFECTS**
- With intravenous use Decreased appetite • dyspnoea • fatigue • headache • hypernatraemia • hypokalaemia • taste disturbances • vertigo
- Rare
  - With intravenous use Aplastic anaemia • blood disorders • eosinophilia
  - Very rare
  - With intravenous use Fatty liver • visual impairment
  - Frequency not known
  - With intravenous use Antibiotic-associated colitis • bronchospasm • confusion • hepatitis • jaundice • tachycardia

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk.

**RENAI IMPAIRMENT**
- With oral use Avoid if eGFR less than 10 mL/minute/1.73 m².
- With intravenous use Use with caution if eGFR 40–80 mL/minute/1.73 m² and consult product literature for dose if eGFR less than 40 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**
- With intravenous use Monitor electrolytes and fluid balance.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion
- Give intermittently in Glucose 5% or 10% or Sodium chloride 0.9%. Reconstitute 1 g with 10 mL water for injections then dilute with 50–150 mL infusion fluid; give over 30–40 minutes.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**
- **ELECTROLYTES: May contain Sodium**
  - **Negaban** (Eumedica Pharmaceuticals)
    - **Temocillin (as Temocillin sodium)** 1 gram
      - **Negaban 1g powder for solution for injection vials** 1 vial (PSt) no price available

**Granules**
- **FOSFOMYCIN (Non-proprietary)**
  - Fosfomycin (as Fosfomycin trometamol) 3 gram
    - Monuril 3g granules sachets | 1 sachet (PSt) £54.45

**Powder for solution for infusion**
- **ELECTROLYTES: May contain Sodium**
  - **Fomicixt (Nordic Pharma Ltd)**
    - Fosfomycin (as Fosfomycin sodium) 2 gram
      - Fomicixt 2g powder for solution for infusion vials | 10 vial (PSt) £150.00
    - Fosfomycin (as Fosfomycin sodium) 4 gram
      - Fomicixt 4g powder for solution for infusion vials | 10 vial (PSt) £300.00

**UNLICENSED USE** Oral preparations containing fosfomycin are not marketed in the UK and use of these preparations is unlicensed.

**CAUTIONS**
- With intravenous use Cardiac insufficiency • elderly (high doses) • hyperaldosteronism • hypernatraemia • hypertension • pulmonary oedema

**INTERACTIONS** ➔ Appendix 1 (fosfomycin).
POLYMYXIN ANTIBACTERIALS

Colistimethate sodium (Colistin sulphomethate sodium)

- **DRUG ACTION** The polymyxin antibiotic, colistimethate sodium (colistin sulphomethate sodium), is active against Gram-negative organisms including *Pseudomonas aeruginosa*, *Acinetobacter baumanii*, and *Klebsiella pneumoniae*. It is not absorbed by mouth and thus needs to be given by injection for a systemic effect.

**INDICATIONS AND DOSE**

Gram-negative infections resistant to other antibacterials, including those caused by *Pseudomonas aeruginosa*, *Acinetobacter baumanii* and *Klebsiella pneumoniae*

**BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENTOUS INFUSION**

- Adult (body-weight up to 59 kg): 50 000–75 000 units/kg daily in 3 divided doses, to be administered into a totally implantable venous access device when giving via slow intravenous injection
- Adult (body-weight 60 kg and above): 1–2 million units every 8 hours, to be administered into a totally implantable venous access device when giving via slow intravenous injection

**Adjunct to standard antibacterial therapy for *Pseudomonas aeruginosa* infection in cystic fibrosis**

**BY INHALATION OF NEBULISED SOLUTION**

- Adult: 1–2 million units twice daily; increased to 2 million units 3 times a day, dose only to be increased for subsequent respiratory isolates of *Pseudomonas aeruginosa*

**BY INHALATION OF POWDER**

- Adult: 1.66 million units twice daily

- **CONTRA-INDICATIONS** Myasthenia gravis
- **CAUTIONS**
- **GENERAL CAUTIONS** Acute porphyrias p. 864
- **SPECIFIC CAUTIONS**
- When used by inhalation: Severe haemoptysis — risk of further haemorrhage
- **INTERACTIONS** Appendix 1 (polymyxins)
- **SIDE-EFFECTS**
- Common or very common
  - When used by inhalation: Bronchospasm · cough · dysphonia · nausea · sore mouth · sore throat · taste disturbances · vomiting
  - Uncommon
  - When used by inhalation: Hypersalivation · thirst
  - Rare
  - With intravenous use: Vasomotor instability
  - Frequency not known
  - With intravenous use: Apnoea · confusion · headache · muscle weakness · nephrotoxicity · neurotoxicity reported especially with excessive doses · perioral paraesthesia · peripheral paraesthesia · psychosis · rash · slurred speech · vertigo · visual disturbances
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Dose-related side effects: The major adverse effects are dose-related neurotoxicity and nephrotoxicity.
  - **PREGNANCY**
  - When used by inhalation: Clinical use suggests probably safe.
  - With intravenous use: Use only if potential benefit outweighs risk.
  - **BREAST FEEDING** Present in milk but poorly absorbed from gut; manufacturers advise avoid (or use only if potential benefit outweighs risk).

- **RENAL IMPAIRMENT**
  - With intravenous use: Reduce dose. In renal impairment, monitor plasma colistimethate sodium concentration during parenteral treatment — consult product literature.
  - Recommended ‘peak’ plasma colistimethate sodium concentration (approx. 1 hour after intravenous injection or infusion) 5–12 mg/litre; pre-dose (‘trough’) concentration 2–6 mg/litre.
  - **MONITORING REQUIREMENTS**
    - With intravenous use: Monitor renal function.
    - When used by inhalation: Measure lung function before and after initial dose of colistimethate sodium and monitor for bronchospasm; if bronchospasm occurs in a patient not using a bronchodilator, repeat test using a bronchodilator before the dose of colistimethate sodium.

- **DIRECTIONS FOR ADMINISTRATION**
  - When used by inhalation: Other inhaled drugs should be administered before colistimethate sodium. For nebulisation: administer required dose in 2–4 mL of sodium chloride 0.9% (or water for injections) or a 1:1 mixture of sodium chloride 0.9% and water for injection.
  - With intravenous use: For intravenous infusion (*Colomycin*, *Promixin*®), give intermittently in sodium chloride 0.9% (or Glucose 5% for *Promixin*® brand only); dilute with 50 mL infusion fluid and give over 30 minutes.

**COLOMYCIN® POWDER FOR SOLUTION FOR INJECTION**

*Colomycin*® Injection may be used for nebulisation; administer required dose in 2–4 mL of sodium chloride 0.9%, (or water for injections) or a 1:1 mixture of sodium chloride 0.9% and water for injection.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Colistimethate sodium is included in some preparations for topical application.
- **PATIENT AND CARER ADVICE**
  - Patient should be advised to rinse mouth with water after each dose of dry powder inhalation.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - Colistimethate sodium by dry powder inhalation for pseudomonal lung infection in cystic fibrosis (March 2013)

  **NICE TA276**

  Colistimethate sodium dry powder for inhalation is recommended for nebulized pulmonary infection caused by *Pseudomonas aeruginosa* in patients with cystic fibrosis who would benefit from continued treatment, but do not tolerate the drug in its nebulised form. The manufacturer must provide colistimethate sodium dry powder for inhalation at the discount agreed as part of the patient access scheme to primary, secondary and tertiary care in the NHS. Patients currently receiving colistimethate sodium dry powder for inhalation can continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA276

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ear drops, oral solution

**Tablet**

- *Colomycin* (Forest Laboratories UK Ltd)
  - Colistin sulphate 1500000 unit Colomycin 1.5 million unit tablets | 50 tablet pack £55.00

**Powder for solution for injection**

**ELECTROLYTES:** May contain Sodium

- *COLISTIMETHATE SODIUM* (Non-proprietary)
  - Colistimethate sodium 1000000 unit Colistimethate 1 million unit powder for solution for injection vials | 10 vial pack £18.00
  - 10 vial pack £19.75 (Hospital only)

- *Colomycin* (Forest Laboratories UK Ltd)
  - Colistimethate sodium 1000000 unit Colomycin 1 million unit powder for solution for injection vials | 10 vial pack £18.00

- Colistimethate sodium 2000000 unit Colomycin 2 million unit powder for solution for injection vials | 10 vial pack £32.40
Bacterial infection

Quinolones

Nalidixic acid p. 493 and norfloxacin p. 493 are effective in uncomplicated urinary-tract infections.

Ciprofloxacin below is active against both Gram-positive and Gram-negative bacteria. It is particularly active against Gram-negative bacteria, including salmonella, shigella, campylobacter, neisseria, and pseudomonas. Ciprofloxacin has only moderate activity against Gram-positive bacteria such as Streptococcus pneumoniae and Enterococcus faecalis; it should not be used for pneumococcal pneumonia. It is active against chlamydia and some mycobacteria. Most anaerobic organisms are not susceptible. Ciprofloxacin can be used for respiratory tract infections (but not for pneumococcal pneumonia). It is particularly active against Gram-negative bacteria, including salmonella, shigella, and Gram-negative bacteria. It has only moderate activity against Gram-positive bacteria, including salmonella, shigella, and pseudomonas. Ciprofloxacin has only moderate activity against Gram-positive bacteria such as Streptococcus pneumoniae and Enterococcus faecalis; it should not be used for pneumococcal pneumonia. It is active against chlamydia and some mycobacteria. Most anaerobic organisms are not susceptible. Ciprofloxacin can be used for respiratory tract infections (but not for pneumococcal pneumonia), urinary-tract infections, infections of the gastro-intestinal system (including typhoid fever), bone and joint infections, gonorrhoea and septicemia caused by sensitive organisms.

Ifloxacin p. 494 is used for urinary-tract infections, lower respiratory-tract infections, gonorrhoea, and non-gonococcal urethritis and cervicitis.

Levofloxacin p. 492 is active against Gram-negative and Gram-negative organisms. It has greater activity against pneumococci than ciprofloxacin below. Levofloxacin is licensed for the treatment of acute sinusitis, acute exacerbations of chronic bronchitis, and community-acquired pneumonia, but it should only be considered for these infections when first-line treatment cannot be used or is ineffective. Levofloxacin is also licensed for the treatment of urinary-tract infections.

Although ciprofloxacin, levofloxacin, moxifloxacin p. 492, and ofloxacin are licensed for skin and soft-tissue infections, many staphylococci are resistant to the quinolones and their use should be avoided in MRSA infections.

Moxifloxacin should be reserved for the treatment of sinusitis, community-acquired pneumonia, exacerbations of chronic bronchitis, mild to moderate pelvic inflammatory disease, or complicated skin and soft-tissue infections which have failed to respond to other antibacterials or for patients who cannot be treated with other antibacterials. It has been associated with QT interval prolongation and life-threatening hepatotoxicity. Moxifloxacin is active against Gram-positive and Gram-negative organisms. It has greater activity against Gram-positive organisms, including pneumococci, than ciprofloxacin. Moxifloxacin is not active against Pseudomonas aeruginosa or meticillin-resistant Staphylococcus aureus (MRSA).

Convulsions; taking NSAIDs at the same time may also induce them.

Tendon damage

Tendon damage (including rupture) has been reported rarely in patients receiving quinolones. Tendon rupture may occur within 48 hours of starting treatment; cases have also been reported several months after stopping a quinolone. Healthcare professionals are reminded that:

- quinolones are contra-indicated in patients with a history of tendon disorders related to quinolone use;
- patients over 60 years of age are more prone to tendon damage;
- the risk of tendon damage is increased by the concomitant use of corticosteroids;
- if tendinitis is suspected, the quinolone should be discontinued immediately.

Quinolones

Important safety information

The CSM has warned that quinolones may induce convulsions in patients with or without a history of convulsions; taking NSAIDs at the same time may also induce them.

Tendon damage

Tendon damage (including rupture) has been reported rarely in patients receiving quinolones. Tendon rupture may occur within 48 hours of starting treatment; cases have also been reported several months after stopping a quinolone. Healthcare professionals are reminded that:

- quinolones are contra-indicated in patients with a history of tendon disorders related to quinolone use;
- patients over 60 years of age are more prone to tendon damage;
- the risk of tendon damage is increased by the concomitant use of corticosteroids;
- if tendinitis is suspected, the quinolone should be discontinued immediately.

Quinolones

CONTRA-INDICATIONS

History of tendon disorders related to quinolone use.

CAUTIONS

Can prolong the QT interval - conditions that predispose to seizures - exposure to excessive sunlight should be avoided (discontinue if photosensitivity occurs).

- G6PD deficiency - history of epilepsy - myasthenia gravis (risk of exacerbation).

INTERACTIONS

Appendix 1 (quinolones).

SIDE-EFFECTS

Very rare - Stevens-Johnson syndrome - toxic epidermal necrolysis.

SIDE-EFFECTS, FURTHER INFORMATION

The drug should be discontinued if psychiatric, neurological, or hypersensitivity reactions (including severe rash) occur.

ALLERGY AND CROSS-SENSITIVITY

Use of quinolones contraindicated in quinolone hypersensitivity.

PREGNANCY

Avoid in pregnancy—shown to cause arthropathy in animal studies; safer alternatives are available.

Ciprofloxacin

INDICATIONS AND DOSE

Fistulating Crohn’s disease

BY MOUTH

- Adult: 500 mg twice daily

Respiratory-tract infections

BY MOUTH

- Adult: 500–750 mg twice daily

BY INTRAVENOUS INFUSION

- Adult: 400 mg every 8–12 hours, dose to be administered over 60 minutes
Pseudomonal lower respiratory-tract infection in cystic fibrosis

BY MOUTH
- Adult: 750 mg twice daily

Urinary-tract infections

BY MOUTH
- Adult: 250–750 mg twice daily

BY INTRAVENOUS INFUSION
- Adult: 400 mg every 8–12 hours, dose to be administered over 60 minutes

Acute uncomplicated cystitis in women

BY MOUTH
- Adult: 250 mg twice daily for 3 days

Acute or chronic prostatitis

BY MOUTH
- Adult: 500 mg twice daily for 28 days

BY INTRAVENOUS INFUSION
- Adult: 400 mg every 8–12 hours, dose to be administered over 60 minutes

Gonorrhoea

BY MOUTH
- Adult: 500 mg for 1 dose

Most other infections

BY MOUTH
- Adult: Initially 500 mg twice daily; increased to 750 mg twice daily, in severe or deep-seated infection

BY INTRAVENOUS INFUSION
- Adult: 400 mg every 8–12 hours, dose to be administered over 60 minutes

Surgical prophylaxis

BY MOUTH
- Adult: 750 mg, to be taken 60 minutes before procedure

Anthrax (treatment and post-exposure prophylaxis)

BY MOUTH
- Adult: 500 mg twice daily

BY INTRAVENOUS INFUSION
- Adult: 400 mg every 12 hours, to be given over 60 minutes

Prevention of secondary case of meningococcal meningitis

BY MOUTH
- Child 1 month–4 years: 30 mg/kg (max. per dose 125 mg) for 1 dose
- Child 5-11 years: 250 mg for 1 dose
- Child 12-17 years: 500 mg for 1 dose
- Adult: 500 mg for 1 dose

**UNLICENSED USE** Not licensed for use in children under 1 year of age. Not licensed for use in children for prophylaxis of meningococcal meningitis

**CAUTIONS** Acute myocardial infarction (risk factor for QT interval prolongation) - avoid excessive alkalinity of urine (risk of crystalluria) - bradycardia (risk factor for QT interval prolongation) - congenital long QT syndrome (risk factor for QT interval prolongation) - electrolyte disturbances (risk factor for QT interval prolongation) - ensure adequate fluid intake (risk of crystalluria) - heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) - history of symptomatic arrhythmias (risk factor for QT interval prolongation)

**INTERACTIONS** Caution if concomitant use with other drugs known to prolong the QT interval.

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
- Rare Abnormal dreams - chest pain - dysphagia - dyspnoea - erythema nodosum - hot flushes - hyperglycaemia - hypoglycaemia - oedema - pancreatitis - sweating - syncope - tachycardia
- Very rare Intracranial hypertension - movement disorders - tenosynovitis - tinnitus - vasculitis (in children)
- Frequency not known Peripheral neuropathy - polyneuropathy

**SPECIFIC SIDE-EFFECTS**

- Common or very common With intravenous use Flattulence - pain at injection site - phlebitis at injection site
- With oral use Flattulence

**PREGNANCY** A single dose of ciprofloxacin may be used for the prevention of a secondary case of meningococcal meningitis.

**BREAST FEEDING** Amount too small to be harmful but manufacturer advises avoid.

**RENAL IMPAIRMENT**
- With oral use in adults Give 250–500 mg every 12 hours if eGFR 30–60 mL/minute/1.73 m² (every 24 hours if eGFR less than 30 mL/minute/1.73 m²).
- With intravenous use in adults Give (200 mg over 30 minutes), 200–400 mg every 12 hours if eGFR 30–60 mL/minute/1.73 m² (every 24 hours if eGFR less than 30 mL/minute/1.73 m²).
- With intravenous use or oral use in children Reduce dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²—consult product literature.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.

**PATIENT AND CARER ADVICE** May impair performance of skilled tasks (e.g. driving); effects enhanced by alcohol. Medicines for Children leaflet: Ciprofloxacin for bacterial infections www.medicinesforchildren.org.uk/ciprofloxacin-bacterial-infections-0

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, oral suspension, ear drops

**Tablet**

Levofoxacin

INDICATIONS AND DOSE

Acute sinusitis
BY MOUTH
- Adult: 500 mg once daily for 10–14 days

Acute exacerbation of chronic bronchitis
BY MOUTH
- Adult: 500 mg once daily for 7–10 days

Community-acquired pneumonia
BY MOUTH
- Adult: 500 mg 1–2 times a day for 7–14 days
- Adult: 500 mg 1–2 times a day, to be given over at least 60 minutes

Urinary-tract infections
BY MOUTH
- Adult: 500 mg once daily for 7–14 days

Urinary-tract infections ( uncomplicated infection)
BY MOUTH
- Adult: 250 mg once daily for 3 days

Complicated urinary-tract infections
BY INTRAVENOUS INFUSION
- Adult: 500 mg once daily, to be given over at least 60 minutes

Chronic prostatitis
BY MOUTH
- Adult: 500 mg once daily for 28 days

Complicated skin and soft tissue infections
BY MOUTH
- Adult: 500 mg 1–2 times a day for 7–14 days
- Adult: 500 mg 1–2 times a day, to be given over at least 60 minutes

Inhalation of anthrax (treatment and post-exposure prophylaxis)
BY MOUTH
- Adult: 500 mg once daily for 8 weeks

INTERACTIONS
- Caution if concomitant use with other drugs known to prolong the QT interval.

SIDE-EFFECTS
- Frequency not known
- Benign intracranial hypertension - extrapyramidal symptoms
- Local reactions - peripheral neuropathy - pneumonitis
- Potentially life-threatening hepatic failure - rhabdomyolysis - stomatitis - syncope - transient hypotension

Moxifloxacin

INDICATIONS AND DOSE

Sinusitis
BY MOUTH
- Adult: 400 mg once daily for 7 days
**Community-acquired pneumonia**

**BY MOUTH**
- Adult: 400 mg once daily for 7–14 days

**BY INTRAVENOUS INFUSION**
- Adult: 400 mg once daily for 7–14 days, to be given over 60 minutes

**Exacerbations of chronic bronchitis**

**BY MOUTH**
- Adult: 400 mg once daily for 5–10 days

**Mild to moderate pelvic inflammatory disease**

**BY MOUTH**
- Adult: 400 mg once daily for 7–21 days

**Complicated skin and soft-tissue infections which have failed to respond to other antibacterials or for patients who cannot be treated with other antibacterials**

**BY MOUTH**
- Adult: 400 mg once daily for 7–21 days, to be given over 60 minutes

**CONTRA-INDICATIONS** Acute myocardial infarction (risk factor for QT interval prolongation) - bradycardia (risk factor for QT interval prolongation) - congenital long QT syndrome (risk factor for QT interval prolongation) - electrolyte disturbances (risk factor for QT interval prolongation) - heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) - history of symptomatic arrhythmias (risk factor for QT interval prolongation)

**INTERACTIONS** + Appendix 1 (quinolones).

Avoid concomitant use with other drugs known to prolong the QT interval.

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
- Common or very common: Angina - arrhythmias - constipation - flatulence - gastritis - hyperlipidaemia - palpitation - sweating - vasodilatation
- Uncommon: Dyspnoea
- Rare: Abnormal dreams - amnesia - dysphagia - hyperglycaemia - hypertension - hyperuricaemia - incoordination - myopathy - oedema - peripheral neuropathy - stomatitis - syncope
- Very rare: Potentially life-threatening hepatic failure - rhabdomyolysis

**SPECIFIC SIDE-EFFECTS**
- With intravenous use: Pain at injection site - phlebitis at injection site

**BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment.

**PATIENT AND CARER ADVICE** May impair performance of skilled tasks (e.g. driving).

**MEDICINAL FORMS**

  - Moxifloxacin (as Moxifloxacin hydrochloride) 1.6 mg per 1 ml Avelox 400mg/250ml solution for infusion bottles | 1 bottle | **POM** £39.95 (Hospital only) | 5 bottle | **POM** £199.75 (Hospital only)

**Nalidixic acid**

**INDICATIONS AND DOSE**

**Urinary-tract infections**

**BY MOUTH**
- Adult: 900 mg every 6 hours for 7 days, then reduced to 600 mg every 6 hours for prolonged therapy in chronic infections

**CAUTIONS** Acute myocardial infarction (risk factor for QT interval prolongation) - avoid in Acute porphyrias p. 864 - bradycardia (risk factor for QT interval prolongation) - congenital long QT syndrome (risk factor for QT interval prolongation) - electrolyte disturbances (risk factor for QT interval prolongation) - heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) - history of symptomatic arrhythmias (risk factor for QT interval prolongation)

**INTERACTIONS** Caution if concomitant use with other drugs known to prolong the QT interval.

**SIDE-EFFECTS** Cranial nerve palsy - increased intracranial pressure - metabolic acidosis - peripheral neuropathy - toxic psychosis

**BREAST FEEDING** Risk to infant very small but one case of haemolytic anaemia reported.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in liver disease.

**RENAL IMPAIRMENT** Use with caution; avoid if eGFR less than 20 mL/minute/1.73 m².

**MONITORING REQUIREMENTS** Monitor blood counts, renal and liver function if treatment exceeds 2 weeks.

**EFFECT ON LABORATORY TESTS** False positive urinary glucose (if tested for reducing substances).

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include raspberry and strawberry.

**MEDICINAL FORMS**

Medicines not identified.

**Norfloxacin**

**INDICATIONS AND DOSE**

**‘Lower’ urinary-tract infections**

**BY MOUTH**
- Adult: 400 mg twice daily for 7–10 days (for 3 days for uncomplicated infections in women)

**Chronic relapsing ‘lower’ urinary-tract infections**

**BY MOUTH**
- Adult: 400 mg twice daily for up to 12 weeks; reduced to 400 mg once daily, if adequate suppression within first 4 weeks

**Chronic prostatitis**

**BY MOUTH**
- Adult: 400 mg twice daily for 28 days
Infection

MEDICINAL FORMS

BREAST FEEDING

▶ Very rare

▶ Rare

Common or very common

INTERACTIONS Caution if concomitant use with other drugs known to prolong the QT interval.

SIDE-EFFECTS

▶ Common or very common Epiphora • tinnitus

▶ Rare Pancreatitis

▶ Very rare Arthralgia

Frequency not known Exfoliative dermatitis • polyneuropathy

INTERACTIONS Caution if concomitant use with other drugs known to prolong the QT interval.

SIDE-EFFECTS

▶ Common or very common Cough • eye irritation • nasopharyngitis

▶ Rare ▶ With intravenous use Abnormal dreams • arrhythmias • bronchospasm • dyspnoea • hot flushes • hyperhidrosis

▶ Very rare Extrapyramidal symptoms • neuropathy • tinnitus

▶ Frequency not known Changes in blood sugar • pneumonitis • rhabdomyolysis

PATIENT AND CARER ADVICE May impair performance of skilled tasks (e.g. driving).

CAUTIONS Acute myocardial infarction (risk factor for QT interval prolongation) • bradycardia (risk factor for QT interval prolongation) • congenital long QT syndrome (risk factor for QT interval prolongation) • heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) • history of symptomatic arrhythmias (risk factor for QT interval prolongation)

INTERACTIONS Caution if concomitant use with other drugs known to prolong the QT interval.

SIDE-EFFECTS

▶ Common or very common Epiphora • tinnitus

▶ Rare Pancreatitis

▶ Very rare Arthralgia

Frequency not known Exfoliative dermatitis • polyneuropathy

RENAI IMPAIRMENT Use No information available—manufacturer advises avoid.

PATIENT AND CARER ADVICE May impair performance of skilled tasks (e.g. driving).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet CAUTIONARY AND ADVISORY LABELS 7, 9, 23 ▶ NORFLOXACIN (Non-proprietary)

Norfloxacin 400 mg Norfloxacin 400mg tablets | 6 tablet [PMS] £5.40 | 14 tablet [PMS] £8.90

Norfloxacin (Non-proprietary) 400 mg TABLET (Sanofi)

INDICATIONS AND DOSE

Urinary-tract infections

BY MOUTH

▶ Adult: 200–400 mg daily, preferably taken in the morning; increased if necessary to 400 mg twice daily, in upper urinary tract infections

Complicated urinary-tract infection

BY INTRAVENOUS INFUSION

▶ Adult: 200 mg daily Increased to 400 mg twice daily, for severe or complicated infections, to be given over at least 30 minutes for each 200 mg

Acute or chronic prostatitis

BY MOUTH

▶ Adult: 200 mg twice daily for 28 days

Lower respiratory-tract infections

BY MOUTH

▶ Adult: 400 mg daily, dose preferably taken in the morning, then increased if necessary to 400 mg twice daily

BY INTRAVENOUS INFUSION

▶ Adult: 200 mg twice daily, increased to 400 mg twice daily, for severe or complicated infections, to be given over at least 30 minutes for each 200 mg

Skin and soft-tissue infections

BY MOUTH

▶ Adult: 400 mg twice daily

BY INTRAVENOUS INFUSION

▶ Adult: 400 mg twice daily, to be given over at least 30 minutes for each 200 mg

Uncomplicated gonorrhoea

BY MOUTH

▶ Adult: 400 mg once daily as a single dose

Uncomplicated genital chlamydial infection | Non-gonococcal urethritis

BY MOUTH

▶ Adult: 400 mg daily for 7 days, dose may be taken as a single daily dose or in divided doses

Pelvic inflammatory disease

BY MOUTH

▶ Adult: 400 mg twice daily for 14 days

Septicaemia

BY INTRAVENOUS INFUSION

▶ Adult: 200 mg twice daily, increased to 400 mg twice daily, for severe or complicated infections. To be given over at least 30 minutes for each 200 mg

CAUTIONS Acute myocardial infarction (risk factor for QT interval prolongation) • bradycardia (risk factor for QT interval prolongation) • congenital long QT syndrome (risk factor for QT interval prolongation) • heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) • history of symptomatic arrhythmias (risk factor for QT interval prolongation)

INTERACTIONS Caution if concomitant use with other drugs known to prolong the QT interval.

SIDE-EFFECTS

▶ Common or very common Cough • eye irritation • nasopharyngitis

▶ Rare ▶ With intravenous use Abnormal dreams • arrhythmias • bronchospasm • dyspnoea • hot flushes • hyperhidrosis

▶ Very rare Extrapyramidal symptoms • neuropathy • tinnitus

▶ Frequency not known Changes in blood sugar • pneumonitis • rhabdomyolysis

PATIENT AND CARER ADVICE May impair performance of skilled tasks (e.g. driving); effects enhanced by alcohol.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet CAUTIONARY AND ADVISORY LABELS 6, 9, 11 ▶ OFLOXACIN (Non-proprietary)

Solution for infusion

Tarivid (Sanofi)

Ofloxacin (as Ofloxacin hydrochloride) 2 mg per 1 ml Tarivid 200mg/100ml solution for infusion bottles | 1 bottle [PMS] £16.16
Rifaximin

- **DRUG ACTION** Rifaximin is a rifamycin that is poorly absorbed from the gastro-intestinal tract, and, therefore, should not be used to treat systemic infections.

**INDICATIONS AND DOSE**

Travellers’ diarrhoea that is not associated with fever, bloody diarrhoea, blood or leucocytes in the stool, or 8 or more unformed stools in the previous 24 hours

**BY MOUTH**

- Adult: 200 mg every 8 hours for 3 days
- **Reduction in recurrence of hepatic encephalopathy**
  - **BY MOUTH**
  - Adult: 550 mg twice daily

- **CONTRA-INDICATIONS** Intestinal obstruction
- **INTERACTIONS** Rifaximins interactions in Appendix 1 do not apply to rifaximin.
- **SIDE-EFFECTS** Rifaximins interactions in Appendix 1 do not apply to rifaximin.
  - **Uncommon** Anorexia, antibiotic-associated colitis, diarrhoea, dizziness, dyspnoea, flatulence, headache, muscle spasm, nausea, pruritus, rash, vomiting
  - **Uncommon** Anorexia, antibiotic-associated colitis, diarrhoea, dizziness, dyspnoea, flatulence, headache, muscle spasm, nausea, pruritus, rash, vomiting
  - **Rare** Blood pressure changes, constipation
  - **Frequency not known** Syncpe

- **ALLERGY AND CROSS-SENSITIVITY** Contraindicated if history of rifamycin hypersensitivity.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Unlikely to be present in milk in significant amounts, but manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution when used for hepatic encephalopathy in patients with severe hepatic impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** Not recommended for diarrhoea associated with invasive organisms such as Campylobacter and Shigella.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
  - **Rifaximin for preventing episodes of overt hepatic encephalopathy** (March 2015) NICE TA337
  - Rifaximin is recommended, within its marketing authorisation, as an option for reducing the recurrence of episodes of overt hepatic encephalopathy in adults.
  - www.nice.org.uk/TA337

**SULFONAMIDES**

**Sulfadiazine** (Sulphadiazine)

- **DRUG ACTION** Sulfadiazine is a short-acting sulphonamide with bacteriostatic activity against a broad spectrum of organisms. The importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic.

**INDICATIONS AND DOSE**

Prevention of rheumatic fever recurrence

**BY MOUTH**

- Adult (body-weight up to 30 kg): 500 mg daily
- Adult (body-weight 30 kg and above): 1 g daily

- **UNLICENSED USE** Not licensed for use in toxoplasmosis.
- **CONTRA-INDICATIONS** Acute porphyrias p. 864
- **CAUTIONS** Asthma • avoid in blood disorders (unless under specialist supervision) • avoid in infants under 6 weeks (except for treatment or prophylaxis of pneumocystis pneumonia) because of the risk of kernicterus • elderly • G6PD deficiency (risk of haemolytic anaemia) • maintain adequate fluid intake • predisposition to folate deficiency • predisposition to hyperkalaemia

- **INTERACTIONS** → Appendix 1 (sulfonamides).

- **SIDE-EFFECTS**
  - **Common or very common** Diarrhoea, headache, hyperkalaemia, nausea, rash
  - **Uncommon** Vomiting
  - **Rare** Agranulocytosis • bone marrow depression
  - **Very rare** Anorexia, antibiotic-associated colitis, arthralgia, aseptic meningitis, ataxia, blood disorders, convulsions, cough, depression, eosinophilia, glositis, hallucinations, hepatic necrosis, hypoglycaemia, hypoponeraemia, interstitial nephritis, jaundice, leucopenia, liver damage, megaloblastic anaemia, myalgia, myocardiitis, pancreatitis, peripheral neuropathy, photosensitivity, pulmonary infiltrates, renal disorders, shortness of breath, Stevens-Johnson syndrome, stomatitis, systemic lupus erythematous, thrombocytopenia, tinnitus, toxic epidermal necrosis, uveitis, vasculitis, vertigo
  - **Frequency not known** Benign intracranial hypertension, photosensitivity, optic neuropathy, rhabdomyolysis reported in HIV-infected patients

**SIDE-EFFECTS, FURTHER INFORMATION**

Blood disorders or rash Discontinue immediately if blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia) or rash (including Stevens-Johnson syndrome, toxic epidermal necrosis, photosensitivity) develop.

- **PREGNANCY** Risk of neonatal haemolysis and methaemoglobinemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded

- **BREAST FEEDING** Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants.

- **HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment; avoid in severe impairment.

- **RENAI IMPAIRMENT** Use with caution in mild to moderate impairment; avoid in severe impairment; high risk of crystalluria.

- **MONITORING REQUIREMENTS** Monitor blood counts on prolonged treatment.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**SULFONAMIDES**

**Bacterial infection** 495
TETRACYCLINES AND RELATED DRUGS

Tetracyclines

The tetracyclines are broad-spectrum antibiotics whose value has decreased owing to increasing bacterial resistance. They remain, however, the treatment of choice for infections caused by chlamydia (trachoma, psittacosis, salpingitis, urethritis, and lymphogranuloma venereum), rickettsia (including Q-fever), brucella (doxycycline below with either streptomycin p. 451 or rifampicin p. 508), and the spirochaete, Borrelia burgdorferi (See Lyme disease). They are also used in respiratory and genital mycoplasma infections, in acne, in destructive (refractory) periodontal disease, in exacerbations of chronic bronchitis (because of their activity against Haemophilus influenzae), and for leptospirosis in penicillin hypersensitivity (as an alternative to erythromycin p. 471).

Tetracyclines have a role in the management of metcillin-resistant Staphylococcus aureus (MRSA) infection. Microbiologically, there is little to choose between the various tetracyclines, the only exception being minocycline p. 498 which has a broader spectrum; it is active against Neisseria meningitidis and has been used for meningococcal prophylaxis but is no longer recommended because of side-effects including dizziness and vertigo. Compared to other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation.

Tetracyclines

- **CONTRA-INDICATIONS** Children under 12 years (deposition in growing bone and teeth, by binding to calcium, causes staining and occasionally dental hypoplasia)
- **CAUTIONS** Myasthenia gravis (muscle weakness may be increased) - systemic lupus erythematosus (may be exacerbated)
- **INTERACTIONS** ➔ Appendix 1 (tetracyclines). Antacids, and aluminium, calcium, iron, magnesium and zinc salts decrease the absorption of tetracyclines. Use with caution in those receiving potentially hepatotoxic drugs.
- **SIDE-EFFECTS**
  - Rare Anaphylaxis - angioedema - blood disorders - exfoliative dermatitis - hepatotoxicity - hypersensitivity reactions - pancreatitis - pericarditis - photosensitivity (particularly with demeclocycline) - rash - Stevens-Johnson syndrome - urticaria
  - Frequency not known Antibiotic-associated colitis - benign intracranial hypertension - diarrhoea - dysphagia - headache - nausea - oesophageal irritation - visual disturbances - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

Benign intracranial hypertension Headache and visual disturbances may indicate benign intracranial hypertension (discontinue treatment).

- **PREGNANCY** Should not be given to pregnant women; effects on skeletal development have been documented in the first trimester in animal studies. Administration during the second or third trimester may cause discoloration of the child’s teeth, and maternal hepatotoxicity has been reported with large parenteral doses.

- **BREAST FEEDING** Should not be given to women who are breast-feeding (although absorption and therefore discoloration of teeth in the infant is probably usually prevented by chelation with calcium in milk).

- **HEPATIC IMPAIRMENT** Should be avoided or used with caution in patients with hepatic impairment.

Demeclocycline hydrochloride

**INDICATIONS AND DOSE**

Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)

- **BY MOUTH**
- Adult: 150 mg 4 times a day, alternatively 300 mg twice daily

Treatment of hypotension resulting from inappropriate secretion of antidiuretic hormone, if fluid restriction alone does not restore sodium concentration or is not tolerable

- **BY MOUTH**
- Adult: Initially 0.9–1.2 g daily in divided doses, maintenance 600–900 mg daily

- **CAUTIONS** Photosensitivity more common than with other tetracyclines

- **INTERACTIONS** Milk reduces absorption.

- **SIDE-EFFECTS** Acute renal failure - reversible nephrogenic diabetes insipidus

- **HEPATIC IMPAIRMENT** Max. 1 g daily in divided doses.

- **RENAL IMPAIRMENT** May exacerbate renal failure and should not be given to patients with renal impairment.

**PATIENT AND CARER ADVICE**

Patients should be advised to avoid exposure to sunlight or sun lamps.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Capsule

CAUTIONARY AND ADVISORY LABELS 7, 9, 11, 23

**DEMECLOCYCLINE HYDROCHLORIDE (Non-proprietary)**

Demeclocycline hydrochloride 150 mg Demeclocycline 150mg capsules | 28 capsule [Pack] £81.49 DT price = £81.49

Doxycycline

**INDICATIONS AND DOSE**

Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)

- **BY MOUTH**
  - Child 12-17 years: Initially 200 mg daily for 1 dose, then 100 mg daily; 200 mg daily, increased dose used for severe infections including refractory urinary-tract infections
  - Adult: Initially 200 mg daily for 1 dose, then 100 mg daily; 200 mg daily, increased dose used for severe infections including refractory urinary-tract infections

**Acne**

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 12-17 years: 100 mg daily
- Adult: 100 mg daily

**Rosacea**

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: 100 mg daily

**Papulopustular facial rosacea (without ocular involvement)**

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: 40 mg once daily for 16 weeks, dose to be taken in the morning, consider discontinuing treatment if no response after 6 weeks

**Early syphilis**

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 12-17 years: 100 mg twice daily for 14 days
- Adult: 100 mg twice daily for 14 days
RENAL IMPAIRMENT

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 12-17 years: 100 mg twice daily for 28 days
- Adult: 100 mg twice daily for 28 days

Neurosyphilis

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: 200 mg twice daily for 28 days

Uncomplicated genital chlamydia / Non-gonococcal urethritis

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 12-17 years: 100 mg twice daily for 7 days
- Adult: 100 mg twice daily for 7 days

Pelvic inflammatory disease

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 12-17 years: 100 mg twice daily for 14 days
- Adult: 100 mg twice daily for 14 days

Lyme disease

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: 200 mg twice daily for 28 days in Lyme arthritis
- Adult: 100 mg twice daily for 10–14 days (for 28 days in Lyme arthritis)

Anthrax (treatment or post-exposure prophylaxis)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 12-17 years: 100 mg twice daily
- Adult: 100 mg twice daily

Prophylaxis of malaria

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 12-17 years: 100 mg once daily, to be started 1–2 days before entering endemic area and continued for 4 weeks after leaving, can be used for up to 2 years
- Adult: 100 mg once daily, to be started 1–2 days before entering endemic area and continued for 4 weeks after leaving

Adjunct to quinine in treatment of Plasmodium falciparum malaria

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 12-17 years: 200 mg daily for 7 days
- Adult: 200 mg daily for 7 days

Periodontitis (as an adjunct to gingival scaling and root planing)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 12-17 years: 20 mg twice daily for 3 months
- Adult: 20 mg twice daily for 3 months

UNLICENSED USE

CAUTIONS

Alcohol dependence

INTERACTIONS

The metabolism of doxycycline may be influenced by antiepileptics.

SIDE-EFFECTS

Anorexia - anxiety - dry mouth - flushing - fungal superinfection (when used for periodontitis) - tinnitus

PREGNANCY

When travel to malarious areas is unavoidable during pregnancy, doxycycline can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks’ gestation.

RENAL IMPAIRMENT

Use with caution (avoid excessive doses).

MONITORING REQUIREMENTS

When used for periodontitis, monitor for superficial fungal infection, particularly if predisposition to oral candidiasis.

DIRECTIONS FOR ADMINISTRATION

Capsules and tablets should be swallowed whole with plenty of fluid, while sitting or standing. Capsules should be taken during meals.

PATIENT AND CARER ADVICE

Counselling on administration advised (posture). Photosensitivity Patients should be advised to avoid exposure to sunlight or sun lamps.

PROFESSION SPECIFIC INFORMATION

Dental practitioners’ formulary

Doxycycline Capsules 100 mg may be prescribed. Dispersible tablets may be prescribed as Dispersible Doxycycline Tablets. Tablets may be prescribed as Doxycycline Tablets 20 mg.

Acne

BY MOUTH
- Child 12-17 years: 500 mg twice daily for at least 3 months, if there is no improvement for the first 3 months another oral antibacterial should be used, maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer
- Adult: 500 mg twice daily for at least 3 months, if there is no improvement after the first 3 months another oral antibacterial should be used, maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer

Diabetic diarrhoea in autonomic neuropathy

BY MOUTH
- Adult: 250 mg for 2 or 3 doses

Non-gonococcal urethritis

BY MOUTH
- Child 12-17 years: 500 mg 4 times a day for 7–14 days (21 days if failure or relapse after first course)
- Adult: 500 mg 4 times a day for 7–14 days (21 days if failure or relapse after first course)

Helicobacter pylori eradication failure in combination with a proton pump inhibitor, tripotassium dicitratobismuthate, and metronidazole

BY MOUTH
- Adult: 500 mg 4 times a day for 2 weeks

- UNLICENSED USE Not licensed for treatment of diabetic diarrhoea in autonomic neuropathy.
- INTERACTIONS Milk reduces absorption.
- SIDE-EFFECTS Acute renal failure, skin discoloration
- HEPATIC IMPAIRMENT Max. 1 g daily in divided doses.
- RENAL IMPAIRMENT May exacerbate renal failure and should not be given to patients with renal impairment.
- DIRECTIONS FOR ADMINISTRATION Tablets should be swallowed whole with plenty of fluid while sitting or standing.
- PATIENT AND CARER ADVICE Counselling on administration advised.
- PROFESSION SPECIFIC INFORMATION Dental practitioners’ formulary Tetracycline Tablets may be prescribed.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, capsule

Tablet

| CAUTIONARY AND ADVISORY LABELS | 7, 9, 23 |
| TETRACYCLINE (Non-proprietary) |
| Tetracycline hydrochloride 250 mg | Tetracycline 250mg tablets | 28 tablet pack | £25.65 DT price = £2.44 |

2.1 Anthrax

Anthrax

Inhalation or gastro-intestinal anthrax should be treated initially with either ciprofloxacin [unlicensed indication] or doxycycline [unlicensed indication] for 7 days. Treatment may be switched to amoxicillin if the infecting strain is susceptible. Treatment may need to be extended to 60 days if exposure is due to aerosol. A combination of antibacterials for 14 days is recommended for cutaneous anthrax with systemic features, extensive oedema, or lesions of the head or neck.

Ciprofloxacin or doxycycline may be given for post-exposure prophylaxis. If exposure is confirmed, antibacterial prophylaxis should continue for 60 days. Antibacterial prophylaxis may be switched to amoxicillin after 10–14 days if the strain of *B. anthracis* is susceptible. Vaccination against anthrax may allow the duration of antibacterial prophylaxis to be shortened.

2.2 Leprosy

Leprosy

Advice from a member of the Panel of Leprosy Opinion is essential for the treatment of leprosy (Hansen’s disease). Details can be obtained from the Hospital for Tropical Diseases, London (telephone (020) 3456 7890). The World Health Organization has made recommendations to overcome the problem of dapsone p. 500 resistance and to prevent the emergence of resistance to other antileproptic drugs. Drugs recommended are dapsone, rifampicin p. 508, and clofazimine p. 500. Other drugs with significant activity against *Mycobacterium leprae* include ofloxacin p. 494, minocycline p. 498 and clarithromycin p. 470, but none of these are as active as rifampicin; at present they should be reserved as second-line drugs for leprosy.

A three-drug regimen is recommended for *multibacillary leprosy* (lepromatous, borderline-lepromatous, and borderline leprosy) and a two-drug regimen for *paucibacillary leprosy* (borderline-tuberculoid, tuberculoid, and indeterminate).

Multibacillary leprosy should be treated with a combination of rifampicin, dapsone and clofazimine p. 500 for at least 2 years. Treatment should be continued unchanged during both type I (reversal) or type II (erythema nodosum lepromatous) reactions. During reversal reactions neuritic pain or weakness can herald the rapid onset of permanent nerve damage. Treatment with prednisolone p. 585 should be instituted at once. Mild type II reactions may respond to aspirin. Severe type II reactions may require corticosteroids; thalidomide p. 798 [unlicensed] is also useful in patients who have become corticosteroid dependent, but it should be used only under specialist supervision. Thalidomide is teratogenic and, therefore, contra-indicated in pregnancy; it must not be given to women of child-bearing potential unless they comply with a pregnancy prevention programme. Increased doses of clofazimine are also useful.

Paucibacillary leprosy should be treated with rifampicin and dapsone for 6 months. If treatment is interrupted the regimen should be recommenced where it was left off to complete the full course.

Neither the multibacillary nor the paucibacillary antileprosy regimen is sufficient to treat tuberculosis.
Dapsone

**INDICATIONS AND DOSE**
Multibacillary leprosy in combination with rifampicin and dapsone (3-drug regimen) | Paucibacillary leprosy in combination with rifampicin (2-drug regimen)

**BY MOUTH**
- **Adult** (body-weight up to 35 kg): 50 mg daily, alternatively 1–2 mg/kg daily, may be self-administered
- **Adult** (body-weight 35 kg and above): 100 mg daily, may be self-administered

**Dermatitis herpetiformis**
- **BY MOUTH**
  - **Adult**: (consult product literature or local protocols)

**Treatment of Pneumocystis jirovecii (Pneumocystis carinii) pneumonia** (in combination with trimethoprim)

**BY MOUTH**
- **Adult**: 100 mg once daily

**Prophylaxis of Pneumocystis jirovecii (Pneumocystis carinii) pneumonia**
- **BY MOUTH**
  - **Adult**: 100 mg daily

### 2.3 Lyme disease

**Lyme disease**

Lyme disease should generally be treated by those experienced in its management. Doxycycline p. 496, amoxicillin p. 482 [unlicensed indication] or cefuroxime p. 460 (as cefuroxime axetil) are the antibacterials of choice for early Lyme disease or Lyme arthritis. If these antibacterials are contra-indicated, a **macrolide** (e.g. clarithromycin p. 470) can be used for early Lyme disease. Intravenous administration of ceftriaxone p. 459, cefotaxime p. 457, or benzylpenicillin sodium p. 480 is recommended for Lyme disease associated with cardiac or neurological complications. The duration of treatment is usually 2–4 weeks; Lyme arthritis may require further treatment.
2.4 Methicillin-resistant staphylococcus aureus

MRSA

Infection from Staphylococcus aureus strains resistant to meticillin (now discontinued) (methicillin-resistant Staph. aureus, MRSA) and to flucloxacillin p. 486 can be difficult to manage. Treatment is guided by the sensitivity of the infecting strain.

Rifampicin p. 508 or fusidic acid p. 463 should not be used alone because resistance may develop rapidly. A tetracycline alone or a combination of rifampicin and fusidic acid can be used for skin and soft-tissue infections caused by MRSA; clindamycin p. 467 alone is an alternative.

A glycopeptide (e.g. vancomycin p. 465) can be used for severe skin and soft-tissue infections associated with MRSA; if a glycopeptide is unsuitable, linezolid p. 477 can be used on expert advice. As linezolid is not active against gram-negative organisms, it can be used for mixed skin and soft-tissue infections only when other treatments are not available; linezolid must be given with other antibacterials if the infection also involves Gram-negative organisms. A combination of a glycopeptide and fusidic acid or a glycopeptide and rifampicin can be considered for skin and soft-tissue infections that have failed to respond to a single antibiotic.

Tigecycline p. 466 and daptomycin p. 468 are licensed for the treatment of complicated skin and soft-tissue infections involving MRSA.

A tetracycline or clindamycin can be used for bronchiectasis caused by MRSA. A glycopeptide can be used for pneumonia associated with MRSA; if a glycopeptide is unsuitable, linezolid can be used on expert advice. Linezolid must be given with other antibacterials if the infection also involves Gram-negative organisms.

A tetracycline can be used for urinary-tract infections caused by MRSA; trimethoprim p. 462 or nitrofurantoin p. 512 are alternatives. A glycopeptide can be used for urinary-tract infections that are severe or resistant to other antibacterials.

A glycopeptide can be used for septicaemia associated with MRSA.

See the management of endocarditis, osteomyelitis, or septic arthritis associated with MRSA.

Prophylaxis with vancomycin p. 465 or teicoplanin p. 464 (alone or in combination with another antibacterial active against other pathogens) is appropriate for patients undergoing surgery if:

- there is a history of MRSA colonisation or infection without documented eradication;
- there is a risk that the patient’s MRSA carriage has recurred;
- the patient comes from an area with a high prevalence of MRSA.

See eradication of nasal carriage of MRSA in Nose p. 980.

2.5 Tuberculosis

Tuberculosis is treated in two phases—an initial phase using 4 drugs and a continuation phase using 2 drugs in fully sensitive cases. Treatment requires specialised knowledge and supervision, particularly where the disease involves resistant organisms or non-respiratory organs.

There are two regimens recommended for the treatment of tuberculosis in the UK; variations occur in other countries. Either the unsupervised regimen or the supervised regimen should be used; the two regimens should not be used concurrently. Compliance with therapy is a major determinant of its success.

Initial phase

The concurrent use of 4 drugs during the initial phase is designed to reduce the bacterial population as rapidly as possible and to prevent the emergence of drug-resistant bacteria. The drugs are best given as combination preparations unless one of the components cannot be given because of resistance or intolerance. The treatment of choice for the initial phase is the daily use of isoniazid p. 506, rifampicin p. 508, pyrazinamide p. 506 and ethambutol hydrochloride p. 505. Treatment should be started without waiting for culture results if clinical features or histology results are consistent with tuberculosis; treatment should be continued even if initial culture results are negative. The initial phase drugs should be continued for 2 months. Where a positive culture for M. tuberculosis has been obtained, but susceptibility results are not available after 2 months, treatment with rifampicin, isoniazid, pyrazinamide and ethambutol hydrochloride should be continued until full susceptibility is confirmed, even if this is for longer than 2 months.

Streptomycin p. 451 is rarely used in the UK but it may be used in the initial phase of treatment if resistance to isoniazid has been established before therapy is commenced.

Continuation phase

After the initial phase, treatment is continued for a further 4 months with isoniazid with rifampicin p. 510 (preferably given as a combination preparation). Longer treatment is necessary for meningitis, direct spinal cord involvement, and for resistant organisms which may also require modification of the regimen.

Unsupervised treatment

The unsupervised treatment regimen should be used for patients who are likely to take antituberculous drugs reliably without supervision. Patients who are unlikely to comply with daily administration of antituberculous drugs should be treated with the regimen described under Supervised Treatment.

Pregnancy and breast-feeding

The standard unsupervised 6-month treatment regimen may be used during pregnancy. Streptomycin should not be given in pregnancy.

The standard unsupervised 6-month treatment regimen may be used during breast-feeding.

Supervised treatment

Drug administration needs to be fully supervised (directly observed therapy, DOT) in patients who cannot comply reliably with the treatment regimen. These patients are given isoniazid, rifampicin, pyrazinamide and ethambutol hydrochloride (or streptomycin) 3 times a week under supervision for the first 2 months followed by isoniazid and rifampicin 3 times a week for a further 4 months.

Immunocompromised patients

Multi-resistant Mycobacterium tuberculosis may be present in immunocompromised patients. The organism should always be cultured to confirm its type and drug sensitivity. Confirmed M. tuberculosis infection sensitive to first-line drugs should be treated with a standard 6-month regimen; after completing treatment, patients should be closely monitored. The regimen may need to be modified if
**Recommended dosage for standard unsupervised 6-month treatment**

- Adult: 30 mg/kg 3 times a week |

Infection is caused by resistant organisms, and specialist advice is needed. Specialist advice should be sought about tuberculosis treatment or chemoprophylaxis in a HIV-positive individual; care is required in choosing the regimen and in avoiding potentially serious interactions. Starting antiretroviral treatment in the first 2 months of antituberculosis treatment increases the risk of immune reconstitution syndrome. Infection may also be caused by other mycobacteria e.g. M. avium complex in which case specialist advice on management is needed.

**Corticosteroids**

In meningeal or pericardial tuberculosis, a corticosteroid should be started at the same time as antituberculosis therapy.

**Prevention of tuberculosis**

Some individuals may develop tuberculosis owing to reactivation of previously latent disease. Chemoprophylaxis may be required in those who have evidence of latent tuberculosis and are receiving treatment with immunosuppressants (including cytotoxics and possibly long-term treatment with systemic corticosteroids). In these cases, chemoprophylaxis involves use of either isoniazid alone for 6 months or of isoniazid and rifampicin for 3 months; longer chemoprophylaxis is not recommended.

See prevention of tuberculosis in susceptible close contacts or those who have become tuberculin-positive. See advice on immunisation against tuberculosis.

**Treatment failure**

Major causes of treatment failure are incorrect prescribing by the physician and inadequate compliance by the patient. Monthly tablet counts and urine examination (rifampicin imparts an orange-red coloration) may be useful indicators of compliance with treatment. Avoid both excessive and inadequate dosage. Treatment should be supervised by a specialist physician.

**Antituberculosis drugs**

Isoniazid is cheap and highly effective. Like rifampicin it should always be included in any antituberculous regimen unless there is a specific contra-indication. Rifampicin, a rifamycin, is a key component of any antituberculous regimen. Like isoniazid it should always be included unless there is a specific contra-indication.

During the first two months (‘initial phase’) of rifampicin administration transient disturbance of liver function with elevated serum transaminases is common but generally does not require interruption of treatment. Occasionally more serious liver toxicity requires a change of treatment particularly in those with pre-existing liver disease.

On intermittent treatment six toxicity syndromes have been recognised—influenza-like, abdominal, and respiratory symptoms, shock, renal failure, and thrombocytopenic purpura—and can occur in 20 to 30% of patients.
Rifabutin, another rifamycin, is indicated for prophylaxis against M. avium complex infections in patients with a low CD4 count; it is also licensed for the treatment of non-tuberculous mycobacterial disease and pulmonary tuberculosis.

Pyrazinamide is a bactericidal drug only active against intracellular dividing forms of Mycobacterium tuberculosis; it exerts its main effect only in the first two or three months. It is particularly useful in tuberculous meningitis because of good meningeal penetration. It is not active against M. bovis.

Ethambutol hydrochloride is included in a treatment regimen if isoniazid resistance is suspected; it can be omitted if the risk of resistance is low.

Drugs resistant tuberculosis should be treated by a specialist physician with experience in such cases, and where appropriate facilities for infection-control exist. Second-line drugs available for infections caused by resistant organisms, or when first-line drugs cause unacceptable side-effects, include aminosalicylic acid below, amikacin p. 450, capreomycin p. 504, cycloserine p. 594, newer macrolides (e.g. azithromycin p. 469 and clarithromycin p. 470), moxifloxacin p. 492 and prothionamide (prothionamide; no longer on UK market).

Bedaquiline below and delamanid p. 504 are licensed for the treatment of multiple-drug resistant pulmonary tuberculosis. Bedaquiline has a long half-life.

Management of tuberculosis in children

Children are given isoniazid, rifampicin, pyrazinamide, and ethambutol hydrochloride for the first 2 months followed by isoniazid and rifampicin during the next 4 months. However, care is needed in young children receiving ethambutol hydrochloride because of the difficulty in testing eyesight and in obtaining reports of visual symptoms.

Drugs used for Tuberculosis not listed below; Streptomycin, p. 451

ANTIMYCOBACTERIALS

Aminosalicylic acid

INDICATIONS AND DOSE

Multiple-drug resistant tuberculosis, in combination with other drugs

BY MOUTH

Adult: 4 g every 8 hours for a usual treatment duration of 24 months; maximum 12 g per day

Desensitisation regimen

BY MOUTH

Adult: (consult product literature)

CAUTIONS

Peptic ulcer

SIDE-EFFECTS

Common or very common Abdominal pain - bloating - diarrhoea - nausea - rash - vestibular syndrome - vomiting

Uncommon Anorexia

Rare Gastrointestinal bleeding - hypothyroidism - jaundice - malabsorption syndrome - metallic taste - peptic ulcer - urticaria

Very rare Agranulocytosis - anaemia - crystalluria - dizziness - headache - hypoglycaemia - leucopenia - methemoglobinemia - peripheral neuropathy - purpura - tendon pain - thrombocytopenia - visual abnormalities - weight loss

Frequency not known Hepatitis - hypersensitivity

Bedaquiline

INDICATIONS AND DOSE

Multiple-drug resistant pulmonary tuberculosis, in combination with other drugs

BY MOUTH

Adult: Initially 400 mg once daily for 2 weeks, then 200 mg 3 times a week for 22 weeks, intervals of at least 48 hours between each dose, continue appropriate combination therapy after bedaquiline

CONTRA-INDICATIONS QTc interval more than 500 milliseconds (derived using Fridericia’s formula) - ventricular arrhythmia

CAUTIONS Hypothyroidism - QTc interval (derived using Fridericia’s formula) 450–500 milliseconds—discontinue if QTc interval more than 500 milliseconds - risk factors for QT interval prolongation (e.g. electrolyte disturbances, heart failure with reduced left ventricular ejection fraction, history of symptomatic arrhythmias (avoid if ventricular arrhythmia present), bradycardia, congenital long QT syndrome)

INTERACTIONS Appendix 1 (bedaquiline). Caution with concomitant use of hepatotoxic drugs.

SIDE-EFFECTS Arthralgia - diarrhoea - dizziness - headache - myalgia - nausea - QT interval prolongation - vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Syncope If syncope occurs, obtain ECG.

PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk.

BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT Manufacturer advises caution in moderate impairment; avoid in severe impairment—no

Infection
information available. Avoid concomitant use of hepatotoxic drugs unless essential.

- **RENAL IMPAIRMENT** Manufacturer advises caution if eGFR less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**
  - Determine serum potassium, calcium, and magnesium before starting treatment (correct if abnormal)—remeasure if QT prolongation occurs during treatment.
  - Obtain ECG before starting treatment, and then at least monthly during treatment or more frequently if concomitant use with other drugs known to prolong the QT interval.
  - Monitor liver function before starting treatment and then at least monthly during treatment—discontinue treatment if severe abnormalities in liver function tests.

- **PATIENT AND CARER ADVICE**
  - Dizziness may affect performance of skilled tasks (e.g. driving)
  - **Missed doses** If a dose is missed during the first two weeks of treatment, the missed dose should not be taken and the next dose should be taken at the usual time; if a dose is missed during weeks 3–24 of treatment, the missed dose should be taken as soon as possible and then the usual regimen resumed.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**:
    - CAUTIONARY AND ADVISORY LABELS 4, 8, 21
      - Sirturo (Janssen-Cilag Ltd) ▼
      - Bedaquiline (as Bedaquiline fumarate) 100 mg Sirturo 100mg tablets | 188 tablet [PO] £18,700.00

### Capreomycin

#### INDICATIONS AND DOSE

Tuberculosis resistant to first-line drugs in combination with other drugs

**BY DEEP INTRAMUSCULAR INJECTION**

- Adult: 1 g daily (max. per dose 20 mg/kg) for 2–4 months, then reduced to 1 g 2–3 times a week

#### CAUTIONS

- Auditory impairment

#### INTERACTIONS

- Appendix 1 (capreomycin).

#### SIDE-EFFECTS

- Induration at injection site
- Changes in liver function tests
- Electrolyte disturbances
- Hearing loss with tinnitus and vertigo
- Hypersensitivity reactions
- Leucocytosis
- Nephrotoxicity
- Neuromuscular block after large doses
- Pain at injection site
- Rash
- Thrombocytopenia
- Urticaria

#### PREGNANCY

- Manufacturer advises use only if potential benefit outweighs risk—teratogenic in animal studies.

#### BREAST FEEDING

- Manufacturer advises caution—no information available.

#### HEPATIC IMPAIRMENT

- Use with caution.

#### RENAL IMPAIRMENT

- Reduce dose—consult product literature. Nephrotoxic; ototoxic.

#### MONITORING REQUIREMENTS

- Monitor renal, hepatic, auditory, and vestibular function and electrolytes.

#### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.
  - **Powder for solution for injection**
    - CAPREOMYCIN (Non-proprietary)
      - Capreomycin (as Capreomycin sulfate) 1 gram Capreomycin 1g powder for solution for injection vials | 1 vial [PO] £28.61

### Cycloserine

#### INDICATIONS AND DOSE

Tuberculosis resistant to first-line drugs, in combination with other drugs

**BY MOUTH**

- Adult: Initially 250 mg every 12 hours for 2 weeks, then increased if necessary up to 500 mg every 12 hours, dose to be increased according to blood concentration and response

#### PHARMACOKINETICS

- Cycloserine penetrates the CNS.

#### CONTRA-INDICATIONS

- Alcohol dependence · depression · epilepsy · psychotic states · severe anxiety

#### INTERACTIONS

- Appendix 1 (cycloserine).

#### SIDE-EFFECTS

- Allergic dermatitis · changes in liver function tests · confusion · convulsions · depression · dizziness · drowsiness · headache · heart failure at high doses · megaloblastic anaemia · psychosis · rashes · tremor · vertigo

#### SIDE-EFFECTS, FURTHER INFORMATION

- CNS toxicity
  - Discontinue or reduce dose if symptoms of CNS toxicity occur.
  - Rashes or allergic dermatitis
  - Discontinue or reduce dose if rashes or allergic dermatitis develops.

- **PREGNANCY**
  - Manufacturer advises use only if potential benefit outweighs risk—crosses the placenta.

- **BREAST FEEDING**
  - Present in milk—amount too small to be harmful.

- **RENAL IMPAIRMENT**
  - Increase interval between doses if creatinine clearance less than 50 mL/minute. Monitor blood-cycloserine concentration if creatinine clearance less than 50 mL/minute.

#### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.
  - **Capsule**:
    - CAUTIONARY AND ADVISORY LABELS 2, 8
      - CYCLOSERINE (Non-proprietary)
        - Cycloserine 250 mg Cycloserine 250mg capsules | 100 capsule [PO] £402.63 DT price = £402.63

### Delamanid

#### INDICATIONS AND DOSE

Multiple-drug resistant pulmonary tuberculosis, in combination with other drugs

**BY MOUTH**

- Adult: 100 mg twice daily for 24 weeks, continue appropriate combination therapy after delamanid

#### CONTRA-INDICATIONS

- QTC interval more than 500 milliseconds (derived using Fridericia’s formula) · serum albumin less than 28 g/litre

#### CAUTIONS

- Risk factors for QT interval prolongation (e.g. electrolyte disturbances, acute myocardial infarction, heart failure with reduced left ventricular ejection fraction, severe hypertension, left ventricular hypertrophy, bradycardia, congenital long QT syndrome, history of symptomatic arrhythmias).

#### INTERACTIONS

- Appendix 1 (delamanid).
CAUTIONS

CONTRA-INDICATIONS

ETHAMBUTOL HYDROCHLORIDE (Non-proprietary)

Ethambutol hydrochloride 100 mg Ethambutol 100mg tablets | 56 tablet [P38] £11.52 DT price = £11.52
Ethambutol hydrochloride 400 mg Ethambutol 400mg tablets | 56 tablet [P38] £42.74 DT price = £42.74

Also available in combination with isoniazid, pyrazinamide and rifampicin, p. 509
Isoniazid

INDICATIONS AND DOSE
Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

BY MOUTH OR BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION

- Child: 10 mg/kg once daily (max. per dose 300 mg) for 6 months (initial and continuation phases)
- Adult: 300 mg daily for 6 months (initial and continuation phases)

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

BY MOUTH OR BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION

- Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)
- Adult: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive

BY MOUTH OR BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION

- Child 1 month-11 years: 10 mg/kg daily (max. per dose 300 mg) for 6 months, alternatively 10 mg/kg daily (max. per dose 300 mg) for 3 months, to be taken in combination with rifampicin
- Child 12-17 years: 300 mg daily for 6 months, alternatively 300 mg daily for 3 months, to be taken in combination with rifampicin
- Adult: 300 mg daily for 6 months, alternatively 300 mg daily for 3 months, to be taken in combination with rifampicin

CONTRA-INDICATIONS Drug-induced liver disease

CAUTIONS Acute porphyrias p. 864 - alcohol dependence - diabetes mellitus - epilepsy - history of psychosis - HIV infection - malnutrition - slow acetylator status (increased risk of side-effects)

CAUTIONS, FURTHER INFORMATION
Peripheral neuropathy Peripheral neuropathy is more likely to occur where there are pre-existing risk factors such as diabetes, alcohol dependence, chronic renal failure, pregnancy, malnutrition and HIV infection. In patients at increased risk of peripheral neuropathy, pyridoxine hydrochloride p. 882 should be given prophylactically from the start of treatment.

INTERACTIONS Appendix 1 (isoniazid).

When used with tyramine or histamine rich foods, tachycardia, palpitation, hypotension, flushing, headache, dizziness, and sweating reported.

SIDE-EFFECTS

- Common or very common Peripheral neuropathy
- Rare Hepatitis - psychotic episodes

SIDE-EFFECTS, FURTHER INFORMATION

Hepatitis Hepatitis more common in those aged over 35 years.

PREGNANCY Not known to be harmful; prophylactic pyridoxine recommended.

BREAST FEEDING Theoretical risk of convulsions and neuropathy; prophylactic pyridoxine advisable in mother. In breast-feeding, monitor infant for possible toxicity.

HEPATIC IMPAIRMENT Use with caution. In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months.

RENAL IMPAIRMENT Risk of ototoxicity and peripheral neuropathy; prophylactic pyridoxine hydrochloride p. 882 recommended.

MONITORING REQUIREMENTS
- Renal function should be checked before treatment.
- Hepatic function should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment.
- Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months.

PRESCRIBING AND DISPENSING INFORMATION
- In children in general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. Doses may need to be recalculated to allow for weight gain in younger children.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Isoniazid for latent tuberculosis www.medicinesforchildren.org.uk/isoniazid-for-latent-tuberculosis

Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet

Isoniazid (Non-proprietary) Isoniazid 50 mg Isoniazid 5mg tablets | 56 tablet £19.24 DT price = £19.24
Isoniazid 100 mg Isoniazid 10 mg tablets | 28 tablet £19.24 DT price = £19.24

Solution for injection

Isoniazid (Non-proprietary) Isoniazid 25 mg per ml Isoniazid 50mg/2ml solution for injection ampoules | 10 ampoule £277.00

Also available in combination with pyrazinamide and rifampicin, p. 510 - rifampicin, p. 510

Pyrazinamide

INDICATIONS AND DOSE
Tuberculosis in combination with other drugs (standard unsupervised 6-month treatment)

BY MOUTH

- Child (body-weight up to 50 kg): 35 mg/kg once daily for 2 months (initial phase); maximum 1.5 g per day
- Child (body-weight 50 kg and above): 35 mg/kg once daily for 2 months (initial phase); maximum 2 g per day
- Adult (body-weight up to 50 kg): 1.5 g once daily for 2 months (initial phase)
- Adult (body-weight 50 kg and above): 2 g once daily for 2 months (initial phase)
**Tuberculosis in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)**

**BY MOUTH**
- **Child** (body-weight up to 50 kg): 50 mg/kg 3 times a week (max. per dose 2 g 3 times a week) for 2 months (initial phase)
- **Child** (body-weight 50 kg and above): 50 mg/kg 3 times a week (max. per dose 2.5 g 3 times a week) for 2 months (initial phase)
- **Adult** (body-weight up to 50 kg): 2 g 3 times a week for 2 months (initial phase)
- **Adult** (body-weight 50 kg and above): 2.5 g 3 times a week for 2 months (initial phase)

**MONITORING REQUIREMENTS**
- **In children**
- Hepatic function should be checked before treatment. If there is no evidence of liver disease (and pre-treatment checks of hepatic function, particularly in the first 30 months) further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment.
- **Those with alcohol dependence** should have frequent checks of hepatic function, particularly in the first 3 months; blood counts should also be monitored in these patients.

**CAUTIONS**
- Diabetes • gout

**INTERACTIONS**
- Appendix 1 (pyrazinamide).

**SIDE-EFFECTS**
- Anorexia • arthralgia • dysuria • fever • flushing • hepatomegaly • hepatotoxicity • jaundice • liver failure • nausea • photosensitivity • rash • sideroblastic anaemia • splenomegaly • thrombocytopenia • vomiting

**PREGNANCY**
- Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**
- Amount too small to be harmful.

**HEPATIC IMPAIRMENT**
- Idiosyncratic hepatotoxicity more common; avoid in severe hepatic impairment. In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months.

**RENAI IMPAIRMENT**
- Monitor for gout in renal impairment.
- **In adults** 25–30 mg/kg 3 times a week if eGFR less than 30 mL/minute/1.73 m².
- **In children** If estimated glomerular filtration rate less than 30 mL/minute/1.73 m², use 25–30 mg/kg 3 times a week.

**MONITORING REQUIREMENTS**
- Renal function should be checked before treatment.
- Hepatic function should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment.
- Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months.

**PRESCRIBING AND DISPENSING INFORMATION**
- In children In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. Doses may also need to be recalculated to allow for weight gain in younger children.

**PATIENT AND CARER ADVICE**
- Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

**MEDICINAL FORMS**

- **Tablet**
- **Pyrazinamide (Non-proprietary)**
  - Pyrazinamide 500 mg Pyrazinamide 500mg tablets | 30 tablet [P] £38.34 | 50 tablet [P] £52.25

- **Zinamide** (Thornton & Ross Ltd)
  - Pyrazinamide 500 mg Zinamide 500mg tablets | 30 tablet [P] £31.35

Also available in combination with ethambutol with isoniazid and rifampicin, p. 509 - isoniazid and rifampicin, p. 510

**INDICATIONS AND DOSE**

**PROPHYLAXIS OF Mycobacterium avium complex infections in immunosuppressed patients with low CD4 count**

**BY MOUTH**
- **Adult**: 300 mg once daily, also consult product literature

**TREATMENT OF non-tuberculous mycobacterial disease, in combination with other drugs**

**BY MOUTH**
- **Adult**: 450–600 mg once daily for up to 6 months after cultures negative

**TREATMENT OF pulmonary tuberculosis, in combination with other drugs**

**BY MOUTH**
- **Adult**: 150–450 mg once daily for at least 6 months

**CAUTIONS**
- Acute porphyrias p. 864 • discoulors soft contact lenses

**INTERACTIONS**
- Appendix 1 (rifamycins).

**SIDE-EFFECTS**
- **Common or very common** Anaemia • blood disorders • leucopenia • myalgia • nausea • pyrexia • rash • thrombocytopenia
- **Uncommon** Arthralgia • body secretions coloured orange-red • bronchospasm • corneal deposits • eosinophilia • hypersensitivity reactions • jaundice • raised liver enzymes • saliva coloured orange-red • skin coloured orange-red • urine coloured orange-red • uvetitis (especially following high doses or concomitant use with drugs that increase plasma concentration) • vomiting
- **Rare** Haemolysis
- **Frequency not known** Chest pain • dyspnoea • hepatitis • influenza-like symptoms

**SIDE-EFFECTS, FURTHER INFORMATION**

Discontinue permanently if serious side-effects develop.

**ALLERGY AND CROSS-SENSITIVITY**
Contra-indicated in patients with rifamycin hypersensitivity.

**CONCEPTION AND CONTRACEPTION**
- Important Rifabutin induces hepatic enzymes and the effectiveness of hormonal contraceptives is reduced; alternative family planning advice should be offered.

**PREGNANCY**
- Manufacturer advises avoid — no information available.

**BREAST FEEDING**
- Manufacturer advises avoid — no information available.

**HEPATIC IMPAIRMENT**
- Reduce dose in severe impairment.

In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months; blood counts should also be monitored in these patients.

**RENAI IMPAIRMENT**
- Use half normal dose if eGFR less than 30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**
- Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months. Blood counts should also be monitored in these patients.
Renal function should be checked before treatment.

Hepatic function should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. However, hepatic function should be monitored on prolonged therapy.

Blood counts should be monitored on prolonged therapy.

**PRESCRIBING AND DISPENSING INFORMATION** If treatment interruption occurs, re-introduce with low dosage and increase gradually.

**PATIENT AND CARER ADVICE**

Soft contact lenses Patients or their carers should be advised to replace them if there is any risk of transmission. Soft contact lenses should be discarded if a patient becomes tuberculin positive. In those who have become tuberculin positive, who are under expert supervision, those who have become tuberculin positive, in combination with other drugs (standard 3-drug regimen)

**MENICAl FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**Capsule**

CAUTIONARY AND ADVISORY LABELS 8, 14

- Mycobutin (Pfizer Ltd)
- rifabutin 150 mg Mycobutin 150mg capsules | 30 capsule £30.38

**Rifampicin**

**INDICATIONS AND DOSE**

Brucellosis in combination with other antibacterials | Legionnaires disease in combination with other antibacterials | Serious staphylococcal infections in combination with other antibacterials

**BY MOUTH OR BY INTRAVENOUS INFUSION**

- Child 1–11 months: 5–10 mg/kg; twice daily
- Child 1–7 years: 10 mg/kg; twice daily (max. per dose 600 mg)
- Adult: 0.6–1.2 g daily in 2–4 divided doses

Endocarditis in combination with other drugs

**BY MOUTH OR BY INTRAVENOUS INFUSION**

- Adult: 0.6–1.2 g daily in 2–4 divided doses

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

**BY MOUTH**

- Child: 15 mg/kg; 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)
- Adult: 600–900 mg; 3 times a week for 6 months (initial and continuation phases)

Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

**BY MOUTH**

- Child (body-weight up to 50 kg): 15 mg/kg; once daily for 6 months (initial and continuation phases); maximum 450 mg per day
- Child (body-weight 50 kg and above): 15 mg/kg; once daily for 6 months (initial and continuation phases); maximum 600 mg per day
- Adult (body-weight up to 50 kg): 450 mg daily for 6 months (initial and continuation phases)
- Adult (body-weight 50 kg and above): 600 mg daily for 6 months (initial and continuation phases)

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, in combination with isoniazid

**BY MOUTH**

- Child 1 month–11 years (body-weight up to 50 kg): 15 mg/kg; daily for 3 months; maximum 450 mg per day
- Child 1 month–11 years (body-weight 50 kg and above): 15 mg/kg; daily for 3 months; maximum 600 mg per day
- Child 12–17 years (body-weight up to 50 kg): 450 mg daily for 3 months
- Adult (body-weight up to 50 kg): 450 mg daily for 3 months
- Child 12–17 years (body-weight 50 kg and above): 600 mg daily for 3 months
- Adult (body-weight 50 kg and above): 600 mg daily for 3 months

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, who are isoniazid-resistant

**BY MOUTH**

- Child 1 month–11 years (body-weight up to 50 kg): 15 mg/kg; daily for 6 months; maximum 450 mg per day
- Child 1 month–11 years (body-weight 50 kg and above): 15 mg/kg; daily for 6 months; maximum 600 mg per day
- Child 12–17 years (body-weight up to 50 kg): 450 mg daily for 6 months
- Child 12–17 years (body-weight 50 kg and above): 600 mg daily for 6 months

Prevention of secondary case of Haemophilus influenzae type b disease

**BY MOUTH**

- Adult 18–34 years (body-weight up to 50 kg): 450 mg daily for 6 months
- Adult 18–34 years (body-weight 50 kg and above): 600 mg daily for 6 months

Prevention of secondary case of meningococcal meningitis

**BY MOUTH**

- Child 1–11 months: 10 mg/kg; once daily for 4 days
- Child 3 months–11 years: 20 mg/kg; once daily (max. per dose 600 mg) for 4 days
- Child 12–17 years: 600 mg; once daily for 4 days
- Adult: 600 mg once daily for 4 days

Multibacillary leprosy in combination with dapson and clofazimine (3-drug regimen) | Paucibacillary leprosy in combination with dapson (2-drug regimen)

**BY MOUTH**

- Adult (body-weight up to 35 kg): 450 mg once a month, supervised administration
- Adult (body-weight 35 kg and above): 600 mg once a month, supervised administration

**CONTRA-INDICATIONS** Acute porphyrias p. 864; jaundice

**CAUTIONS** Discolours soft contact lenses

**INTERACTIONS** Appendix 1 (rifamycins). Rifampicin induces hepatic enzymes which accelerate the metabolism of several drugs including oestrogens,
corticosteroids, phenytoin, sulfonylureas, and anticoagulants.

- **SIDE-EFFECTS**
  
  **GENERAL SIDE-EFFECTS**
  Acute renal failure · adrenal insufficiency · alterations of liver function · anorexia · antibiotic-associated colitis · body secretions coloured orange-red · collapse and shock · diarrhoea · disseminated intravascular coagulation · drowsiness · eosinophilia · exfoliative dermatitis · flushing · gastro-intestinal symptoms · haemolytic anaemia · headache · influenza-like symptoms (with chills, fever, dizziness, bone pain) · jaundice · leucopenia · menstrual disturbances · muscular weakness · myopathy · nausea · oedema · pemphigoid reactions · psychoses · rashes · respiratory symptoms · saliva coloured orange-red · shortness of breath · Stevens-Johnson syndrome · thrombocytopenic purpura · toxic epidermal necrolysis · urine coloured orange-red · urticaria · vomiting

  **SPECIFIC SIDE-EFFECTS**
  - With intravenous use Thrombophlebitis reported if infusion used for prolonged period
  - **SIDE-EFFECTS, FURTHER INFORMATION**
  Discontinue permanently if serious side-effects develop.
  - **Intermittent therapy** Side-effects that mainly occur with intermittent therapy include influenza-like symptoms (with chills, fever, dizziness, bone pain), respiratory symptoms (including shortness of breath), collapse and shock, haemolytic anaemia, thrombocytopenic purpura, disseminated intravascular coagulation, and acute renal failure
  - **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with rifampicyn hypersensitivity.
  - **CONCEPTION AND CONTRACEPTION** Important Effectiveness of hormonal contraceptives is reduced and alternative family planning advice should be offered.
  - **PREGNANCY** Manufacturers advise very high doses teratogenic in animal studies in first trimester; risk of neonatal bleeding may be increased in third trimester.
  - **BREAST FEEDING** Amount too small to be harmful.
  - **HEPATIC IMPAIRMENT** Impaired elimination. Avoid or do not exceed 8 mg/kg daily. In patients with pre-existing liver disease or hepatic impairment, monitor liver function regularly and particularly frequently in the first 2 months; blood counts should also be monitored in these patients.
  - **RENAL IMPAIRMENT**
    - In children Use with caution if doses above 10 mg/kg daily.
    - In adults Use with caution if dose above 600 mg daily.
  - **MONITORING REQUIREMENTS**
    - Renal function should be checked before treatment.
    - Hepatic function should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. However, liver function should be monitored on prolonged therapy.
    - Blood counts should be monitored in patients on prolonged therapy.
    - Those with alcohol dependence should have frequent checks of hepatic function, particularly in the first 2 months. Blood counts should also be monitored in these patients.
  - **DIRECTIONS FOR ADMINISTRATION**
    - With intravenous use in adults. For intravenous infusion (Rifadin®), give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute with solvent provided then dilute with 500 mL infusion fluid; give over 2–3 hours.
    - With intravenous use in children Displacement value may be significant, consult local reconstitution guidelines; reconstitute with solvent provided. May be further diluted with Glucose 5% or Sodium chloride 0.9% to a final concentration of 1.2 mg/mL. Infuse over 2–3 hours.

  **PRESCRIBING AND DISPENSING INFORMATION**
  If treatment interruption occurs, re-introduce with low dosage and increase gradually.

  - **With oral use in children** In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. Doses may also need to be recalculated to allow for weight gain in younger children. Flavours of syrup may include raspberry.

  **PATIENT AND CARER ADVICE**
  Medicines for Children leaflet: Rifampicin for meningococcal prophylaxis www.medicinesforchildren.org.uk/rifampicin-for-meningococcal-prophylaxis

  **SIDE-EFFECTS**
  Soft contact lenses Patients or their carers should be advised that rifampicin discolours soft contact lenses. Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

  **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution
  - **Capsule**
    - **CAUTIONARY AND ADVISORY LABELS** 8, 14, 23
    - **RIFAMPICIN (Non-proprietary)**
      - Rifampicin 150 mg Rifampicin 150mg capsules | 100 capsule £47.10 DT price = £15.75
      - Rifampicin 300 mg Rifampicin 300mg capsules | 100 capsule £47.39-£48.00 DT price = £48.00
      - Rifadin (Sanofi)
      - Rifampicin 150 mg Rifampicin 150mg capsules | 100 capsule £18.32 DT price = £15.75
      - Rifampicin 300 mg Rifampicin 300mg capsules | 100 capsule £36.63 DT price = £48.00
      - Rimactane (Sandoz Ltd)
      - Rifampicin 300 mg Rimactane 300mg capsules | 60 capsule £25.92
  - **Oral suspension**
    - **CAUTIONARY AND ADVISORY LABELS** 8, 14, 23
    - **EXCIPIENTS:** May contain Sucrose
      - Rifadin (Sanofi)
      - Rifampicin 20 mg per 1 ml Rifampicin 100mg/5ml syrup | 120 ml £3.56
  - **Powder and solvent for solution for infusion**
    - **ELECTROLYTES:** May contain Sodium
      - Rifadin (Sanofi)
      - Rifampicin 600 mg Rifadin 600mg powder and solvent for solution for infusion vials | 1 vial £7.67

---

**Ethambutol with isoniazid, pyrazinamide and rifampicin**

The properties listed below are those particular to the combination only. For the properties of the components please consider, ethambutol hydrochloride p. 505, isoniazid p. 506, pyrazinamide p. 506, rifampicin p. 506.
Isoniazid with rifampicin and pyrazinamide

The properties listed below are those particular to the combination only. For the properties of the components please consider, isoniazid p. 506, rifampicin p. 508.

INDICATIONS AND DOSE

Treatment of tuberculosis (continuation phase)

BY MOUTH
- Adult (body-weight 50 kg and above): 4 tablets daily for 3 months (continuation phase after 2-month initial phase), use Rifater 150/100 Tablets, preferably taken before breakfast.
- Adult (body-weight 50 kg and above): 6 tablets daily for 4 months (continuation phase after 2-month initial phase), use Rifinah 300/150 Tablets, preferably taken before breakfast.

Dose equivalence and conversion
Rifinah Tablets contain rifampicin and isoniazid; the proportions are expressed in the form x/y where x and y are the strengths in milligrams of rifampicin and isoniazid respectively. Each Rifinah 150/100 Tablet contains rifampicin 150 mg and isoniazid 100 mg. Each Rifinah 300/150 Tablet contains rifampicin 300 mg and isoniazid 150 mg.

2.6 Urinary tract infections

Urinary-tract infections

Urinary-tract infection is more common in women than in men; when it occurs in men there is frequently an underlying abnormality of the renal tract. Recurrent episodes of infection are an indication for radiological investigation especially in children in whom untreated pyelonephritis may lead to permanent kidney damage.

Escherichia coli is the most common cause of urinary-tract infection; Staphylococcus saprophyticus is also common in sexually active young women. Less common causes include Proteus and Klebsiella spp. Pseudomonas aeruginosa infections usually occur in the hospital setting and may be associated with functional or anatomical abnormalities of the renal tract. Staphylococcus epidermidis and Enterococcus faecalis infection may complicate catheterisation or instrumentation.

A specimen of urine should be collected for culture and sensitivity testing before starting antibacterial therapy;
- in men;
- in pregnant women;
- in children under 3 years of age;
- in patients with suspected upper urinary-tract infection;
- complicated infection, or recurrent infection;
- if resistant organisms are suspected;
- if urine dipstick testing gives a single positive result for leucocyte esterase or nitrite;
- if clinical symptoms are not consistent with results of dipstick testing.
Treatment should not be delayed while waiting for results. The antibacterial chosen should reflect current local bacterial sensitivity to antibacterials.

**Antibacterial therapy for lower urinary-tract infections**

Uncomplicated lower urinary-tract infections often respond to trimethoprim p. 462 or nitrofurantoin p. 512, or alternatively, amoxicillin p. 482, ampicillin p. 483 or oral cephalosporin.

_Suggested duration of treatment_ is 7 days, but a short course (e.g. 3 days) is usually adequate for uncomplicated urinary-tract infections in women.

Infections caused by fully sensitive bacteria respond to amoxicillin.

Widespread bacterial resistance to ampicillin, amoxicillin, and trimethoprim has been reported. Alternatives for resistant organisms include co-amoxiclav p. 484 (amoxicillin with clavulanic acid), an oral cephalosporin, nitrofurantoin, pimecillinam hydrochloride p. 486, or a quinolone.

Fosfomycin [unlicensed] can be used, on the advice of a microbiologist, for the treatment of uncomplicated lower urinary-tract infections caused by multiple-antibacterial resistant organisms when other antibacterials cannot be used.

Long-term low dose therapy may be required in selected patients to prevent _recurrence of infection_; indications include frequent relapses and significant kidney damage. Trimethoprim, nitrofurantoin and cefalexin p. 456 have been recommended for long-term therapy.

Methenamine hippurate below (hexamine hippurate) should not generally be used because it requires an acidic urine for its antimicrobial activity and it is ineffective for upper urinary-tract infections; it may, however, have a role in the prophylaxis and treatment of chronic or recurrent uncomplicated lower urinary-tract infections.

**Antibacterial therapy for upper urinary-tract infections**

Acute pyelonephritis can lead to septicemia and is treated initially by injection of a broad-spectrum antibacterial such as a cephalosporin (e.g. cefuroxime p. 460) or a quinolone if the patient is severely ill; gentamicin p. 450 can also be used.

_Suggested duration of treatment_ is 10–14 days (longer treatment may be necessary in complicated pyelonephritis). Prostatitis can be difficult to cure and requires treatment for several weeks with an antibacterial which penetrates prostatic tissue such as some of the quinolones (ciprofloxacin p. 490 or ofloxacin p. 494), or alternatively, trimethoprim.

_Suggested duration of treatment_ is 28 days. Where infection is localised and associated with an indwelling catheter, a bladder instillation is often effective.

**Pregnancy**

Urinary-tract infection in pregnancy may be asymptomatic and requires prompt treatment to prevent progression to acute pyelonephritis. Penicillins and cephalosporins are suitable for treating urinary-tract infection during pregnancy. Nitrofurantoin may also be used but it should be avoided at term. Sulfonamides and quinolones should be avoided during pregnancy; trimethoprim should also preferably be avoided particularly in the first trimester.

**Renal impairment**

In renal failure antibacterials normally excreted by the kidney accumulate with resultant toxicity unless the dose is reduced. This applies especially to the aminopenicillins which should be used with great caution; tetracyclines, methenamine hippurate, and nitrofurantoin should be avoided altogether.

**Urinary-tract infections in children**

Urinary-tract infections in children require prompt antibacterial treatment to minimise the risk of renal scarring. Uncomplicated ‘lower’ urinary-tract infections in _children over 3 months of age_ can be treated with trimethoprim, nitrofurantoin, a first generation cephalosporin (e.g. cefalexin), or amoxicillin for 3 days; children should be reassessed if they continue to be unwell 24–48 hours after the initial assessment. Amoxicillin should only be used if the organism causing the infection is sensitive to it.

Acute pyelonephritis in children over 3 months of age can be treated with a first generation cephalosporin or co-amoxiclav for 7–10 days. If the patient is severely ill, then the infection is best treated initially by injection of a broad-spectrum antibacterial such as cefotaxime or co-amoxiclav; gentamicin is an alternative.

_Children under 3 months of age_ should be transferred to hospital and treated initially with intravenous antibacterial drugs such as ampicillin with gentamicin, or cefotaxime alone, until the infection responds; full doses of oral antibacterials are then given for a further period.

Recurrent episodes of infection are an indication for imaging tests. _Antibacterial prophylaxis_ with low doses of trimethoprim or nitrofurantoin may be considered for children with recurrent infection, significant urinary-tract anomalies, or significant kidney damage.

---

**Methenamine hippurate**

*(Hexamine hippurate)*

**INDICATIONS AND DOSE**

**Prophylaxis and long-term treatment of chronic or recurrent uncomplicated lower urinary-tract infections**

**BY MOUTH**

- **Adult:** 1 g every 12 hours

**Prophylaxis and long-term treatment of chronic or recurrent uncomplicated lower urinary-tract infections in patients with catheters**

**BY MOUTH**

- **Adult:** 1 g every 8–12 hours

- **CONTRA-INDICATIONS** Gout - metabolic acidosis - severe dehydration

- **INTERACTIONS** → Appendix 1 (methenamine). Caution—avoid concurrent administration with sulfonamides (risk of crystalluria) or urinary alkalising agents.

- **SIDE-EFFECTS** Bladder irritation - gastro-intestinal disturbances - rash

- **PREGNANCY** Use with caution.

- **BREAST FEEDING** Amount too small to be harmful.

- **HEPATIC IMPAIRMENT** Avoid.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 10 mL/minute/1.73 m² — risk of hippurate crystalluria.

- **LESS SUITABLE FOR PRESCRIBING** Methenamine (hexamine) hippurate should not generally be used because it requires an acidic urine for its antimicrobial activity and it is ineffective for upper urinary-tract infections; it may, however, have a role in the prophylaxis and treatment of chronic or recurrent uncomplicated lower urinary-tract infections. It is considered less suitable for prescribing.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

---
Nitrofurantoin

INDICATIONS AND DOSE
Acute uncomplicated urinary-tract infections
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 3 months-11 years: 750 micrograms/kg 4 times a day for 3–7 days
- Child 12-17 years: 50 mg 4 times a day for 3–7 days
- Adult: 50 mg 4 times a day for 3–7 days

BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Child 12-17 years: 100 mg twice daily, dose to be taken with food
- Adult: 100 mg twice daily, dose to be taken with food

Severe chronic recurrent urinary-tract infections
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 12-17 years: 100 mg 4 times a day for 3–7 days
- Adult: 100 mg 4 times a day for 7 days, dose to be taken with food, reduce dose or discontinue treatment if severe nausea occurs

Prophylaxis of urinary-tract infection (considered for recurrent infection, significant urinary-tract anomalies, or significant kidney damage)
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Child 3 months-11 years: 1 mg/kg once daily, dose to be taken at night
- Child 12-17 years: 50–100 mg once daily, dose to be taken at night
- Adult: 50–100 mg once daily, dose to be taken at night

Genito-urinary surgical prophylaxis
BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Adult: 100 mg twice daily on day of operation and for 3 days after surgery

CONTRA-INDICATIONS
Acute porphyrias p. 864. G6PD deficiency. Infants less than 3 months old

CAUTIONS
Anemia. Diabetes mellitus. Electrolyte imbalance. Folate deficiency. Pulmonary fibrosis. Susceptibility to peripheral neuropathy. Urine may be coloured yellow or brown. Vitamin B deficiency

INTERACTIONS
Side-effects of nitrofurantoin

RARE
- Agranulocytosis
- Aplastic anemia
- Arthralgia
- Benign intracranial hypertension
- Blood disorders
- Cholestatic jaundice
- Erythema multiforme
- Exfoliative dermatitis
- Hepatitis
- Pancreatitis
- Thrombocytopenia
- Transient alopecia

FREQUENCY NOT KNOWN
- Acute pulmonary reactions
- Anaphylaxis
- Angioedema
- Anorexia
- Chronic pulmonary reactions (pulmonary fibrosis reported; possible association with lupus erythematosus-like syndrome)
- Diarrhoea
- Hypersensitivity reactions
- Nausea
- Peripheral neuropathy
- Pruritus
- Rash
- Sialadenitis
- Urticaria
- Vomiting

PREGNANCY
Avoid at term—may produce neonatal haemolysis.

BREAST FEEDING
Avoid; only small amounts in milk but enough to produce haemolysis in G6PD-deficient infants.

HEPATIC IMPAIRMENT
Use with caution; cholestatic jaundice and chronic active hepatitis reported.

RENAL IMPAIRED
Risk of peripheral neuropathy; antibacterial efficacy depends on renal secretion of the drug into urinary tract.

In adults Avoid if eGFR less than 45 mL/minute/1.73 m²; may be used with caution if eGFR 30–44 mL/minute/1.73 m² as a short-course only (3 to 7 days), to treat uncomplicated lower urinary-tract infection caused by suspected or proven multidrug resistant bacteria and only if potential benefit outweighs risk.

In children Avoid if estimated glomerular filtration rate less than 45 mL/minute/1.73 m²; may be used with caution if estimated glomerular filtration rate 30–44 mL/minute/1.73 m² as a short-course only (3 to 7 days), to treat uncomplicated lower urinary-tract infection caused by suspected or proven multidrug resistant bacteria and only if potential benefit outweighs risk.

MONITORING REQUIREMENTS
On long-term therapy, monitor liver function and monitor for pulmonary symptoms, especially in the elderly (discontinue if deterioration in lung function).

EFFECT ON LABORATORY TESTS
False positive urinary glucose (if tested for reducing substances).

PATIENT AND CARER ADVICE
Medicines for Children leaflet: Nitrofurantoin for urinary tract infections www.medicinesforchildren.org.uk/nitrofurantoin-for-urinary-tract-infections

MEDICAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet
CAUTIONARY AND ADVISORY LABELS 9, 14, 21
- NITROFURANTOIN (Non-proprietary)

Nitrofurantoin 50 mg
- Nitrofurantoin 50 mg tablets | 28 tablet (£5.00 DT price = £13.93)
- 100 tablet (£6.00 DT price = £12.99)

Nitrofurantoin 100 mg
- Nitrofurantoin 100 mg tablets | 28 tablet (£6.00 DT price = £12.99)

Nitrofurantoin 150 mg
- Nitrofurantoin 150 mg tablets | 28 tablet (£4.62 DT price = £11.89)

Modified-release capsule
CAUTIONARY AND ADVISORY LABELS 9, 14, 21
- NITROFURANTOIN (Non-proprietary)

Nitrofurantoin 50 mg
- Nitrofurantoin 50 mg capsules | 30 capsule (£0.52 DT price = £1.12)

Nitrofurantoin 100 mg
- Nitrofurantoin 100 mg capsules | 30 capsule (£0.52 DT price = £1.12)

Macrobid

Oral suspension
CAUTIONARY AND ADVISORY LABELS 9, 14, 21
- NITROFURANTOIN (Non-proprietary)

Nitrofurantoin 5 mg per 1 ml
- Nitrofurantoin 5 mg/1 ml oral suspension (sugar-free) | 300 ml (£15.42 DT price = £46.46)

3 Fungal infection

Antifungals, systemic use

The systemic treatment of common fungal infections is outlined below; specialist treatment is required in most forms of systemic or disseminated fungal infections. Local treatment is suitable for a number of fungal infections (genital, bladder, eye, ear, oropharynx, and skin).

Aspergillosis
Aspergillosis most commonly affects the respiratory tract but in severely immunocompromised patients, invasive forms can affect the heart, brain, and skin. Voriconazole p. 521 is the treatment of choice for aspergillosis; liposomal amphotericin p. 517 is an alternative first-line treatment...
Fungal infection

513

Immunocompromised patients

514

Fungal infection

515

Immunocompromised patients are at particular risk of fungal infections and may receive antifungal drugs prophylactically; oral triazole antifungals are the drugs of choice for prophylaxis. Fluconazole is more reliably absorbed than itraconazole p. 519, but fluconazole is not effective against Aspergillus spp. Itraconazole is preferred in patients at risk of invasive aspergillosis. Posaconazole p. 521 can be used for prophylaxis in patients who are undergoing haematopoietic stem cell transplantation or receiving chemotherapy for acute myeloid leukaemia and myelodysplastic syndrome, if they are intolerant of fluconazole or itraconazole. Micafungin p. 516 can be used for prophylaxis of candidiasis in patients undergoing haematopoietic stem cell transplantation when fluconazole, itraconazole or posaconazole cannot be used.

Amphotericin p. 517 by intravenous infusion or caspofungin p. 515 is used for the empirical treatment of serious fungal infections; caspofungin is not effective against fungal infections of the CNS.

Triazole antifungals

516

Triazole antifungal drugs have a role in the prevention and systemic treatment of fungal infections.

Fluconazole is very well absorbed after oral administration. It also achieves good penetration into the cerebrospinal fluid to treat fungal meningitis. Fluconazole is excreted largely unchanged in the urine and can be used to treat candiduria.

Itraconazole is active against a wide range of dermatophytes. Itraconazole capsules require an acid environment in the stomach for optimal absorption. Itraconazole has been associated with liver damage and should be avoided or used with caution in patients with liver disease; fluconazole is less frequently associated with hepatotoxicity.

Posaconazole is licensed for the treatment of invasive fungal infections unresponsive to conventional treatment. Voriconazole p. 521 is a broad-spectrum antifungal drug which is licensed for use in life-threatening infections.

Imidazole antifungals

517

The imidazole antifungals include clotrimazole p. 712, econazole nitrate p. 712, ketoconazole p. 713, and tioconazole p. 1012. They are used for the local treatment of vaginal candidiasis and for dermatophyte infections. Miconazole p. 997 can be used locally for oral infections; it is also effective in intestinal infections. Systemic absorption may follow use of miconazole oral gel and may result in significant drug interactions.
Polyene antifungals

The polyene antifungals include amphotericin p. 517 and nystatin p. 997; neither drug is absorbed when given by mouth. Nystatin is used for oral, oropharyngeal, and perioral infections by local application in the mouth. Nystatin is also used for Candida albicans infection of the skin.

Amphotericin by intravenous infusion is used for the treatment of systemic fungal infections and is active against most fungi and yeasts. It is highly protein bound and penetrates poorly into body fluids and tissues. When given parenterally amphotericin is toxic and side-effects are common. Lipid formulations of amphotericin (Abelcet® and AmBisome®) are significantly less toxic and are recommended when the conventional formulation of amphotericin is contra-indicated because of toxicity, especially nephrotoxicity or when response to conventional amphotericin is inadequate; lipid formulations are more expensive.

Echinocandin antifungals

The echinocandin antifungals include anidulafungin p. 515, caspofungin p. 515 and micafungin p. 516. They are only active against Aspergillus spp. and Candida spp.; however, anidulafungin and micafungin are not used for the treatment of aspergillosis. Echinocandins are not effective against fungal infections of the CNS.

Other antifungals

Flucytosine p. 516 is used with amphotericin in a synergistic combination. Bone marrow depression can occur which limits its use, particularly in HIV-positive patients; weekly blood counts are necessary during prolonged therapy. Resistance to flucytosine can develop during treatment and sensitivity testing is essential before and during treatment. Resistance to flucytosine can develop during therapy and sensitivity testing is essential before and during treatment. Flucytosine has a role in the treatment of systemic candidiasis and cryptococcal meningitis.

Griseofulvin below is effective for widespread or intractable dermatophyte infections but has been superseded by newer antifungals, particularly for nail infections. It is the drug of choice for widespread or intractable dermatophyte infections but has been superseded by newer antifungals, particularly for nail infections. It is the drug of choice for trichophyton infections and is also used for ringworm infections where oral treatment is considered appropriate.

Antifungals

Griseofulvin

**INDICATIONS AND DOSE**

Dermatophyte infections where topical therapy has failed or is inappropriate

**BY MOUTH**

- Child 1 month-11 years: Usual dose 10 mg/kg daily (max. per dose 500 mg), alternatively 20 mg/kg daily, higher dose for severe infections; reduce dose when response occurs, daily dose may be taken once daily or in divided doses
- Child 12-17 years: 500 mg daily, alternatively 1 g daily, higher dose for severe infections; reduce dose when response occurs, daily dose may be taken once daily or in divided doses
- Adult: 500 mg daily, alternatively 1 g daily, higher dose for severe infections; reduce dose when response occurs, daily dose may be taken once daily or in divided doses

Tinea capitis caused by Trichophyton tonsurans

**BY MOUTH**

- Child 1 month-11 years: 15–20 mg/kg once daily (max. per dose 1 g), alternatively 15–20 mg/kg daily in divided doses
- Child 12-17 years: 1 g once daily, alternatively 1 g daily in divided doses
- Adult: 1 g once daily, alternatively 1 g daily in divided doses

- **UNLICENSED USE** Griseofulvin doses in BNF may differ from those in product literature.
- **CONTRA-INDICATIONS** Acute porphyrias p. 864 · systemic lupus erythematosus (risk of exacerbation)
- **INTERACTIONS** → Appendix 1 (griseofulvin).
- **SIDE-EFFECTS**
  - Rare Erythema multiforme · toxic epidermal necrolysis
  - Very rare Headache
- **Frequency not known** Abdominal pain · agitation · confusion · depression · diarrhoea · dizziness · dyspepsia · fatigue · glossitis · hepatotoxicity · impaired coordination · impaired hearing · leucopenia · menstrual disturbances · nausea · peripheral neuropathy · photosensitivity · rash · renal failure · sleep disturbances · systemic lupus erythematosus · taste disturbances · vomiting

**CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 1 month after administration to women (important: effectiveness of oral contraceptives may be reduced, additional contraceptive precautions e.g. barrier method, required). Men should avoid fathering a child during and for at least 6 months after administration

**PREGNANCY** Avoid (fetotoxicity and teratogenicity in animals).

**BREAST FEEDING** Avoid — no information available.

**HEPATIC IMPAIRMENT** Avoid in severe liver disease.

**PATIENT AND CARER ADVICE** May impair performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

**M EDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

Terbinafine

**INDICATIONS AND DOSE**

Tinea pedis

**BY MOUTH**

- Adult: 250 mg daily for 2–6 weeks

Tinea corporis

**BY MOUTH**

- Adult: 250 mg once daily for 4 weeks

Tinea cruris

**BY MOUTH**

- Adult: 250 mg once daily for 2–4 weeks
Echinocandin antifungals

Anidulafungin

**INDICATIONS AND DOSE**

**Invasive candidiasis**

**BY INTRAVENOUS INFUSION**

- Adult: Initially 200 mg once daily for 1 day, then 100 mg once daily

**SIDE-EFFECTS**

- **Common or very common** Gagging; convulsion; diarrhea; flushing; headache; hypokalaemia; nausea; pruritus; raised serum creatinine; rash; vomiting

- **Uncommon** Abdominal pain; cholestasis; hyperglycaemia; hypertension; injection-site pain; urticaria

**FREQUENCY NOT KNOWN** Bronchospasm; dyspnoea; hepatitis; hypotension

**PREGNANCY** Manufacturer advises avoid—no information available.

**BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—present in milk in animal studies.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Ecalta®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute each 100 mg with 30 mL water for injections and allow up to 5 minutes for reconstitution; dilute dose in infusion fluid to a concentration of 770 micrograms/mL; give at a rate not exceeding 1.1 mg/minute. Follow product information if using stock supplied with ethanol solvent.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

- Ecalta (Pfizer Ltd) Anidulafungin 100 mg Ecalta 100mg powder for concentrate for solution for infusion vials | 1 vial (P) £295.99

**Caspofungin**

**INDICATIONS AND DOSE**

Invasive aspergillosis | Invasive candidiasis | Empirical treatment of systemic fungal infections in patients with neutropenia

**BY INTRAVENOUS INFUSION**

- Adult (body-weight up to 81 kg): 70 mg once daily for 1 day, then 50 mg once daily

- Adult (body-weight 81 kg and above): 70 mg once daily

**INTERACTIONS** → Appendix 1 (caspofungin).

**SIDE-EFFECTS**

- **Common or very common** Arthralgia; diarrhoea; dyspnoea; headache; hypokalaemia; injection-site reactions; nausea; pruritus; rash; sweating; vomiting

- **Uncommon** Abdominal pain; anaemia; anorexia; anxiety; arthrythmia; ascites; blurred vision; bronchospasm; chest pain; cholestasis; constipation; cough; disorientation; dizziness; dry mouth; dyspnoea; dysphagia; erythema multiforme; fatigue; flatulence; flushing; heart failure; hepatic dysfunction; hyperglycaemia; hypertension; hypoaesthesia; hypocalcaemia; hypomagnesaemia; hypotension; leukopenia; metabolic acidosis; muscular weakness; myalgia; palpitation; paraesthesia; renal failure; sleep disturbances; taste disturbances; thrombocytopenia; thrombophlebitis; tremor

- **FREQUENCY NOT KNOWN** Adult respiratory distress syndrome | anaphylaxis

**PREGNANCY** Manufacturer advises avoid unless essential—toxicity in animal studies.

**BREAST FEEDING** Present in milk in animal studies—manufacturer advises avoid.

**HEPATIC IMPAIRMENT** 70 mg on first day then 35 mg once daily in moderate impairment. No information available for severe impairment.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Cancidas®), give intermittently in Sodium chloride 0.9%. Allow vial to reach room temperature; initially reconstitute each vial with 10.5 mL water for injections, mixing gently to dissolve then dilute requisite dose in 250 mL infusion fluid (35- or 50-mg doses may be diluted in 100 mL infusion fluid if necessary); give over 60 minutes; incompatible with glucose solutions.
Micafungin

**INDICATIONS AND DOSE**

Invasive candidiasis

**BY INTRAVENOUS INFUSION**

- Adult (body-weight up to 40 kg): 2 mg/kg once daily for at least 14 days; increased if necessary to 4 mg/kg once daily, increase dose if response inadequate
- Adult (body-weight 40 kg and above): 100 mg once daily for at least 14 days; increased if necessary to 200 mg once daily, increase dose if response inadequate

**Oesophageal candidiasis**

**BY INTRAVENOUS INFUSION**

- Adult (body-weight up to 40 kg): 3 mg/kg once daily
- Adult (body-weight 40 kg and above): 150 mg once daily

**Prophylaxis of candidiasis in patients undergoing bone-marrow transplantation or who are expected to become neutropenic for over 10 days**

**BY INTRAVENOUS INFUSION**

- Adult (body-weight up to 40 kg): 1 mg/kg once daily continue for at least 7 days after neutrophil count is desirable range
- Adult (body-weight 40 kg and above): 50 mg once daily continue for at least 7 days after neutrophil count is desirable range

**INTERACTIONS**

Appendix 1 (micafungin).

Caution with concomitant use of other hepatotoxic drugs.

**SIDE-EFFECTS**

- **Common or very common**
  - Abdominal pain
  - anaemia
  - diarrhoea
  - fever
  - headache
  - hypokalaemia
  - hypoglycaemia
  - leucopenia
  - nausea
  - phlebitis
  - rash
  - vomiting
- **Uncommon**
  - Anorexia
  - anxiety
  - blood pressure changes
  - bradycardia
  - cholestasis
  - confusion
  - constipation
  - dizziness
  - dyspepsia
  - dysphonia
  - eosinophilia
  - flushing
  - hepatitis
  - hepatomegaly
  - hyperhidrosis
  - hyperkalaemia
  - hypotension
  - hypophosphataemia
  - myalgia
  - neuralgia
  - pruritus
  - rashes
  - tremor
- **Rare**
  - Haemolytic anaemia
- **Frequency not known**
  - Disseminated intravascular coagulation
  - hepatotoxicity (potentially life-threatening)
  - renal failure
  - Stevens-Johnson syndrome
  - toxic epidermal necrolysis
- **PREGNANCY**
  - Manufacturer advises avoid unless essential—toxicity in animal studies.
- **BREAST FEEDING**
  - Manufacturer advises use only if potential benefit outweighs risk—present in milk in animal studies.
- **HEPATIC IMPAIRMENT**
  - Use with caution in mild to moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT**
  - Use with caution; renal function may deteriorate.
- **MONITORING REQUIREMENTS**
  - Monitor renal function.
  - Monitor liver function—discontinue if significant and persistent abnormalities in liver function tests develop.
- **DIRECTIONS FOR ADMINISTRATION**
  - For intravenous infusion (Micafungin®), give intravenously in Glucose 5% or Sodium chloride 0.9%. Reconstitute each vial with 5 mL infusion fluid; gently rotate vial, without shaking, to dissolve; dilute requisite dose with infusion fluid to 100 mL (final concentration of 0.5–2 mg/mL); protect infusion from light; give over 60 minutes.

**MEDIINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

- **Cancidas** (Merck Sharp & Dohme Ltd)
  - Caspofungin (as Caspofungin acetate) 50 mg
  - Cancidas 50mg powder for solution for infusion vials | 1 vial (PMD) £327.67
  - Caspofungin (as Caspofungin acetate) 70 mg
  - Cancids 70mg powder for solution for infusion vials | 1 vial (PMD) £416.78

**FLUORONATED PYRIMIDINE ANTIFUNGALS**

**Flucytosine**

**INDICATIONS AND DOSE**

Systemic yeast and fungal infections

**ADJUNCT TO AMPHOTERICIN IN SEVERE SYSTEMIC CANDIDIASIS AND IN OTHER SEVERE OR LONG-LASTING INFECTIONS**

**BY INTRAVENOUS INFUSION**

- Adult: Usual dose 200 mg/kg daily in 4 divided doses usually for not more than 7 days, alternatively 100–150 mg/kg daily in 4 divided doses, lower dose may be sufficient for sensitive organisms

**CRYPTOCOCCAL MENINGITIS (ADJUNCT TO AMPHOTERICIN)**

**BY INTRAVENOUS INFUSION**

- Adult: 100 mg/kg daily in 4 divided doses for 2 weeks

**INTERACTIONS**

Appendix 1 (flucytosine).

- **SIDE-EFFECTS**
  - Diarrhoea
  - nausea
  - rashes
  - vomiting
  - Hair loss
  - Alopecia
  - Anaphylaxis
  - Tachycardia
  - Vomiting
  - Bradycardia

**UNLICENSED USE**

Use in cryptococcal meningitis for 2 weeks is an unlicensed duration.

**CAUTIONS**

Blood disorders - elderly

**INTERACTIONS**

Appendix 1 (flucytosine).

**MEDIINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

- **Mycame** (Astellas Pharma Ltd)
  - Micafungin (as Micafungin sodium) 50 mg
  - Mycame 50mg powder for solution for infusion vials | 1 vial (PMD) £196.09
  - Micafungin (as Micafungin sodium) 100 mg
  - Mycame 100mg powder for solution for infusion vials | 1 vial (PMD) £341.00
POLYENE ANTIFUNGALS

Amphotericin (Amphotericin B)

**INDICATIONS AND DOSE**

**AMBISOME®**

Severe systemic or deep mycoses where toxicity (particularly nephrotoxicity) precludes use of conventional amphotericin | Suspected or proven infection in febrile neutropenic patients unresponsive to broad-spectrum antibacterials

**BY INTRAVENOUS INFUSION**

- Adult: Test dose 1 mg, to be given over 10 minutes, then 3 mg/kg once daily; maximum 5 mg/kg per day

**Aspergillosis**

**BY INTRAVENOUS INFUSION**

- Adult: Test dose 1 mg, to be given over 10 minutes, then 3 mg/kg once daily; maximum 5 mg/kg per day

**Visceral leishmaniasis (unresponsive to the antimonal alone)**

**BY INTRAVENOUS INFUSION**

- Adult: 1–3 mg/kg daily for 10–21 days to a cumulative dose of 21–30 mg/kg, alternatively 3 mg/kg for 5 consecutive days, followed by 3 mg/kg after 6 days for 1 dose

**FUNGIZONE®**

Systemic fungal infections

**BY INTRAVENOUS INFUSION**

- Adult: Test dose 1 mg, to be given over 20–30 minutes, then 250 micrograms/kg daily, gradually increased over 2–4 days, increased if tolerated to 1 mg/kg daily, max. (severe infection) 1.5 mg/kg daily or on alternate days. Prolonged treatment usually necessary; if interrupted for longer than 7 days recommence at 250 micrograms/kg daily and increase gradually

**ABELCET®**

Severe invasive candidiasis | Severe systemic fungal infections in patients not responding to conventional amphotericin or to other antifungal drugs or where toxicity or renal impairment precludes conventional amphotericin, including invasive aspergillosis, cryptococcal meningoitits and disseminated cryptococcosis in HIV patients

**BY INTRAVENOUS INFUSION**

- Adult: Test dose 1 mg, to be given over 15 minutes, then 5 mg/kg once daily for at least 14 days

**INTERACTIONS**

- Appendix 1 (amphotericin).
- Caution—corticosteroids (avoid except to control reactions).

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain | abnormal liver function (discontinue treatment) | anaemia | arrhythmias | blood disorders | blood pressure changes | cardiovascular effects | chest pain | diarrhoea | disturbances in renal function | dyspnoea | electrolyte disturbances | febrile reactions | headache | hypokalaemia | hypomagnesaemia | nausea | rash | renal tubular acidosis | thrombocytopenia | vomiting

- **Uncommon** Anaphylactic reactions | bronchospasm | convulsions | diplopia | encephalopathy | hearing loss | neurological disorders | peripheral neuropathy | tremor

- **Frequency not known** Anorexia | arthralgia | myalgia | Stevens-Johnson syndrome | toxic epidermal necrolysis

**PREGNANCY** Not known to be harmful but manufacturers advise avoid unless potential benefit outweighs risk

**BREAST FEEDING** No information available.

**RENAL IMPAIRMENT** Use only if no alternative; nephrotoxicity may be reduced with use of lipid formulation

**MONITORING REQUIREMENTS** Hepatic and renal function tests, blood counts, and plasma electrolyte (including plasma-potassium and magnesium concentration) monitoring required.

**DIRECTIONS FOR ADMINISTRATION**

**AMBISOME®**

Amphotericin (liposomal)

For intravenous infusion (AmBisome®), give intermittently in Glucose 5% or 10%. Reconstitute each vial with 12 mL water for injections and shake vigorously to produce a preparation containing 4 mg/mL; withdraw requisite dose from vial and introduce into infusion fluid through the 5 micron filter provided to produce a final concentration of 0.2–2 mg/mL; infuse over 30–60 minutes, or if non-anaphylactic infusion-related reactions occur infuse over 2 hours (initial test dose of 1 mg over 10 minutes); an in-line filter (pore size no less than 1 micron) may be used; incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or 10%, or use separate line.

**FUNGIZONE®**

Amphotericin (as sodium deoxycholate complex)

For intravenous infusion (Fungizone®), give intermittently in Glucose 5%. Reconstitute each vial with 10 mL water of injections and shake immediately to produce a 5 mg/mL colloidal solution; dilute further in infusion fluid to a concentration of 100 micrograms/mL: pH of the glucose must not be below 4.2 (check each container—consult product literature for details of the buffer); infuse over 2–4 hours, or longer if not tolerated (initial test dose of 1 mg over 20–30 minutes); begin infusion immediately after dilution; protect from light; incompatible with sodium chloride solutions, flush existing intravenous line with glucose 5% or use separate line; an in-line filter (pore size no less than 1 micron) may be used.

**ABELCET®**

Amphotericin (lipid complex)

For intravenous infusion, give intermittently in Glucose 5%. Allow suspension to reach room temperature, shake gently to ensure no yellow settlement, withdraw requisite dose (using 17–19 gauge needle) into one or more 20–mL syringes; replace needle on syringe with a 5-micron filter needle provided (fresh needle for each syringe) and dilute to a concentration of 1 mg/mL (2 mg/mL can be used if fluid restriction and in children); preferably give via an infusion pump at a rate of 2.5 mg/kg/hour (initial test dose of 1 mg over 15 minutes); an in-line filter (pore size no less than 15 micron) may be used; do not use sodium
Fluconazole

TRIAZOLE ANTIFUNGALS

**Fluconazole**

**INDICATIONS AND DOSE**

**Candidal balanitis**
- **BY MOUTH**
  - Child 16–17 years: 150 mg for 1 dose
  - Adult: 150 mg for 1 dose

**Vaginal candidiasis**
- **BY MOUTH**
  - Child 16–17 years: 150 mg for 1 dose
  - Adult: 150 mg for 1 dose

**Vulvovaginal candidiasis (recurrent)**
- **BY MOUTH**
  - Adult: Initially 150 mg every 72 hours for 3 doses, then 150 mg once weekly for 6 months

**Mucosal candidiasis (except genital)**
- **BY MOUTH OR BY INTRAVENOUS INFUSION**
  - Child 1 month–11 years: 3–6 mg/kg, dose to be given on first day, then 3 mg/kg daily (max. per dose 100 mg) for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections)
  - Child 12–17 years: 50 mg for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections); increased to 100 mg daily, increased dose only for unusually difficult infections

**BY MOUTH**
- Adult: 50 mg daily given for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14 days in atrophic oral candidiasis associated with dentures; for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections); increased to 100 mg daily, increased dose only for unusually difficult infections

**SIDE-EFFECTS**

- **Common or very common** Abdominal discomfort, diarrhoea, flatulence, headache, nausea, rash
- **Uncommon** Alopecia, anaemia, angioedema (in children), dizziness, dyspepsia, hepatic disorders, hyperlipidaemia, hypersensitivity reactions (in adults), pruritus, seizures, Stevens-Johnson syndrome, taste disturbance, toxic epidermal necrolysis, vomiting
- **Frequency not known** Hypokalaemia, leucopenia, thrombocytopenia

**SIDE-EFFECTS, FURTHER INFORMATION**

- If rash occurs, discontinue treatment (or monitor closely if infection invasive or systemic); severe cutaneous reactions are more likely in patients with AIDS

**PREGNANCY**
- Manufacturer advises avoid—multiple congenital abnormalities reported with long-term high doses

**BREAST FEEDING**
- Present in milk but amount probably too small to be harmful

**HEPATIC IMPAIRMENT**
- Toxicity with related drugs

**PRESCRIBING AND DISPENSING INFORMATION**

Different preparations of intravenous amphotericin vary in their pharmacodynamics, pharmacokinetics, dosage, and administration; these preparations should not be considered interchangeable. To avoid confusion, prescribers should specify the brand to be dispensed.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, oral solution, lozenge

**Powder for solution for infusion**
- **EXCIPIENTS:** May contain Sucrose
- **ELECTROLYTES:** May contain Sodium
- **AmBisome** (Gilead Sciences International Ltd)
  - Amphotericin B liposomal 50 mg AmBisome 50mg powder for solution for infusion vials |10 vial £212.97
- **Fungizone** (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Amphotericin B 50 mg Fungizone intravenous 50mg powder for solution for infusion vials |1 vial £3.88

**Suspension for infusion**
- **EXCIPIENTS:** May contain Sodium
- **Abelcet** (Teva UK Ltd)
  - Amphotericin B (as Amphotericin B phospholipid complex) 5 mg per 1 ml Abelcet 100mg/20ml concentrate for suspension for infusion vials |10 vial £775.04 (Hospital only)

**Interactions**

- Susceptibility to QT interval prolongation
- Acute porphyrias
- Hepatic impairment

**Contraindications**

- Acute porphyrias

**Caution**

- Susceptibility to QT interval prolongation

**Further information**

- More information can be found in the Appendix of Antifungals and Triazole.

**Fungal infection**

- Tinea pedis, corporis, cruris, pityriasis versicolor
- Dermal candidiasis

**BY MOUTH**

- Adult: 50 mg daily for 2–4 weeks (for up to 6 weeks in tinea pedis); max. duration of treatment 6 weeks

**Invasive candidal infections (including candidaemia and disseminated candidiasis) and cryptococcal infections (including meningitis)**

**BY MOUTH OR BY INTRAVENOUS INFUSION**

- Child: 6–12 mg/kg daily (max. per dose 800 mg) treatment continued according to response (at least 8 weeks for cryptococcal meningitis)
- Adult: 400 mg, dose to be given on first day, then 200–400 mg daily (max. per dose 800 mg daily) treatment continued according to response (at least 8 weeks for cryptococcal meningitis), maximum dose for use in severe infections

**Prevention of fungal infections in immunocompromised patients**

**BY MOUTH OR BY INTRAVENOUS INFUSION**

- Child: 3–12 mg/kg daily (max. per dose 400 mg), commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range, dose given according to extent and duration of neutropenia
- Adult: 50–400 mg daily, commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range, dose adjusted according to risk

**Prevention of fungal infections in immunocompromised patients (for patients with high risk of systemic infections e.g. following bone-marrow transplantation)**

**BY MOUTH OR BY INTRAVENOUS INFUSION**

- Adult: 400 mg daily, commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range

**Prevention of relapse of cryptococcal meningitis in HIV-infected patients after completion of primary therapy**

**BY MOUTH OR BY INTRAVENOUS INFUSION**

- Adult: 200 mg daily

**CONTRA-INDICATIONS**

- Acute porphyrias p. 864

**CAUTIONS**

- Susceptibility to QT interval prolongation

**INTERACTIONS**

- Appendix 1 (antifungals, triazole); in general, fluconazole interactions in Appendix 1 relate to multiple-dose treatment. Caution with concomitant use of hepatotoxic drugs.
Itraconazole

INDICATIONS AND DOSE

Vulvovaginal candidiasis

BY MOUTH

▸ Adult: 200 mg twice daily for 1 day

Vulvovaginal candidiasis (recurrent)

BY MOUTH

▸ Adult: 50–100 mg daily for 6 months

Oral or oesophageal candidiasis that has not responded to fluconazole

BY MOUTH USING ORAL SOLUTION

▸ Adult: 100–200 mg twice daily for 2 weeks (continue for another 2 weeks if no response; the higher dose should not be used for longer than 2 weeks if no signs of improvement)

Oral or oesophageal candidiasis in HIV-positive or other immunocompromised patients

BY MOUTH USING ORAL SOLUTION

▸ Adult: 200 mg daily in 1–2 divided doses for 1 week (continue for another week if no response)

Systemic candidiasis where other antifungal drugs inappropriate or ineffective

BY MOUTH

▸ Adult: 100–200 mg once daily

BY INTRAVENOUS INFUSION

▸ Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

Pityriasis versicolor

BY MOUTH

▸ Adult: 200 mg once daily for 7 days

Tinea pedis | Tinea manuum

BY MOUTH

▸ Adult: 100 mg once daily for 30 days, alternatively 200 mg twice daily for 7 days

Tinea corporis | Tinea cruris

BY MOUTH

▸ Adult: 100 mg once daily for 15 days, alternatively 200 mg once daily for 7 days

Onychomycosis

BY MOUTH

▸ Adult: 200 mg once daily for 3 months, alternatively 200 mg twice daily for 7 days, subsequent courses repeated after 21-day intervals; fingernails 2 courses, toenails 3 courses

Aspergillosis

BY MOUTH

▸ Adult: 200 mg twice daily

Systemic aspergillosis where other antifungal drugs inappropriate or ineffective

BY INTRAVENOUS INFUSION

▸ Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

Histoplasmosis

BY MOUTH

▸ Adult: 200 mg 3 times a day for 3 days, then 200 mg 1–2 times a day

BY INTRAVENOUS INFUSION

▸ Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

Systemic cryptococcosis including cryptococcal meningitis where other antifungal drugs inappropriate or ineffective

BY MOUTH

▸ Adult: 200 mg once daily, dose increased in invasive or disseminated disease and in cryptococcal meningitis, increased to 200 mg twice daily

continued

MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 9

▸ FLUCONAZOLE (Non-proprietary)

Fluconazole 50 mg Fluconazole 50 mg capsules | 7 capsule (£0.02)

Fluconazole 150 mg Fluconazole 150 mg capsules | 1 capsule (£1.03)

Fluconazole 200 mg Fluconazole 200 mg capsules | 7 capsule (£1.31)

▸ Diflucan (Pfizer Ltd)

Fluconazole 50 mg Diflucan 50 mg capsules | 7 capsule (£0.02)

Fluconazole 150 mg Diflucan 150 mg capsules | 1 capsule (£1.03)

Fluconazole 200 mg Diflucan 200 mg capsules | 7 capsule (£1.31)

▸ Brands may include Canesten (fluconazole)

Oral suspension

CAUTIONARY AND ADVISORY LABELS 9

▸ FLUCONAZOLE (Non-proprietary)

Fluconazole 10 mg per 1 ml Fluconazole 50 mg/5 ml oral suspension | 35 ml (£0.51)

▸ Diflucan (Pfizer Ltd)

Fluconazole 10 mg per 1 ml Diflucan 50 mg/5 ml oral suspension | 35 ml (£0.51)

Infusion

▸ FLUCONAZOLE (Non-proprietary)

Fluconazole 2 mg per 1 ml Fluconazole 200 mg/100 ml infusion bags | 5 bag (£18.45)

Solution for infusion

ELECTROLYTES: May contain Sodium

▸ FLUCONAZOLE (Non-proprietary)

Fluconazole 2 mg per 1 ml Fluconazole 100 mg/50 ml solution for infusion bottles | 5 bottle (£0.02)

Fluconazole 2 mg per 1 ml Fluconazole 200 mg/100 ml solution for infusion vials | 1 vial (£0.02)

Fluconazole 2 mg per 1 ml Fluconazole 50 mg/25 ml solution for infusion vials | 1 vial (£0.02)

▸ Diflucan (Pfizer Ltd)

Fluconazole 2 mg per 1 ml Diflucan 200 mg/100 ml solution for infusion vials | 1 vial (£0.02)
**BY INTRAVENOUS INFUSION**
- Adult: 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

**Maintenance in HIV-infected patients to prevent relapse of underlying fungal infection and prophylaxis in neutropenia when standard therapy inappropriate***
- Adult: 200 mg once daily, then increased to 200 mg twice daily, dose increased only if low plasma-itraconazole concentration

Prophylaxis of deep fungal infections (when standard therapy inappropriate) in patients with haematological malignancy or undergoing bone-marrow transplantation who are expected to become neutropenic
- Adult: 5 mg/kg daily in 2 divided doses, to be started before transplantation or before chemotherapy (taking care to avoid interaction with cytotoxic drugs) and continued until neutrophil count recovers, safety and efficacy not established in elderly patients

### Important safety information
- **HEART FAILURE**
  Following reports of heart failure, caution is advised when prescribing itraconazole to patients at high risk of heart failure. Those at risk include:
  - patients receiving high doses and longer treatment courses;
  - older adults and those with cardiac disease;
  - patients with chronic lung disease (including chronic obstructive pulmonary disease) associated with pulmonary hypertension;
  - patients receiving treatment with negative inotropic drugs, e.g. calcium channel blockers.
  Itraconazole should be avoided in patients with ventricular dysfunction or a history of heart failure unless the infection is serious.

### CONTRA-INDICATIONS
- Acute porphyrias p. 864

### CAUTIONS
- Active liver disease - history of hepatotoxicity with other drugs - susceptibility to congestive heart failure

### INTERACTIONS
- Appendix 1 (antifungals, triazole).

### SIDE-EFFECTS
- **GENERAL SIDE-EFFECTS**
  - Abdominal pain - diarrhea - dyspepsia - headache - hepatitis - hypokalaemia - nausea - rash - taste disturbances - vomiting
  - Constipation - dizziness - dyspepsia - flatulence - menstrual disorder - myalgia - oedema - peripheral neuropathy (discontinue treatment)
  - Frequency not known - Arthralgia - blood pressure changes - confusion - drowsiness - hepatotoxicity - renal impairment - thrombocytopenia - tremor

### SPECIFIC SIDE-EFFECTS
- With intravenous use - Hyperglycaemia

**SIDE-EFFECTS, FURTHER INFORMATION**
- **Hepatotoxicity** Potentially life-threatening hepatotoxicity reported very rarely—discontinue if signs of hepatitis develop.

**CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment and until the next menstrual period following end of treatment.

**PREGNANCY** Manufacturer advises use only in life-threatening situations (toxicity at high doses in animal studies).

**BREAST FEEDING** Small amounts present in milk—may accumulate; manufacturer advises avoid.

**HEPATIC IMPAIRMENT** Dose reduction may be necessary. Use only if potential benefit outweighs risk of hepatotoxicity.

**RENAI IMPAIRMENT** Risk of congestive heart failure.
- With oral use Bioavailability of oral formulations possibly reduced.
- With intravenous use Use intravenous infusion with caution if eGFR less than 30 mL/minute/1.73 m²; avoid intravenous infusion if eGFR less than 30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**
- Absorption reduced in AIDS and neutropenia (monitor plasma-itraconazole concentration and increase dose if necessary).
- Monitor liver function if treatment continues for longer than one month, if receiving other hepatotoxic drugs, if history of hepatotoxicity with other drugs, or in hepatic impairment.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use For intravenous infusion (Sporanox®), give intermittently in Sodium Chloride 0.9%; dilute 250 mg in 50 mL infusion fluid and infuse only 60 mL through an in-line filter (0.2 micron) over 60 minutes.
- With oral use For oral liquid, do not take with food; swish around mouth and swallow, do not rinse afterwards.

**PRESCRIBING AND DISPENSING INFORMATION**
- Flavours of oral liquid formulations may include cherry.

**PATIENT AND CARER ADVICE**
- Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain or dark urine develop. Patients or carers should be given advice on how to administer itraconazole oral liquid.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**Capsule**
- **CAUTIONARY AND ADVISORY LABELS** 5, 9, 21, 25
- **ITRACONAZOLE (Non-proprietary)**
  - Itraconazole 100 mg Itraconazole 100mg capsules | 4 capsule | £3.75  | 15 capsule | £21.50  | DT price | £4.57  | 60 capsule | £11.74  | £56.21
  - Sporanox (Janssen-Cilag Ltd)
  - Itraconazole 100 mg Sporanox-Pulse 100mg capsules | 28 capsule | £25.72  
  - Sporanox 100mg capsules | 4 capsule | £3.67  | 15 capsule | £13.77  | DT price | £4.57  | 60 capsule | £55.10

**Oral solution**
- **CAUTIONARY AND ADVISORY LABELS** 9, 23
- **ITRACONAZOLE (Non-proprietary)**
  - Itraconazole 10 mg per 1 ml Itraconazole 50mg/5ml oral solution | sugar free | 150 ml | £58.34  | DT price | £58.34
  - Sporanox (Janssen-Cilag Ltd)
  - Itraconazole 10 mg per 1 ml Sporanox 50mg/5ml oral solution (sugar-free) | 150 ml | £58.34  | DT price | £58.34

**Solution for infusion**
- **EXCipients:** May contain Propylene glycol
- **Sporanox** (Janssen-Cilag Ltd)
  - Itraconazole 10 mg per 1 ml Sporanox I.V. 250mg/25ml solution for infusion ampoules and diluent | 1 ampoule | £79.71
**Posaconazole**

**INDICATIONS AND DOSE**

Invasive aspergillosis in patients who are refractory to, or intolerant of voriconazole and liposomal amphotericin | Fusariosis either unresponsive to, or in patients intolerant of, amphotericin | Chromoblastomycosis and mycetoma either unresponsive to, or in patients intolerant of, itraconazole | Coccidioidomycosis either unresponsive to, or in patients intolerant of, amphotericin, itraconazole, or fluconazole

**BY MOUTH USING ORAL SUSPENSION**
- Adult: 400 mg twice daily, to be taken with food, alternatively 200 mg 4 times a day, dose if food not tolerated

**BY MOUTH USING TABLETS**
- Adult: 300 mg twice daily on first day, then 300 mg once daily

Oropharyngeal candidiasis (severe infection or in immunocompromised patients only)

**BY MOUTH USING ORAL SUSPENSION**
- Adult: 200 mg on first day, then 100 mg once daily for 13 days, dose to be taken with food

Prophylaxis of invasive fungal infections in patients undergoing bone-marrow transplantation or receiving chemotherapy for acute myeloid leukaemia and myelodysplastic syndrome who are expected to become neutropenic, and who are intolerant of fluconazole or itraconazole

**BY MOUTH USING ORAL SUSPENSION**
- Adult: 200 mg 3 times a day start before transplantation or before chemotherapy and continued until neutrophil count recovers, dose to be taken with food

**BY MOUTH USING TABLETS**
- Adult: 300 mg twice daily on first day, then 300 mg once daily start before transplantation or before chemotherapy and continued until neutrophil count recovers

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain | anaemia | anorexia | blood disorders | constipation | diarrhoea | dizziness | drowsiness | dry mouth | dyspepsia | electrolyte disturbances | fatigue | fever | flatulence | gastro-intestinal disturbances | headache | nausea | neutropenia | paraesthesia | pruritus | rash | thrombocytopenia | vomiting
- **Uncommon** Alopecia | aphasia | arrhythmias | bradycardia | changes in blood pressure | convulsions | cough | gastro-oesophageal reflux | hepatic disorders | hiccups | hyperglycaemia | insomnia | menstrual disorders | mouth ulcers | muscular skeletal pain | neuropathy | oedema | palpitation | pancreatitis | renal failure | tachycardia | tremor | vasculitis | visual disturbances
- **Rare** Adrenal insufficiency | breast pain | cardiac failure | depression | encephalopathy | hearing impairment | ileus | myocardial infarction | pneumonitis | psychosis | Stevens-Johnson syndrome | stroke | syncope | thrombosis

**CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception during treatment.

**PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk; toxicity in animal studies.

**BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Manufacturer advises caution. Monitor liver function in hepatic impairment.

**MONITORING REQUIREMENTS**
- Monitor electrolytes (including potassium, magnesium, and calcium) before and during therapy.
- Monitor liver function before and during therapy.

**PRESCRIBING AND DISPENSING INFORMATION** Where possible, Noxfail® tablets should be used in preference to the suspension because the tablets have a higher bioavailability; the suspension is not interchangeable with the tablets on a milligram-for-milligram basis. Flavours of oral liquid formulations may include cherry.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Gastro-resistant tablet**

**CAUTIONARY AND ADVISORY LABELS 3, 9, 25**

- Noxfail (Merck Sharp & Dohme Ltd)

  Posaconazole 100 mg Noxfail 100mg gastro-resistant tablets | 24 tablet (P37) £596.96 | 96 tablet (P37) £2,387.85

**Oral suspension**

**CAUTIONARY AND ADVISORY LABELS 3, 9, 21**

- Noxfail (Merck Sharp & Dohme Ltd)

  Posaconazole 40 mg per 1 ml Noxfail 40mg/ml oral suspension | 105 ml (P37) £491.20 (Hospital only)

**Voriconazole**

**INDICATIONS AND DOSE**

Invasive aspergillosis | Serious infections caused by Scedosporium spp., Fusarium spp., or invasive fluconazole-resistant Candida spp. (including C. krusei)

**BY MOUTH**

- Adult (body-weight up to 40 kg): 200 mg every 12 hours for 2 doses, then 100 mg every 12 hours, (by mouth) increased if necessary to 150 mg every 12 hours
- Adult (body-weight 40 kg and above): 400 mg every 12 hours for 2 doses, then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours

**BY INTRAVENOUS INFUSION**

- Adult: Initially 6 mg/kg every 12 hours for 2 doses, then 4 mg/kg every 12 hours for max. 6 months, reduced if not tolerated to 3 mg/kg every 12 hours

**CONTRA-INDICATIONS** Acute porphyrias p. 864

**CAUTIONS** Avoid exposure to sunlight - bradycardia - cardiomyopathy - electrolyte disturbances - history of QT interval prolongation - patients at risk of pancreatitis - symptomatic arrhythmias

**INTERACTIONS** → Appendix 1 (antifungals, triazole). Caution with comitant use with other drugs known to cause QT-interval prolongation.

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain | acute renal failure | agitation | alopecia | altered perception | anaemia | anxiety | asthenia | blood disorders | blurred vision | chest pain | confusion | depression | diarrhea | diziness | encephalopathy | hearing impairment | ileus | myocardial infarction | nausea | oedema | pancytopenia | paraesthesia | photosensitivity | pruritus | rash | respiratory distress

- **Unlicensed Use** Tablets not licensed for oropharyngeal candidiasis.

- **Contra-Indications** Acute porphyrias p. 864

- **Caution** Avoid exposure to sunlight - bradycardia - cardiomyopathy - electrolyte disturbances - history of QT interval prolongation - patients at risk of pancreatitis - symptomatic arrhythmias

- **Interactions** → Appendix 1 (antifungals, triazole). Caution with comitant use with other drugs that prolong QT interval.

- **Side-Effects**

**General Side-Effects**

- **Common or very common** Abdominal pain | acute renal failure | agitation | alopecia | altered perception | anaemia | anxiety | asthenia | blood disorders | blurred vision | chest pain | confusion | depression | diarrhea | diziness | encephalopathy | hearing impairment | ileus | myocardial infarction | nausea | oedema | pancytopenia | paraesthesia | photosensitivity | pruritus | rash | respiratory distress
Patients and their carers should be advised that patients should avoid intense or prolonged exposure to direct sunlight, and to avoid the use of sunbeds. In sunlight, patients should cover sun-exposed areas of skin and use a sunscreen with a high sun protection factor. Patients should seek medical attention if they experience sunburn or a severe skin reaction following exposure to light or sun.

### Medicinal Forms

- **Tablet**
  - Cautionary and Advisory Labels 9, 11, 23
  - Vfenonazole 50 mg VFEND 50mg tablets | 28 tablet £27.68
  - Vfenonazole 200 mg VFEND 200mg tablets | 28 tablet £1.102.74

- **Oral Suspension**
  - Cautionary and Advisory Labels 9, 11, 23
  - VFEND (Pfizer Ltd)
  - Vfenonazole 40 mg per 1 ml VFEND 40mg/ml oral suspension | 75 ml [Post] £551.37

- **Powder for Solution for Infusion**
  - Exipients: May contain Sulphobutyl ether beta cyclodextrin sodium
  - ElectrOlytes: May contain Sodium
  - VFEND (Pfizer Ltd)
  - Vfenonazole 200 mg VFEND 200mg powder for solution for infusion vials | 1 vial [Post] £77.14

- **Powder and Solvent for Solution for Infusion**
  - Exipients: May contain Sulphobutyl ether beta cyclodextrin sodium
  - ElectrOlytes: May contain Sodium
  - VFEND (Pfizer Ltd)
  - Vfenonazole 200 mg VFEND 200mg powder and solvent for solution for infusion vials | 1 vial [Post] £77.14

### Pneumocystis pneumonia

**Pneumocystis pneumonia**

Pneumonia caused by *Pneumocystis jirovecii* (*Pneumocystis carinii*) occurs in immunosuppressed patients; it is a common cause of pneumonia in AIDS. Pneumocystis pneumonia should generally be treated by those experienced in its management. Blood gas measurement is used to assess disease severity.

**Treatment**

- **Mild to moderate disease**
  - Co-trimoxazole p. 461 in high dosage is the drug of choice for the treatment of mild to moderate pneumocystis pneumonia.
  - Atovaquone p. 523 is licensed for the treatment of mild to moderate pneumocystis infection in patients who cannot tolerate co-trimoxazole. A combination of dapsone p. 500 with trimethoprim p. 462 is given by mouth for the treatment of mild to moderate disease [unlicensed indication].
  - A combination of clindamycin p. 467 and primaquine p. 538 by mouth is used in the treatment of mild to moderate disease [unlicensed indication]; this combination is associated with considerable toxicity.

- **Severe disease**
  - Co-trimoxazole in high dosage, given by mouth or by intravenous infusion, is the drug of choice for the treatment of severe pneumocystis pneumonia. Pentamidine isetionate p. 523 given by intravenous infusion is an alternative for patients who cannot tolerate co-trimoxazole, or who have not responded to it. Pentamidine isetionate is a potentially toxic drug that can cause severe hypotension during or immediately after infusion.
Corticosteroid treatment can be lifesaving in those with severe pneumocystis pneumonia. 

**Adjuvant therapy**
In moderate to severe infections associated with HIV infection, prednisolone p. 585 is given by mouth for 5 days (alternatively, hydrocortisone p. 583 may be given parenterally); the dose is then reduced to complete 21 days of treatment. Corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete.

**Prophylaxis**
Prophylaxis against pneumocystis pneumonia should be given to all patients with a history of the infection. Prophylaxis against pneumocystis pneumonia should also be considered for severely immunocompromised patients. Prophylaxis should continue until immunity recovers sufficiently. It should not be discontinued if the patient has oral candidiasis, continues to lose weight, or is receiving cytotoxic therapy or long-term immunosuppressant therapy.

Co-trimoxazole p. 461 by mouth is the drug of choice for prophylaxis against pneumocystis pneumonia. It is given daily or on alternate days (3 times a week); the dose may be reduced to improve tolerance. Inhaled pentamidine isetionate is better tolerated than parental pentamidine isetionate. Intermittent inhalation of pentamidine isetionate is used for prophylaxis against pneumocystis pneumonia in patients unable to tolerate co-trimoxazole. It is effective but patients may be prone to extrapulmonary infection. Alternatively, dapsone p. 500 can be used. Atovaquone below has also been used for prophylaxis [unlicensed indication].

**Atovaquone**

**INDICATIONS AND DOSE**

**Treatment of mild to moderate** Pneumocystis jirovecii (Pneumocystis carinii) pneumonia in patients intolerant of co-trimoxazole

**BY MOUTH**
- Adult: 750 mg twice daily for 21 days, dose to be taken with food, particularly high fat food

**Prophylaxis against pneumocystis pneumonia**

**BY MOUTH**
- Adult: 750 mg twice daily

**SIDE-EFFECTS**

- Abnormal liver-function tests
- Anaemia
- Chills
- Diarrhoea
- Headache
- Rash
- Stevens–Johnson syndrome
- Vomiting

**CAUTIONS**
- Other causes of pulmonary disease should be sought and treated
- Elderly: initial diarrhoea and difficulty in taking with food may reduce absorption (and require alternative therapy)
- Elderly: high fat content may reduce absorption

**UNLICENSED USE**
Not licensed for primary prevention of Pneumocystis jirovecii (Pneumocystis carinii) pneumonia by inhalation of nebulised solution.

**CAUTIONS**
- Anaemia
- Bradycardia
- Coronary heart disease
- History of ventricular arrhythmia
- Hyperglycaemia
- Hypertension
- Hypoglycaemia
- Hypokalaemia
- Hypomagnesaemia
- Hypotension
- Leucopenia
- Risk of severe hypotension following administration
- Thrombocytopenia

**INTERACTIONS**
- Appendix 1 (pentamidine isetionate)
- Caution with concomitant use of other drugs that prolong the QT interval

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
- Abnormal liver-function tests
- Acute renal failure
- Anaemia
- Arrhythmias (can be severe and sometimes fatal)
- Azotaemia
- Dizziness
- Flushing
- Hyperglycaemia
- Hyperkalaemia
- Hypocalcaemia
- Hypoglycaemia (can be severe and sometimes fatal)
- Hypotension (can be severe and sometimes fatal)
- Leucopenia
- Nausea
- Pancreatitis (can be severe and sometimes fatal)
- Rash
- Stevens–Johnson syndrome
- Syncope
- Taste disturbances
- Thrombocytopenia
- Vomiting

**SPECIFIC SIDE-EFFECTS**
- When used by inhalation
- Bronchoconstriction (may be prevented by prior use of bronchodilators)
- Cough
- Shortness of breath
- With intramuscular use
- Injection site reactions (muscle necrosis, discomfort, pain, induration, abscess formation)
- With intravenous use
- Injection site reactions (muscle necrosis, discomfort, pain, induration, abscess formation)

**PREGNANCY**
Manufacturer advises avoid unless essential.
Infection

hands and scrubbing nails before each meal and after each mouth, often via food eaten with unwashed hands. Washing take place in the large bowel. Adult female worms lay ova intestinal tract. Direct multiplication of worms does not and exposed to the action of digestive juices in the upper and for development of fresh worms, ova must be swallowed and for threadworm (pinworms, Drugs for threadworms

Advice on prophylaxis and treatment of helminth infections is available from the following specialist centres:

| Birmingham | (0121) 424 0357 |
| Scotland | Contact local Infectious Diseases Unit |
| Liverpool | (0151) 705 3100 |
| London | 0845 155 5000 (treatment) |

Drugs for hookworms

Hookworms (ancylostomiasis, necatoriasis) live in the upper small intestine and draw blood from the point of their attachment to their host. An iron-deficiency anaemia may occur and, if present, effective treatment of the infection requires not only expulsion of the worms but treatment of the anaemia.

Mebendazole p. 526 has a useful broad-spectrum activity, and is effective against hookworms. Albendazole p. 525 [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is an alternative. Levamisole p. 525 is also effective in children.

Schistosomicides (bilharziasis)

Adult Schistosoma haematobium worms live in the genito-urinary veins and adult S. mansoni in those of the colon and mesentery. S. japonicum is more widely distributed in veins of the alimentary tract and portal system. Praziquantel p. 526 [unlicensed] is available from Merck Serono (Cysticide®) and is effective against all human schistosomes. No serious adverse effects have been reported. Of all the available schistosomicides, it has the most attractive combination of effectiveness, broad-spectrum activity, and low toxicity.

Filaricides

Diethylcarbamazine [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is
effective against microfilareia and adults of *Loa loa*, *Wuchereria bancrofti*, and *Brugia malayi*. To minimise reactions, treatment in adults and children over 1 month, is commenced with a dose of diethylcarbamazine citrate on the first day and increased gradually over 3 days. Length of treatment varies according to infection type, and usually gives a radical cure for these infections. Close medical supervision is necessary particularly in the early phase of treatment.

In heavy infections there may be a febrile reaction, and in heavy *Loa loa* infection there is a small risk of encephalopathy. In such cases specialist advice should be sought, and treatment must be given under careful in-patient supervision and stopped at the first sign of cerebral involvement.

Ivermectin below [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is the treatment of choice for chronic Strongyloides infection in adults and children over 5 years. Albendazole [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is an alternative given to adults and children over 2 years.

**Drugs for cutaneous larva migrans (creeping eruption)**

Dog and cat hookworm larvae may enter human skin where they produce slowly extending itching tracks usually on the foot. Single tracks can be treated with topical thiabendazole (no commercial preparation available). Multiple infections respond to ivermectin, albendazole or thiabendazole (thiabendazole) by mouth [all unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies).

**Drugs for strongyloidiasis**

Adult *Strongyloides stercoralis* live in the gut and produce larvae which penetrate the gut wall and invade the tissues, setting up a cycle of auto-infection. Ivermectin [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is the treatment of choice for chronic *Strongyloides* infection in adults and children over 5 years. Albendazole [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is an alternative given to adults and children over 2 years.

**ANTHELMINTICS**

**Albendazole**

**INDICATIONS AND DOSE**

**Chronic *Strongyloides* infection**

**BY MOUTH**

- Adult: 400 mg twice daily for 3 days, dose may be repeated after 3 weeks if necessary

**Hydatid disease, in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases**

**BY MOUTH**

- Adult: (consult product literature)

**Hookworm infections**

**BY MOUTH**

- Adult: 400 mg for 1 dose

- **UNLICENSED USE** Albendazole is an unlicensed drug.

- **INTERACTIONS** ➔ Appendix 1 (albendazole).

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, chewable tablet

**Diethylcarbamazine**

**INDICATIONS AND DOSE**

*Wuchereria bancrofti* infections | *Brugia malayi* infections

**BY MOUTH**

- Adult: Initially 1 mg/kg daily in divided doses on the first day, then increased to 6 mg/kg daily in divided doses, dose to be increased gradually over 3 days

*Loa loa* infections

**BY MOUTH**

- Adult: Initially 1 mg/kg daily in divided doses on the first day, then increased to 6 mg/kg daily in divided doses, dose to be increased gradually over 3 days; maximum 9 mg/kg per day

- **INTERACTIONS** ➔ Appendix 1 (diethylcarbamazine).

- **MEDICINAL FORMS**

  Medicines are available from importing manufacturers.

**Ivermectin**

**INDICATIONS AND DOSE**

*Chronic *Strongyloides* infection*

**BY MOUTH**

- Adult: 200 micrograms/kg daily for 2 days

*Onchoderciasis*

**BY MOUTH**

- Adult: 150 micrograms/kg for 1 dose, retreatment at intervals of 6 to 12 months may be required depending on symptoms

**Scabies, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or ‘Norwegian’) scabies that does not respond to topical treatment alone**

**BY MOUTH**

- Adult: 200 micrograms/kg for 1 dose, further doses of 200 micrograms/kg may be required

- **UNLICENSED USE** Ivermectin is an unlicensed drug.

- **INTERACTIONS** ➔ Appendix 1 (ivermectin).

- **SIDE-EFFECTS**

  Aggravation of itching - aggravation of rash

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

**Levamisole**

**INDICATIONS AND DOSE**

*Roundworm infections*

**BY MOUTH**

- Adult: 120–150 mg for 1 dose

- **UNLICENSED USE** Not licensed.

- **CONTRA-INDICATIONS**

  Blood disorders

- **CAUTIONS**

  Epilepsy - Sjögren’s syndrome

- **INTERACTIONS** ➔ Appendix 1 (levamisole).

- **SIDE-EFFECTS**

  Arthralgia (on prolonged treatment) - blood disorders (on prolonged treatment) - convulsions (on prolonged treatment) - diarrhoea - dizziness - headache - influenza-like syndrome (on prolonged treatment) - insomniia (on prolonged treatment) - myalgia (on prolonged treatment) - nausea - rash (on prolonged treatment) - taste disturbances (on prolonged treatment) - vasculitis (on prolonged treatment) - vomiting

- **PREGNANCY**

  Embryotoxic in animal studies, avoid if possible.
Mebendazole

INDICATIONS AND DOSE

Threadworm infections

BY MOUTH
- Child 6 months–1 year: 100 mg for 1 dose, if reinfection occurs, second dose may be needed after 2 weeks
- Adult: 100 mg for 1 dose, if reinfection occurs, second dose may be needed after 2 weeks

Whipworm infections | Hookworm infections

BY MOUTH
- Child 1–7 years: 100 mg twice daily for 3 days
- Adult: 100 mg twice daily for 3 days

Roundworm infections

BY MOUTH
- Child 1 year: 100 mg twice daily for 3 days
- Child 2–7 years: 100 mg twice daily for 3 days, alternatively 500 mg for 1 dose
- Adult: 100 mg twice daily for 3 days, alternatively 500 mg for 1 dose

UNLICENSED USE Not licensed for use in children under 2 years.

Treatment of roundworm infections with mebendazole 500 mg as a single dose is an unlicensed dose.

INTERACTIONS → Appendix 1 (mebendazole).

SIDE-EFFECTS
- Common or very common Abdominal pain
- Uncommon Diarrhoea, flatulence
- Rare Alopecia, convulsions, dizziness, hepatitis, neutropenia, rash, Stevens–Johnson syndrome, toxic epidermal necrolysis, urticaria
- PREGNANCY Manufacturer advises avoid—toxicity in animal studies.
- BREAST FEEDING Amount present in milk too small to be harmful but manufacturer advises avoid.
- PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include banana.
- PATIENT AND CARER ADVICE Medicines for Children leaflet: Mebendazole for worm infections www.medicinesforchildren.org.uk/mebendazole-for-worm-infections
- EXCEPTIONS TO LEGAL CATEGORY Mebendazole tablets can be sold to the public if supplied for oral use in the treatment of enterobiasis in adults and children over 2 years provided its container or package is labelled to show a max. single dose of 100 mg and it is supplied in a container or package containing not more than 800 mg.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Chewable tablet
- MEBENDAZOLE (Non-proprietary)
  - Mebendazole 100 mg
  - Vermox (Janssen-Cilag Ltd)
  - Mebendazole 100 mg Vermox 100 mg chewable tablets (sugar-free) | 6 tablet | £1.36 OT price = £1.36
- Brands may include Ovex

Praziquantel

INDICATIONS AND DOSE

Tapeworm infections (Taenia solium)

BY MOUTH
- Adult: 5–10 mg/kg for 1 dose, to be taken after a light breakfast

Tapeworm infections (Hymenolepis nana)

BY MOUTH
- Adult: 25 mg/kg for 1 dose, to be taken after a light breakfast

Schistosoma haematobium worm infections | Schistosoma mansoni worm infections

BY MOUTH
- Adult: 20 mg/kg, followed by 20 mg/kg after 4–6 hours

Schistosoma japonicum worm infections

BY MOUTH
- Adult: 20 mg/kg 3 times a day for 1 day

UNLICENSED USE Praziquantel is an unlicensed drug.

INTERACTIONS → Appendix 1 (praziquantel).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

5 Protozoal infection

Antiprotozoal drugs

Amoebicides

Metronidazole p. 475 is the drug of choice for acute invasive amoebic dysentery since it is very effective against vegetative forms of Entamoeba histolytica in ulcers. Tinidazole p. 476 is also effective. Metronidazole and tinidazole p. 476 are also active against amoebae which may have migrated to the liver. Treatment with metronidazole or tinidazole is followed by a 10-day course of diloxanide furoate p. 438.

Diloxanide furoate is the drug of choice for asymptomatic patients with E. histolytica cysts in the faeces; metronidazole and tinidazole are relatively ineffective. Diloxanide furoate is relatively free from toxic effects and the usual course is of 10 days, given alone for chronic infections or following metronidazole or tinidazole treatment.

For amoebic abscesses of the liver metronidazole is effective; tinidazole is an alternative. Aspiration of the abscess is indicated where it is suspected that it may rupture or where there is no improvement after 72 hours of metronidazole; the aspiration may need to be repeated. Aspiration aids penetration of metronidazole and, for abscesses with more than 100 mL of pus, if carried out in conjunction with drug therapy, may reduce the period of disability.

Diloxanide furoate p. 438 is not effective against hepatic amoebiasis, but a 10-day course should be given at the completion of metronidazole or tinidazole treatment to destroy any amoebae in the gut.
Trichomonacides
Metronidazole is the treatment of choice for *Trichomonas vaginalis* infection. Contact tracing is recommended and sexual contacts should be treated simultaneously. If metronidazole is ineffective, tinidazole may be tried.

Antigiardial drugs
Metronidazole is the treatment of choice for *Giardia lamblia* infections. Alternative treatments are tinidazole or mepacrine hydrochloride p. 438.

Leishmaniacides
Cutaneous leishmaniasis frequently heals spontaneously but if skin lesions are extensive or unsightly, treatment is indicated, as it is in visceral leishmaniasis (kala-azar). Leishmaniasis should be treated under specialist supervision.

Sodium stibogluconate below, an organic pentavalent antimony compound, is used for visceral leishmaniasis. The dosage varies with different geographical regions and expert advice should be obtained. Some early non-inflamed lesions of cutaneous leishmaniasis can be treated with intralesional injections of sodium stibogluconate below under specialist supervision.

Amphotericin p. 517 is used with or after an antimony compound for visceral leishmaniasis unresponsive to the antimonial alone; side-effects may be reduced by using liposomal amphotericin (AmBisome®) Abelet® a lipid formulation of amphotericin is also likely to be effective but less information is available.

Pentamidine isetionate p. 523 has been used in antimony-resistant visceral leishmaniasis, but although the initial response is often good, the relapse rate is high; it is associated with serious side-effects. Other treatments include paromomycin [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies).

Trypanocides
The prophylaxis and treatment of trypanosomiasis is difficult and differs according to the strain of organism. Expert advice should therefore be obtained.

Drugs for toxoplasmosis
Most infections caused by *Toxoplasma gondii* are self-limiting, and treatment is not necessary. Exceptions are patients with eye involvement (toxoplasma chorioretinitis), and those who are immunosuppressed. Toxoplastic encephalitis is a common complication of AIDS. The treatment of choice is a combination of pyrimethamine p. 539 and sulfadiazine p. 495, given for several weeks (expert advice essential). Pyrimethamine is a folate antagonist, and adverse reactions to this combination are relatively common (folinic acid supplements and weekly blood counts needed). Alternative regimens use combinations of pyrimethamine p. 539 with clindamycin p. 467 or clariithromycin p. 470 or azithromycin p. 469. Long-term secondary prophylaxis is required after treatment of toxoplasmosis in immunocompromised patients; prophylaxis should continue until immunity recovers.

If toxoplasmosis is acquired in pregnancy, transplacental infection may lead to severe disease in the fetus; specialist advice should be sought on management. Spiramycin [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) may reduce the risk of transmission of maternal infection to the fetus.

5.1 Leishmaniasis

Sodium stibogluconate

<table>

- **CAUTIONS** Heart disease (withdraw if conduction disturbances occur) - mucocutaneous disease - predisposition to QT interval prolongation - treat intercurrent infection (e.g. pneumonia)

**CAUTIONS, FURTHER INFORMATION**
Mucocutaneous disease Successful treatment of mucocutaneous leishmaniasis may induce severe inflammation around the lesions (may be life-threatening if pharyngeal or tracheal involvement)—may require corticosteroid.

**INTERACTIONS** -> Appendix 1 (sodium stibogluconate). Caution with concomitant use of drugs that prolong QT interval.

**SIDE-EFFECTS**
- Rare: Bleeding from gums, bleeding from nose, fever, flushing, jaundice, rash, substernal pain, sweating, vertigo
- **Frequency not known** Abdominal pain, anaphylaxis, anorexia, arthralgia, coughing, diarrhoea, ECG changes, headache, lethargy, myalgia, nausea, pain on intramuscular injection, pain on intravenous administration, pancreatitis, thrombosis on intravenous administration, vomiting

**PREGNANCY**
Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**
Amount probably too small to be harmful.

**HEPATIC IMPAIRMENT**
Use with caution.

**RENAL IMPAIRMENT**
Avoid in significant impairment.

**MONITORING REQUIREMENTS**
Monitor ECG before and during treatment.

**DIRECTIONS FOR ADMINISTRATION**
Intravenous injections must be given slowly over 5 minutes (to reduce risk of local thrombosis) and stopped if coughing or substernal pain occur. Injection should be filtered immediately before administration using a filter of 5 microns or less.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- Pentostam (GlaxoSmithKline UK Ltd)
  - Antimony pentavalent (as Sodium stibogluconate) 100 mg per 1 ml Pentostam 10g/100ml solution for injection vials | 1 vial £66.43

5.2 Malaria

**Antimalarials**

Artemether with lumefantrine p. 534 is licensed for the treatment of acute non-complicated *falciparum* malaria.
Chloroquine
Chloroquine p. 536 is used for the prophylaxis of malaria in areas of the world where the risk of chloroquine-resistant falciparum malaria is still low. It is also used with proguanil hydrochloride p. 539 when chloroquine-resistant falciparum malaria is present but this regimen may not give optimal protection (see recommended regimens for prophylaxis against malaria in Malaria, prophylaxis below).

Chloroquine is no longer recommended for the treatment of falciparum malaria owing to widespread resistance, nor is it recommended if the infective species is not known or if the infection is mixed; in these cases treatment should be with quinine p. 540, Malarone®, or Riamet®. It is still recommended for the treatment of non-falciparum malaria.

Mefloquine
Mefloquine p. 537 is used for the prophylaxis of malaria in areas of the world where there is a high risk of chloroquine-resistant falciparum malaria (for details, see recommended regimens for prophylaxis against malaria in Malaria, prophylaxis below).

Mefloquine is now rarely used for the treatment of falciparum malaria because of increased resistance. It is rarely used for the treatment of non-falciparum malaria because better tolerated alternatives are available.

Mefloquine should not be used for treatment if it has been used for prophylaxis.

Piperaquine with artenimol
Artenimol with piperquaine phosphate p. 535 is not recommended for the first-line treatment of acute uncomplicated falciparum malaria because of its widespread use in travellers who usually reside in areas where malaria is not endemic. Piperaquine has a long half-life.

Primaquine
Primaquine p. 536 is used to eliminate the liver stages of P. vivax or P. ovale following chloroquine treatment.

Proguanil
Proguanil hydrochloride p. 539 is used (usually with chloroquine, but occasionally alone) for the prophylaxis of malaria, (for details, see Recommended regimens for prophylaxis against malaria p. 530).

Proguanil hydrochloride used alone is not suitable for the treatment of malaria; however, Malarone® (a combination of atovaquone with proguanil hydrochloride p. 536) is licensed for the treatment of acute uncomplicated falciparum malaria. Malarone® is also used for the prophylaxis of falciparum malaria in areas of widespread mefloquine or chloroquine resistance. Malarone® is also used as an alternative to mefloquine or doxycycline p. 496. Malarone® is particularly suitable for short trips to highly chloroquine-resistant areas because it needs to be taken only for 7 days after leaving an endemic area.

Pyrimethamine
Pyrimethamine p. 539 should not be used alone, but is used with sulfadoxine.

Pyrimethamine with sulfadoxine is not recommended for the prophylaxis of malaria, but can be used in the treatment of falciparum malaria with (or following) quinine.

Quinine
Quinine is not suitable for the prophylaxis of malaria.

Quinine is used for the treatment of falciparum malaria or if the infective species is not known or if the infection is mixed (for details see Malaria, treatment p. 529).

Tetracyclines
Doxycycline p. 496 is used in adults and children over 12 years for the prophylaxis of malaria in areas of widespread mefloquine or chloroquine resistance. Doxycycline is also used as an alternative to mefloquine or Malarone® (for details, see Recommended regimens for prophylaxis against malaria p. 530).

Malaria, prophylaxis

Prophylaxis
The recommendations on prophylaxis reflect guidelines agreed by UK malaria specialists; the advice is aimed at residents of the UK who travel to endemic areas. The choice of drug for a particular individual should take into account:

- risk of exposure to malaria
- extent of drug resistance
- efficacy of the recommended drugs
- side-effects of the drugs
- patient-related factors (e.g. age, pregnancy, renal or hepatic impairment, compliance with prophylactic regimen)

Protection against bites

Prophylaxis is not absolute, and breakthrough infection can occur with any of the drugs recommended. Personal protection against being bitten is very important. Mosquito nets impregnated with permethrin p. 1015 provide the most effective barrier protection against insects; mats and vapourised insecticides are also useful. Diethyltoluamide (DEET) 20–50% in lotions, sprays, or roll-on formulations is safe and effective when applied to the skin of adults and children over 2 months of age. It can also be used during pregnancy and breast-feeding. The duration of protection varies according to the concentration of DEET and is longest for DEET 50%. When sunscreen is also required, DEET should be applied after the sunscreen. Long sleeves and trousers worn after dusk also provide protection against bites.

Length of prophylaxis

In order to determine tolerance and to establish habit, prophylaxis should generally be started one week (2–3 weeks in the case of mefloquine p. 537) before travel into an endemic area; Malarone® or doxycycline p. 496 prophylaxis should be started 1–2 days before travel. Prophylaxis should be continued for 4 weeks after leaving (except for Malarone® prophylaxis which should be stopped 1 week after leaving).

In those requiring long-term prophylaxis, chloroquine p. 536 and proguanil hydrochloride p. 539 may be used for periods of over 5 years. Mefloquine is licensed for up to 1 year (although, if it is tolerated in the short term, there is no evidence of harm when it is used for up to 3 years). Doxycycline can be used for up to 2 years. Malarone® can be used for up to 1 year. Prophylaxis with mefloquine, doxycycline, or Malarone® may be considered for longer durations if it is justified by the risk of exposure to malaria. Specialist advice should be sought for long-term prophylaxis.

Return from malarial region

It is important to be aware that any illness that occurs within 1 year and especially within 3 months of return might be malaria even if all recommended precautions against malaria were taken. Travellers should be warned of this and told that if they develop any illness particularly within 3 months of their return they should go immediately to a doctor and specifically mention their exposure to malaria.

Epilepsy

Both chloroquine p. 536 and mefloquine are unsuitable for malaria prophylaxis in individuals with a history of epilepsy. In areas without chloroquine resistance proguanil alone is recommended; in areas with chloroquine resistance, doxycycline or Malarone® may be considered.
Asplenia
Asplenic individuals (or those with severe splenic dysfunction) are at particular risk of severe malaria. If travel to malarious areas is unavoidable, rigorous precautions are required against contracting the disease.

Renal impairment
Avoidance (or dosage reduction) of proguanil hydrochloride p. 539 is recommended since it is excreted by the kidneys. Malarone® should not be used for prophylaxis in patients with estimated glomerular filtration rate less than 30 mL/minute/1.73m². Chloroquine p. 536 is only partially excreted by the kidneys and reduction of the dose for prophylaxis is not required except in severe impairment. Mefloquine is considered to be appropriate to use in renal impairment and does not require dosage reduction. Doxycycline is also considered to be appropriate.

Pregnancy
Travel to malarious areas should be avoided during pregnancy; if travel is unavoidable, effective prophylaxis must be used. Chloroquine and proguanil hydrochloride can be given in the usual doses during pregnancy, but these drugs are not appropriate for most areas because their effectiveness has declined, particularly in Sub-Saharan Africa; in the case of proguanil hydrochloride, folic acid p. 836 (dosed as a pregnancy at ‘high-risk’ of neural tube defects) should be given for at least the first trimester. The centres listed (see Malaria, treatment below) should be consulted for advice on prophylaxis in chloroquine-resistant areas. Although the manufacturer advises that mefloquine should not be used during pregnancy, particularly in the first trimester, unless the potential benefit outweighs the risk, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas. Doxycycline p. 496 is contra-indicated during pregnancy; however, it can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks’ gestation [unlicensed]. Malarone® should be avoided during pregnancy, however, it can be considered during the second and third trimesters if there is no suitable alternative.

Breast-feeding
Prophylaxis is required in breast-fed infants; although antimalarials are present in milk, the amounts are too variable to give reliable protection.

Anticoagulants
Travellers taking warfarin sodium p. 121 should begin chemoprophyaxis 2–3 weeks before departure. The INR should be stable before departure. It should be measured before starting chemoprophyaxis, 7 days after starting, and after completing the course. For prolonged stays, the INR should be checked at regular intervals.

Standby treatment
Travellers visiting remote, malarious areas for prolonged periods should carry standby treatment if they are likely to be more than 24 hours away from medical care. Self-medication should be avoided if medical help is accessible. In order to avoid excessive self-medication, the traveller should be provided with written instructions that urgent medical attention should be sought if fever (38°C or more) develops 7 days (or more) after arriving in a malarious area and that self-treatment is indicated if medical help is not available within 24 hours of fever onset. In view of the continuing emergence of resistant strains and of the different regimens required for different areas expert advice should be sought on the best treatment course for an individual traveller. A drug used for chemoprophyaxis should not be considered for standby treatment for the same traveller.

Specific recommendations
Where a journey requires two regimens, the regimen for the higher risk area should be used for the whole journey. Those travelling to remote or little-visited areas may require expert advice. See also Recommended regimens for prophylaxis against malaria p. 530

Important
Settled immigrants (or long-term visitors) to the UK may be unaware that any immunity they may have acquired while living in malarious areas is lost rapidly after migration to the UK, or that any non-malarious areas where they lived previously may now be malarious.

Malaria, treatment
A number of specialist centres are able to provide advice on specific problems.

Treatment of malaria
Recommendations on the treatment of malaria reflect guidelines agreed by UK malaria specialists.
If the infective species is not known, or if the infection is mixed, initial treatment should be as for falciparum malaria with quinine p. 540, Malarone® (atovaquone with proguanil hydrochloride p. 536), or Riamet® (artemether with lumefantrine p. 534). Falciparum malaria can progress rapidly in unprotected individuals and antimalarial treatment should be considered in those with features of severe malaria and possible exposure, even if the initial blood tests for the organism are negative.

Falciparum malaria (treatment)
Falciparum malaria (malignant malaria) is caused by Plasmodium falciparum. In most parts of the world P. falciparum is now resistant to chloroquine p. 536 which should not therefore be given for treatment.
Quinine, Malarone® (atovaquone with proguanil hydrochloride p. 536), or Riamet® (artemether with lumefantrine) can be given by mouth if the patient can swallow and retain tablets and there are no serious manifestations (e.g. impaired consciousness); quinine should be given by intravenous infusion if the patient is seriously ill or unable to take tablets. Mefloquine p. 537 is now rarely used for treatment because of concerns about resistance.
Oral quinine is given by mouth for 5–7 days, together with or followed by either doxycycline p. 496 for 7 days or

Infection

clindamycin p. 467 for 7 days [unlicensed].

If the parasite is likely to be sensitive, pyrimethamine with sulfadoxine p. 540 as a single dose [unlicensed] may be given (instead of either clindamycin p. 467 or doxycycline p. 496) together with, or after, a course of quinine. Alternatively, Malarone® or Riamet® may be given instead of quinine. It is not necessary to give clindamycin, doxycycline, or pyrimethamine with sulfadoxine after Malarone® or Riamet® treatment.

If the patient is seriously ill or unable to take tablets, or if more than 2% of red blood cell are parasitized, quinine should be given by intravenous infusion [unlicensed] (until patient can swallow tablets to complete the 7-day course together with or followed by either doxycycline p. 496 or clindamycin p. 467).

Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine p. 540, infection acquired in quinine-resistant areas of south east Asia) because intravenous artesunate may be available for ‘named-patient’ use.

Pregnancy

Falciparum malaria is particularly dangerous in pregnancy, especially in the last trimester. The adult treatment doses or oral and intravenous quinine (including the loading dose) can safely be given to pregnant women. Clindamycin should be given after quinine [unlicensed indication]. Doxycycline should be avoided in pregnancy (affects teeth and skeletal development); pyrimethamine with sulfadoxine, Malarone®, and Riamet® are also best avoided until more information is available. Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous artesunate may be available for ‘named patient’ use.

Non-falciparum malaria (treatment)

Non-falciparum malaria is usually caused by Plasmodium vivax and less commonly by P. ovale and P. malariae. P. knowlesi is also present in the Asia-Pacific region. Chloroquine p. 536 is the drug of choice for the treatment of non-falciparum malaria but chloroquine-resistant P. vivax has been reported in the Indonesian archipelago, the Malay Peninsula, including Myanmar, and eastward to Southern Vietnam). For the treatment of chloroquine-resistant non-falciparum malaria, Malarone® [unlicensed indication], quinine, or Riamet® [unlicensed indication] can be used; as with chloroquine p. 536, primaquine p. 538 should be given for radical cure.

Chloroquine p. 536 alone is adequate for P. malariae and P. knowlesi infections but in the case of P. vivax and P. ovale, a radical cure (to destroy parasites in the liver and thus prevent relapses) is required. This is achieved with primaquine p. 538 [unlicensed] given after chloroquine, with the dose dependent on the infecting organism. For a radical cure, primaquine [unlicensed] is then given for 14 days, with the dose also dependent on the infecting organism.

Parenteral

Parenteral If the patient is unable to take oral therapy, quinine p. 540 can be given by intravenous infusion [unlicensed], changed to oral chloroquine p. 536 as soon as the patient’s condition permits.

Pregnancy

The adult treatment doses of chloroquine p. 536 can be given for non-falciparum malaria. In the case of P. vivax or P. ovale, however, the radical cure with primaquine p. 538 should be postponed until the pregnancy is over; instead chloroquine p. 536 should be continued, given weekly during the pregnancy.

Artemether with lumefantrine

INDICATIONS AND DOSE

Treatment of acute uncomplicated falciparum malaria | Treatment of chloroquine-resistant non-falciparum malaria

BY MOUTH

Adult (body-weight 35 kg and above): Initially 4 tablets, followed by 4 tablets for 5 doses each given at 8, 24, 36, 48, and 60 hours (total 24 tablets over 60 hours)
Artemether with piperaquine phosphate (Piperquine tetraphosphate with dihydroartemisinin)

**INDICATIONS AND DOSE**

Treatment of uncomplicated falciparum malaria

**BY MOUTH**

- Child 6 months-17 years (body-weight 7-12 kg): 0.5 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- Child 6 months-17 years (body-weight 13-23 kg): 1 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- Child 6 months-17 years (body-weight 24-35 kg): 2 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- Child 6 months-17 years (body-weight 36-74 kg): 3 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- Adult (body-weight 36-74 kg): 3 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
- Adult (body-weight 75 kg and over): 4 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain - anorexia - arthralgia - asthma - cough - diarrhea - dizziness - headache - myalgia - nausea - palpitation - paraesthesia - prolonged QT interval - pruritus - rash - sleep disturbances - vomiting
- **Uncommon** Ataxia - clonus - hypoaesthesia

**PREGNANCY** Toxicity in animal studies with artemether. Manufacturer advises use only if potential benefit outweighs risk.

**CONTRA-INDICATIONS**

- Acute myocardial infarction - bradycardia - congenital long QT syndrome - electrolyte disturbances - family history of sudden death - heart failure with reduced left ventricular ejection fraction - history of symptomatic arrhythmias - left ventricular hypertrophy - risk factors for QT interval prolongation - severe hypertension

**INTERACTIONS**

- Avoid in Acute porphyrias p. 864 - electrolyte disturbances
- Monitor patients unable to take food (greater risk of recrudescence).
- Manufacturer advises caution in breastfeeding for at least 3 week after last dose. Present in milk in animal studies.
- Manufacturer advises use only if potential benefit outweighs risk.
- Manufacturer advises monitor ECG and plasma-potassium concentration.
- Monitor patients unable to take food (greater risk of recrudescence).
- Tablets may be crushed just before administration.
- Dizziness may affect performance of skilled tasks (e.g. driving).
- There is no information available in moderate to severe impairment.
- Thrombocytopenia (in children) - vomiting (in children)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS**

- Riamet (Novartis Pharmaceuticals UK Ltd)
- Artemether 20 mg, Lumefantrine 120 mg
- Riamet tablets | 24 tablet £22.50

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain - anorexia - arthralgia - asthma - cough - diarrhea - dizziness - headache - myalgia - nausea - palpitation - paraesthesia - prolonged QT interval - pruritus - rash - sleep disturbances - vomiting
- **Uncommon** Ataxia - clonus - hypoaesthesia

**MEDICATIONS**

- No information available in moderate to severe impairment.
- Manufacturer advises monitor ECG and plasma-potassium concentration in moderate to severe hepatic impairment.

**MONITORING REQUIREMENTS**

- Obtain ECG as soon as possible after starting treatment then continue monitoring in those taking medicines that increase plasma-piperaquine concentration, in children who are vomiting, in females, or in the elderly.
- Consider obtaining ECG in all patients before third dose and 4–6 hours after third dose.
- If QTc interval more than 500 milliseconds, discontinue treatment and monitor ECG for a further 24–48 hours.

**DIRECTIONS FOR ADMINISTRATION**

- Tablets to be taken at least 3 hours before and at least 3 hours after food.
- Tablets may be crushed and mixed with water immediately before administration.

**PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer tablets containing piperaquine phosphate with arteminol.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.
**Indications and Dose**

**Malarone®**

Prophylaxis of falciparum malaria, particularly where resistance to other antimalarial drugs suspected

**By mouth**

- Adult (body-weight 40 kg and above): 1 tablet daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving

**Treatment of acute uncomplicated falciparum malaria**

**By mouth**

- Adult (body-weight 11–20 kg): 1 tablet once daily for 3 days
- Adult (body-weight 21–30 kg): 2 tablets once daily for 3 days
- Adult (body-weight 31–40 kg): 3 tablets once daily for 3 days
- Adult (body-weight 41 kg and above): 4 tablets once daily for 3 days

**Atovaquone with proguanil hydrochloride**

**Tablet**

<table>

<tr>
<td>Malarone (GlaxoSmithKline UK Ltd)</td>
</tr>
<tr>
<td>Atovaquone 250 mg, Proguanil hydrochloride 100 mg</td>
</tr>
<tr>
<td>Brands may include Reprapog</td>
</tr>
</tbody>
</table>

**Side-effects**

- **Common or very common** Abdominal pain, abnormal dreams, anorexia, cough, depression, diarrhea, dizziness, fever, headache, insomnia, nausea, pruritus, rash, vomiting
- **Uncommon** Anxiety, blood disorders, hair loss, hypotension, palpitation, stomatitis
- **Frequency not known** Cholestasis, hallucinations, hepatitis, mouth ulcers, photosensitivity, seizures, Stevens-Johnson syndrome, tachycardia, vasculitis

**Pregnancy**

Manufacturer advises avoid unless essential.

**Breast-feeding**

Use only if no suitable alternative available.

**Renal Impairment**

Avoid for malaria prophylaxis (and if possible for malaria treatment) if eGFR less than 30 mL/minute/1.73m².

**Patient and Carer Advice**

Warn travellers about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return.

**National Funding/Access Decisions**

NHS restrictions Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed.

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug.

**Chloroquine**

**Indications and Dose**

Active rheumatoid arthritis (administered on expert advice) | Systemic and discoid lupus erythematosus (administered on expert advice)

**By mouth**

- Adult: 150 mg daily; maximum 2.5 mg/kg per day

**Prophylaxis of Malaria**

**Initially by mouth using syrup**

- Child 6 weeks–5 months (body-weight 4.5–8 kg): 50 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 6–11 months (body-weight 8–11 kg): 75 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 1–2 years (body-weight 11–15 kg): 100 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 3–4 years (body-weight 15–16.5 kg): 125 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 4–7 years (body-weight 16.5–25 kg): 150 mg once weekly, alternatively (by mouth using tablets) 155 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 8–12 years (body-weight 25–45 kg): 225 mg once weekly, alternatively (by mouth using tablets) 232.5 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Child 13–17 years (body-weight 45 kg and above): 310 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- Adult (body-weight 45 kg and above): 310 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

**Treatment of non-falciparum malaria**

**By mouth**

- Child: Initially 10 mg/kg (max. per dose 620 mg), then 5 mg/kg after 6–8 hours (max. per dose 310 mg), then 5 mg/kg daily (max. per dose 310 mg) for 2 days
- Adult: Initially 620 mg, then 310 mg after 6–8 hours, then 310 mg daily for 2 days, approximate total cumulative dose of 25 mg/kg of base

**P. vivax or P. ovale infection during pregnancy while radical cure is postponed**

**By mouth**

- Adult: 310 mg once weekly

**Doses at extremes of body-weight**

In active rheumatoid arthritis and systemic and discoid lupus erythematosus, to avoid excessive dosage in obese patients, the daily maximum dose should be calculated on the basis of ideal body weight.

**Dose equivalence and conversion**

Doses expressed as chloroquine base. Chloroquine base 150 mg = chloroquine sulfate 200 mg = chloroquine phosphate 250 mg (approx).
**UNLICENSED USE** Chloroquine doses for the treatment and prophylaxis of malaria in BNF publications may differ from those in product literature.

**Important safety information**

Ocular toxicity is unlikely if the adult dose of chloroquine phosphate does not exceed 4 mg/kg daily (equivalent to chloroquine base approx. 2.5 mg/kg daily).

**CAUTIONS** Acute porphyrias p. 864 - elderly - G6PD deficiency - long-term therapy (regular ophthalmic examination recommended by manufacturers) - may aggravate myasthenia gravis - may exacerbate psoriasis - neurological disorders, especially epilepsy (avoid for prophylaxis of malaria if history of epilepsy) - severe gastro-intestinal disorders

**CAUTIONS, FURTHER INFORMATION**

Screening for ocular toxicity A review group convened by the Royal College of Ophthalmologists has updated guidelines for screening adults to prevent ocular toxicity on long-term treatment with chloroquine and hydroxychloroquine (Hydroxychloroquine and Ocular Toxicity: Recommendations on Screening 2009).

Chloroquine should be considered (for treating chronic inflammatory conditions) only if other drugs have failed. All patients taking chloroquine should receive oculcar examination according to a protocol arranged locally between the prescriber and the ophthalmologist.

**INTERACTIONS** → Appendix 1 (chloroquine, hydroxychloroquine).

Avoid concurrent therapy with hepatotoxic drugs.

**SIDE-EFFECTS**

- **Common or very common** Gastro-intestinal disturbances • headache • pruritus • rashes • skin reactions
- **Uncommon** Convulsions • discoloration of mucous membranes • discoloration of nails • discoloration of skin • ECG changes • hyperpigmentation • hair loss • keratopathy • otoxicity • retinal damage • visual changes
- **Rare** Acute generalised exanthematous pustulosis • agranulocytosis • angioedema • aplastic anaemia • blood disorders • bone marrow suppression • cardiomyopathy • emotional disturbances • exfoliative dermatitis • hepatic damage • hypersensitivity reactions • mental changes • myopathy • neuromyopathy • photosensitivity • psychosis • Stevens-Johnson syndrome • thrombocytopenia • urticaria
- **Frequency not known** Diffuse parenchymal lung disease • drug rash with eosinophilia and systemic symptoms • extrapyramidal symptoms (associated with use in malaria) • hypotension • visual disturbances • bronchospasm (in children)

**SIDE-EFFECTS, FURTHER INFORMATION**

**Malaria prophylaxis and treatment** Serious skin reactions, ECG changes, visual effects, otoxicity, blood disorders, mental changes, myopathies and hepatic damage are not usually associated with malaria prophylaxis or treatment.

**Overdose** Chloroquine is very toxic in overdosage; overdosage is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

**PREGNANCY** Benefit of use in prophylaxis and treatment in malaria outweighs risk. For rheumatoid disease, it is not necessary to withdraw an antimalarial drug during pregnancy if the disease is well controlled.

**BREAST FEEDING** Present in breast milk and breast-feeding should be avoided when used to treat rheumatic disease. Amount in milk probably too small to be harmful when used for malaria.

**HEPATIC IMPAIRMENT** Use with caution in moderate to severe impairment.

**RENAL IMPAIRMENT** Only partially excreted by the kidneys and reduction of the dose is not required for prophylaxis of malaria except in severe impairment. For rheumatoid arthritis and lupus erythematosus, reduce dose. Manufacturers advise caution.

**MONITORING REQUIREMENTS**

- in adults Manufacturers recommend regular ophthalmological examination but the evidence of practical value is unsatisfactory.
- in children Ophthalmic examination with long-term therapy.

**PATIENT AND CARER ADVICE** Warn travellers going to malarious areas about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NHS restrictions** Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials are prescribed.

**EXCEPTIONS TO LEGAL CATEGORY** Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS** 5

- **Avloclor** (Alliance Pharmaceuticals Ltd)
  - Chloroquine phosphate 250 mg Avloclor 250mg tablets | 20 tablet (50) £4.90 DT price = £4.90

**Oral solution**

**CAUTIONARY AND ADVISORY LABELS** 5

Protozoal infection

Prophylaxis of malaria

BY MOUTH

- Child (body-weight 5-15 kg): 62.5 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving.
- Child (body-weight 16–24 kg): 125 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving.
- Child (body-weight 25–44 kg): 187.5 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving.
- Child 1–17 years (body-weight 45 kg and above): 250 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving.
- Adult (body-weight 45 kg and above): 250 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving.

**UNLICENSED USE** Melquine doses in BNF Publications may differ from those in product literature. Not licensed for use in children under 5 kg body-weight and under 3 months.

**CONTRA-INDICATIONS** Avoid for prophylaxis if history of psychiatric disorders (including depression) or convulsions. Avoid for standby treatment if history of convulsions - history of blackwater fever.

**CAUTIONS** Cardiac conduction disorders - epilepsy (avoid for prophylaxis) - not recommended in infants under 3 months (5 kg) - traumatic brain injury.

**CAUTIONS, FURTHER INFORMATION**

**Neuropsychiatric reactions** Melquine is associated with potentially serious neuropsychiatric reactions. Abnormal dreams, insomnia, anxiety, and depression occur commonly. Psychosis, suicidal ideation, and suicide have also been reported. Psychiatric symptoms such as nightmares, acute anxiety, depression, restlessness, or confusion should be regarded as potentially prodromal for a more serious event. If neuropsychiatric symptoms occur, patients should be advised to discontinue melquine and to seek immediate medical attention so that melquine can be replaced with an alternative antimalarial. Adverse reactions may occur and persist up to several months after discontinuation because melquine has a long half-life. Melquine is contraindicated for malaria prophylaxis in those with a history of psychiatric disorders or convulsions.

**INTERACTIONS** → Appendix 1 (melquine).

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain - diarrhea - dizziness - headache - nausea - neuropsychiatric reactions - pruritus - visual disturbances - vomiting.
- **Very rare** Optic neuropathy.

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with hypersensitivity to quinine.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during prophylaxis and for 4 months after stopping (teratogenicity in animal studies).

**PREGNANCY** Manufacturer advises avoid (particularly in the first trimester) unless the potential benefit outweighs the risk; however, studies of melquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas.

**BREAST FEEDING** Present in milk but risk to infant minimal.

**HEPATIC IMPAIRMENT** Elimination may be prolonged; avoid in severe impairment.

**RENNAL IMPAIRMENT** Manufacturer advises caution.

**DIRECTIONS FOR ADMINISTRATION** Tablet may be crushed and mixed with food such as jam or honey just before administration.

**PATIENT AND CARER ADVICE** Inform travellers about adverse reactions of melquine and, if they occur, to seek medical advice on alternative antimalarials before the next dose is due. Also warn travellers about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return. Dizziness or a disturbed sense of balance may affect performance of skilled tasks (e.g. driving); effects may occur and persist up to several months after stopping melquine.

**NATIONAL FUNDING/ACCESS DECISIONS** NHS restrictions Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**Primquine**

**INDICATIONS AND DOSE**

Adjunct in the treatment of non-falciparum malaria caused by *P. vivax* infection

**BY MOUTH**

- Adult: 30 mg daily for 14 days

Adjunct in the treatment of non-falciparum malaria caused by *P. ovale* infection

**BY MOUTH**

- Adult: 15 mg daily for 14 days

Adjunct in the treatment of non-falciparum malaria caused by *P. vivax* infection in patients with mild G6PD deficiency (administered on expert advice)

Adjunct in the treatment of non-falciparum malaria caused by *P. ovale* infection in patients with mild G6PD deficiency (administered on expert advice)

**BY MOUTH**

- Adult: 45 mg once weekly for 8 weeks

Treatment of mild to moderate pneumocystis infection (in combination with clindamycin)

**BY MOUTH**

- Adult: 30 mg daily, this combination is associated with considerable toxicity

**UNLICENSED USE** Not licensed.

**CAUTIONS** G6PD deficiency - systemic diseases associated with granulocytopenia (e.g. juvenile idiopathic arthritis, rheumatoid arthritis, lupus erythematosus)

**INTERACTIONS** → Appendix 1 (primquine).
Primaquine (as Primaquine phosphate) 7.5 mg tablets | 100 tablet no price available

Pyrimethamine

INDICATIONS AND DOSE
Toxoplasmosis in pregnancy (in combination with sulfadiazine and folic acid)

BY MOUTH
Adult: 50 mg once daily until delivery

Congenital toxoplasmosis (in combination with sulfadiazine and folic acid)

BY MOUTH
Adult 18-28 years: 1 mg/kg twice daily for 2 days, then 1 mg/kg once daily for 5 months, then 1 mg/kg 3 times a week for 6 months

Malaria
Adult: No dose stated because not recommended alone

SIDE-EFFECTS
Common or very common Anaemia (with high doses) - blood disorders (with high doses) - diarrhoea - dizziness - headache - leucopenia (with high doses) - nausea - rash - thrombocytopenia (with high doses) - vomiting

UNLICENSED USE
Proguanil doses in BNF Publications may differ from those in product literature.

INTERACTIONS
Appendix 1 (pyrimethamine).

References:
...
540 Protozoal infection

**MONITORING REQUIREMENTS** Blood counts required with prolonged treatment.

**LESS SUITABLE FOR PRESCRIBING** Pyrimethamine should not be used alone for malaria, but is used with sulfadoxine.

**INTERACTIONS**

**CONTRA-INDICATIONS**

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

- **Daraprim (GlaxoSmithKline UK Ltd)**
  - Pyrimethamine 25 mg Daraprim 25mg tablets | 30 tablet £13.00

**CONTRASTIVE USE**

**SIDE-EFFECTS**

**Dose equivalence and conversion**

Dose quantities are expressed in the form x/y where x and y are the strengths in milligrams of pyrimethamine and sulfadoxine respectively.

**SIDE-EFFECTS, FURTHER INFORMATION**

Discontinue immediately if blood disorders or rash occur. Discontinue if cough or shortness of breath occur.

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with sulfonamide allergy.

**PREGNANCY** Possible teratogenic risk in first trimester (pyrimethamine a folate antagonist); in third trimester—risk of neonatal haemolysis and methaemoglobinemia. Fear of increased risk of kernicterus in neonates appears to be unfounded.

**BREAST FEEDING** Small risk of kernicterus in jaundiced infants; risk of haemolysis in G6PD-deficient infants (due to sulfadoxine).

**MONITORING REQUIREMENTS** Monitor blood counts on prolonged treatment.

**PATIENT AND CARER ADVICE** Patients should be advised to maintain adequate fluid intake.

**QUININE**

**INDICATIONS AND DOSE**

Nocturnal leg cramps

**BY MOUTH**

- Adult: 200–300 mg once daily, to be taken at bedtime

**Non-falciparum malaria**

**BY INTRAVENOUS INFUSION**

- Adult: 10 mg/kg every 8 hours (max. per dose 700 mg), infused over 4 hours, given if patient is unable to take oral therapy. Changed to oral chloroquine as soon as the patient’s condition permits

**Falciparum malaria**

**BY MOUTH**

- Child: 10 mg/kg every 8 hours (max. per dose 600 mg) for 7 days together with or followed by either clindamycin or, in children over 12 years, doxycycline
- Adult: 600 mg every 8 hours for 5–7 days, the quinine should be given together with or followed by either doxycycline or clindamycin

**Falciparum malaria (in intensive care unit)**

**BY INTRAVENOUS INFUSION**

- Adult: Loading dose 20 mg/kg (max. per dose 1.4 g), infused over 4 hours, the loading dose of 20 mg/kg should not be used if the patient has received quinine or mefloquine during the previous 12 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, to be given 8 hours after the start of the loading dose and infused over 4 hours, the quinine should be given together with or followed by either doxycycline or clindamycin

**Dose equivalence and conversion**

When using quinine for malaria, doses are valid for quinine hydrochloride, dihydrochloride, and sulfate; they are not valid for quinine bisulfate which contains a correspondingly smaller amount of quinine.

Quinine (anhydrous base) 100 mg = quinine bisulfate 169 mg; quinine dihydrochloride 122 mg; quinine hydrochloride 122 mg; and quinine sulfate 121 mg. Quinine bisulfate 300 mg tablets are available but provide less quinine than 300 mg of the dihydrochloride, hydrochloride, or sulfate.
6 Viral infection

6.1 Hepatitis

Hepatitis

Treatment for viral hepatitis should be initiated by a specialist. The management of uncomplicated acute viral hepatitis is largely symptomatic. Early treatment of acute hepatitis C with interferon alfa p. 794 [unlicensed indication] may reduce the risk of chronic infection. Hepatitis B and hepatitis C viruses are major causes of chronic hepatitis. Active or passive immunisation against hepatitis A and B infections can be given.

Hepatitis B, chronic

Peginterferon alfa p. 542 is an option for the initial treatment of chronic hepatitis B and may be preferable to interferon alfa. The use of peginterferon alfa and interferon alfa is limited by a response rate of 30–40% and relapse is frequent. Treatment should be discontinued if no improvement occurs after 4 months. The manufacturers of peginterferon alfa-2a and interferon alfa contraindicate use in decompensated liver disease, but low doses can be used with great caution in these patients. Although interferon alfa is contra-indicated in patients receiving immunosuppressant treatment (or who have received it recently), cautious use of peginterferon alfa-2a may be justified in some cases.

Entecavir p. 543 or tenofovir disoproxil p. 564 are options for the initial treatment of chronic hepatitis B. If the response is inadequate after 6–9 months of treatment, a change in treatment should be considered. Other drugs that are licensed for the treatment of chronic hepatitis B include adefovir dipivoxil p. 544, lamivudine p. 563, or telbivudine p. 544.

Entecavir p. 543 alone, tenofovir disoproxil p. 564 alone, or a combination of lamivudine with either adefovir dipivoxil or tenofovir disoproxil can be used in patients with decompensated liver disease.

If drug-resistant hepatitis B virus emerges during treatment, another antiviral drug to which the virus is sensitive should be added. Hepatitis B viruses with reduced susceptibility to lamivudine have emerged following extended therapy. Adefovir dipivoxil or tenofovir disoproxil can be given with lamivudine in lamivudine-resistant chronic hepatitis B; telbivudine p. 544 or entecavir p. 543 should not be used because cross-resistance can occur. If there is no toxicity or loss in efficacy, treatment with adefovir dipivoxil, entecavir, lamivudine, telbivudine, or tenofovir disoproxil is usually continued until 6 months after adequate seroconversion has occurred. Treatment is usually continued long-term in patients with decompensated liver disease.

Tenofovir disoproxil, or a combination of tenofovir disoproxil with either emtricitabine p. 563 or lamivudine may be used with other antiretrovirals, as part of ‘highly active antiretroviral therapy’ in patients who require treatment for both HIV and chronic hepatitis B. If patients infected with both HIV and chronic hepatitis B only require treatment for chronic hepatitis B, they should receive antivirals that are not active against HIV, such as peginterferon alfa p. 542 or adefovir dipivoxil. Treatment may be continued long-term, even if adequate seroconversion occurs. Management of these patients should be coordinated between HIV and hepatology specialists.

Hepatitis C, chronic

Before starting treatment, the genotype of the infecting hepatitis C virus should be determined and the viral load
measured as this may affect the choice and duration of treatment. A combination of ribavirin p. 545 and peginterferon alfa below is used for the treatment of chronic hepatitis C. The combination of ribavirin and interferon alfa is less effective than the combination of peginterferon alfa and ribavirin. Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Ribavirin monotherapy is ineffective.

Boceprevir p. 547 and telaprevir p. 548 are protease inhibitors that inhibit the replication of hepatitis C virus genotype 1, but they are less effective against other genotypes of the virus. Monotherapy is not recommended because there is a high likelihood of resistance developing. Either boceprevir or telaprevir is licensed for use in combination with ribavirin and peginterferon alfa for the treatment of chronic hepatitis C infection of genotype 1 in patients with compensated liver disease; these combinations are more effective than dual therapy with ribavirin and peginterferon alfa. However, triple therapy is associated with a higher incidence and greater severity of anaemia than dual therapy. Neutropenia seems to be more frequent during treatment with regimens containing boceprevir than with those containing telaprevir. Rash is a particular concern with telaprevir, and to a lesser extent with boceprevir.

Daclatasvir p. 544 is licensed for use in combination with sofosbuvir p. 546 for the treatment of chronic hepatitis C infection of genotypes 1 or 4, with or without compensated cirrhosis; the addition of ribavirin should be considered for patients with advanced liver disease or with other negative prognostic factors, such as prior treatment experience. It is also licensed in combination with sofosbuvir and ribavirin for the treatment of chronic hepatitis C infection of genotype 3 in patients who are treatment experienced, with or without compensated cirrhosis, and in combination with peginterferon alfa and ribavirin for the treatment of chronic hepatitis C infection of genotype 4. Daclatasvir p. 544 must not be given as monotherapy. Sofosbuvir is a pro-drug of a nucleoside inhibitor that is effective against hepatitis C virus polymerase NS5B. It is licensed for use in combination with ribavirin, with or without peginterferon alfa, for the treatment of chronic hepatitis C infection of genotypes 1, 2, 3, 4, 5, or 6 in patients with compensated liver disease. Sofosbuvir monotherapy is not recommended because it is less effective than combination therapy.

Simeprevir p. 548 is licensed for use in combination with ribavirin and peginterferon alfa for the treatment of chronic hepatitis C infection of genotype 1 or 4; regimens containing peginterferon alfa-2b are less effective than those containing peginterferon alfa-2a. Simeprevir may also be used in combination with sofosbuvir, with or without ribavirin p. 545, for the urgent treatment of chronic hepatitis C infection of genotypes 1 or 4 only when peginterferon alfa cannot be used because of intolerance or contra-indications. Simeprevir monotherapy is not recommended.

6.2 Hepatitis B, chronic

INTERFERONS

Peginterferon alfa

- **Drug Action** Polyethylene glycol-conjugated (‘pegylated’) derivatives of interferon alfa (peginterferon alfa-2a and peginterferon alfa-2b) are available; pegylation increases the persistence of the interferon in the blood.

**INDICATIONS AND DOSE**

PEGASYS®

Combined with ribavirin for chronic hepatitis C | Monotherapy for chronic hepatitis C if ribavirin not tolerated or contra-indicated | Monotherapy for chronic hepatitis B

BY SUBCUTANEOUS INJECTION

- Adults: (consult product literature)

VIRAFERON peg®

Combined with ribavirin for chronic hepatitis C | Combined with ribavirin and boceprevir for chronic hepatitis C infection of genotype 1 in patients with compensated liver disease | Monotherapy for chronic hepatitis C if ribavirin not tolerated or contra-indicated

BY SUBCUTANEOUS INJECTION

- Adults: (consult product literature)

- **CONTRA-INDICATIONS** For contra-indications consult product literature.
- **CAUTIONS** For cautions consult product literature.
- **INTERACTIONS** → Appendix 1 (interferons).
- **SIDE-EFFECTS**
  - **Common or very common** Anorexia, diarrhoea, influenza-like symptoms, lethargy, nausea.
  - **Frequency not known** Alopecia, arthralgia, cardiovascular problems, coma (usually with high doses in the elderly), confusion, depression, hepatotoxicity, hyperglycaemia, hypertension, hypertriglyceridaemia (sometimes severe), hypotension, myelosuppression (particularly affecting granulocyte counts), nephrotoxicity, ocular side-effects, palpitation, psoriasiform rash, seizures (usually with high doses in the elderly), suicidal behaviour, thyroid abnormalities

**SIDE-EFFECTS, FURTHER INFORMATION**

For information on side effects consult product literature.

**CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.

**PREGNANCY** Manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in animal studies).

**BREAST FEEDING** Manufacturers advise avoid—no information available.

**HEPATIC IMPAIRMENT** Avoid in severe impairment. Close monitoring required in mild to moderate hepatic impairment.

**RENAL IMPAIRMENT** Reduce dose in moderate to severe impairment. For information on peginterferon alfa use in renal impairment consult product literature. Close monitoring required in renal impairment.

**MONITORING REQUIREMENTS** Monitoring of lipid concentration is recommended.

**NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

- Peginterferon alfa and ribavirin for mild chronic hepatitis C (August 2006 and September 2010) NICE TA200
  - The combination of peginterferon alfa and ribavirin can be used for treating mild chronic hepatitis C in patients over 18 years. Alternatively, treatment can be delayed until the disease has reached a moderate stage (‘watchful waiting’). Peginterferon alfa alone can be used if ribavirin is contra-indicated or not tolerated. www.nice.org.uk/TA200
- Peginterferon alfa, interferon alfa, and ribavirin for moderate to severe chronic hepatitis C (January 2004 and September 2010) NICE TA200
  - The combination of peginterferon alfa and ribavirin should be used for treating moderate to severe chronic hepatitis C in patients aged over 18 years:
  - not previously treated with interferon alfa or peginterferon alfa;
Entecavir

**INDICATIONS AND DOSE**

Chronic hepatitis B in patients with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) not previously treated with nucleoside analogues

**BY MOUTH**

- Adult: 500 micrograms once daily

**SIDE-EFFECTS**

- Alopecia
- Diarrhoea
- Fatigue
- Headache
- Nausea
- Raised serum amylase
- Raised serum lipase
- Sleep disturbances
- Vomiting

**CAUTIONS, FURTHER INFORMATION**

Discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis.

**NATIONAL FUNDING/ACCESS DECISIONS**

Entecavir is an option for the treatment of chronic hepatitis B. www.nice.org.uk/TA153

Entecavir is an option for the treatment of chronic hepatitis B (August 2008) NICE TA153

Entecavir is an option for the treatment of chronic hepatitis B. www.nice.org.uk/TA153

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

**EXCIPIENTS:** May contain Benzyl alcohol

- Peginterferon alfa.2a 180 microgram per 1 ml Pegasis 90 micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (PSD) £76.51

- Viraferon Peg 100 microgram powder and solvent for solution for injection pre-filled disposable devices CLEARCLICK | 1 pre-filled disposable injection (PSD) £132.92
- Viraferon Peg 120 microgram powder and solvent for solution for injection pre-filled disposable devices CLEARCLICK | 1 pre-filled disposable injection (PSD) £139.38
- Viraferon Peg 150 microgram powder and solvent for solution for injection pre-filled disposable devices CLEARCLICK | 1 pre-filled disposable injection (PSD) £199.38

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Baraclude (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Entecavir (as Entecavir monohydrate) 0.5 microgram Baraclude 0.5mg tablets | 30 tablet (PT) £63.26
  - Entecavir (as Entecavir monohydrate) 1 mg Baraclude 1mg tablets | 30 table (PT) £63.26

**Oral solution**

- Baraclude (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Entecavir (as Entecavir monohydrate) 50 microgram per 1 ml Baraclude 0.05mg/ml oral solution (sugar-free) | 210 ml (PSO) £423.80

**NUCLEOSIDE ANALOGUES**

Entecavir

**INDICATIONS AND DOSE**

Chronic hepatitis B in patients with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis) not previously treated with nucleoside analogues

**BY MOUTH**

- Adult: 1 mg once daily, consider other treatment if inadequate response after 6 months

Chronic hepatitis B in patients with decompensated liver disease

**BY MOUTH**

- Adult: 1 mg once daily
Telbivudine

**INDICATIONS AND DOSE**
Chronic hepatitis B infection with compensated liver disease, evidence of viral replication, and histologically documented active liver inflammation or fibrosis, when other treatment is not appropriate

**BY MOUTH**
- Adult: 600 mg once daily

- **CAUTIONS**
  - Lamivudine-resistant chronic hepatitis B—risk of telbivudine resistance

- **CAUTIONS, FURTHER INFORMATION**
  - Discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis.

- **INTERACTIONS**
  - Appendix 1 (telbivudine).

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain · cough · diarrhea · dizziness · fatigue · headache · nausea · raised serum amylase · raised serum lipase · rash
  - **Uncommon** Arthralgia · myalgia · myopathy (discontinue treatment) · peripheral neuropathy · taste disturbance
  - **Rare** Lactic acidosis · rhabdomyolysis

- **PREGNANCY**
  - Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING**
  - Manufacturer advises avoid—present in milk in animal studies.

- **RENAL IMPAIRMENT**
  - 600 mg every 48 hours if eGFR 30–49 mL/minute/1.73 m²; 600 mg every 72 hours if eGFR less than 30 mL/minute/1.73 m²

- **MONITORING REQUIREMENTS**
  - Monitor liver function tests every 3 months and viral markers of hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

- **PATIENT AND CARER ADVICE**
  - Muscle effects and peripheral neuropathy
  - Patients should be advised to promptly report unexplained muscle pain, tenderness, or weakness, or numbness, tingling or burning sensations.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  - NICE technology appraisals (TAs)
    - Telbivudine for chronic hepatitis B (August 2008) NICE TA154
    - Telbivudine is not recommended for the treatment of chronic hepatitis B. Patients currently receiving telbivudine can continue treatment until they and their clinician consider it appropriate to stop. [www.nice.org.uk/TA154](http://www.nice.org.uk/TA154)

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**
  - Hepsera (Gilead Sciences International Ltd)
    - Telbivudine 600 mg Hepsera 600mg tablets | 28 tablet [Pres] £290.33

Nucleotide Analogue

**Adefovir dipivoxil**

**INDICATIONS AND DOSE**
Chronic hepatitis B infection with either compensated liver disease with evidence of viral replication, and histologically documented active liver inflammation and fibrosis, when other treatment not appropriate or decompensated liver disease in combination with another antiviral for chronic hepatitis B that has no cross-resistance to adefovir

**BY MOUTH**
- Adult: 10 mg once daily

- **CAUTIONS**
  - Elderly
  - Discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis.

  - **SIDE-EFFECTS**
    - Abdominal pain · asthenia · diarrhea · dyspepsia · flatulence · headache · hypophosphataemia · nausea · pancreatitis · pruritus · rash · renal failure · vomiting

  - **CONCEPTION AND CONTRACEPTION**
    - Effective contraception required during treatment.

  - **PREGNANCY**
    - Toxicity in animal studies—manufacturer advises use only if potential benefit outweighs risk.

  - **BREAST FEEDING**
    - Manufacturer advises avoid—no information available.

  - **RENAL IMPAIRMENT**
    - 10 mg every 48 hours if eGFR 30–50 mL/minute/1.73 m²; 10 mg every 72 hours if eGFR 10–30 mL/minute/1.73 m²

  - **MONITORING REQUIREMENTS**
    - Monitor liver function tests every 3 months, and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

    - Monitor renal function before treatment then every 3 months during treatment and discontinuation.

    - **MONITORING REQUIREMENTS**
      - Monitor liver function tests every 3 months, and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

    - **MONITORING REQUIREMENTS**
      - Monitor renal function before treatment then every 3 months, more frequently in patients receiving nephrotoxic drugs.

  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug.

  - **Tablet**
    - Hepsera (Gilead Sciences International Ltd)
      - Adefovir dipivoxil 10 mg Hepsera 10mg tablets | 30 tablet [Pres] £252.22

6.3 Hepatitis C, chronic

**Non-structural protein 5a inhibitors**

**Daclatasvir**

- **DRUG ACTION**
  - Daclatasvir is an inhibitor of the multifunctional protein NS5A, which is an essential component of the hepatitis C virus replication process.

- **INDICATIONS AND DOSE**
  - In combination with sofosbuvir for the treatment of chronic hepatitis C infection of genotypes 1 or 4, with or without compensated cirrhosis
  - In combination with sofosbuvir and ribavirin for the treatment of chronic hepatitis C infection of genotype 3 in patients who are treatment experienced, with or without compensated cirrhosis
  - In combination with peginterferon alfa and ribavirin for the treatment of chronic hepatitis C infection of genotype 4

- **BY MOUTH**
  - Adult: Usual dose 60 mg once daily (for duration of treatment consult product literature)

  - **Dose adjustments due to interactions**
    - Reduce dose to 30 mg once daily with concomitant use of potent CYP3A4 inhibitors (e.g. atazanavir boosted with ritonavir, boceprevir, clarithromycin, cobicistat, itraconazole, ketoconazole, posaconazole, telaprevir, telithromycin, and voriconazole).
    - Increase dose to 90 mg once daily with concomitant use of moderate CYP3A4 inducers (e.g. efavirenz).
**Ribavirin (Tribavirin)**

**INDICATIONS AND DOSE**

**COPEGUS® TABLETS**

Chronic hepatitis C (in combination with direct acting antivirals, or interferon alfa 2a, or peginterferon alfa 2a with or without direct acting antivirals)

**BY MOUTH**

- Adult (body-weight up to 74 kg): 400 mg, dose to be taken in the morning and 600 mg, dose to be taken in the evening
- Adult (body-weight 75 kg and above): 600 mg twice daily

Chronic hepatitis C (in combination with peginterferon alfa 2b with or without direct acting antivirals)

**BY MOUTH**

- Adult (body-weight up to 64 kg): 400 mg twice daily
- Adult (body-weight 65-80 kg): 400 mg, to be taken in the morning and 600 mg, to be taken in the evening
- Adult (body-weight 81-105 kg): 600 mg twice daily
- Adult (body-weight 106 kg and above): 600 mg, to be taken in the morning and 800 mg, to be taken in the evening

**SIDE-EFFECTS**

**Common or very common** Abdominal pain, alopecia, anaemia, anxiety, arthralgia, blurred vision, constipation, cough, decreased appetite, depression, diarrhoea, disturbance in attention, dizziness, dry mouth, dry skin, dyspnoea, flatulence, gastro-oesophageal reflux, headache, hot flush, insomnia, irritability, lymphopenia, malaise, migraine, myalgia, nasal congestion, nausea, neutropenia, pruritus, pyrexia, rash, reduced visual acuity, vomiting.

**SIDE-EFFECTS, FURTHER INFORMATION**

Side-effects listed are reported when daclatasvir is used in combination with sofosbuvir with or without ribavirin or with ribavirin and peginterferon alfa.

**CONCEPTION AND CONTRACEPTION**

Highly effective contraception required during and for 5 weeks after treatment.

**PREGNANCY**

Manufacturer advises avoid (toxicity in animal studies).

**BREAST FEEDING**

Manufacturer advises avoid—present in milk in animal studies.

**PATIENT AND CARER ADVICE**

Missed doses: If a dose is more than 2 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. May affect performance of skilled tasks (e.g. driving).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 25

- Daklinza (Bristol-Myers Squibb Pharmaceuticals Ltd)
- Daclatasvir (as Daclatasvir dihydrochloride) 30 mg Daklinza 30mg tablets | 28 tablet (P08) £8.172.61

**NUCLEOSIDE ANALOGUES**

**Ribavirin**

**INDICATIONS AND DOSE**

**COPEGUS® TABLETS**

Chronic hepatitis C genotype 2 or 3 (not previously treated), or patients infected with HIV and hepatitis C (in combination with peginterferon alfa)

**BY MOUTH**

- Adult: Usual dose 400 mg twice daily

**REBETOL® CAPSULES**

Chronic hepatitis C (in combination with interferon alfa 2b, or peginterferon alfa 2b with or without boceprevir)

**BY MOUTH**

- Adult (body-weight up to 64 kg): 400 mg twice daily
- Adult (body-weight 65-80 kg): 400 mg, dose to be given in the morning and 600 mg, dose to be given in the evening
- Adult (body-weight 81-104 kg): 600 mg twice daily
- Adult (body-weight 105 kg and above): 600 mg, dose to be given in the morning and 800 mg, dose to be given in the evening

**REBETOL® ORAL SOLUTION**

Chronic hepatitis C (in combination with interferon alfa or peginterferon alfa)

**BY MOUTH**

- Adult (body-weight up to 64 kg): 400 mg twice daily
- Adult (body-weight 65-80 kg): 400 mg daily, dose to be given in the morning and 600 mg daily, dose to be given in the evening
- Adult (body-weight 81-104 kg): 600 mg twice daily
- Adult (body-weight 105 kg and above): 600 mg daily, dose to be given in the morning and 800 mg daily, dose to be given in the evening

**CONTRA-INDICATIONS**

Consult product literature for specific contra-indications when ribavirin used in combination with other medicinal products.

**CAUTIONS**

Anaemia (haemoglobin concentration should be monitored during the treatment and corrective action taken) - cardiac disease (assessment including ECG recommended before and during treatment—discontinue if deterioration) - consult product literature for specific cautions when ribavirin used in combination with other medicinal products - gout - haemolysis (haemoglobin concentration should be monitored during the treatment and corrective action taken) - patients with a transplant—risk of rejection - severe dental disorders - severe ocular disorders - severe periodontal disorders - severe psychiatric effects.

**INTERACTIONS**

Appendix 1 (ribavirin).

**SIDE-EFFECTS**

Abdominal pain, abnormal dreams, acne, alopecia, angina, anorexia, anxiety, aplastic anaemia, arthralgias, ataxia, bacterial disorders, breast pain, cardiomyopathy, cerebral haemorrhage, cerebral ischaemia, changes in blood pressure, cholelithiasis, chest pain, colitis, constipation, cough, dehydration, diabetes, diarrhoea, dizziness, dry eyes, dry mouth, dry skin, dyspepsia, dysphagia, dysphonia, earache, endocarditis, eye pain, flatulence, flushing, gastro-intestinal bleeding, gingival bleeding, gingivitis, glossitis, haemolytic anaemia (anaemia may be improved by epoprostenol), headache, hearing impairment, hearing loss, hyperaesthesia, hyperglycaemia, hyperkinesia, hyperventilation, hypertonia, hypertriglyceridaemia, hyperuricaemia, hypoaesthesia, hypocalcaemia, impaired concentration and memory, increased sweating, influenza-like symptoms, interstitial pneumonitis, leucopenia, lymphadenopathy, malaise, mania, menstrual disturbance, micturition disorders, mouth ulcers, musculoskeletal pain, myalgia, myocardial infarction, myositis, nasal congestion, nausea, neutropenia, optic neuropathy, oral candidiasis, palpititation, pancreatitis, —
paraesthesia • peptic ulcer • pericarditis • peripheral neuropathy • peripheral oedema • photosensitivity • prostatitis • pruritus • psoriasis • psychotic disorders • pulmonary embolism • rash • renal failure • respiratory infections • retinal detachment • retinal haemorrhage • rhombomylia • rheumatoid arthritis • sarcoidosis • seizures • sexual dysfunction • sinus congestion • skin discoloration • sleep disturbances • sore throat • Stevens-Johnson syndrome • stomatitis • suicidal ideation (more frequent in children) • syncope • systemic lupus erythematosus • tachycardia • taste disturbance • thrombocytopenia • thrombocytopenia purpura • thyroid disorders • tinnitus • tongue pigmentation • toxic epidermal necrolysis • tremor • urinary tract infections • vacuities • vision loss • visual disturbances • vomiting • weight loss • wheezing

SIDE-EFFECTS, FURTHER INFORMATION

Side-effects listed are reported when oral ribavirin is used in combination with peginterferon alfa or interferon alfa, consult product literature for details.

- CONCEPTION AND CONTRACEPTION
  Exclude pregnancy before treatment in females of childbearing age. Effective contraception essential during treatment and for 4 months after treatment in females and for 7 months after treatment in males of childbearing age. Routine monthly pregnancy tests recommended. Condoms must be used if partner of male patient is pregnant (ribavirin excreted in semen).

- PREGNANCY
  Avoid; teratogenicity in animal studies.

- BREAST FEEDING
  Avoid—no information available.

- HEPATIC IMPAIRMENT
  No dosage adjustment required. Avoid oral ribavirin in severe hepatic dysfunction or decompensated cirrhosis.

- RENAL IMPAIRMENT
  Plasma-ribavirin concentration increased.

  Manufacturer advises avoid oral ribavirin unless essential if eGFR less than 50 ml/minute/1.73 m²—monitor haemoglobin concentration closely.

- MONITORING REQUIREMENTS
  Determine full blood count, platelets, electrolytes, glucose, serum creatinine, liver function tests and uric acid before starting treatment and then on weeks 2 and 4 of treatment, then as indicated clinically—adjust dose if adverse reactions or laboratory abnormalities develop (consult product literature).

- PRESCRIBING AND DISPENSING INFORMATION
  Flavours of oral liquid formulations may include bubble-gum.

- NATIONAL FUNDING/ACCESS DECISIONS

  NICE technology appraisals (Tas)
  - Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Interferon alfa for either monotherapy or combined therapy should be used only if neutropenia and thrombocytopenia are a particular risk. Patients receiving interferon alfa may be switched to peginterferon alfa. www.nice.org.uk/TA200

  NUCLEOTIDE ANALOGUES

  **Sofosbuvir**

  **INDICATIONS AND DOSE**
  In combination with ribavirin (Copegus®), with or without peginterferon alfa, for chronic hepatitis C infection of genotypes 1, 3, 4, 5, or 6 in patients with compensated liver disease | In combination with ribavirin (Copegus®) for chronic hepatitis C infection of genotype 2 in patients with compensated liver disease | In combination with daclatasvir for chronic hepatitis C infection of genotype 1, 3, or 4

  **BY MOUTH**

  - Adult: 400 mg once daily, for duration of treatment consult product literature

  **CAUTIONS, FURTHER INFORMATION**
  In chronic hepatitis C of genotype 1, 4, 5, or 6, only use sofosbuvir with ribavirin in those with intolerance or contra-indications to peginterferon alfa who require urgent treatment.

  **INTERACTIONS** → Appendix 1 (sofosbuvir).

  **SIDE-EFFECTS** Abdominal discomfort • agitation • alopecia • anaemia • anxiety • arthralgia • asthma • blurred vision • chest pain • constipation • cough • decreased appetite • depression • diarrhoea • disturbance in attention • dizziness • dry mouth • dyspnoea • gastro-oesophageal reflux • headache • influenza-like symptoms • insomnia • irritability • memory impairment • migraine • myalgia • nausea • neutropenia • rash • vomiting • weight loss

  **SIDE-EFFECTS, FURTHER INFORMATION**
  Side-effects listed are reported when sofosbuvir is used in combination with ribavirin or with ribavirin and peginterferon alfa

  **PREGNANCY** Manufacturer advises avoid.

  **BREAST FEEDING** Manufacturer advises avoid—metabolites present in milk in animal studies.
Hepatitis C, chronic

547

RENAL IMPAIRMENT Safety and efficacy not established if eGFR less than 30 mL/minute/1.73 m²—accumulation may occur.

PRESCRIBING AND DISPENSING INFORMATION Dispense in original container (contains desiccant).

PATIENT AND CARER ADVICE Missed doses If a dose is more than 18 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Sofosbuvir for treating chronic hepatitis C (February 2015) NICE TA330

Sofosbuvir in combination with peginterferon alfa and ribavirin is an option for treating adults with chronic hepatitis C infection:
- of genotype 1
- of genotype 3 with cirrhosis (treatment naive patients)
- of genotype 3 that has not adequately responded to interferon-based treatment
- of genotype 4, 5, or 6 with cirrhosis

Sofosbuvir in combination with ribavirin is an option for treating adults with chronic hepatitis C infection:
- of genotype 2 who are intolerant to or ineligible for interferon (treatment naive patients)
- of genotype 2 that has not adequately responded to interferon-based treatment
- of genotype 3 with cirrhosis who are intolerant to or ineligible for interferon (treatment naive patients)
- of genotype 3 that has not adequately responded to interferon-based treatment

Sofosbuvir in combination with ribavirin is not recommended for the treatment of adults with chronic hepatitis C infection of genotypes 1, 4, 5, or 6. www.nice.org.uk/TA330

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (June 2014) that sofosbuvir (Sovaldi®) is accepted for use within NHS Scotland for the treatment of chronic hepatitis C infection of genotypes 1 to 6; its use in combination with ribavirin as dual therapy for chronic hepatitis C infection of either genotype 2 (in treatment naive patients) or genotype 3 is restricted to those who cannot use peginterferon alfa because of intolerance or contra-indications.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Table CAUTIONARY AND ADVISORY LABELS 21, 25

Sofosbuvir 400 mg Sovaldi 400mg tablets | 28 tablet £11.660.98

PROTEASE INHIBITORS (HEPATITIS)

Boceprevir

INDICATIONS AND DOSE Chronic hepatitis C infection of genotype 1 in patients with compensated liver disease

BY MOUTH
- Adult: 800 mg 3 times a day, for duration of treatment consult product literature

CONTRA-INDICATIONS Autoimmune hepatitis
CAUTIONS Coagulopathy hypoalbuminaemia low platelets predisposition to QT interval prolongation

CAUTIONS, FURTHER INFORMATION

Low platelets, hypoalbuminaemia, or coagulopathy Not recommended in patients with low platelets, hypoalbuminaemia, or coagulopathy—if initiated in these patients monitor closely for signs of infection, worsening liver impairment and anaemia (increased risk of severe morbidity and mortality).

INTERACTIONS Appendix 1 (boceprevir). Caution with concomitant use of other drugs known to prolong QT interval.

SIDE-EFFECTS

Common or very common Abdominal pain agitation alopecia amnesia anaemia anxiety arthralgia asthenia blood pressure changes changes in libido constipation cough decreased appetite depression diarrhoea disturbances in smell disturbances in taste dizziness dry eyes dry mouth dysphagia erectile dysfunction flatulence gastro-oesophageal reflux haemorrhoids headache hyperglycaemia hyperhidrosis hyperglycaemia hyperuricaemia hyperkalaemia hypothyroidism influenza-like symptoms insomnia leucopenia mouth ulcers muscle spasms myalgia nausea palpitation pancytopenia paraesthesia peripheral oedema polyuria pruritus psoriasis rash stomatitis syncope thrombocytopenia tinnitus tooth disorder tremor visual disturbances vomiting weight loss

Uncommon Amenorrhoea arrhythmias colitis conjunctival haemorrhage dysphagia dysphonia dysuria eye pain flushing gingivitis gout hearing impairment homicidal ideation hyperaesthesia hyperbilirubinaemia hypercalcaemia hypercalciuria hypokalaemia increased lacrimation menorrhagia pallor pancreatitis photophobia photosensitivity retinal ischaemia retinopathy skin ulceration suicidal ideation tongue discoloration venous thromboembolism

Rare Acute myocardial infarction aspergillosis bipolar disorder cholecytitis coronary artery disease encephalopathy hallucinations pericarditis pleural effusion respiratory failure sarcoidosis thyroid neoplasms

Frequency not known Rash with eosinophilia and systemic symptoms Stevens-Johnson syndrome}

SIDE-EFFECTS, FURTHER INFORMATION Side-effects listed are reported when boceprevir is used in combination with ribavirin and peginterferon alfa

PREGNANCY Manufacturer advises avoid.

BREAST FEEDING Manufacturer advises avoid; present in milk in animal studies.

MONITORING REQUIREMENTS Monitor full blood count before starting treatment and then on weeks 2, 4, 8, and 12 of treatment, then as indicated clinically.

PATIENT AND CARER ADVICE Missed doses If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Boceprevir for chronic hepatitis C infection of genotype 1 (April 2012) NICE TA253

Boceprevir in combination with ribavirin and peginterferon alfa is an option for the treatment of chronic hepatitis C infection of genotype 1 in adults with compensated liver disease:
- who have not been treated previously;
- in whom previous treatment (e.g. with peginterferon alfa in combination with ribavirin) has failed. www.nice.org.uk/TA253
Simeprevir

**INDICATIONS AND DOSE**

In combination with ribavirin and peginterferon alfa for chronic hepatitis C infection of genotype 1 or 4. In combination with sofosbuvir (with or without ribavirin) for urgent treatment of chronic hepatitis C infection of genotype 1 or 4 when peginterferon alfa cannot be used because of intolerance or contra-indications.

**BY MOUTH**

- Adult: 150 mg once daily (for duration of treatment consult product literature).

**CAUTIONS**

Consider alternative treatment in presence of NS3 Q80K polymorphism—efficacy of simeprevir is reduced. Patients of East Asian origin.

**INTERACTIONS**

Appendix 1 (simeprevir).

**SIDE-EFFECTS**

Contipation, dyspnoea, fatigue (in combination with sofosbuvir), headache (in combination with sofosbuvir), insomnia (in combination with sofosbuvir), nausea, photoaenstivity, pruritus, raised bilirubin concentration. Rash

**SIDE-EFFECTS, FURTHER INFORMATION**

Rash. Monitor for deterioration if mild or moderate; discontinue if severe.

**CONCEPTION AND CONTRACEPTION**

Effective contraception essential during treatment.

**PREGNANCY**

Manufacturer advises use only if potential benefit outweighs risk—toxicity in animal studies.

**BREAST FEEDING**

Manufacturer advises avoid—present in plasma of breast-fed animals.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution in moderate to severe impairment—elimination reduced in severe impairment. Manufacturer advises caution in decompensated cirrhosis—elimination reduced in severe impairment.

**RENAL IMPAIRMENT**

Manufacturer advises caution if eGFR less than 30 mL/minute/1.73 m²—elimination may be reduced.

**PRE-TREATMENT SCREENING**

Test for NS3 Q80K polymorphism before combination treatment with ribavirin and peginterferon alfa in patients with chronic hepatitis C infection of genotype 1a. Consider testing for NS3 Q80K polymorphism before combination treatment with sofosbuvir (with or without ribavirin) in patients with chronic hepatitis C infection of genotype 1a.

**PATIENT AND CARER ADVICE**

Missed doses. If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Simeprevir in combination with peginterferon alfa and ribavirin for treating genotypes 1 and 4 chronic hepatitis C (February 2015) NICE TA331

Simeprevir in combination with peginterferon alfa and ribavirin, is recommended within its marketing authorisation, as an option for the treatment of chronic hepatitis C infection of genotype 1 and 4 in adults. www.nice.org.uk/TA331

Telaprevir

**INDICATIONS AND DOSE**

In combination with ribavirin and peginterferon alfa for chronic hepatitis C infection of genotype 1 in patients with compensated liver disease.

BY MOUTH

- Adult: 1.125 g every 12 hours, alternatively 750 mg every 8 hours, for duration of treatment consult product literature.

**CAUTIONS**

**INTERACTIONS**

Appendix 1 (telaprevir). Caution in concomitant use with other drugs known to prolong QT interval.

**SIDE-EFFECTS**

- Rare. Stevens-Johnson syndrome. Toxic epidermal necrosis.

**SIDE-EFFECTS, FURTHER INFORMATION**

Side-effects listed are reported when telaprevir is used in combination with ribavirin and peginterferon alfa.

**SIDE-EFFECTS, FURTHER INFORMATION**

Rash. Rash occurs very commonly. If rash mild or moderate, may continue without interruption, but monitor for deterioration. If moderate rash deteriorates, consider permanent discontinuation of telaprevir; if rash does not improve within 7 days of discontinuation, suspend ribavirin. If severe rash or if rash accompanied by blistering or mucosal ulceration, discontinue telaprevir permanently; if rash does not improve within 7 days of discontinuation, consider discontinuation of ribavirin and peginterferon alfa. If serious rash, or if severe rash deteriorates, or if rash accompanied by systemic symptoms, discontinue telaprevir, ribavirin, and peginterferon alfa permanently.

**CONCEPTION AND CONTRACEPTION**

Effectiveness of hormonal contraceptives reduced during treatment and for 2 months after stopping telaprevir—effective non-hormonal methods of contraception necessary during this time.

**PREGNANCY**

Manufacturer advises avoid.

**BREAST FEEDING**

Manufacturer advises avoid—present in milk in animal studies.
Herpesvirus infections

Herpes simplex infections

The two most important herpesvirus pathogens are herpes simplex virus (herpesvirus hominis) and varicella–zoster virus.

Herpes simplex infections

Herpes infection of the mouth and lips and in the eye is generally associated with herpes simplex virus serotype 1 (HSV-1); other areas of the skin may also be infected, especially in immunodeficiency. Genital infection is most often associated with HSV-2 and also HSV-1. Treatment of herpes simplex infection should start as early as possible and usually within 5 days of the appearance of the infection. In individuals with good immune function, mild infection of the eye (ocular herpes) and of the lips (herpes labialis or cold sores) is treated with a topical antiviral drug. Primary herpetic gingivostomatitis is managed by changes to diet and with analgesics. Severe infection, neonatal herpes infection or infection in immunocompromised individuals requires treatment with a systemic antiviral drug. Primary or recurrent genital herpes simplex infection is treated with an antiviral drug given by mouth. Persistence of a lesion or recurrence in an immunocompromised patient may signal the development of resistance.

Specialist advice should be sought for systemic treatment of herpes simplex infection in pregnancy.

Varicella-zoster infections

Regardless of immune function and the use of any immunoglobulins, neonates with chickenpox should be treated with a parenteral antiviral to reduce the risk of severe disease. Oral therapy in children is not recommended as absorption is variable. Chickenpox in otherwise healthy children between 1 month and 12 years is usually mild and antiviral treatment is not usually required.

Chickenpox is more severe in adolescents and adults than in children; antiviral treatment started within 24 hours of the onset of rash may reduce the duration and severity of symptoms in otherwise healthy adults and adolescents. Antiviral treatment is generally recommended in immunocompromised patients and those at special risk (e.g. because of severe cardiovascular or respiratory disease or chronic skin disorder); in such cases, an antiviral is given for 10 days with at least 7 days of parenteral treatment.

Pregnant women who develop severe chickenpox may be at risk of complications, especially varicella pneumonia. Specialist advice should be sought for the treatment of chickenpox during pregnancy.

Those who have been exposed to chickenpox and are at special risk of complications may require prophylaxis with varicella-zoster immunoglobulin (see under Disease Specific Immunoglobulins).

In herpes zoster (shingles) systemic antiviral treatment can reduce the severity and duration of pain, reduce complications, and reduce viral shedding. Treatment with the antiviral should be started within 72 hours of the onset of rash and is usually continued for 7–10 days. Immunocompromised patients at high risk of disseminated or severe infection should be treated with a parenteral antiviral drug.

Chronic pain which persists after the rash has healed (postherpetic neuralgia) requires specific management.

Choice

Aciclovir p. 550 is active against herpesviruses but does not eradicate them. Uses of aciclovir include systemic treatment of varicella–zoster and the systemic and topical treatment of herpes simplex infections of the skin and mucous membranes. It is used by mouth for severe herpetic stomatitis. Aciclovir eye ointment is used for herpes simplex infections of the eye; it is combined with systemic treatment for ophthalmic zoster.

Famciclovir p. 552, a prodrug of penciclovir, is similar to aciclovir and is licensed for use in herpes zoster and genital herpes.

Valaciclovir p. 552 is an ester of aciclovir, licensed for herpes zoster and herpes simplex infections of the skin and mucous membranes (including genital herpes); it is also licensed for preventing cytomegalovirus disease following solid organ transplantation. Famciclovir or valaciclovir are suitable alternatives to aciclovir for oral lesions associated with herpes zoster. Valaciclovir once daily may reduce the risk of transmitting genital herpes to heterosexual partners—specialist advice should be sought.

Foscarnet sodium p. 553 is used for mucocutaneous herpes simplex virus infection unresponsive to aciclovir in immunocompromised patients; it is toxic and can cause renal impairment.

Inosine pranobex p. 550 has been used by mouth for herpes simplex infections; its effectiveness remains unproven.

Cytomegalovirus infection

Ganciclovir p. 554 is related to aciclovir but it is more active against cytomegalovirus (CMV); it is also much more toxic than aciclovir and should therefore be prescribed only when the potential benefit outweighs the risks. Ganciclovir is administered by intravenous infusion for the initial treatment of CMV infection. Ganciclovir causes profound myelosuppression when given with zidovudine p. 566; the
two should not normally be given together particularly during initial ganciclovir therapy. The likelihood of ganciclovir resistance increases in patients with a high viral load or in those who receive the drug over a long duration. Valganciclovir is an ester of ganciclovir which is licensed for the initial treatment and maintenance treatment of CMV retinitis in AIDS patients. Valganciclovir is also licensed for preventing CMV disease following solid organ transplantation from a cytomegalovirus-positive donor. Foscarnet sodium is also active against cytomegalovirus; it is toxic and can cause renal impairment. See local treatment of CMV retinitis.

**INOSINE COMPLEXES**

**Inosine pranobex** *(Inosine acedoben dimepranol)*

**INDICATIONS AND DOSE**

**Mucocutaneous herpes simplex**

*BY MOUTH*

- Adult: 1 g 4 times a day for 7–14 days

**Adjuvant treatment of genital warts**

*BY MOUTH*

- Adult: 1 g 3 times a day for 14–28 days

**Subacute sclerosing panencephalitis**

*BY MOUTH*

- Adult: 50–100 mg/kg daily in 6 divided doses

**CAUTIONS**

- History of gout - history of hyperuricaemia

**SIDE-EFFECTS**

- Common or very common Reversible increase in serum uric acid - reversible increase in urinary uric acid

- Uncommon Arthralgia - epigastric discomfort - fatigue - headache - itching - nausea - rashes - vertigo - vomiting

- Rare Anxiety - constipation - diarrhoea - polyuria - sleep disturbances

**PREGNANCY**

Manufacturer advises avoid.

**RENAL IMPAIRMENT**

Manufacturer advises caution;

metabolised to uric acid.

**LESS SUITABLE FOR PRESCRIBING**

Inosine pranobex is less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS**

*Imunovir* *(KoRa Healthcare)*

- Inosine acedoben dimepranol 500 mg Imunovir 500mg tablets £39.50

**NUCLEOSIDE ANALOGUES**

**Aciclovir** *(Acyclovir)*

**INDICATIONS AND DOSE**

**Herpes simplex, suppression**

*BY MOUTH*

- Child 12-17 years: 400 mg twice daily, alternatively 200 mg 4 times a day; increased to 400 mg 3 times a day, dose may be increased if recurrences occur on standard suppressive therapy or for suppression of genital herpes during late pregnancy (from 36 weeks gestation), therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

- Adult: 400 mg twice daily, alternatively 200 mg 4 times a day; increased to 400 mg 3 times a day, dose may be increased if recurrences occur on standard suppressive therapy or for suppression of genital herpes during late pregnancy (from 36 weeks gestation), therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

**Herpes simplex, prophylaxis in the immunocompromised**

*BY MOUTH*

- Child 1 month-1 year: 100–200 mg 4 times a day

- Child 2-17 years: 200–400 mg 4 times a day

- Adult: 200–400 mg 4 times a day

**Herpes simplex, treatment (non-genital)**

*BY MOUTH*

- Child 1 month-1 year: 100 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

- Child 2-17 years: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

- Adult: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

**Herpes simplex, treatment (non-genital) in simplex encephalitis, immunocompromised patients or if absorption impaired**

*BY MOUTH*

- Child 1 month-1 year: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

- Child 2-17 years: 400 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

- Adult: 400 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

**Genital herpes simplex, treatment of first episode**

*BY MOUTH*

- Adult: 200 mg 5 times a day, alternatively 400 mg 3 times a day both courses usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

**Genital herpes simplex, treatment of severe, initial infection**

*BY INTRAVENOUS INFUSION*

- Adult: Initially 5 mg/kg every 8 hours usually for 5 days; increased to 10 mg/kg every 8 hours for at least 14 days in encephalitis (at least 21 days if also immunocompromised)—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment, to be increased only if resistant organisms suspected or in simplex encephalitis

**Genital herpes simplex, treatment of first episode in immunocompromised or HIV-positive patients**

*BY MOUTH*

- Adult: 400 mg 5 times a day for 7–10 days

**Herpes simplex, treatment of recurrent infection**

*BY MOUTH*

- Adult: 800 mg 3 times a day for 2 days, alternatively 200 mg 5 times a day for 5 days, alternatively 400 mg 3 times a day for 3–5 days

**Genital herpes simplex, treatment of recurrent infection in immunocompromised or HIV-positive patients**

*BY MOUTH*

- Adult: 400 mg 3 times a day for 5–10 days
<table>
<thead>
<tr>
<th>Side-effects</th>
<th>Doses at extremes of body weight</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Risk of neurological reactions</strong></td>
<td>To avoid excessive dosage in obese patients parenteral dose should be calculated on the basis of ideal weight for height.</td>
</tr>
</tbody>
</table>

**Unlicensed use**

Attenuation of chickenpox is an unlicensed indication. Tablets and suspension not licensed for suppression of herpes simplex or for treatment of herpes zoster in children (age range not specified by manufacturer).

**Caution**

Elderly (risk of neurological reactions) (in adults) - maintain adequate hydration (especially with infusion or high doses).

**Interactions**

Appendix 1 (aciclovir).

**Side-effects**

**General side-effects**

Abdominal pain, diarrhoea, fatigue, headache, nausea, photosensitivity, pruritus, rash, urticaria, vomiting.

**Very rare**

Acute renal failure, anaemia, ataxia, confusion, convulsions, dizziness, drowsiness, dysarthria, dyspnoea, hallucinations, hepatitis, jaundice, leucopenia, neurological reactions, thrombocytopenia.

**Specific side-effects**

**Very rare**

With intravenous use — agitation, fever, psychosis, severe local inflammation (sometimes leading to ulceration) — tremors.

**Pregnancy**

Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.

**Breast feeding**

Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution.

**Renal impairment**

Risk of neurological reactions increased. Maintain adequate hydration (especially during renal impairment).

With intravenous use in adults

Use normal intravenous dose every 12 hours if eGFR 25–50 mL/minute/1.73 m² (every 24 hours if eGFR 10–25 mL/minute/1.73 m²). Consult product literature for intravenous dose if eGFR less than 10 mL/minute/1.73 m².

With oral use in adults

For herpes zoster, use normal oral dose every 8 hours if eGFR 10–25 mL/minute/1.73 m² (every 12 hours if eGFR less than 10 mL/minute/1.73 m²). For herpes simplex, use normal oral dose every 12 hours if eGFR less than 10 mL/minute/1.73 m².

With oral use in children

For herpes zoster, use normal oral dose every 8 hours if estimated glomerular filtration rate 10–25 mL/minute/1.73 m² (every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²). For herpes simplex, use normal dose every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

**Directions for administration**

For intravenous infusion

Zovirax IV®, Aciclovir IV® (Genus), give intermittently in Sodium chloride 0.9% or Sodium chloride and glucose; initially reconstitute to 25 mg/mL in water for injection or sodium chloride 0.9% then dilute to not more than 5 mg/mL with the infusion fluid; to be given over 1 hour; alternatively, may be administered in a concentration of 25 mg/mL using a suitable infusion pump and given over 1 hour; for Aciclovir IV® (Hospira) dilute to not more than 5 mg/mL with infusion fluid; give over 1 hour.

**Prescribing and dispensing information**

Flavours of oral liquid preparations may include banana, or orange.

**Patient and carer advice**

Medicines for Children leaflet: Aciclovir (oral) for viral infections www.medicinesforchildren.org.uk/aciclovir-for-viral-infections

**Professor specific information**

Dental practitioners' formulary: Aciclovir Tablets 200 mg or 800 mg may be prescribed. Aciclovir Oral Suspension 200 mg/5mL may be prescribed. Aciclovir Cream may be prescribed.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

Famciclovir

**INDICATIONS AND DOSE**

**Herpes zoster infection, treatment**

BY MOUTH

- Adult: 500 mg 3 times a day for 7 days, alternatively 750 mg 1–2 times a day for 7 days

**Herpes zoster infection, treatment in immunocompromised patients**

BY MOUTH

- Adult: 500 mg 3 times a day for 10 days, continue for 2 days after crusting of lesions

**Genital herpes, suppression**

BY MOUTH

- Adult: 250 mg twice daily, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

**Genital herpes, suppression in immunocompromised or HIV-positive patients**

BY MOUTH

- Adult: 500 mg twice daily, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

**Herpes simplex infection, treatment of first episode**

BY MOUTH

- Adult: 250 mg 3 times a day for 5 days or longer if new lesions appear during treatment or if healing incomplete

**Herpes simplex infection, treatment of first episode in immunocompromised or HIV-positive patients**

BY MOUTH

- Adult: 500 mg twice daily for 10 days

**Genital herpes infection, treatment of recurrent infection**

BY MOUTH

- Adult: 125 mg twice daily for 5 days, alternatively 1 g twice daily for 1 day

**Genital herpes infection, treatment of recurrent infections in immunocompromised or HIV-positive patients**

BY MOUTH

- Adult: 500 mg twice daily for 5–10 days

**Herpes simplex infection (non-genital), treatment in immunocompromised patients**

BY MOUTH

- Adult: 500 mg twice daily for 5–10 days

**UNLICENSED USE** Famciclovir doses in BNF may differ from those in product literature.

Valaciclovir

**INDICATIONS AND DOSE**

**Herpes zoster infection, treatment**

BY MOUTH

- Adult: 1 g 3 times a day for 7 days

**Herpes zoster infection, treatment in immunocompromised patients**

BY MOUTH

- Adult: 1 g 3 times a day for at least 7 days and continued for 2 days after crusting of lesions

**Herpes simplex, treatment of first infective episode**

BY MOUTH

- Adult: 500 mg twice daily for 5 days (longer if new lesions appear during treatment or healing is incomplete)

**Herpes simplex infections treatment of first episode in immunocompromised or HIV-positive patients**

BY MOUTH

- Adult: 1 g twice daily for 10 days

**Herpes simplex, treatment of recurrent infections**

BY MOUTH

- Adult: 500 mg twice daily for 3–5 days

**Treatment of recurrent herpes simplex infections in immunocompromised or HIV-positive patients**

BY MOUTH

- Adult: 1 g twice daily for 5–10 days

**INTERACTIONS** → Appendix 1 (famciclovir).

**SIDE-EFFECTS**

- Common or very common: Headache, nausea, vomiting
- Rare: Confusion
- Very rare: Dizziness, drowsiness, hallucinations, jaundice, rash, Stevens-Johnson syndrome, thrombocytopenia

**PREGNANCY** Manufacturers advise avoid unless potential benefit outweighs risk.

**BREAST FEEDING** No information available—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Usual dose in well compensated liver disease (information not available on decompensated).

**RENAL IMPAIRMENT** Reduce dose; consult product literature.

**PRESCRIBING AND DISPENSING INFORMATION** Famciclovir is a pro-drug of penciclovir.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

**Tablet**

Herpes simplex, suppression of infections

**BY MOUTH**

- Adult: 500 mg daily in 1–2 divided doses, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences.
- Adult: 500 mg twice daily, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences.

**Genital herpes, reduction of transmission**

Administer on herpes simplex virus infections every 10 hours after initial dose; if eGFR less than 10 mL/minute/1.73 m²; 500 mg every 24 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

**For treatment of herpes simplex**, 500 mg (1 g in immunocompromised or HIV-positive children) every 24 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

**For treatment of herpes labialis**, if estimated glomerular filtration rate 30–50 mL/minute/1.73 m², initially 1 g, then 1 g 12 hours after initial dose if estimated glomerular filtration rate 10–30 mL/minute/1.73 m², initially 500 mg, then 500 mg every 12 hours after initial dose; if estimated glomerular filtration rate less than 10 mL/minute/1.73 m², 500 mg as a single dose.

For suppression of herpes simplex, 250 mg (500 mg in immunocompromised or HIV-positive patients) every 24 hours if eGFR less than 30 mL/minute/1.73 m².

For reduction of genital herpes transmission, 250 mg every 24 hours if eGFR less than 15 mL/minute/1.73 m². Reduce dose according to eGFR for *cytomegalovirus prophylaxis* following solid organ transplantation (consult product literature).

**In children**

For herpes zoster, 1 g every 12 hours if estimated glomerular filtration rate 30–50 mL/minute/1.73 m², 1 g every 24 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²; 500 mg every 24 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

**For treatment of herpes simplex**, 500 mg (1 g in immunocompromised or HIV-positive children) every 24 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

**For treatment of herpes labialis**, if estimated glomerular filtration rate 30–50 mL/minute/1.73 m², initially 1 g, then 1 g 12 hours after initial dose (if estimated glomerular filtration rate 10–30 mL/minute/1.73 m², initially 500 mg, then 500 mg every 12 hours after initial dose; if estimated glomerular filtration rate less than 10 mL/minute/1.73 m², 500 mg as a single dose). For suppression of herpes simplex, 250 mg (500 mg in immunocompromised or HIV-positive children) every 24 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m². Reduce dose according to estimated glomerular filtration rate for *cytomegalovirus prophylaxis* following solid organ transplantation (consult product literature).

**PRESCRIBING AND DISPENSING INFORMATION**

Valaciclovir is a pro-drug of aciclovir.
Ganciclovir

INDICATIONS AND DOSE
Prevention of cytomegalovirus disease during immunosuppressive therapy following organ transplantation

BY INTRAVENOUS INFUSION
- Adult: 5 mg/kg every 12 hours for 7–14 days

Treatment of life-threatening or sight-threatening cytomegalovirus infections in immunocompromised patients only

BY INTRAVENOUS INFUSION
- Adult: 5 mg/kg every 12 hours for 14–21 days, followed by maintenance 6 mg/kg daily on 5 days of the week, alternatively 5 mg/kg daily until adequate recovery of immunity, maintenance only for patients at risk of relapse of retinitis, if retinitis progresses initial induction treatment may be repeated

CONTRA-INDICATIONS
- Abnormally low haemoglobin count (consult product literature)
- Abnormally low neutrophil count (consult product literature)
- Abnormally low platelet count (consult product literature)

CAUTIONS
- Children (possible risk of long-term carcinogenic or reproductive toxicity) ensure adequate hydration, history of cytopenia, potential carcinogen, potential teratogen, radiotherapy, vesicant

INTERACTIONS
- Appendix 1 (ganciclovir).
- Increased risk of myelosuppression with other myelosuppressive drugs—consult product literature.

SIDE-EFFECTS
- Common or very common Abdominal pain, acute renal failure, aggression, agitation, anaemia, anorexia, anxiety, changes in blood pressure, changes in ECG, confusion, constipation, convulsions, depression, diarrhoea, dizziness, dyspepsia, dysuria, electrolyte disturbances, genital irritation and ulceration (due to high concentrations excreted in urine), granulocytopenia, headache, hepatic dysfunction, hypocalcaemia, hypokalaemia, hypomagnesaemia, leucopenia, malaise, myalgia, nausea (reduce infusion rate), neurological disorders, oedema, palpitation, pancreatitis, paraesthesia (reduce infusion rate), polyuria, pruritus, rash, renal impairment, thrombocytopenia, thrombophlebitis if given undiluted by peripheral vein, tremor, vomiting
- Uncommon Acidity
- Frequency not known Diabetes insipidus, myasthenia, myositis, oesophageal ulceration, rhabdomyolysis, ventricular arrhythmias

CONCEPTION AND CONTRACEPTION
- Men should avoid fathering a child during and for 6 months after treatment.

PREGNANCY
- Manufacturer advises avoid.

BREAST FEEDING
- Avoid—present in milk in animal studies.

RENAHAL IMPAIRMENT
- Reduce dose; consult product literature.

MONITORING REQUIREMENTS
- Monitor electrolytes, particularly calcium and magnesium.
- Monitor serum creatinine every second day during induction and every week during maintenance.

DIRECTIONS FOR ADMINISTRATION
- Avoid rapid infusion.
- For intravenous infusion (Foscavir®), give intermittently in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of 12 mg/mL for infusion into peripheral vein (undiluted solution via central venous line only); infuse over at least 1 hour (infuse doses greater than 60 mg/kg over 2 hours).

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.
- Solution for infusion ELECTROLYTES: May contain Sodium
  - Foscavir (Clinigen Healthcare Ltd)
  - Foscarnet sodium 24 mg per 1 ml Foscavir 6g/250ml solution for infusion bottles | 1 bottle £119.85 (Hospital only)

NUCLEOSIDE ANALOGUES

Ganciclovir
Valganciclovir

**INDICATIONS AND DOSE**

**Cytomegalovirus retinitis, induction**

**BY MOUTH**
- Adult: Initially 900 mg twice daily for 21 days, then 900 mg daily, induction regimen may be repeated if retinitis progresses.

**Prevention of cytomegalovirus disease following solid organ transplantation**

**BY MOUTH**
- Adult: 900 mg daily for 100 days (for 100–200 days following kidney transplantation), to be started within 10 days of transplantation.

**Dose equivalence and conversion**

Oral valganciclovir 900 mg twice daily is equivalent to intravenous ganciclovir 5 mg/kg twice daily.

- **CONTRA-INDICATIONS** Abnormally low haemoglobin count (consult product literature) - abnormally low neutrophil count (consult product literature) - abnormally low platelet count (consult product literature).
- **CAUTIONS** Children (possible risk of long-term carcinogenic or reproductive toxicity) - history of cytopenia - potential carcinogen - potential teratogen - radiotherapy.
- **INTERACTIONS** → Appendix 1 (valganciclovir).
- **SIDE-EFFECTS**
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients hypersensitive to ganciclovir, aciclovir, or valaciclovir.
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment and barrier contraception for men during and for at least 90 days after treatment.
- **PREGNANCY** Avoid - teratogenic risk.
- **BREAST FEEDING** Avoid - no information available.
- **RENAL IMPAIRMENT** Reduce dose, consult product literature.
- **MONITORING REQUIREMENTS** Monitor full blood count closely (severe deterioration may require correction and possibly treatment interruption).
- **PRESCRIBING AND DISPENSING INFORMATION**
  - Valganciclovir is a pro-drug of ganciclovir. Flavours of oral liquid formulations may include tutti-frutti.
- **HANDLING AND STORAGE**
  - Caution in handling Valganciclovir is a potential teratogen and carcinogen and caution is advised when handling the powder, reconstituted solution, or broken tablets; if these come into contact with skin or mucosa, wash off immediately with water; avoid inhalation of powder.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS 21**
  - **Valcyte** (Roche Products Ltd)
    - Valganciclovir (as Valganciclovir hydrochloride) 450 mg Valcyte 450 mg tablets | 60 tablet £1.081.46
- **Oral solution**
  - **CAUTIONARY AND ADVISORY LABELS 21**
    - **Valcyte** (Roche Products Ltd)
      - Valganciclovir (as Valganciclovir hydrochloride) 50 mg per 1 ml Valcyte 50 mg/ml oral solution (sugar-free) | 100 ml £220.32

### 6.6 HIV infection

**HIV infection**

There is no cure for infection caused by the human immunodeficiency virus (HIV) but a number of drugs slow or halt disease progression. Drugs for HIV infection (antiretrovirals) may be associated with serious side-effects. Although antiretrovirals increase life expectancy considerably and decrease the risk of complications associated with premature ageing, mortality and morbidity remain slightly higher than in uninfected individuals. Treatment should be undertaken only by those experienced in their use.

**Principles of treatment**

Treatment aims to prevent the mortality and morbidity associated with chronic HIV infection whilst minimising drug toxicity. Although it should be started before the immune system is irreversibly damaged, the need for early drug treatment should be balanced against the risk of toxicity. Commitment to treatment and strict adherence over many years are required; the regimen chosen should take into account convenience and patient tolerance. The development of drug resistance is reduced by using a combination of drugs; such combinations should have synergistic or additive activity while ensuring that their toxicity is not additive. It is recommended that viral sensitivity to antiretroviral drugs is established before starting treatment or before switching drugs if the infection is not responding.

Treatment also reduces the risk of HIV transmission to sexual partners, but the risk is not eliminated completely; this risk and strategies to reduce HIV transmission should be discussed with patients and their sexual partners.

**Initiation of treatment**

The optimum time for initiating antiretroviral treatment depends primarily on the CD4 cell count. The timing and choice of treatment should also take account of clinical symptoms, comorbidities, and the possible effect of antiretroviral drugs on factors such as the risk of cardiovascular events. Treatment includes a combination of drugs known as ‘highly active antiretroviral therapy’.

Treatment of HIV-1 infection is initiated with 2 nucleoside reverse transcriptase inhibitors and either a non-nucleoside reverse transcriptase inhibitor, or a boosted protease inhibitor, or an integrase inhibitor; the regimens of choice contain tenofovir disoproxil and emtricitabine with either efavirenz or ritonavir-boosted atazanavir, or ritonavir-boosted darunavir, or raltegravir. Alternative regimens contain abacavir and lamivudine with either lopinavir or ritonavir, or ritonavir-boosted fosamprenavir, or nevirapine, or rilpivirine. Patients who require treatment for both HIV
and chronic hepatitis B should be treated with antivirals active against both diseases.

**Switching therapy**

Deterioration of the condition (including clinical and virological changes) may require a change in therapy. The choice of an alternative regimen depends on factors such as the response to previous treatment, tolerance and the possibility of cross-resistance.

**Pregnancy**

Treatment of HIV infection in pregnancy aims to reduce the risk of toxicity to the fetus (although information on the teratogenic potential of most antiretroviral drugs is limited), to minimise the viral load and disease progression in the mother, and to prevent transmission of infection to the neonate. All treatment options require careful assessment by a specialist. Combination antiretroviral therapy maximises the chance of preventing transmission and represents optimal therapy for the mother. However, it may be associated with a greater risk of preterm delivery. Pregnancies in HIV-positive women and babies born to them should be reported prospectively to the National Study of HIV in Pregnancy and Childhood at www.ucl.ac.uk/ nshpc/ and to the Antiretroviral Pregnancy Registry at www.apregistry.com.

**Breast-feeding**

Breast-feeding by HIV-positive mothers may cause HIV infection in the infant and should be avoided.

**Post-exposure prophylaxis**

Prophylaxis with antiretroviral drugs [unlicensed indication] may be appropriate following exposure to HIV-contaminated material. Immediate expert advice should be sought in such cases; national guidelines on post-exposure prophylaxis for healthcare workers have been developed (by the Chief Medical Officer’s Expert Advisory Group on AIDS), www.gov.uk/dh and local ones may also be available. Antiretrovirals for prophylaxis are chosen on the basis of efficacy and potential for toxicity. Prompt prophylaxis with antiretroviral drugs [unlicensed indication] is also appropriate following potential sexual exposure to HIV; recommendations have been developed by the British Association for Sexual Health and HIV, www.bashh.org.

**Drugs for HIV infection**

Zidovudine p. 566, a nucleoside reverse transcriptase inhibitor (or ‘nucleoside analogue’), was the first anti-HIV drug to be introduced. Other nucleoside reverse transcriptase inhibitors include abacavir p. 561, didanosine p. 562, emtricitabine p. 563, lamivudine p. 563, stavudine p. 564, and tenofovir disoproxil p. 564.

The protease inhibitors include atazanavir p. 567, darunavir p. 568, fosamprenavir p. 568 (a pro-drug of amprenavir), indinavir p. 569, lopinavir (available as lopinavir with ritonavir), ritonavir p. 570, saquinavir p. 570, and tipranavir p. 571. Indinavir is rarely used in the treatment of HIV-infection because it is associated with nephrolithiasis. Ritonavir in low doses boosts the activity of atazanavir, darunavir, fosamprenavir, indinavir, lopinavir (available as lopinavir with ritonavir), saquinavir, and tipranavir increasing the persistence of plasma concentrations of these drugs; at such a low dose, ritonavir has no intrinsic antiviral activity. The protease inhibitors are metabolised by cytochrome P450 enzyme systems and therefore have a significant potential for drug interactions. Protease inhibitors are associated with lipodystrophy and metabolic effects.

The non-nucleoside reverse transcriptase inhibitors efavirenz p. 558, etravirine p. 559, nevirapine p. 560, and rilpivirine p. 561 are used in the treatment of HIV-1 infection, but not against the subtype HIV-2, a subtype that is rare in the UK. Nevirapine is associated with a high incidence of rash (including Stevens-Johnson syndrome) and occasionally fatal hepatitis. Rash is also associated with efavirenz and etravirine but it is usually milder. Psychiatric or CNS disturbances are common with efavirenz, CNS disturbances are often self-limiting and can be reduced by taking the dose at bedtime (especially in the first 2–4 weeks of treatment). Efavirenz has also been associated with an increased plasma–cholesterol concentration. Etravirine is used in regimens containing a boosted protease inhibitor for HIV infection resistant to other non-nucleoside reverse transcriptase inhibitors and protease inhibitors.

Efavirenz p. 557, which inhibits the fusion of HIV to the host cell, is licensed for managing infection that has failed to respond to a regimen of other antiretroviral drugs; enfuvirtide should be combined with other potentially active antiretroviral drugs.

Maraviroc p. 557 is an antagonist of the CCR5 chemokine receptor. It is licensed for patients exclusively infected with CCR5-tropic HIV.

Dolutegravir p. 557 and raltegravir p. 558 are inhibitors of HIV integrase. They are licensed for the treatment of HIV infection in combination with other antiretroviral drugs.

Elvitegravir is also an inhibitor of HIV integrase that is only available as a component of a fixed-dose combination product (cobicistat with elvitegravir, emtricitabine and tenofovir). Cobicistat p. 567 is a pharmacokinetic enhancer that boosts the concentrations of other antiretrovirals, but it has no antiretroviral activity itself.

**Immune reconstitution syndrome**

Improvement in immune function as a result of antiretroviral treatment may provoke a marked inflammatory reaction against residual opportunistic organisms; these reactions may occur within the first few weeks or months of initiating treatment. Autoimmune disorders (such as Graves’ disease) have also been reported many months after initiation of treatment.

**Lipodystrophy syndrome**

Metabolic effects associated with antiretroviral treatment include fat redistribution, insulin resistance, and dyslipidaemia; collectively these have been termed lipodystrophy syndrome. The usual risk factors for cardiovascular disease should be taken into account before starting antiretroviral therapy and patients should be advised about lifestyle changes to reduce their cardiovascular risk. Plasma lipids and blood glucose should be measured before starting antiretroviral therapy, after 3–6 months of treatment, and then annually.

Fat redistribution (with loss of subcutaneous fat, increased abdominal fat, ‘buffalo hump’ and breast enlargement) is associated with regimens containing protease inhibitors and nucleoside reverse transcriptase inhibitors. Stavudine (especially in combination with didanosine), and to a lesser extent zidovudine, are associated with a higher risk of lipodystrophy and should be used only if alternative regimens are not suitable.

Dyslipidaemia is associated with antiretroviral treatment, particularly with protease inhibitors. Protease inhibitors and some nucleoside reverse transcriptase inhibitors are associated with insulin resistance and hyperglycaemia. Of the protease inhibitors, atazanavir and darunavir may be less likely to cause dyslipidaemia, while saquinavir and atazanavir may be less likely to impair glucose tolerance.

**Osteonecrosis**

Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.
HIV infection in children

HIV disease in children has a different natural progression to adults. Children infected with HIV should be managed within a formal paediatric HIV clinical network by specialists with access to guidelines and information on antiretroviral drugs for children.

CCR5 CHEMOKINE RECEPTOR ANTAGONISTS

Maraviroc

**DRUG ACTION** Maraviroc is an antagonist of the CCR5 chemokine receptor.

**INDICATIONS AND DOSE**

CCR5-tropic HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretrovirals

**BY MOUTH**

- Adult: 300 mg twice daily

**CAUTIONS** Cardiovascular disease

**INTERACTIONS** → Appendix 1 (maraviroc).

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain, anaemia, anorexia, depression, diarrhoea, flatulence, headache, insomnia, malaise, nausea, rash

- **Uncommon** Myositis, proteinuria, renal failure, seizures

- **Rare** Angina, granulocytopenia, hepatitis, pancreatopathy, Stevens-Johnson syndrome, toxic epidermal necrolysis

**FREQUENCY NOT KNOWN** Eosinophilia, fever, hepatic reactions, hypersensitivity reactions, osteonecrosis, rash

**SIDE-EFFECTS, FURTHER INFORMATION**

Osteonecrosis

For further information see HIV infection p. 555.

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risks.

**HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available; chronic hepatitis B or C (possibly greater risk of hepatic side-effects).

**DIRECTIONS FOR ADMINISTRATION**

For **SUBCUTANEOUS INJECTION**, reconstitute with 1.1 mL Water for Injections and allow to stand (for up to 45 minutes) to dissolve; do not shake or invert vial.

**PATIENT AND CARER ADVICE**

Hypersensitivity reactions. Patients or carers should be told how to recognise signs of hypersensitivity, and advised to discontinue treatment and seek immediate medical attention if symptoms develop.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Celsentri** (ViiV Healthcare UK Ltd)
  - Maraviroc 150 mg Celsentri 150mg tablets | 60 tablet | £441.27
  - Maraviroc 300 mg Celsentri 300mg tablets | 60 tablet | £812.54

**HIV-FUSION INHIBITORS**

Enfuvirtide

**DRUG ACTION** Enfuvirtide inhibits the fusion of HIV to the host cell.

**INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs for resistant infection or for patients intolerant to other antiretroviral regimens

**BY SUBCUTANEOUS INJECTION**

- Adult: 90 mg twice daily

**INTERACTIONS** → Appendix 1 (enfuvirtide).

**SIDE-EFFECTS**

- **Common or very common** Acne, anorexia, anxiety, asthenia, conjunctivitis, diabetes mellitus, dry skin, erythema, gastro-oesophageal reflux disease, haematuria, hypertriglyceridaemia, impaired concentration, influenza-like illness, injection-site reactions, irritability, lymphenadonopathy, myalgia, nightmares, pancreatitis, peripheral neuropathy, pneumonia, renal calculi, sinusitis, skin papilloma, tremor, vertigo, weight loss

- **Uncommon** Hypersensitivity reactions

**FREQUENCY NOT KNOWN** Osteonecrosis

**SIDE-EFFECTS, FURTHER INFORMATION**

Hypersensitivity reactions

Hypersensitivity reactions including rash, fever, nausea, vomiting, chills, rigors, low blood pressure, respiratory distress, glomerulonephritis, and raised liver enzymes reported; discontinue immediately if any signs or symptoms of systemic hypersensitivity develop and do not rechallenge.

Osteonecrosis

For further information see HIV infection p. 555.

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risks.

**HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available; chronic hepatitis B or C (possibly greater risk of hepatic side-effects).

**DIRECTIONS FOR ADMINISTRATION**

For **SUBCUTANEOUS INJECTION**, reconstitute with 1.1 mL Water for Injections and allow to stand (for up to 45 minutes) to dissolve; do not shake or invert vial.

**PATIENT AND CARER ADVICE**

Hypersensitivity reactions. Patients or carers should be told how to recognise signs of hypersensitivity, and advised to discontinue treatment and seek immediate medical attention if symptoms develop.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

**ELECTROLYTES** May contain Sodium

- Fusenze (Roche Products Ltd)
  - Enfuvirtide 108 mg Fusenze 108mg powder and solvent for solution for injection vials | 60 vial (enfuvirtide)

**HIV-INTEGRASE INHIBITORS**

Dolutegravir

**DRUG ACTION** Dolutegravir is an inhibitor of HIV integrase.

**INDICATIONS AND DOSE**

HIV infection without resistance to other inhibitors of HIV integrase, in combination with other antiretroviral drugs

**BY MOUTH**

- Adult: 50 mg once daily

**HIV infection in patients where resistance to other inhibitors of HIV integrase suspected, in combination with other antiretroviral drugs**

**BY MOUTH**

- Adult: 50 mg twice daily, dose to be taken with food

**HIV infection in combination with other antiretroviral drugs (with concomitant efavirenz, nevirapine, tipranavir, or rifampicin)**

**BY MOUTH**

- Adult: 50 mg twice daily, avoid concomitant use with these drugs if resistance to other inhibitors of HIV integrase suspected

**INTERACTIONS** → Appendix 1 (dolutegravir).
Caution—avoid concomitant use with etravirine, unless used in combination with atazanavir, darunavir, or lopinavir.

### SIDE-EFFECTS

- **Common or very common** Abdominal pain · abnormal dreams · diarrhoea · dizziness · fatigue · flatulence · headache · insomnia · nausea · pruritus · raised creatine kinase · rash · vomiting
- **Uncommon** Hepatitis · hypersensitivity reactions
- **Frequency not known** Osteonecrosis

#### SIDE-EFFECTS, FURTHER INFORMATION

**Hypersensitivity reactions** Hypersensitivity reactions (including severe rash, or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, oral lesions, conjunctivitis, angioedema, eosinophilia, or raised liver enzymes) reported uncommonly. Discontinue immediately if any sign or symptoms of hypersensitivity reactions develop.

**Osteonecrosis** For further information see HIV infection p. 555.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **DIRECTIONS FOR ADMINISTRATION** Avoid antacids 6 hours before or 2 hours after taking raltegravir.
- **PATIENT AND CARER ADVICE**

- **Missed doses** If a dose is more than 2 hours late on the once daily regimen (or more than 8 hours late on the twice daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time. Patients or carers should be given advice on how to administer raltegravir tablets.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**
  - Tivicay (ViiV Healthcare UK Ltd) ▼
    - Raltegravir (as Raltegravir sodium) 50 mg Tivicay 50mg tablets | 30 tablet [P] £49.87
  - Also available in combination with abacavir and lamivudine, p. 562

#### Raltegravir

**DRUG ACTION** Raltegravir is an inhibitor of HIV integrase.

**INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs

- **BY MOUTH USING TABLETS**
  - Adult: 400 mg twice daily
  - Dose equivalence and conversion
    - The bioavailability of Isentress® chewable tablets is higher than that of the 'standard' 400 mg tablets; the chewable tablets are not interchangeable with the 'standard' tablets on a milligram-for-milligram basis.

- **CAUTIONS** Psychiatric illness (may exacerbate underlying illness including depression) · risk factors for myopathy · risk factors for rhabdomyolysis
- **INTERACTIONS** Appendix 1 (raltegravir).

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain · abnormal dreams · anxiety · arthritis · depression · diarrhoea · dizziness · dyspepsia · flatulence · headache · hyperactivity · hypertriglyceridaemia · insomnia · nausea · rash · vomiting
- **Uncommon** Acne · alopecia · anaemia · anxiety · appetite changes · arthralgia · bradycardia · carpal tunnel syndrome · chest pain · chills · confusion · constipation · drowsiness · dry mouth · dry skin · dysphonia · epistaxis · erectile dysfunction · flushing · gastritis · gingivitis · glossitis · gynaecomastia · hepatitis · hyperhidrosis · hypertension · impaired memory and attention · lipodystrophy · Lipodystrophy Syndrome · menopausal symptoms · myalgia · nasal congestion · neutropenia · nocturia · oedema · osteopenia · pain on swallowing · palpitation · pancreatitis · peptic ulcer · peripheral neuropathy · polyphasia · pruritus · pyrexia · rash with eosinophilia and systemic symptoms · rectal bleeding · renal failure · rhabdomyolysis · skin papilloma · Stevens-Johnson syndrome · suicidal ideation · taste disturbances · thrombocytopenia · tinnitus · tremor · ventricular extrasystoles · visual disturbances
- **Frequency not known** Osteonecrosis

**SIDE-EFFECTS, FURTHER INFORMATION**

**Rash** Rash occurs commonly. Discontinue if severe rash or rash accompanied by fever, malaise, arthralgia, myalgia, blisters, mouth ulceration, conjunctivitis, angioedema, hepatitis, or eosinophilia.

**Lipodystrophy syndrome** For further information see HIV infection p. 555.

**Osteonecrosis** For further information see HIV infection p. 555.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available. Use with caution in patients with chronic hepatitis B or C (at greater risk of hepatic side-effects).
- **PRESCRIBING AND DISPENSING INFORMATION** Dispense raltegravir chewable tablets in original container (contains desiccant).

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

- The Scottish Medicines Consortium has advised (April 2010) that raltegravir (Isentress®) is accepted for restricted use within NHS Scotland for the treatment of HIV infection when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**
  - Isentress (Merck Sharp & Dohme Ltd)
    - Raltegravir 400 mg Isentress 400mg tablets | 60 tablet [P] £471.41
  - Isentress 25 mg Isentress 25mg chewable tablets | 60 tablet [P] £29.46
  - Isentress 100 mg Isentress 100mg chewable tablets | 60 tablet [P] £117.85
  - Also available in granules
    - Isentress (Merck Sharp & Dohme Ltd)
      - Raltegravir 25 mg Isentress 25mg chewable tablets | 60 tablet [P] £29.46
      - Isentress 100 mg Isentress 100mg chewable tablets | 60 tablet [P] £117.85
      - Granules
        - Isentress 100 mg Isentress 100mg granules sachets | 60 satch [P] £231.02

**NON-NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS**

**Efavirenz**

**INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs

- **BY MOUTH USING CAPSULES**
  - Adult: 600 mg once daily
Etravirine

INDICATIONS AND DOSE
HIV infection resistant to other non-nucleoside reverse transcriptase inhibitor and protease inhibitors in combination with other antiretroviral drugs (including a boosted protease inhibitor)

BY MOUTH

Adult: 200 mg twice daily, to be taken after food

CONTRA-INDICATIONS
Acute porphyrias p. 864

SIDE-EFFECTS
- Common or very common Abdominal pain · abnormal dreams · anxiety · depression · diarrhoea · dizziness · fatigue · headache · impaired concentration · nausea · pruritus · rash · sleep disturbances · Stevens-Johnson syndrome · vomiting
- Uncommon Amnesia · ataxia · blurred vision · convulsions · flushing · gynaecomastia · hepatitis · mania · pancreatitis · psychosis · suicidal ideation · tinnitus · tremor
- Rare Hepatic failure · photosensitivity · suicide
- Frequency not known Lipodystrophy Syndrome · osteonecrosis · raised serum cholesterol

SIDE-EFFECTS, FURTHER INFORMATION
- Rash Rash, usually in the first 2 weeks, is the most common side-effect; discontinue if severe rash with blistering, desquamation, mucosal involvement or fever; if rash mild or moderate, may continue without interruption—usually resolves within 1 month.
- CNS effects Administration at bedtime especially in first 2–4 weeks reduces CNS effects.
- Lipodystrophy Syndrome For further information see HIV infection p. 555.
- Osteonecrosis For further information see HIV infection p. 555.

PREGNANCY
Reports of neural tube defects when used in first trimester.

HEPATIC IMPAIRMENT Greater risk of hepatic side-effects in chronic hepatitis B or C. Avoid in moderate to severe impairment. In mild liver disease, monitor for dose related side-effects (e.g. CNS effects) and monitor liver function.

RENAL IMPAIRMENT Manufacturer advises caution in severe renal failure—no information available.

MONITORING REQUIREMENTS Monitor liver function if receiving other hepatotoxic drugs.

DIRECTIONS FOR ADMINISTRATION Capsules may be opened and contents added to food (contents have a peppery taste).

PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include strawberry and mint.

PATIENT AND CARER ADVICE
Psychiatric disorders Patients or their carers should be advised to seek immediate medical attention if symptoms such as severe depression, psychosis or suicidal ideation occur.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet
CAUTIONARY AND ADVISORY LABELS 23

ETRAVIRINE (Non-proprietary)
Etravirine 600 mg Etravirine 600 mg tablets | 30 tablet £102.79 (Hospital only)
PATIENT AND CARER ADVICE

Missed doses If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Hypersensitivity reactions Patients or carers should be told how to recognise hypersensitivity reactions and advised to seek immediate medical attention if hypersensitivity reaction or severe rash develop.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Nevirapine

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs (initial dose)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: Initially 200 mg once daily for first 14 days, initial dose titration using 'immediate-release' preparation should not exceed 28 days; if rash occurs and is not resolved within 28 days, alternative treatment should be sought. If treatment interrupted for more than 7 days, restart using the lower dose of the 'immediate-release' preparation for the first 14 days as for new treatment

HIV infection in combination with other antiretroviral drugs (maintenance dose following initial dose titration if no rash present)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Adult: 400 mg once daily

CONTRA-INDICATIONS

Acute porphyrias p. 864; post-exposure prophylaxis

CAUTIONS

Females (at greater risk of hepatic side effects)
- high CD4 cell count (at greater risk of hepatic side effects)

CAUTIONS, FURTHER INFORMATION

Hepatic effects Patients with chronic hepatitis B or C, high CD4 cell count, and women are at increased risk of hepatic side effects— if plasma HIV-1 RNA detectable, manufacturer advises avoid in women with CD4 cell count greater than 250 cells/mm³ or in men with CD4 cell count greater than 400 cells/mm³ unless potential benefit outweighs risk.

INTERACTIONS

→ Appendix 1 (nevirapine).

SIDE-EFFECTS

Common or very common
- Abdominal pain, diarrhea, headache, fatigue, fever, granulocytopenia, myalgia, nausea, rash, Stevens-Johnson syndrome, toxic epidermal necrolysis, vomiting

Uncommon
- Anaemia, arthralgia, myalgia

Frequency not known
- Osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION

Hepatic effects Potentially life-threatening hepatotoxicity including fatal fulminant hepatitis reported usually in first 5 weeks; discontinue permanently if abnormalities in liver function tests accompanied by hypersensitivity reaction (rash, fever, arthralgia, myalgia, lymphadenopathy, hepatitis, renal impairment, eosinophilia, granulocytopenia); suspend if severe abnormalities in liver function tests but no hypersensitivity reaction—discontinue permanently if significant liver function abnormalities recur; monitor patient closely if mild to moderate abnormalities in liver function tests with no hypersensitivity reaction.

Rash Rash, usually in first 5 weeks, is most common side-effect; incidence reduced if introduced at low dose and dose increased gradually (after 14 days); discontinue permanently if severe rash or if rash accompanied by blistering, oral lesions, conjunctivitis, facial oedema, general malaise or hypersensitivity reactions; if rash mild or moderate may continue without interruption but dose should not be increased until rash resolves.

Osteonecrosis For more information see HIV infection p. 555.

HEPATIC IMPAIRMENT

Manufacturer advises avoid modified-release preparation—no information available; use 'immediate-release' preparation with caution in moderate impairment and avoid in severe impairment.

Use with caution in patients with chronic hepatitis B or C (at greater risk of hepatic side effects).

RENAI IMPAIRMENT

Manufacturer advises avoid modified-release preparation—no information available.

MONITORING REQUIREMENTS

- Hepatic disease Close monitoring of liver function required during first 18 weeks; monitor liver function before treatment then every 2 weeks for 2 months then after 1 month and then regularly.
- Rash Monitor closely for skin reactions during first 18 weeks.

PATIENT AND CARER ADVICE

Missed doses If a dose is more than 8 hours late with the 'immediate-release' preparation or more than 12 hours late with the modified-release preparation, the missed dose should not be taken and the next dose should be taken at the usual time.

Hypersensitivity reactions Patients or carers should be told how to recognise hypersensitivity reactions and advised to discontinue treatment and seek immediate medical attention if severe skin reaction, hypersensitivity reactions, or symptoms of hepatitis develop.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Rilpivirine

INDICATIONS AND DOSE
HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy and if plasma HIV-1 RNA concentration less than 100,000 copies/mL

BY MOUTH

Adult: 25 mg once daily

INTERACTIONS

> Appendix 1 (rilpivirine).

SIDE-EFFECTS

Abnormal dreams - anorexia - depression - dizziness - dry mouth - headache - hyperlipidaemia - Lipodystrophy Syndrome - malaise - nausea - osteonecrosis - raised serum amylase - raised serum lipase - rash - sleep disturbances - vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Lipodystrophy

For further information see HIV infection p. 555.

Osteonecrosis

For further information see HIV infection p. 555.

PREGNANCY

Manufacturer advises caution in moderate impairment; avoid in severe impairment — no information available; greater risk of hepatic side-effects in chronic hepatitis B or C.

HEPATIC IMPAIRMENT

Manufacturer advises caution in severe impairment.

DIRECTIONS FOR ADMINISTRATION

Avoid antacids 2 hours before or 4 hours after taking rilpivirine.

PATIENT AND CARER ADVICE

Missed doses

If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time. Patients or carers should be given advice on how to administer rilpivirine tablets.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS

Edurant (Janssen-Cilag Ltd).

Rilpivirine (as Rilpivirine hydrochloride) 25 mg

Edurant 25 mg tablets | 30 tablet blister pack £20.27

Also available in combination with emtricitabine and tenofovir, p. 565

NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS

Nucleoside reverse transcriptase inhibitors

> Appendix 1 (abacavir).

SIDE-EFFECTS

SIDE-EFFECTS, FURTHER INFORMATION

Lipodystrophy Syndrome

For further information see HIV infection p. 555.

Osteonecrosis

For further information see HIV infection p. 555.

PREGNANCY

Mitochondrial dysfunction has been reported in infants exposed to nucleoside reverse transcriptase inhibitors in utero; the main effects include haematological, metabolic, and neurological disorders; all infants whose mothers received nucleoside reverse transcriptase inhibitors during pregnancy should be monitored for relevant signs or symptoms.

HEPATIC IMPAIRMENT

Use with caution in patients with chronic hepatitis B or C (greater risk of hepatic side-effects).

Abacavir

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

BY MOUTH

Adult: 600 mg daily in 1–2 divided doses

CAUTIONS

HIV load greater than 100,000 copies/mL - patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%)

INTERACTIONS

> Appendix 1 (abacavir).

SIDE-EFFECTS

Very rare - Stevens-Johnson syndrome - toxic epidermal necrolysis

Frequency not known - Hypersensitivity reactions

Hypersensitivity reactions

Life-threatening hypersensitivity reactions reported—characterised by fever or rash and possibly nausea, vomiting, diarrhoea, abdominal pain, dyspnoea, cough, lethargy, malaise, headache, and myalgia; less frequently mouth ulceration, oedema, hypotension, sore throat, acute respiratory distress syndrome, anaphylaxis, paraesthesia, arthralgia, conjunctivitis, lymphadenopathy, lymphocytopenia and renal failure; rarely myolysis; laboratory abnormalities may include raised liver function tests and creatine kinase; symptoms usually appear in the first 6 weeks, but may occur at any time. Discontinue immediately if any symptom of hypersensitivity develops and do not rechallenge (risk of more severe hypersensitivity reaction); discontinue if hypersensitivity cannot be ruled out, even when other diagnoses possible—if rechallenge necessary it must be carried out in hospital setting; if abacavir is stopped for any reason other than hypersensitivity, exclude hypersensitivity reaction as the cause and rechallenge only if medical assistance is readily available; care needed with concomitant use of drugs which cause skin toxicity.

Gastro-intestinal disturbances

More common in children.

Rash

More common in children.
Abacavir with lamivudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 561, lamivudine p. 563.

**INDICATIONS AND DOSE**

HIV infection in combination with other antiretrovirals by mouth
- Adult (body-weight 40 kg and above): 1 tablet once daily

**RENALE IMPAIRMENT** Avoid Kivexa® if eGFR less than 50 mL/minute/1.73 m² (consult product literature).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- Kivexa (ViiV Healthcare UK Ltd)
  Abacavir (as Abacavir sulfate) 600 mg, Lamivudine 300 mg
  Kivexa 600mg/300mg tablets | 30 tablet £299.41

Abacavir with lamivudine and zidovudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 561, lamivudine p. 563, zidovudine p. 566.

**INDICATIONS AND DOSE**

HIV infection (use only if patient is stabilised for 6–8 weeks on the individual components in the same proportions) by mouth
- Adult: 1 tablet twice daily

**RENALE IMPAIRMENT** Avoid Trizivir® if eGFR less than 50 mL/minute/1.73 m² (consult product literature). Avoid Trizivir® if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- Trizivir (ViiV Healthcare UK Ltd)
  Abacavir (as Abacavir sulfate) 300 mg, Lamivudine 150 mg, Zidovudine 300 mg
  Trizivir tablets | 60 tablet £142.70

Didanosine (ddi; DDI)

**INDICATIONS AND DOSE**

HIV infection in combination with other antiretrovirals by mouth
- Adult (body-weight up to 60 kg): 250 mg daily in 1–2 divided doses
- Adult (body-weight 60 kg and above): 400 mg daily in 1–2 divided doses

**CAUTIONS** History of pancreatitis (preferably avoid, otherwise extreme caution) • hyperuricaemia • peripheral neuropathy

**INTERACTIONS** Appendix 1 (didanosine).

Antacids in tablet formulation might affect absorption of other drugs—give at least 2 hours apart.

**SIDE-EFFECTS** Acute renal failure • alopecia • anaphylactic reactions • diabetes mellitus • dry eyes • dry mouth • hyperuricaemia (suspend if raised significantly) • hypoglycaemia • liver failure • non-cirrhotic portal hypertension • optic nerve changes • pancreatitis (less
common in children - parotid gland enlargement - peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops) - retinal changes - rhabdomyolysis - siadalenitis

**SIDE-EFFECTS, FURTHER INFORMATION**

**Pancreatitis** Suspend treatment if serum lipase raised (even if asymptomatic) or if symptoms of pancreatitis develop; discontinue if pancreatitis confirmed. Whenever possible avoid concomitant treatment with other drugs known to cause pancreatic toxicity (e.g. intravenous pentamidine isetionate); monitor closely if concomitant therapy unavoidable. Since significant elevations of triglycerides cause pancreatitis monitor closely if elevated.

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

**HEPATIC IMPAIRMENT** Insufficient information. In hepatic impairment, monitor for toxicity.

**RENAL IMPAIRMENT** Reduce dose if eGFR less than 60 mL/minute/1.73 m²; consult product literature.

**MONITORING REQUIREMENTS** Ophthalmological examination (including visual acuity, colour vision, and dilated fundus examination) recommended annually or if visual changes occur.

**DIRECTIONS FOR ADMINISTRATION** With chewable tablets, to ensure sufficient antacid, each dose to be taken as at least 2 tablets (child under 1 year 1 tablet) chewed thoroughly, crushed or dispersed in water; clear apple juice may be added for flavouring; tablets to be taken 2 hours after food; capsules should be swallowed whole and taken at least 2 hours before or 2 hours after food.

**PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer didanosine capsules and chewable tablets.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Chewable tablet**

- **Gastro-resistant capsule**
  - **Videx (Bristol-Myers Squibb Pharmaceuticals Ltd)**
    - Didanosine 25 mg: Videx 25mg chewable dispersible tablets (sugar-free) | 60 tablet (POM) £25.06 (Hospital only)

    - Didanosine 25 mg: Videx EC 125mg capsules | 30 capsule (POM) £46.18 (Hospital only)
    - Didanosine 200 mg: Videx EC 200mg capsules | 30 capsule (POM) £17.09 (Hospital only)
    - Didanosine 250 mg: Videx EC 250mg capsules | 30 capsule (POM) £96.37 (Hospital only)
    - Didanosine 400 mg: Videx EC 400mg capsules | 30 capsule (POM) £154.19 (Hospital only)

**Emtricitabine**

**(FTC)**

**INDICATIONS AND DOSE**

**HIV infection in combination with other antiretroviral drugs**

- **BY MOUTH USING CAPSULES**
  - Adult: 200 mg once daily
- **BY MOUTH USING ORAL SOLUTION**
  - Adult: 240 mg once daily

Dose equivalence and conversion

240 mg oral solution ≡ 200 mg capsule; where appropriate the capsule may be used instead of the oral solution.

**INTERACTIONS** → Appendix 1 (emtricitabine).

**SIDE-EFFECTS** Abnormal dreams - hyperpigmentation - pruritus

**HEPATIC IMPAIRMENT** On discontinuation, monitor patients with hepatitis B (risk of exacerbation of hepatitis).

**RENAL IMPAIRMENT** Reduce dose if eGFR less than 50 mL/minute/1.73 m²; consult product literature.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include candy.

**PATIENT AND CARER ADVICE** Missed doses. If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- **Emtriva (Gilead Sciences International Ltd)**
  - Emtricitabine 200 mg: Emtriva 200mg capsules | 30 capsule (POM) £138.98

**Oral solution**

ELECTROLYTES: May contain Sodium

- **Emtriva (Gilead Sciences International Ltd)**
  - Emtricitabine 10 mg per 1 ml: Emtriva 10mg/ml oral solution (sugar-free) | 170 ml (POM) £39.53

Also available in combination with cobicistat with elvitegravir, tenofovir, p. 565 · efavirenz with tenofovir, p. 565 · rilpivirine and tenofovir, p. 565 · tenofovir, p. 566

**Lamivudine**

**(3TC)**

**INDICATIONS AND DOSE**

**ZEFFIX®**

Chronic hepatitis B infection either with compensated liver disease (with evidence of viral replication and histology of active liver inflammation or fibrosis) when first-line treatments cannot be used, or (in combination with another antiviral drug without cross-resistance to lamivudine) with decompensated liver disease

**BY MOUTH**

- Adult: 100 mg once daily, patients receiving lamivudine for concomitant HIV infection should continue to receive lamivudine in a dose appropriate for HIV infection

**EPIVIR® TABLETS**

HIV infection in combination with other antiretroviral drugs

**BY MOUTH**

- Adult: 150 mg every 12 hours, alternatively 300 mg once daily

**EPIVIR® ORAL SOLUTION**

HIV infection in combination with other antiretroviral drugs

**BY MOUTH**

- Adult: 150 mg every 12 hours, alternatively 300 mg once daily

**CAUTIONS** Recurrent hepatitis in patients with chronic hepatitis B may occur on discontinuation of lamivudine.

**INTERACTIONS** → Appendix 1 (lamivudine).

**SIDE-EFFECTS** Alopecia - muscle disorders - nasal symptoms - peripheral neuropathy - rhabdomyolysis

**BREAST FEEDING** Can be used with caution in women infected with chronic hepatitis B alone, providing that adequate measures are taken to prevent hepatitis B infection in infants.

**RENAL IMPAIRMENT** Reduce dose if eGFR less than 50 mL/minute/1.73 m²; consult product literature.
Stavudine (d4T)

**INDICATIONS AND DOSE**
HIV infection in combination with other antiretroviral drugs when no suitable alternative available and when prescribed for shortest period possible

**BY MOUTH**
- Adult (body-weight up to 60 kg): 30 mg every 12 hours, to be taken preferably at least 1 hour before food
- Adult (body-weight 60 kg and above): 40 mg every 12 hours, to be taken preferably at least 1 hour before food

**CAUTIONS**
Excessive alcohol intake · higher risk of lactic acidosis than other nucleoside reverse transcriptase inhibitors (especially when used in combination with didanosine)—use only if alternative regimens are not suitable · history of pancreatitis · history of peripheral neuropathy

**INTERACTIONS**
Appendix 1 (stavudine). Caution with concomitant use of isoniazid—risk of peripheral neuropathy. Caution with concomitant use with other drugs associated with pancreatitis.

**SIDE-EFFECTS**
- Common or very common · Abnormal dreams · cognitive dysfunction · depression · drowsiness · peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops) · pruritus
- Uncommon · Anxiety · gynaecomastia
- PREGNANCY
- Manufacturer advises use only if potential benefit outweighs risk.
- RENAL IMPAIRMENT
- Use half normal dose every 12 hours if eGFR 25–50 mL/minute/1.73 m². Use half normal dose every 24 hours if eGFR less than 25 mL/minute/1.73 m².

Risk of peripheral neuropathy.

**PRESCRIBING AND DISPENSING INFORMATION**
Flavours of oral liquid formulations may include cherry.

**LESS SUITABLE FOR PRESCRIBING**
Stavudine (especially in combination with didanosine) is associated with a higher risk of lipodystrophy and should be used only if alternative regimens are not suitable; it is considered to be less suitable for prescribing.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- LAMIVUDINE (Non proprietary)
  - Lamivudine 100 mg Lamivudine 100mg tablets | 28 tablet £74.19-£78.09 DT price = £74.55

**Tenofovir disoproxil**

**INDICATIONS AND DOSE**
HIV infection in combination with other antiretroviral drugs (Chronic hepatitis B infection with compensated liver disease (with evidence of viral replication, and histologically documented active liver inflammation or fibrosis)) | Chronic hepatitis B infection with decompensated liver disease

**BY MOUTH**
- Adult: 245 mg once daily

**Dose equivalence and conversion**
7.5 scoops of granules contains approx. 245 mg tenofovir disoproxil (as fumarate).

**INTERACTIONS**
Appendix 1 (tenofovir). Use with caution if concomitant or recent use of nephrotoxic drugs.

**SIDE-EFFECTS**
- Rare · Nephrogenic diabetes insipidus · proximal renal tubulopathy · renal failure
- Frequency not known · Hypophosphataemia · reduced bone density

**RENA L IMPAIRMENT**
- Granules: 132 mg once daily if eGFR 30–50 mL/minute/1.73 m²; 66 mg once daily if eGFR 20–30 mL/minute/1.73 m²; 33 mg once daily if eGFR 10–20 mL/minute/1.73 m². Tablets: 245 mg every 2 days if eGFR 30–50 mL/minute/1.73 m²; 245 mg every 3–4 days if eGFR 10–30 mL/minute/1.73 m². Monitor renal function—interrupt treatment if further deterioration.

**MONITORING REQUIREMENTS**
- Test renal function and serum phosphate before treatment, then every 4 weeks (more frequently if at increased risk of renal impairment) for 1 year and then every 3 months, interrupt treatment if renal function deteriorates or serum phosphate decreases.
- When treating chronic hepatitis B with tenofovir, monitor liver function tests every 3 months and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

**DIRECTIONS FOR ADMINISTRATION**
- Granules: mix 1 scoop of granules with 1 tablespoon of soft food (e.g. yoghurt, apple sauce) and take immediately without chewing. Do not mix granules with liquids.
Cobicistat with elvitegravir, emtricitabine and tenofovir

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine p. 563, tenofovir disoproxil p. 564, cobicistat p. 567.

INDICATIONS AND DOSE
HIV infection
BY MOUTH
Adult: 1 tablet once daily

INTERACTIONS → Appendix 1 (cobicistat, elvitegravir, emtricitabine, tenofovir).

SIDE-EFFECTS
Uncommon Depression and suicidal ideation (in patients with a history of psychiatric illness)

CONCEPTION AND CONTRACEPTION Women of childbearing potential should use effective contraception during treatment (if using a hormonal contraceptive, it must contain norgestimate as the progestogen and at least 30 micrograms ethinylestradiol).

PREGNANCY Manufacturer advises use only if potential benefit outweighs risk.

HEPATIC IMPAIRMENT Avoid Strivid® in severe impairment.

RENAL IMPAIRMENT If eGFR less than 90 mL/minute/1.73 m², only initiate Strivid® if other treatments cannot be used (avoid initiating Strivid® if eGFR less than 70 mL/minute/1.73 m²); if eGFR less than 70 mL/minute/1.73 m², only continue Strivid® if potential benefit outweighs risk (discontinue Strivid® if eGFR less than 50 mL/minute/1.73 m²).

MONITORING REQUIREMENTS Test urine glucose before treatment, then every 4 weeks for 1 year and then every 3 months.

DIRECTIONS FOR ADMINISTRATION Avoid antacids 4 hours before or 4 hours after taking Strivid®.

PRESCRIBING AND DISPENSING INFORMATION Dispense in original container (contains desiccant).

PATIENT AND CARER ADVICE
Missed doses
If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Efavirenz with emtricitabine and tenofovir

The properties listed below are those particular to the combination only. For the properties of the components please consider, efavirenz p. 558, emtricitabine p. 563, tenofovir disoproxil p. 564.

INDICATIONS AND DOSE
HIV infection stabilised on antiretroviral therapy for more than 3 months
BY MOUTH
Adult: 1 tablet once daily

HEPATIC IMPAIRMENT Manufacturer of Atripla® advises caution in mild impairment; avoid Atripla® in moderate to severe impairment.

RENAL IMPAIRMENT Avoid Atripla® if eGFR less than 50 mL/minute/1.73 m².

PATIENT AND CARER ADVICE
Missed doses If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Emtricitabine with rilpivirine and tenofovir

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine p. 563, rilpivirine p. 561, tenofovir disoproxil p. 564.

INDICATIONS AND DOSE
HIV infection in patients with plasma HIV-1 RNA concentration less than 100 000 copies/mL
BY MOUTH
Adult: 1 tablet once daily
HIV infection in combination with other antiretroviral drugs in patients temporarily unable to take zidovudine by mouth

BY INTRAVENOUS INFUSION

▶ Adult: 0.8–1 mg/kg every 4 hours usually for not more than 2 weeks, dose approximating to 1.2–1.5 mg/kg every 4 hours by mouth

CONTRA-INDICATIONS

Acute porphyrias p. 864 • abnormally low haemoglobin concentration (consult product literature) • abnormally low neutrophil counts (consult product literature)

CAUTIONS

Elderly • risk of haematological toxicity particularly with high dose and advanced disease • vitamin B12 deficiency (increased risk of neutropenia)

INTERACTIONS

▶ Appendix 1 (zidovudine). Increased risk of toxicity with nephrotoxic and myelosuppressive drugs—for further details consult product literature.

SIDE-EFFECTS

Anaemia (may require transfusion) • anxiety • chest pain • convulsions • depression • dizziness • drowsiness • gynaecomastia • influenza-like symptoms • loss of mental acuity • myopathy • neuropathy • paraesthesia • pigmentation of nails • pigmentation of oral mucosa • pigmentation of skin • pruritus • sweating • taste disturbance • urinary frequency

SIDE-EFFECTS, FURTHER INFORMATION

Anaemia and myelosuppression If anaemia or myelosuppression occur, reduce dose or interrupt treatment according to product literature, or consider other treatment

Lipoatrophy Zidovudine is associated with a higher risk of lipoatrophy than other antiretrovirals and should be used only if alternative regimens are not suitable.

HEPATIC IMPAIRMENT

Accumulation may occur.

RENAL IMPAIRMENT

Reduce oral dose to 300–400 mg daily in divided doses or intravenous dose to 1 mg/kg 3–4 times daily if eGFR is less than 10 mL/minute/1.73 m².

MONITORING REQUIREMENTS

Monitor full blood count after 4 weeks of treatment, then every 3 months.

DIRECTIONS FOR ADMINISTRATION

For intermittent intravenous infusion, dilute to a concentration of 2 mg/mL or 4 mg/mL with Glucose 5% and give over 1 hour.

PRESCRIBING AND DISPENSING INFORMATION

The abbreviation AZT which is sometimes used for zidovudine has also been used for another drug.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

▶ ZIDOVUDINE (Non-proprietary)

Zidovudine 100 mg Zidovudine 100mg capsules | 60 capsule £40.41

Zidovudine 250 mg Zidovudine 250mg capsules | 60 capsule £96.36

▶ Retrovir (ViiV Healthcare UK Ltd)

Zidovudine 100 mg Retrovir 100mg capsules | 100 capsule £68.86

Zidovudine 250 mg Retrovir 250mg capsules | 40 capsule £88.86

Oral solution

▶ Retrovir (ViiV Healthcare UK Ltd)

Zidovudine 10 mg per 1 ml Retrovir 50mg/5ml oral solution (sugar-free) | 200 ml £17.78

Solution for infusion

▶ Retrovir (ViiV Healthcare UK Ltd)

Zidovudine 10 mg per 1 ml Retrovir IV 200mg/20ml concentrate for solution for infusion vials | 5 vial £44.61

Emtricitabine with tenofovir

The properties listed below are those particular to the combination only. For the properties of the components please consider, emtricitabine p. 563, tenofovir disoproxil p. 564.

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

BY MOUTH

▶ Adult: 1 tablet once daily

RENAL IMPAIRMENT

Use normal dose of Truvada® every 2 days if eGFR 30–50 mL/minute/1.73 m².

Avoid Truvada® if eGFR less than 30 mL/minute/1.73 m².

DIRECTIONS FOR ADMINISTRATION

Patients with swallowing difficulties may disperse tablet in half a glass of water, orange juice, or grape juice (but bitter taste).

PATIENT AND CARER ADVICE

Missed doses

If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Patients or carers should be given advice on how to administer Emtriva®.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

► Emtriva (Gilead Sciences International Ltd)

Emtricitabine 200 mg, Tenofovir disoproxil (as Tenofovir disoproxil fumarate) 245 mg Truvada tablets | 30 tablet £55.95

Zidovudine (Azidothymidine; AZT)

INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

BY MOUTH

▶ Adult: 250–300 mg twice daily

Prevention of maternal-fetal HIV transmission

BY MOUTH OR BY INTRAVENOUS INFUSION

▶ Adult: Seek specialist advice (combination therapy preferred) (consult local protocol)
Abacavir with lamivudine and zidovudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 561, lamivudine p. 563, zidovudine p. 566.

**INDICATIONS AND DOSE**

HIV infection (use only if patient is stabilised for 6–8 weeks on the individual components in the same proportions)

**BY MOUTH**

- **Adult:** 1 tablet twice daily

**RENAL IMPAIRMENT**

Avoid *Trizivir*® if eGFR less than 50 mL/minute/1.73 m² (consult product literature). Avoid *Trizivir*® if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**
  - *Trizivir* (ViiV Healthcare UK Ltd)
  - Abacavir (as Abacavir sulfate) 300 mg, Lamivudine 150 mg, Zidovudine 300 mg *Trizivir* tablets | 60 tablet [POD] £432.70

Lamivudine with zidovudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, lamivudine p. 563, zidovudine p. 566.

**INDICATIONS AND DOSE**

HIV infection in combination with other antiretrovirals

**BY MOUTH**

- **Adult:** 1 tablet twice daily

**RENAL IMPAIRMENT**

Avoid if eGFR less than 50 mL/minute/1.73 m² (consult product literature).

**DIRECTIONS FOR ADMINISTRATION**

**COMBIVIR® TABLETS**

Tablets may be crushed and mixed with semi-solid food or liquid just before administration.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**
  - **LAMIVUDINE WITH ZIDOVUDINE (Non-proprietary)**
    - Lamivudine 150 mg, Zidovudine 300 mg | Zidovudine 300mg tablets | 60 tablet [POD] £70.61–£80.12
  - **Combivir** (ViiV Healthcare UK Ltd)
    - Lamivudine 150 mg, Zidovudine 300 mg | Combivir 150mg/300mg tablets | 60 tablet [POD] £255.10

**PHARMACOKINETIC ENHANCERS**

**Cobicistat**

**INDICATIONS AND DOSE**

Pharmacokinetic enhancer used to increase the effect of atazanavir or darunavir

**BY MOUTH**

- **Adult:** 150 mg once daily

**INTERACTIONS**

† Appendix 1 (cobicistat).

**PREGNANCY**

Manufacturer advises avoid unless essential.

**HEPATIC IMPAIRMENT**

Manufacturer advises avoid in severe impairment—no information available.

**RENAL IMPAIRMENT**

No dose adjustment required; inhibits tubular secretion of creatinine; when any co-administered drug requires dose adjustment based on renal function, avoid initiating cobicistat if eGFR less than 70 mL/minute/1.73 m².

**PRESCRIBING AND DISPENSING INFORMATION**

Dispense in original container (contains desiccant).

**PATIENT AND CARER ADVICE**

**Missed doses**

If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**
  - **CAUTIONARY AND ADVISORY LABELS** 21
    - *Tybost* (Gilead Sciences International Ltd) ▼
      - Cobicistat 150 mg Tybost 150mg tablets | 30 tablet [POD] £21.38
  - Also available in combination with *elvitegravir, emtricitabine and tenofovir*, p. 565

**PROTEASE INHIBITORS (HIV)**

**Protease inhibitors**

**CONTRA-INDICATIONS**

Acute porphyrias p. 864

**CAUTIONS**

Diabetes - haemophilia (increased risk of bleeding)

**SIDE-EFFECTS**

**SIDE-EFFECTS, FURTHER INFORMATION**

Lipodystrophy Syndrome For further information see HIV infection p. 555.

**OSTEONECROSIS**

For further information see HIV infection p. 555.

**HEPATIC IMPAIRMENT**

Use with caution in patients with chronic hepatitis B or C (increased risk of hepatic side-effects).

**Atazanavir**

**INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs—*with low-dose ritonavir*

**BY MOUTH**

- **Adult:** 300 mg once daily

**HIV infection in combination with other antiretroviral drugs—*with cobicistat***

**BY MOUTH**

- **Adult:** 300 mg daily

**CAUTIONS**

Cardiac conduction disorders - electrolyte disturbances - predisposition to QT interval prolongation

**INTERACTIONS**

† Appendix 1 (atazanavir).

Caution if concomitant use with drugs that prolong PR interval. Caution with concomitant use of drugs that prolong QT interval.

**SIDE-EFFECTS**

- **Uncommon** Abnormal dreams - alopecia - amnesia - anxiety - arthralgia - chest pain - cholelithiasis - depression - disorientation - dry mouth - dyspnoea - gynaecomastia - haematuria - hypertension - increased appetite - mouth
ulcers · nephrolithiasis · peripheral neuropathy · proteinuria · syncope · torsiade de pointes · urinary frequency · weight changes

- **Rare** Abnormal gait · cholecystitis · hepatosplenomegaly · oedema · palpititation

**SIDE-EFFECTS, FURTHER INFORMATION**

**Rash** Mild to moderate rash occurs commonly, usually within the first 3 weeks of therapy. Severe rash occurs less frequently and may be accompanied by systemic symptoms. Discontinue if severe rash develops.

- **PREGNANCY** Theoretical risk of hyperbilirubinemia in neonate if used at term. In pregnancy, monitor viral load and plasma-atazanavir concentration during third trimester.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Capsule**

  **CAUTIONARY AND ADVISORY LABELS 5, 21**

  - Reyataz (Bristol-Myers Squibb Pharmaceuticals Ltd)
    - Darunavir (as Darunavir ethanolate) 150 mg Reyataz 150mg capsules | 60 capsule (£90.38 (Hospital only))
    - Darunavir (as Darunavir ethanolate) 200 mg Reyataz 200mg capsules | 60 capsule (£90.38 (Hospital only))
    - Darunavir (as Daranavir ethanolate) 300 mg Reyataz 300mg capsules | 30 capsule (£90.38 (Hospital only))

**Darunavir**

**INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretroviral therapy—with low-dose ritonavir

**BY MOUTH**

- Adult: 600 mg twice daily, alternatively 800 mg once daily if no resistance to darunavir, if plasma HIV-RNA concentration less than 100 000 copies/mL, and if CD4 cell count greater than 100 cells × 10⁹/litre

HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretroviral therapy—with cobicistat

**BY MOUTH**

- Adult: 800 mg once daily, if no resistance to darunavir, if plasma HIV-RNA concentration less than 100 000 copies/mL, and if CD4 cell count greater than 100 cells × 10⁹/litre

HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy—with low-dose ritonavir

**BY MOUTH**

- Adult: 800 mg once daily

**INTERACTIONS** → Appendix 1 (darunavir).

**SIDE-EFFECTS**

- **Common or very common** Peripheral neuropathy · rash

- **Uncommon** Abnormal dreams · acne · alopecia · angina · anxiety · arthralgia · conjunctival hyperaemia · cough · depression · dry eyes · dry mouth · dysphagia · dysuria · eczema · erectile dysfunction · flushing · gynaecomastia · hypertension · hypothyroidism · increased appetite · increased sweating · memory impairment · myocardial infarction · nail discolouration · nephrolithiasis · osteoporosis · peripheral oedema · polyuria · pyrexia · QT interval prolongation · reduced libido · renal failure · severe skin rash · Stevens-Johnson syndrome · stomatitis · tachycardia · throat irritation · toxic epidermal necrolysis · weight changes

- **Rare** Bradycardia · confusion · convulsions · haematemesis · palpititation · rhinorrhea · seborrhoeic dermatitis · syncope · visual disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**

**Rash** Mild to moderate rash occurs commonly, usually within the first 4 weeks of therapy and resolves without stopping treatment. Severe skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis) occurs less frequently and may be accompanied by fever, malaise, arthralgia, myalgia, oral lesions, conjunctivitis, hepatitis, or eosinophilia; treatment should be stopped if severe rash develops.

- **ALLERGY AND CROSS-SENSITIVITY** Use with caution in patients with sulphonamide sensitivity.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk; if required, use the twice daily dose regimen.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment—no information available.

- **MONITORING REQUIREMENTS** Monitor liver function before and during treatment.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.

- **PATIENT AND CARER ADVICE**

  **Missed doses** If a dose is more than 6 hours late on the twice daily regimen (or more than 12 hours late on the once daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**

  **CAUTIONARY AND ADVISORY LABELS 21**

  - Prezista (Janssen-Cilag Ltd)
    - Darunavir (as Darunavir ethanolate) 75 mg Prezista 75mg tablets | 480 tablet (£446.70)
    - Darunavir (as Darunavir ethanolate) 150 mg Prezista 150mg tablets | 240 tablet (£446.70)
    - Darunavir (as Darunavir ethanolate) 400 mg Prezista 400mg tablets | 60 tablet (£297.80)
    - Darunavir (as Darunavir ethanolate) 600 mg Prezista 600mg tablets | 60 tablet (£446.70)
    - Darunavir (as Darunavir ethanolate) 800 mg Prezista 800mg tablets | 30 tablet (£297.80)

  **Oral suspension**

  **CAUTIONARY AND ADVISORY LABELS 21**

  - Prezista (Janssen-Cilag Ltd)
    - Darunavir (as Darunavir ethanolate) 100 mg per 1 ml Prezista 100mg/ml oral suspension (sugar-free) | 200 ml (£248.17)

**Fosamprenavir**

- **DRUG ACTION** Fosamprenavir is a pro-drug of ampranavir.

**INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs—with low-dose ritonavir

**BY MOUTH**

- Adult: 700 mg twice daily

**Dose equivalence and conversion**

700 mg fosamprenavir is equivalent to approximately 600 mg ampranavir.

**INTERACTIONS** → Appendix 1 (fosamprenavir).
a low-fat light meal; in combination with didanosine tablets, allow 1 hour between each drug (antacids in didanosine tablets reduce absorption of indinavir); in combination with low-dose ritonavir, give with food.

**SIDE-EFFECTS, FURTHER INFORMATION**

- Rash Rash may occur, usually in the second week of therapy; discontinue permanently if severe rash with systemic or allergic symptoms or, mucosal involvement; if rash mild or moderate, may continue without interruption—usually resolves within 2 weeks and may respond to antihistamines.
- **PREGNANCY** Toxicity in animal studies; manufacturer advises use only if potential benefit outweighs risks.
- **HEPATIC IMPAIRMENT** Reduce dose to 450 mg twice daily in moderate impairment; reduce dose to 300 mg twice daily in severe impairment. Manufacturer advises caution in mild impairment.
- **DIRECTIONS FOR ADMINISTRATION** Oral suspension should be taken on an empty stomach.

**INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs

- **BY MOUTH USING TABLETS**
  - Adult: 400/100 mg twice daily, alternatively (by mouth) 800/200 mg once daily in adults with a HIV strain that has less than 3 mutations to protease inhibitors.
  - **INTERACTIONS** → Appendix 1 (lopinavir, ritonavir).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- **Crixivan** (ViiV Healthcare UK Ltd) Indinavir (as Indinavir sulfate) 200 mg Crixivan 200mg capsules | 360 capsule pack £81.02
- Indinavir (as Indinavir sulfate) 400 mg Crixivan 400mg capsules | 180 capsule pack £161.02

**Dose equivalence and conversion**

The proportions are expressed in the form x/y where x and y are the strengths in milligrams of lopinavir and ritonavir respectively.

**CAUTIONS** Cardiac conduction disorders · pancreatitis · patients at high risk of cardiovascular disease (especially if 10-year cardiovascular risk greater than 20%) · structural heart disease

**SIDE-EFFECTS**

- Common or very common Amenorrhoea · anxiety · arthralgia · colitis · hypertension · menorrhagia · neuropathy · night sweats · sexual dysfunction · weight changes
- Uncommon Abnormal dreams · alopecia · AV block · cerebrovascular accident · convulsions · deep vein thrombosis · dry mouth · gastro-intestinal ulcer · haematuria · myocardial infarction · nephritis · rectal bleeding · stomatitis · tinnitus · tremor · visual disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**

- **PREGNANCY** Avoid oral solution due to high propylene glycol content; use tablets only if potential benefit outweighs risk (toxicity in animal studies).
- **HEPATIC IMPAIRMENT** Avoid oral solution due to propylene glycol content; manufacturer advises avoid tablets in severe impairment.
RENAL IMPAIRMENT  Avoid oral solution due to high propylene glycol content. Use tablets with caution in severe impairment.

MONITORING REQUIREMENTS  Monitor liver function before and during treatment.

PATIENT AND CARER ADVICE  Oral solution tastes bitter.

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS  21, 25

Norvir 100 mg  Norvir 100mg tablets  30 tablet  £19.44

Oral solution

CAUTIONARY AND ADVISORY LABELS  21

EXCIPIENTS: May contain Alcohol, propylene glycol

Ritonavir 80 mg per 1 ml  Norvir 80mg/ml oral solution (sugar-free)  450 ml  £403.20

INDICATIONS AND DOSE

HIV infection in combination with other antiretrovirals in patients previously treated with antiretroviral therapy— with low-dose ritonavir

BY MOUTH

Adult:  1 g every 12 hours

HIV infection in combination with other antiretrovirals in patients not previously treated with antiretroviral therapy—with low-dose ritonavir

BY MOUTH

Adult:  500 mg every 12 hours for 7 days, then increased to 1 g every 12 hours

CONTRA-INDICATIONS  Bradycardia · congenital QT prolongation · electrolyte disturbances · heart failure with reduced left ventricular ejection fraction · history of symptomatic arrhythmias · predisposition to cardiac arrhythmias

INTERACTIONS  → Appendix 1 (saquinavir). Caution with concomitant use of garlic (avoid garlic capsules—reduces plasma-saquinavir concentration). Contra-indicated if concomitant use of drugs that prolong QT or PR interval. Contra-indicated if concomitant use of drugs that increase plasma-saquinavir concentration (avoid unless no alternative treatment available).

SIDE-EFFECTS  Common or very common  Alopecia · changes in libido · dry mouth · dysphonia · increased appetite · peripheral neuropathy

Rare

SIDE-EFFECTS, FURTHER INFORMATION

Pancreatitis  Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed.

PREGNANCY  Only use low-dose booster to increase the effect of other protease inhibitors.

HEPATIC IMPAIRMENT  Avoid in decompensated liver disease; in severe impairment without decompensation, use 'booster' doses with caution (avoid treatment doses).

DIRECTIONS FOR ADMINISTRATION  Bitter taste of oral solution can be masked by mixing with chocolate milk; do not mix with water, measuring cup must be dry.

PATIENT AND CARER ADVICE  Patients or carers should be given advice on how to administer ritonavir oral solution.

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

6.7 Influenza

### Oseltamivir

**INDICATIONS AND DOSE**

Prevention of influenza

**BY MOUTH**

- **Child 1-2 months:** 2.5 mg/kg once daily for 10 days for post-exposure prophylaxis
- **Child 3-11 months:** 3 mg/kg once daily for 10 days for post-exposure prophylaxis

**Dose equivalence and conversion**

- **Oseltamivir capsules**
  - Adult: 75 mg twice daily
  - Child <2 months: 140 mg/kg once daily
  - Child 2-11 months: 75 mg once daily
  - Child >11 months and <12 years: 150 mg twice daily

**Oseltamivir oral solution**

- Child: 10 mg/kg once daily

**Rare**

- Development of resistance to oseltamivir in influenza A virus may occur, typically in people who are severely immunocompromised or who received the drug very late after symptom onset.

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Digestive system**: Nausea, vomiting, abdominal discomfort, diarrhoea
- **Central nervous system**: Confusion, agitation, abnormally elevated body temperature (fever)
- **Skin and subcutaneous tissue**: Rash, itching, photosensitivity
- **Other adverse reactions**
  - Blood and blood-forming organ disorders: Anaemia, leucopenia, lymphopenia
  - Clinical, laboratory, and functional findings: Liver function test abnormalities, renal impairment

**Contraindications**

- Pneumonia cases where oseltamivir is unlikely to be effective
- Patients with severe heart or kidney disease
- Patients with severe liver disease
- Patients with severe neuromuscular disorders
- Patients with severe psychiatric disorders
- Patients with severe renal impairment

**Cautions**

- Patients with cardiac, renal, or psychiatric disorders
- Patients with cardiovascular disease
- Patients with diabetes mellitus
- Patients with seizures

**Drug interactions**

- Omeprazole, atazanavir, ritonavir, saquinavir

**Neurominidase inhibitors**

- **Neurominidase inhibitors**
  - **Oseltamivir**
  - **Zanamivir**

**Oseltamivir**

- **Drug action**: Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

- **Indications and dose**
  - **Prevention of influenza**
    - **Child 1-2 months:** 2.5 mg/kg once daily for 10 days for post-exposure prophylaxis
    - **Child 3-11 months:** 3 mg/kg once daily for 10 days for post-exposure prophylaxis

- **Oseltamivir capsules**
  - Adult: 75 mg twice daily
  - Child <2 months: 140 mg/kg once daily
  - Child 2-11 months: 75 mg once daily
  - Child >11 months and <12 years: 150 mg twice daily

- **Oseltamivir oral solution**
  - Child: 10 mg/kg once daily
Infection

▶ Child 1-12 years (body-weight 10-15 kg): 30 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
▶ Child 1-12 years (body-weight 15-23 kg): 45 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
▶ Child 1-12 years (body-weight 23-40 kg): 60 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
▶ Child 1-12 years (body-weight 40 kg and above): 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
▶ Adult: 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic

Treatment of influenza

BY MOUTH
▶ Child 1-2 months: 2.5 mg/kg twice daily for 5 days
▶ Child 3-11 months: 3 mg/kg twice daily for 5 days
▶ Child 1-12 years (body-weight 10-15 kg): 30 mg twice daily for 5 days
▶ Child 1-12 years (body-weight 15-23 kg): 45 mg twice daily for 5 days
▶ Child 1-12 years (body-weight 23-40 kg): 60 mg twice daily for 5 days
▶ Child 1-12 years (body-weight 40 kg and above): 75 mg twice daily for 5 days
▶ Child 13-17 years: 75 mg twice daily for 5 days
▶ Adult: 75 mg twice daily for 5 days

UNLICENSED USE
Not licensed for use in children under 1 year of age unless there is a pandemic.

SIDE-EFFECTS
▶ Common or very common Abdominal pain · dyspepsia · headache · nausea · vomiting
▶ Uncommon Altered consciousness (usually in children and adolescents) · arrhythmias · convulsions · eczema · rash
▶ Rare Gastro-intestinal bleeding · hepatitis · neuropsychiatric disorders (usually in children and adolescents) · Stevens-Johnson syndrome · thrombocytopenia · toxic epidermal necrolysis · visual disturbances

PREGNANCY
Although safety data are limited, oseltamivir can be used in women who are pregnant when the potential benefit outweighs the risk (e.g. during a pandemic). Use only if potential benefit outweighs risk (e.g. during a pandemic).

BREAST FEEDING
Although safety data are limited, oseltamivir can be used in women who are breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Oseltamivir is the preferred drug in women who are breast-feeding. Amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic).

RENAL IMPAIRMENT
▶ In adults For treatment, use 30 mg twice daily if eGFR 30–60 mL/minute/1.73 m² (30 mg once daily if eGFR 10–30 mL/minute/1.73 m²). For prevention, use 30 mg once daily if eGFR 30–60 mL/minute/1.73 m² (30 mg every 48 hours if eGFR 10–30 mL/minute/1.73 m²). Avoid for treatment and prevention if eGFR less than 10 mL/minute/1.73 m².
▶ In children For treatment, use 40% of normal dose twice daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m² (40% of normal dose once daily if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²). For prevention, use 40% of normal dose once daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m² (40% of normal dose every 48 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²). Avoid for treatment and prevention if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

DIRECTIONS FOR ADMINISTRATION
If suspension not available, capsules can be opened and the contents mixed with a small amount of sweetened food, such as sugar water or chocolate syrup, just before administration.

PRESCRIBING AND DISPENSING INFORMATION
Flavours of oral liquid formulations may include tutti-frutti.

PATIENT AND CARER ADVICE
Medicines for Children leaflet: Oseltamivir for influenza (flu) www.medicinesforchildren.org.uk/oseltamivir-for-influenza

NATIONAL FUNDING/ACCESS DECISIONS

Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008) [NICE TA158]
The drugs described here are not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.

Amantadine is not recommended for prophylaxis of influenza.

Oseltamivir is not recommended for seasonal prophylaxis against influenza.

When influenza is circulating in the community, either oseltamivir or zanamivir is recommended (in accordance with UK licensing) for post-exposure prophylaxis in at-risk patients who are not effectively protected by influenza vaccine, and who have been in close contact with someone suffering from influenza-like illness in the same household or residential setting. Oseltamivir should be given within 48 hours of exposure to influenza while zanamivir should be given within 36 hours of exposure to influenza. National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.

During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, either oseltamivir or zanamivir may be used for post-exposure prophylaxis in at-risk patients (regardless of influenza vaccination) living in long-term residential or nursing homes.

At risk patients include those aged over 65 years or those who have one or more of the following conditions:
chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
chronic heart disease;
chronic renal disease;
chronic liver disease;
chronic neurological disease;
immunosuppression;
diabetes mellitus.
The Department of Health in England has advised (November 2010 and April 2011) that ‘at risk patients’ also includes patients under 65 years of age who are at risk of developing medical complications from influenza (treatment only) or women who are pregnant.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community. www.nice.org.uk/TA158

Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (February 2009) [NICE TA168]
The drugs described here are not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.

Amantadine is not recommended for prophylaxis of influenza.
When influenza is circulating in the community, either oseltamivir or zanamivir is recommended (in accordance with UK licensing) for the treatment of influenza in at-risk patients who can start treatment within 48 hours of the onset of symptoms. National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.

During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, either oseltamivir or zanamivir may be used for treatment at-risk patients living in long-term residential or nursing homes. At risk patients include those aged over 65 years or those who have one or more of the following conditions:

- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.

The Department of Health in England has advised (November 2010 and April 2011) that ‘at risk patients’ also includes patients under 65 years of age who are at risk of developing medical complications from influenza (treatment only) or women who are pregnant. This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community. www.nice.org.uk/TA168

NHS restrictions Except for the treatment and prophylaxis of influenza as indicated in the NICE guidance; endorse prescription ‘SLS’.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**Capsule**

- **Tamiflu** (Roche Products Ltd)
  - Oseltamivir (as Oseltamivir phosphate) 30 mg Tamiflu 30mg capsules | 10 capsule [PDL] £7.71
  - Oseltamivir (as Oseltamivir phosphate) 45 mg Tamiflu 45mg capsules | 10 capsule [PDL] £15.41
  - Oseltamivir (as Oseltamivir phosphate) 75 mg Tamiflu 75mg capsules | 10 capsule [PDL] £15.41

**Oral suspension**

- **Tamiflu** (Roche Products Ltd)
  - Oseltamivir (as Oseltamivir phosphate) 6 mg per 1 ml Tamiflu 6mg/ml oral suspension (sugar-free) | 65 ml [PDL] £10.27

**Oral solution**

- **Oseltamivir (Non-proprietary)**
  - Oseltamivir (as Oseltamivir phosphate) 15 mg per 1 ml Oseltamivir 15mg/ml oral solution sugar free (sugar-free) | 20 ml [PDL] £10.00

**Zanamivir**

**DRUG ACTION** Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

**INDICATIONS AND DOSE**

**Post-exposure prophylaxis of influenza**

- **BY INHALATION OF POWDER**
  - Child 5-17 years: 10 mg once daily for up to 28 days
  - Adult: 10 mg once daily for up to 28 days

**Prevention of influenza during an epidemic**

- **BY INHALATION OF POWDER**
  - Child 5-17 years: 10 mg twice daily for 5 days (for up to 10 days if resistance to oseltamivir suspected)
  - Adult: 10 mg twice daily for 5 days (for up to 10 days if resistance to oseltamivir suspected)

**UNLICENSED USE** Use of zanamivir for up to 10 days if resistance to oseltamivir suspected is an unlicensed duration.

**CAUTIONS**

- Asthma - chronic pulmonary disease - uncontrolled chronic illness

**CAUTIONS, FURTHER INFORMATION**

- **Asthma and chronic pulmonary disease** Risk of bronchospasm—short-acting bronchodilator should be available. Avoid in severe asthma unless close monitoring possible and appropriate facilities available to treat bronchospasm.

**SIDE-EFFECTS**

- Common or very common Rash
- Uncommon Angioedema - bronchospasm - dyspnoea - urticaria
- Rare Neuropsychiatric disorders (in children) - neuropsychiatric disorders (especially in children and adolescents) (in adults) - Stevens-Johnson syndrome - toxic epidermal necrolysis

**PREGNANCY** Although safety data are limited, zanamivir can be used in women who are pregnant when the potential benefit outweighs the risk (e.g. during a pandemic). Amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic). Amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic). Use only if potential benefit outweighs risk (e.g. during a pandemic). Amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic). Amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic).

**DIRECTIONS FOR ADMINISTRATION** Other inhaled drugs should be administered before zanamivir.

**PRESCRIBING AND DISPENSING INFORMATION** Except for the treatment and prophylaxis of influenza as indicated in the NICE guidance; endorse prescription ‘SLS’.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

Chapter 6
Endocrine system

1 Antidiuretic hormone disorders

Posterior pituitary hormones and antagonists

Posterior pituitary hormones

Diabetes insipidus
Vasopressin p. 576 (antidiuretic hormone, ADH) is used in the treatment of pituitary (cranial) diabetes insipidus as is its analogue desmopressin. Dosage is tailored to produce a slight diuresis every 24 hours to avoid water intoxication. Treatment may be required for a limited period only in diabetes insipidus following trauma or pituitary surgery.

Desmopressin is more potent and has a longer duration of action than vasopressin; unlike vasopressin it has no vasoconstrictor effect. It is given by mouth or intranasally for maintenance therapy, and by injection in the postoperative period or in unconscious patients. Desmopressin is also used in the differential diagnosis of diabetes insipidus. Following a dose intramuscularly or intranasally, restoration of the ability to concentrate urine after water deprivation confirms a diagnosis of cranial diabetes insipidus. Failure to respond occurs in nephrogenic diabetes insipidus.

In nephrogenic and partial pituitary diabetes insipidus benefit may be gained from the paradoxical antidiuretic effect of thiazides.

Carbamazepine p. 387 is sometimes useful in partial pituitary diabetes insipidus [unlicensed]; it may act by sensitising the renal tubules to the action of remaining endogenous vasopressin.

Other uses
Desmopressin is also used to boost factor VIII concentration in mild to moderate haemophilia and in von Willebrand’s disease; it is also used to test fibrinolytic response. Desmopressin may also have a role in nocturnal enuresis.

 Vasopressin infusion is used to control variceal bleeding in portal hypertension, prior to more definitive treatment and with variable results. Terlipressin acetate p. 77, a derivative of vasopressin with reportedly less pressor and antidiuretic activity, is used similarly.

Oxytocin p. 705, another posterior pituitary hormone, is indicated in obstetrics.

Antidiuretic hormone antagonists
Demeclocycline hydrochloride p. 496 can be used in the treatment of hyponatraemia resulting from inappropriate secretion of antidiuretic hormone, if fluid restriction alone does not restore sodium concentration or is not tolerable. Demeclocycline hydrochloride is thought to act by directly blocking the renal tubular effect of antidiuretic hormone.

Tolvaptan p. 577 is a vasopressin V2-receptor antagonist licensed for the treatment of hyponatraemia secondary to syndrome of inappropriate antidiuretic hormone secretion; treatment duration with tolvaptan is determined by the underlying disease and its treatment.

Rapid correction of hyponatraemia during tolvaptan therapy can cause osmotic demyelination, leading to serious neurological events; close monitoring of serum sodium concentration and fluid balance is essential.

1.1 Diabetes insipidus

Drugs used for Diabetes insipidus not listed below; Chlortalidone, p. 204

VASOPRESSIN AND ANALOGUES

Desmopressin

• DRUG ACTION Desmopressin is an analogue of vasopressin.
INDICATIONS AND DOSE

Diabetes insipidus, diagnosis (water deprivation test)

BY INTRANASAL ADMINISTRATION

Adult: 20 micrograms, limit fluid intake to 500 mL from 1 hour before to 8 hours after administration

BY INTRAMUSCULAR INJECTION OR BY SUBCUTANEOUS INJECTION

Adult: 2 micrograms for 1 dose, limit fluid intake to 500 mL from 1 hour before to 8 hours after administration

Diabetes insipidus, treatment

BY MOUTH

Child 1 month–1 year: Initially 10 micrograms 2–3 times a day, adjusted according to response; usual dose 30–150 micrograms daily

Child 2–11 years: Initially 50 micrograms 2–3 times a day, adjusted according to response; usual dose 100–800 micrograms daily

Child 12–17 years: Initially 100 micrograms 2–3 times a day, adjusted according to response; usual dose 0.2–1.2 mg daily

Adult: Initially 60 micrograms 3 times a day, adjusted according to response; usual dose 40–240 micrograms 3 times a day

BY INTRANASAL ADMINISTRATION

Child 2–17 years: Initially 60 micrograms 3 times a day, adjusted according to response; usual dose 40–240 micrograms 3 times a day

Adult: Initially 60 micrograms 3 times a day, adjusted according to response; usual dose 40–240 micrograms 3 times a day

BY INTRAVENOUS INFUSION OR BY SUBCUTANEOUS INJECTION

Adult: 1–2 micrograms, blood to be sampled after 8 hours after administration to avoid fluid overload

Primary nocturnal enuresis

BY MOUTH

Child 5–17 years: 200 micrograms once daily, only increased to 400 micrograms if dose not effective; withdraw for at least 1 week for reassessment after 3 months, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration

Adult 18–65 years: 200 micrograms once daily, only increased to 400 micrograms if dose not effective; withdraw for at least 1 week for reassessment after 3 months, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration

BY SUBLINGUAL ADMINISTRATION

Child 5–17 years: 120 micrograms once daily, increased if necessary to 240 micrograms once daily, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration, dose to be increased only if lower dose not effective, reassess after 3 months by withdrawing treatment for at least 1 week

Adult 18–65 years: 120 micrograms once daily, increased if necessary to 240 micrograms once daily, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration, dose to be increased only if lower dose not effective, reassess after 3 months by withdrawing treatment for at least 1 week

Postoperative polyuria or polydipsia

BY MOUTH

Adult: Dose to be adjusted according to urine osmolality

Polyuria or polydipsia after hypophysectomy

BY SUBLINGUAL ADMINISTRATION

Adult: Dose to be adjusted according to urine osmolality

Nocturia associated with multiple sclerosis (when other treatments have failed)

BY INTRANASAL ADMINISTRATION

Adult 18–65 years: 10–20 micrograms once daily, to be taken at bedtime, dose not to be repeated within 24 hours, limit fluid intake from 1 hour before to 8 hours after administration

Renal function testing

BY INTRANASAL ADMINISTRATION

Adult: 40 micrograms, empty bladder at time of administration and limit fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

Adult: 2 micrograms, empty bladder at time of administration and restrict fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload

Mild to moderate haemophilia and von Willebrand’s disease

BY INTRANASAL ADMINISTRATION

Adult: 300 micrograms every 12 hours if required, one 150 microgram spray into each nostril, 30 minutes before surgery or when bleeding, dose may be alternatively repeated at intervals of at least 3 days, if self-administered

BY INTRAVENOUS INFUSION OR BY SUBCUTANEOUS INJECTION

Adult: 300 nanograms/kg for 1 dose, to be administered immediately before surgery or after trauma; may be repeated at intervals of 12 hours if no tachycardia

Fibrinolytic response testing

BY INTRANASAL ADMINISTRATION

Adult: 300 micrograms, blood to be sampled after 1 hour for fibrinolytic activity, one 150 microgram spray to be administered into each nostril

BY SUBCUTANEOUS INJECTION OR BY INTRAVENOUS INJECTION

Adult: 300 nanograms/kg for 1 dose, blood to be sampled after 20 minutes for fibrinolytic activity

Lumbar-puncture-associated headache

BY INTRAMUSCULAR INJECTION OR BY SUBCUTANEOUS INJECTION

Adult: (consult product literature)

**CONTRA-INDICATIONS**

Cardiac insufficiency - conditions treated with diuretics - polydipsia in alcohol dependence - psychogenic polydipsia

**CAUTIONS**

GENERAL CAUTIONS

Asthma - avoid fluid overload - cardiovascular disease (not indicated for nocturnal enuresis or nocturia) - conditions which might be aggravated by water retention - cystic fibrosis - elderly (avoid for nocturnal enuresis and nocturia in those over 65 years) epilepsy - heart failure - hypertension (not indicated for nocturnal enuresis or nocturia) - migraine - nocturia—limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards - nocturnal enuresis—limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards

SPECIFIC CAUTIONS

With intranasal use should not be given intranasally for nocturnal enuresis due to an increased incidence of side-effects
In adults

**SIDE-EFFECTS**

- Allergic reactions - emotional disturbance in children - epistaxis - fluid retention - headache - hyponatraemia (in more serious cases with convulsions) on administration without restricting fluid intake - nasal congestion - nausea - stomach pain - vomiting

**SPECIFIC SIDE-EFFECTS**

- With intranasal use Rhinitis

**SIDE-EFFECTS, FURTHER INFORMATION**

- Hyponatraemic convulsions The risk of hyponatraemic convulsions can be minimised by keeping to the recommended starting doses and by avoiding concomitant use of drugs which increase secretion of vasopressin (e.g. tricyclic antidepressants).

- PREGNANCY Small oxytocic effect in third trimester; increased risk of pre-eclampsia.

- BREAST FEEDING Amount too small to be harmful.

- RENAL IMPAIRMENT Use with caution; antidiuretic effect may be reduced.

**INTERACTIONS**

- Monitor blood pressure and weight checks are needed to monitor for fluid retention (especially disease of coronary arteries) unless extreme caution.

- Antidiuretic hormone disorders

- Osmotic diarrhoea

- Emotional disturbance in children

- Myocardial ischaemia

- Asthma - avoid fluid overload - conditions which might be aggravated by water retention - epilepsy - heart failure - hypertension - migraine

- CONTRA-INDICATIONS Chronic nephritis (until reasonable blood nitrogen concentrations attained) - vascular disease (especially disease of coronary arteries) unless extreme caution

- CAUTIONS Pituitary diabetes insipidus

**MEDICATIONS**

- Pituitary diabetes insipidus

- Osmotic diarrhoea

- Emotional disturbance in children

- Myocardial ischaemia

- Asthma - avoid fluid overload - conditions which might be aggravated by water retention - epilepsy - heart failure - hypertension - migraine

- CONTRA-INDICATIONS Chronic nephritis (until reasonable blood nitrogen concentrations attained) - vascular disease (especially disease of coronary arteries) unless extreme caution

- CAUTIONS Pituitary diabetes insipidus

**SIDE-EFFECTS**

- Abdominal cramps

- Nausea

- Vomiting

- Headache

- Pallor

- Sweating

- Vertigo

- Pallor - peripheral ischaemia - sweating - tremor - vertigo - vomiting

- PREGNANCY Oxytocic effect in third trimester.

**Vasopressin**

**INDICATIONS AND DOSE**

**Pituitary diabetes insipidus**

- By intramuscular injection or by subcutaneous injection

- Adult: ≥ 20 units every 4 hours

- Initial control of oesophageal variceal bleeding

- By intravenous infusion

- Adult: 20 units, dose to be administered over 15 minutes

**Oral lypophilate**

**CAUTIONARY AND ADVISORY LABELS**

**DESMOPRESSIN (Non-proprietary)**

- Desmopressin (as Desmopressin acetate) 60 microgram DDAVP Melt 60 microgram oral lypophilates (sugar-free) | 100 tablet DT price = £50.53

- Desmopressin (as Desmopressin acetate) 120 microgram DDAVP Melt 120 microgram oral lypophilates sugar-free (sugar-free) | 100 tablet DT price = £101.07

- Desmopressin (as Desmopressin acetate) 240 microgram DDAVP Melt 240 microgram oral lypophilates (sugar-free) | 100 tablet DT price = £202.14

- Desmopressin (as Desmopressin acetate) 240 microgram Desmocollin 240 microgram oral lypophilates (sugar-free) | 30 tablet DT price = £60.68

**Solution for Injection**

1.2 Syndrome of inappropriate antidiuretic hormone secretion

Drugs used for Syndrome of inappropriate antidiuretic hormone secretion not listed below; Demeclocycline hydrochloride, p. 496

SELECTIVE VASOPRESSIN V2-RECEPTOR ANTAGONISTS

Tolvaptan

- **DRUG ACTION** Tolvaptan is a vasopressin V₂-receptor antagonist.

- **INDICATIONS AND DOSE**
  Treatment of hyponatraemia secondary to syndrome of inappropriate antidiuretic hormone secretion
  **BY MOUTH**
  - Adult: 15 mg once daily, increased if necessary up to 60 mg daily treatment duration is determined by the underlying disease and its treatment

- **CONTRA-INDICATIONS** Anuria · hyponaatraemia · hypovolaemic hyponatraemia · impaired perception of thirst · volume depletion

- **CAUTIONS**
  Alcoholism (increased risk of demyelination syndrome if rapid correction of hyponatraemia) · diabetes mellitus · ensure adequate fluid intake · hypoxia (increased risk of demyelination syndrome if rapid correction of hyponatraemia) · malnutrition (increased risk of demyelination syndrome if rapid correction of hyponatraemia) · pseudohyponatraemia associated with diabetes mellitus (exclude before treatment)

- **INTERACTIONS** → Appendix 1 (tolvaptan).
  Avoid concomitant drugs that increase serum-sodium concentration.

- **SIDE-EFFECTS**
  - **Common or very common** Constipation · decreased appetite · dehydration · dry mouth · ecchymosis · fever · hyperglycaemia · hyperkalaemia · increased blood creatinine · malaise · nausea · neurological disturbance (following rapid correction of hyponatraemia) · postural hypotension · pruritus · thirst · urinary frequency
  - **Uncommon** Renal impairment · taste disturbance
  - **Frequency not known** Dizziness · hepatic impairment (discontinue) · hyponatraemia · hyperuricaemia · hypoglycaemia · syncope

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - **Hepatic impairment** Discontinue and perform liver-function tests promptly if symptoms of hepatic impairment (anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, dark urine, pruritus).

## 2 Corticosteroid responsive conditions

### CORTICOSTEROIDS

**Corticosteroids, general use**

Dosages of corticosteroids vary widely in different diseases and in different patients. If the use of a corticosteroid can save or prolong life, as in exfoliative dermatitis, pemphigus, acute leukaemia or acute transplant rejection, high doses may need to be given, because the complications of therapy are likely to be less serious than the effects of the disease itself.

When long-term corticosteroid therapy is used in some chronic diseases, the adverse effects of treatment may become greater than the disabilities caused by the disease. To minimise side-effects the maintenance dose should be kept as low as possible.

When potentially less harmful measures are ineffective corticosteroids are used topically for the treatment of inflammatory conditions of the skin. Corticosteroids should be avoided or used only under specialist supervision in psoriasis.

Corticosteroids are used both topically (by rectum) and systematically (by mouth or intravenously) in the management of ulcerative colitis and Crohn’s disease. They are also included in locally applied creams for haemorrhoids.

Use can be made of the mineralocorticoid activity of fludrocortisone acetate p. 582 to treat postural hypotension in autonomic neuropathy.

High-dose corticosteroids should be avoided for the management of septic shock. However, there is evidence that administration of lower doses of hydrocortisone p. 583 and fludrocortisone acetate is of benefit in adrenocortical insufficiency resulting from septic shock.

Dexamethasone p. 581 and betamethasone p. 581 have little if any mineralocorticoid action and their long duration of action makes them particularly suitable for suppressing corticotropin secretion in congenital adrenal hyperplasia where the dose should be tailored to clinical response and

**PREGNANCY** Avoid—toxicity in animal studies.

**BREAST FEEDING** Avoid—present in milk in animal studies.

**BREAST FEEDING** Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Use with caution in severe impairment—no information available.

**RENAL IMPAIRMENT** No information available in severe impairment.

**MONITORING REQUIREMENTS**
- Monitor for dehydration in patients who are fluid-restricted.
- Monitor serum-sodium concentration and fluid balance no later than 6 hours after initiating treatment and every 6 hours during the first 1–2 days of treatment and until dose stabilised. Discontinue if rapid rise in serum-sodium concentration (greater than 12 mmol/litre in 24 hours or 18 mmol/litre in 48 hours).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **Samsca** (Otsuka Pharmaceuticals (UK) Ltd) Tolvaptan 15 mg Samsca 15mg tablets | 10 tablet £74.60
- **Samsca** 30 mg Samsca 30mg tablets | 10 tablet £74.60

**BREAST FEEDING** Not known to be harmful.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (argipressin), give intermittently in Glucose 5%; suggested concentration 20 units/100mL given over 15 minutes.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **VASOPRESSIN (Non-proprietary)** Argipressin 20 unit per 1 ml Argipressin 20units/1ml solution for injection ampoules | 10 ampoule £800.00 (Hospital only)
Corticosteroid therapy is also weakly linked with peptic ulceration and perforation.

Psychiatric reactions may also occur.

**Managing side-effects**

Side-effects can be minimised by using lowest effective dose for minimum period possible. The suppressive action of a corticosteroid on cortisol secretion is least when it is given as a single dose in the morning. In an attempt to reduce pituitary-adrenal suppression further, the usual dose for two days can sometimes be taken as a single dose on alternate days; alternate-day administration has not been very successful in the management of asthma. Pituitary-adrenal suppression can also be reduced by means of intermittent therapy with short courses. In some conditions it may be possible to reduce the dose of corticosteroid by adding a small dose of an immunosuppressive drug.

Whenever possible local treatment with creams, intra-articular injections, inhalations, eye-drops, or enemas should be used in preference to systemic treatment.

Inhaled corticosteroids have considerably fewer systemic effects than oral corticosteroids, but adverse effects including adrenal suppression have been reported. Use of other corticosteroid therapy (including topical) or concurrent use of drugs which inhibit corticosteroid metabolism should be taken into account when assessing systemic risk. In children, growth restriction is associated with systemic corticosteroid therapy does not seem to occur with recommended doses of inhaled therapy; although initial growth velocity may be reduced, there appears to be no effect on achieving normal adult height. Large-volume spacer devices should be used for administering inhaled corticosteroids in children under 15 years; they are also useful in older children and adults, particularly if high doses are required. Spacer devices increase airway deposition and reduce oropharyngeal deposition.

**Corticosteroids, replacement therapy**

The adrenal cortex normally secretes hydrocortisone p. 583 (cortisol) which has glucocorticoid activity and weak mineralocorticoid activity. It also secretes the mineralocorticoid aldosterone.

In deficiency states, physiological replacement is best achieved with a combination of hydrocortisone and the mineralocorticoid fludrocortisone acetate p. 582; hydrocortisone alone does not usually provide sufficient mineralocorticoid activity for complete replacement.

In Addison's disease or following adrenalectomy, hydrocortisone by mouth is usually required. This is given in 2 doses, the larger in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion. The optimum daily dose is determined on the basis of clinical response. Glucocorticoid therapy is supplemented by fludrocortisone acetate.

In acute adrenocortical insufficiency, hydrocortisone is given intravenously (preferably as sodium succinate) every 6 to 8 hours in sodium chloride p. 953 intravenous infusion 0.9%.

In hypopituitarism, glucocorticoids should be given as in adrenocortical insufficiency, but since production of aldosterone is also regulated by the renin-angiotensin system a mineralocorticoid is not usually required. Additional replacement therapy with levothyroxine sodium p. 665 and sex hormones should be given as indicated by the pattern of hormone deficiency.
**Glucocorticoid therapy**

In comparing the relative potencies of corticosteroids in terms of their anti-inflammatory (glucocorticoid) effects it should be borne in mind that high glucocorticoid activity in itself is of no advantage unless it is accompanied by relatively low mineralocorticoid activity (see Disadvantages of Corticosteroids). The mineralocorticoid activity of fluorocortisone acetate p. 582 is so high that its anti-inflammatory activity is of no clinical relevance.

**Equivalent anti-inflammatory doses of corticosteroids**

This table takes no account of mineralocorticoid effects, nor does it take account of variations in duration of action

<table>
<thead>

The relatively high mineralocorticoid activity of hydrocortisone p. 583, and the resulting fluid retention, makes it unsuitable for disease suppression on a long-term basis. However, hydrocortisone can be used for adrenal replacement therapy. Hydrocortisone is used on a short-term basis by intravenous injection for the emergency management of some conditions. The relatively moderate anti-inflammatory potency of hydrocortisone also makes it a useful topical corticosteroid for the management of inflammatory skin conditions because side-effects (both topical and systemic) are less marked.

Prednisolone p. 585 and prednisone p. 586 have predominantly glucocorticoid activity. Prednisolone is the corticosteroid most commonly used by mouth for long-term disease suppression.

Betamethasone p. 581 and dexamethasone p. 581 have very high glucocorticoid activity in conjunction with insignificant mineralocorticoid activity. This makes them particularly suitable for high-dose therapy in conditions where fluid retention would be a disadvantage.

Betamethasone and dexamethasone also have a long duration of action and this, coupled with their lack of mineralocorticoid action makes them particularly suitable for conditions which require suppression of corticotropin (corticotrophin) secretion (e.g. congenital adrenal hyperplasia).

Some esters of betamethasone and of beclometasone dipropionate p. 38 (beclometasone) exert a considerably more marked topical effect (e.g. on the skin or the lungs) than when given by mouth; use is made of this to obtain topical effects whilst minimising systemic side-effects (e.g. for skin applications and asthma inhalations).

Deflazacort p. 581 has a high glucocorticoid activity; it is derived from prednisolone.

**Corticosteroids (systemic)**

**CONTRA-INDICATIONS** Avoid live virus vaccines in those receiving immunosuppressive doses (serum antibody response diminished) - systemic infection (unless specific therapy given)

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

**SPECIFIC SIDE-EFFECTS**

- **With intra-articular use** Flushing - may affect the hyaline cartilage

**SIDE-EFFECTS, FURTHER INFORMATION**

For further information on side-effects associated with intra-articular, intradermal and intralesional preparations, consult product literature.

**CAUTIONS** Congestive heart failure - diabetes mellitus (including a family history of) - diverticulitis - epilepsy - glaucoma (including a family history of or susceptibility to) - history of steroid myopathy - history of tuberculosis or X-ray changes (frequent monitoring required) - hypertension - hypothroidism - infection (particularly untreated) - myasthenia gravis - ocular herpes simplex (risk of corneal perforation) - osteoporosis (postmenopausal women and the elderly at special risk) - peptic ulcer - psychiatric reactions - posterior subcapsular cataracts - recent myocardial infarction (rupture reported) - severe affective disorders (particularly if history of steroid-induced psychosis) - should not be used long-term - thromboembolic disorders - ulcerative colitis

**CONTRA-INDICATIONS, FURTHER INFORMATION**

For further information on contra-indications associated with intra-articular, intradermal and intralesional preparations, consult product literature.

**INTERACTIONS** → Appendix 1 (corticosteroids).
suitable regimen for corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of surgery, is:

- Minor surgery under general anaesthesia—usual oral corticosteroid dose on the morning of surgery or hydrocortisone (usually the sodium succinate) intravenously at induction; the usual oral corticosteroid dose is recommenced after surgery.
- Moderate or major surgery—usual oral corticosteroid dose on the morning of surgery and hydrocortisone intravenously at induction, followed by hydrocortisone 3 times a day by intravenous injection for 24 hours after moderate surgery or for 48–72 hours after major surgery; the usual pre-operative oral corticosteroid dose is recommenced on stopping hydrocortisone injections.

Patients on long-term corticosteroid treatment should carry a steroid treatment card which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.

**Infections** Prolonged courses of corticosteroids increase susceptibility to infections and severity of infections; clinical presentation of infections may also be atypical. Serious infections e.g. *septicaemia* and *tuberculosis* may reach an advanced stage before being recognised, and *amoebiasis* or *strongyloidiasis* may be activated or exacerbated (exlude before initiating a corticosteroid in those at risk or with suggestive symptoms). Fungal or viral *ocular infections* may also be exacerbated.

**Chickenpox** Unless they have had chickenpox, patients receiving oral or parenteral corticosteroids for purposes other than replacement should be regarded as being at risk of severe chickenpox (see Steroid Treatment Card). Manifestations of fulminant illness include pneumonia, hepatitis and disseminated intravascular coagulation; rash is not necessarily a prominent feature. Passive immunisation with varicella–zoster immunoglobulin is needed for exposed non–immune patients receiving systemic corticosteroids or for those who have used them within the previous 3 months. Confirmed chickenpox warrants specialist care and urgent treatment. Corticosteroids should not be stopped and dosage may need to be increased.

**Measles** Patients taking corticosteroids should be advised to take particular care to avoid exposure to measles and to seek immediate medical advice if exposure occurs. Prophylaxis with intramuscular normal immunoglobulin may be needed.

**Psychiatric reactions** Systemic corticosteroids, particularly in high doses, are linked to psychiatric reactions including euphoria, nightmares, insomnia, irritability, mood lability, suicidal thoughts, psychotic reactions, and behavioural disturbances. A serious paranoid state or depression with risk of suicide can be induced, particularly in patients with a history of mental disorder. These reactions frequently subside on reducing the dose or discontinuing the corticosteroid but they may also require specific management. Patients should be advised to seek medical advice if psychiatric symptoms (especially depression and suicidal thoughts) occur and they should also be alert to the rare possibility of such reactions during withdrawal of corticosteroid treatment.

Systemic corticosteroids should be prescribed with care in those predisposed to psychiatric reactions, including those who have previously suffered corticosteroid-induced psychosis, or who have a personal or family history of psychiatric disorders.

**Pregnancy** The benefit of treatment with corticosteroids during pregnancy outweighs the risk. Corticosteroid cover is required during labour. Following a review of the data on the safety of systemic corticosteroids used in pregnancy and breast-feeding the CSM (May 1998) concluded that corticosteroids vary in their ability to cross the placenta but there is no convincing evidence that systemic corticosteroids increase the incidence of congenital abnormalities such as cleft palate or lip. When administration is prolonged or repeated during pregnancy, systemic corticosteroids increase the risk of intra-uterine growth restriction; there is no evidence of intra-uterine growth restriction following short-term treatment (e.g. prophylactic treatment for neonatal respiratory distress syndrome). Any adrenal suppression in the neonate following prenatal exposure usually resolves spontaneously after birth and is rarely clinically important. Pregnant women with fluid retention should be monitored closely when given systemic corticosteroids.

- **BREAST FEEDING** The benefit of treatment with corticosteroids during breast-feeding outweighs the risk.
- **HEPATIC IMPAIRMENT** The plasma–drug concentration may be increased (particularly on systemic use). Oral and parenteral use should be undertaken with caution.
- **RENAL IMPAIRMENT** Use by oral and injectable routes should be undertaken with caution.
- **EFFECT ON LABORATORY TESTS** Suppression of skin test reactions.
- **TREATMENT CESSATION** Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension or death. Withdrawal can also be associated with fever, myalgia, arthralgia, rhinitis, conjunctivitis, painful itchy skin nodules and weight loss. The magnitude and speed of dose reduction in corticosteroid withdrawal should be determined on a case–by–case basis, taking into consideration the underlying condition that is being treated, and individual patient factors such as the likelihood of relapse and the duration of corticosteroid treatment. Gradual withdrawal of systemic corticosteroids should be considered in those whose disease is unlikely to relapse and have:
  - received more than 40 mg prednisolone (or equivalent) daily for more than 1 week;
  - been given repeat doses in the evening;
  - received more than 3 weeks’ treatment;
  - recently received repeated courses (particularly if taken for longer than 3 weeks); taken a short course within 1 year of stopping long-term therapy;
  - other possible causes of adrenal suppression.

Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse and who are not included in the patient groups described above. During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to prednisolone 7.5 mg daily) and then reduced more slowly. Assessment of the disease may be needed during withdrawal to ensure that relapse does not occur.

- **PATIENT AND CARER ADVICE** Advice for patients. Patients on long-term corticosteroid treatment should carry a Steroid Treatment Card which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment. A patient information leaflet is supplied to every patient when a systemic corticosteroid is prescribed. Patients should especially be advised of the following:
  - **Immunosuppression** Prolonged courses of corticosteroids can increase susceptibility to infection and serious infections can go unrecognised. Unless already immune, patients are at risk of severe chickenpox and should avoid close contact with people who have chickenpox or shingles. Similarly,
Betamethasone soluble tablets (steroid card). Patient counselling is advised for these products. Steroid treatment cards should be issued where appropriate. Consider giving a ‘steroid card’ to support communication of the risks associated with treatment, and specific written advice to consider corticosteroid replacement during an episode of stress, such as severe intercurrent illness or an operation, to patients using greater than maximum licensed doses of inhaled corticosteroids. Steroid treatment cards are available for purchase from 3M Security Print and Systems Limited, Gorse Street, Chadderton, Oldham OL9 9QH Tel: 0845 510 1112 GP practices can obtain supplies through their Local Area Team Stores. NHS Trusts can order supplies from www.nhsforms.co.uk or by emailing nhsforms@mmm.com.

In Scotland, steroid treatment cards can be obtained from APS Group Scotland by emailing stockorders.dppas@theapsgroup.com or by fax on 0131 629 9967.

Betamethasone

INDICATIONS AND DOSE

Suppression of inflammatory and allergic disorders

BY MOUTH
▼ Adult: Usual dose 0.5–5 mg daily
▼ By intramuscular injection or by slow intravenous infusion
▼ Adult: 4–20 mg, repeated up to 4 times in 24 hours

PREGNANCY Readily crosses the placenta. Transient effect on fetal movements and heart rate.

DIRECTIONS FOR ADMINISTRATION For intravenous infusion (as sodium phosphate) (Betnesol®), give continuously or intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%.

PATIENT AND CARER ADVICE
▼ With oral use Patient counselling is advised for betamethasone soluble tablets (steroid card).

MEDICINAL FORMS
▼ There can be variation in the licensing of different medicines containing the same drug.

Soluble tablet

CAUTIONARY AND ADVISORY LABELS 10, 13, 21
▼ BETAMETHASONE (Non-proprietary)
Betamethasone (as Betamethasone sodium phosphate) 500 microgram Betamethasone 500 microgram soluble tablets sugar free (sugar-free) | 100 tablet [P] £29.85 DT price + £29.70

Corticosteroid responsive conditions

Deflazacort

INDICATIONS AND DOSE

Suppression of inflammatory and allergic disorders

BY MOUTH
▼ Adult: Maintenance 3–18 mg daily
▼ Suppression of inflammatory and allergic disorders (acute disorders)
▼ Adult: Initially up to 120 mg daily

Inflammatory and allergic disorders

BY MOUTH
▼ Child 1 month–11 years: Maintenance 0.25–1.5 mg/kg daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations
▼ Child 12–17 years: Initially 3–18 mg daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations

RENAL IMPAIRMENT Use with caution.

PATIENT AND CARER ADVICE Patient counselling is advised for deflazacort tablets (steroid card).

MEDICINAL FORMS
▼ There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Tablet

CAUTIONARY AND ADVISORY LABELS 5, 10
▼ Calcort (Sanofi)
Deflazacort 6 mg Calcort 6mg tablets | 60 tablet [P] £15.82

Dexamethasone

INDICATIONS AND DOSE

Diagnosis of Cushing’s disease | Congenital adrenal hyperplasia

BY MOUTH
▼ Adult: 0.5–10 mg daily
▼ By intramuscular injection or by slow intravenous infusion
▼ Adult: 0.4–20 mg

Overnight dexamethasone supression test

BY MOUTH
▼ Adult: 1 mg for 1 dose, to be given at night

Suppression of inflammatory and allergic disorders

BY MOUTH
▼ Adult: 0.5–10 mg daily

Mild croup

BY MOUTH
▼ Child: 150 micrograms/kg for 1 dose
▼ Adult: 150 micrograms/kg for 1 dose

Severe croup (or mild croup that might cause complications)

INITIALLY BY MOUTH
▼ Child: Initially 150 micrograms/kg for 1 dose, to be given before transfer to hospital, then (by mouth or by intravenous injection) 150 micrograms/kg, then (by mouth or by intravenous injection) 150 micrograms/kg after 12 hours if required
### Corticosteroid responsive conditions

- **DIRECTIONS FOR ADMINISTRATION**
  - With oral use in children For administration by mouth tablets may be dispersed in water or injection solution given by mouth.
  - With intravenous use in children For intravenous infusion dilute with Glucose 5% or Sodium Chloride 0.9%; give over 15–20 minutes.
  - With intravenous use in adults For intravenous infusion (Dexamethasone, Hospira) give continuously or intermittently or via drip tubing in Glucose 5% or Sodium Chloride 0.9%.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Dexamethasone 3.8 mg/mL Injection has replaced Dexamethasone 4 mg/mL Injection.
  - **PATIENT AND CARER ADVICE**
    - Medicines for Children leaflet: Dexamethasone for croup [www.medicinesforchildren.org.uk/dexamethasone-croup-0](http://www.medicinesforchildren.org.uk/dexamethasone-croup-0)
    - With systemic use Patient counselling is advised for dexamethasone tablet, oral solution and injection (steroid card).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, capsule Table.

Hydrocortisone

**INDICATIONS AND DOSE**

**Thyrotoxic crisis (thyroid storm)**

- **BY INTRAVENOUS INJECTION**
  - Adult: 100 mg every 6 hours, to be administered as sodium succinate

**Adrenocortical insufficiency in Addison’s disease or following adrenalectomy**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: 20–30 mg daily in 2 divided doses, the larger dose to be given in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion, the optimum daily dose is determined on the basis of clinical response

**Adrenocortical insufficiency**

- **BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INFUSION**
  - Adult: 100–500 mg 3–4 times a day or when required

**Replacement in adrenocortical insufficiency**

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Adult: 20–30 mg once daily, adjusted according to response, dose to be taken in the morning

**Adrenocortical insufficiency resulting from septic shock**

- **BY INTRAVENOUS INJECTION**
  - Adult: 50 mg every 6 hours, given in combination with fludrocortisone

**Acute hypersensitivity reactions such as angioedema of the upper respiratory tract and anaphylaxis (adjunct to adrenaline)**

- **BY INTRAVENOUS INJECTION**
  - Adult: 100–300 mg, to be administered as sodium succinate

Corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of minor surgery under general anaesthesia

- **BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**
  - Adult: Initially 25–50 mg, to be administered at induction of surgery, the patient’s usual oral corticosteroid dose is recommenced after surgery

Corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of moderate or major surgery

- **BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**
  - Adult: Initially 25–50 mg, to be administered at induction of surgery (following usual oral corticosteroid dose on the morning of surgery), followed by 25–50 mg 3 times a day for 24 hours after moderate surgery and for 48–72 hours after major surgery

**Severe inflammatory bowel disease**

- **BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**
  - Adult: 100–500 mg 3–4 times a day or when required

**Ulcerative colitis | Proctitis | Proctosigmoiditis**

- **BY RECTUM USING RECTAL FOAM**
  - Adult: Initially 1 metered application 1–2 times a day for 2–3 weeks, then reduced to 1 metered application once daily on alternate days, to be inserted into the rectum

**Acute hypersensitivity reactions | Angioedema**

- **BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION**
  - Child 1–5 months: Initially 25 mg 3 times a day, adjusted according to response
  - Child 6 months–5 years: Initially 50 mg 3 times a day, adjusted according to response
  - Child 6–11 years: Initially 100 mg 3 times a day, adjusted according to response
  - Child 12–17 years: Initially 200 mg 3 times a day, adjusted according to response

**Severe acute asthma | Life-threatening acute asthma**

- **BY INTRAVENOUS INJECTION**
  - Child 1 month–1 year: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 25 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
  - Child 2–4 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 50 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
  - Child 5–11 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
  - Adult: 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate

**HYDROCORTISTAB®**

**Local inflammation of joints and soft tissues**

- **BY INTRA-ARTICULAR INJECTION**
  - Adult: 5–50 mg, select dose according to size of patient and joint; where appropriate dose may be repeated at intervals of 21 days. Not more than 3 joints should be treated on any one day, for details consult product literature

**Dose equivalence and conversion**

When switching from immediate-release hydrocortisone tablets to modified release Plenadren® use same total daily dose. Bioavailability of Plenadren® lower than immediate release tablets—monitor clinical response.

- **CONTRA-INDICATIONS**
  - With rectal use Bowel perforation | extensive fistulas | intestinal obstruction | recent intestinal anastomoses

- **CAUTIONS**
  - With rectal use Systemic absorption may occur

- **SIDE-EFFECTS**
  - **SPECIFIC SIDE-EFFECTS**
    - With intravenous use Phosphate ester associated with pain and paraesthesia (particularly in the perineal region)
  - With rectal use Local irritation

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use in children For intravenous administration, dilute with Glucose 5% or Sodium Chloride 0.9%. For intermittent infusion give over 20–30 minutes.
  - With intravenous use in adults For intravenous infusion (SoluCortef® or Efocortes®), give continuously or
intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%.

- **PATIENT AND CARER ADVICE** Patient counselling is advised for hydrocortisone tablets and injections (steroid card).

- **LESS SUITABLE FOR PRESCRIBING** Hydrocortisone as the sodium phosphate is less suitable for prescribing as paraesthesia and pain (particularly in the perineal region) may follow intravenous injection. Efcorstol™ is less suitable for prescribing.

- **EXCEPTIONS TO LEGAL CATEGORY**
  - With intramuscular use or intravenous use
  - Prescription only medicine restriction does not apply where administration is for saving life in emergency.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: suppository, oral suspension, oral solution, capsule, liquid

- **Exipients:** May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), propylene glycol
- **Colifoam** (Meda Pharmaceuticals Ltd)
  - Hydrocortisone acetate 100 mg per 1 gram Colifoam 10% aerosol | 14 dose (Pf) £9.33 DT price = £9.33

**Methylprednisolone**

**INDICATIONS AND DOSE**

- Suppression of inflammatory and allergic disorders
- Cerebral oedema associated with malignancy

**BY MOUTH**

- **Adult:** Usual dose 2–40 mg daily

**BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**

- **Adult:** Initially 10–500 mg

**Treatment of graft rejection reactions**

**BY INTRAVENOUS INFUSION**

- **Adult:** Up to 1 g daily for up to 3 days

**DEPO-MEDRONETM**

- Local inflammation of joints and soft tissues

**BY INTRA-ARTICULAR INJECTION**

- **Adult:** 4–80 mg, select dose according to size; where appropriate dose may be repeated at intervals of 7–35 days, for details consult product literature

**Suppression of inflammatory and allergic disorders**

**BY DEEP INTRAMUSCULAR INJECTION**

- **Adult:** 40–120 mg, then 40–120 mg after 2–3 weeks if required, to be injected into the gluteal muscle

- **CAUTIONS**
  - With intravenous use Rapid intravenous administration of large doses associated with cardiovascular collapse

**DIRECTIONS FOR ADMINISTRATION**

For intravenous infusion (as sodium succinate) (Solu-Medrone®), give continuously or intermittently or via drip tubing in Glucose 5% or Sodium chloride 0.9%. Reconstitute initially with water for injections; doses up to 250 mg should be given over at least 5 minutes, high doses over at least 30 minutes.

- **PATIENT AND CARER ADVICE** Patient counselling is advised for methylprednisolone tablets and injections (steroid card).

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

- **Adult:** Up to 1 g daily for up to 3 days
Prednisolone

INDICATIONS AND DOSE

Exacerbation of chronic obstructive pulmonary disease (if increased breathlessness interferes with daily activities)

BY MOUTH

» Adult: 30 mg daily for 7–14 days

Severe cough (before transfer to hospital) | Mild cough that might cause complications (before transfer to hospital)

BY MOUTH

» Child: 1–2 mg/kg

Mild to moderate acute asthma (when oral corticosteroid taken for more than a few days) | Severe or life-threatening acute asthma (when oral corticosteroid taken for more than a few days)

BY MOUTH

» Child 1 month–11 years: 2 mg/kg once daily (max. per dose 60 mg) for up to 3 days, longer if necessary

» Child 12–17 years: 40–50 mg daily for at least 5 days

Mild to moderate acute asthma | Severe or life-threatening acute asthma

BY MOUTH

» Child 1 month–11 years: 1–2 mg/kg once daily (max. per dose 40 mg) for up to 3 days, longer if necessary

» Child 12–17 years: 40–50 mg daily for at least 5 days

Suppressive treatment of inflammatory and allergic disorders

BY MOUTH

» Adult: Initially 10–20 mg daily, dose preferably taken in the morning after breakfast, can often be reduced within a few days but may need to be continued for several weeks or months; maintenance 2.5–15 mg daily, higher doses may be needed; cushingoid side-effects increasingly likely with doses above 7.5 mg daily

BY INTRAMUSCULAR INJECTION

» Adult: 25–100 mg 1–2 times a week, as prednisolone acetate

Suspension for injection

CAUTIONARY AND ADVISORY LABELS 10

Methylprednisolone acetate 40 mg per 1 ml

Depo-Medrone (Pfizer Ltd)

40mg/1ml suspension for injection vials | 1 vial £3.44 10 vial pack £34.04

Depo-Medrone 80mg/2ml suspension for injection vials | 1 vial £6.18 10 vial pack £61.39

Depo-Medrone 120mg/3ml suspension for injection vials | 1 vial £8.96 10 vial pack £88.81

Response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone

Rectal complications of Crohn’s disease

BY RECTUM USING SUPPOSITORIES

» Adult: 5 mg twice daily, to be inserted into the rectum morning and night, after a bowel movement

Rectal and rectosigmoidal ulcerative colitis | Rectal and rectosigmoidal Crohn’s disease

BY RECTUM USING ENEMA

» Adult: 20 mg daily for 2–4 weeks, continued if response good, to be used at bedtime

Proctitis

BY RECTUM USING RECTAL FOAM

» Adult: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone

Rectal and rectosigmoidal ulcerative colitis

BY RECTUM USING SUPPOSITORIES

» Adult: 5 mg twice daily, to be inserted in to the rectum morning and night, after a bowel movement

Neuritic pain or weakness heralding rapid onset of permanent nerve damage (during reversal reactions multidisciplinary leprosy)

BY MOUTH

» Adult: Initially 40–60 mg daily, dose to be instituted at once

Generalised myasthenia gravis (when given on alternate days)

INITIALLY BY MOUTH

» Adult: Initially 10 mg once daily on alternate days, then increased in steps of 10 mg once daily on alternate days, increased to 1–1.5 mg/kg once daily on alternate days (max. per dose 100 mg)

Generalised myasthenia gravis in ventilated patients (when given on alternate days)

BY MOUTH

» Adult: Initially 1.5 mg/kg once daily on alternate days (max. per dose 100 mg)

Generalised myasthenia gravis (when giving daily)

BY MOUTH

» Adult: Initially 5 mg daily, increased in steps of 5 mg daily. maintenance 60–80 mg daily, alternatively maintenance 0.75–1 mg/kg daily, ventilated patients may be started on 1.5 mg/kg (max. 100 mg) on alternate days

Ocular myasthenia

BY MOUTH

» Adult: Usual dose 10–40 mg daily on alternate days, reduce to minimum effective dose

Reduction in rate of joint destruction in moderate to severe rheumatoid arthritis of less than 2 years’ duration

BY MOUTH

» Adult: 7.5 mg daily

Polymyalgia rheumatica

BY MOUTH

» Adult: 10–15 mg daily until remission of disease activity; maintenance 7.5–10 mg daily, reduce gradually to maintenance dose. Many patients require treatment for at least 2 years and in some patients it may be necessary to continue long term low-dose corticosteroid treatment

Giant cell (temporal) arteritis

BY MOUTH

» Adult: 40–60 mg daily until remission of disease activity, the higher dose being used if visual symptoms occur; maintenance 7.5–10 mg daily, reduce gradually to maintenance dose. Many patients require treatment for at least 2 years and in continued
some patients it may be necessary to continue long-term low-dose corticosteroid treatment

**Polyarteritis nodosa** | **Polyomylitis** | Systemic lupus erythematosus
---|---|---

**BY MOUTH**
- Adult: Initially 60 mg daily, then maintenance 10–15 mg daily

**Pneumocystis pneumonia in moderate to severe infections associated with HIV infection**

**BY MOUTH**
- Adult: 50–80 mg daily for 5 days, the dose is then reduced to complete 21 days of treatment, corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete

**Short-term prophylaxis of episodic cluster headache as monotherapy or in combination with verapamil during verapamil titration**

**BY MOUTH**
- Adult: 60–100 mg once daily for 2–5 days, then reduced in steps of 10 mg every 2–3 days until prednisolone is discontinued

**Anorexia (symptom control in palliative care)**

**BY MOUTH**
- Adult: 15–30 mg daily

**Deltastab®**

**Local inflammation of joints**

**BY INTRA-ARTICULAR INJECTION**
- Adult: 5–25 mg, dose according to size; not more than 3 joints should be treated on any one day; where appropriate may be repeated when relapse occurs, for details consult product literature

**CONTRA-INDICATIONS**
- With rectal use Bowel perforation - extensive fistulas - intestinal obstruction - recent intestinal anastomoses

**CAUTIONS**
- With rectal use Systemic absorption may occur with rectal preparations
- With systemic use Duchenne’s muscular dystrophy (possible transient rhabdomyolysis and myoglobinuria following strenuous physical activity)

**PREGNANCY**
- As it crosses the placenta 88% of prednisolone is inactivated.
- With systemic use Pregnant women with fluid retention should be monitored closely.

**BREAST FEEDING**
- Prednisolone appears in small amounts in breast milk but maternal doses of up to 40 mg daily are unlikely to cause systemic effects in the infant.
- With systemic use Infant should be monitored for adrenal suppression if mother is taking a dose higher than 40 mg.

**PATIENT AND CARER ADVICE**
- Medicines for Children leaflet: Prednisolone for asthma www.medicinesforchildren.org.uk/prednisolone-for-asthma and Prednisolone (oral) for nephrotic syndrome www.medicinesforchildren.org.uk/prednisolone-oral-for-nephrotic-syndrome
- Patient counselling is advised for prednisolone tablets (steroid card).

**MEDICINAL FORMS**

  - Prednisolone (as Prednisolone sodium metasulphobenzoate) 20 mg per 1 application Prednisolone 20mg/application foam enema | 14 dose (PO) £68.00 DT price = £68.00

**Suppository**
- **Prednisolone (Non-proprietary)**
  - Prednisolone (as Prednisolone sodium phosphate) 5 mg Prednisolone sodium phosphate 5mg suppositories | 10 suppository (PO) £27.50 DT price = £27.36

**Enema**
- **Predsol** (Focus Pharmaceuticals Ltd)
  - Prednisolone sodium phosphate 200 microgram per 1 ml Predsol 20mg/100ml retention enema | 7 enema (PO) £7.50

**Prednisone**

**INDICATIONS AND DOSE**
- Moderate to severe rheumatoid arthritis

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- Adult: 10–20 mg daily, adjusted according to response, dose to be taken at bedtime

**HEPATIC IMPAIRMENT**
- Monitor patient closely in hepatic impairment.

**PATIENT AND CARER ADVICE**
- Patient counselling is advised for prednisone tablets (steroid card).

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Modified-release tablet**
- **CAUTIONARY AND ADVISORY LABELS 10, 21, 25**
- **Lodotra** (Napp Pharmaceuticals Ltd)
  - Prednisone 1 mg Lodotra 1mg modified-release tablets | 30 tablet (PO) £26.70
  - Prednisone 2 mg Lodotra 2mg modified-release tablets | 30 tablet (PO) £26.70 | 100 tablet (PO) £89.00
  - Prednisone 5 mg Lodotra 5mg modified-release tablets | 30 tablet (PO) £26.70 | 100 tablet (PO) £89.00
Cushing’s syndrome and disease

2.1 Cushing’s syndrome and disease

Cushing’s Syndrome

Most types of Cushing’s syndrome are treated surgically, that which occasionally accompanies carcinoma of the bronchus is not usually amenable to surgery. Metyrapone p. 588 has been found helpful in controlling the symptoms of the disease; it is also used in other forms of Cushing’s syndrome to prepare the patient for surgery.

The dosages of metyrapone used are either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed.

IMIDAZOLE ANTIFUNGALS

Ketoconazole

- **DRUG ACTION** An imidazole derivative which acts as a potent inhibitor of cortisol and aldosterone synthesis by inhibiting the activity of 17α-hydroxylase, 11-hydroxylation steps and at higher doses the cholesterol side-chain cleavage enzyme. It also inhibits the activity of adrenal C17-20 lyase enzymes resulting in androgen synthesis inhibition, and may have a direct effect on corticotrophic tumour cells in patients with Cushing’s disease.

**INDICATIONS AND DOSE**

**Endogenous Cushing’s syndrome (specialist use only)**

**BY MOUTH**

- Adult: Initially 400–600 mg daily in 2–3 divided doses, increased to 800–1200 mg daily; maintenance 400–800 mg daily in 2–3 divided doses, for dose titrations in patients with established dose, adjustments in adrenal insufficiency, or concomitant corticosteroid replacement therapy, consult product literature; maximum 1200 mg per day

**Important safety information**

**CHMP ADVICE: KETOCONAZOLE (JULY 2013)**

The CHMP has recommended that the marketing authorisation for oral ketoconazole to treat fungal infections should be suspended. The CHMP concluded that the risk of hepatotoxicity associated with oral ketoconazole is greater than the benefit in treating fungal infections. Doctors should review patients who are being treated with oral ketoconazole for fungal infections, with a view to stopping treatment or choosing an alternative treatment. Patients with a prescription of oral ketoconazole for fungal infections should be referred back to their doctors.

Oral ketoconazole for Cushing’s syndrome and topical products containing ketoconazole are not affected by this advice.

**contra-indications** Acquired QTc prolongation - avoid concomitant use of hepatotoxic drugs - congenital QTc prolongation

**cautions** Risk of adrenal insufficiency

**interactions** → Appendix 1 (antifungals, imidazole).

**side-effects**

- Common or very common Abdominal pain - adrenal insufficiency - diarrhoea - hepatic enzymes increased - nausea - pruritus - rash - vomiting

- Uncommon Alopecia - dizziness - headache - malaise - somnolence - thrombocytopenia - urticaria

- Rare Hepatic failure - hepatitis - jaundice - liver damage

- Very rare Pyrexia

**side-effects, further information**

**Hepatotoxicity** Potentially life-threatening hepatotoxicity reported rarely.
CONCEPTION AND CONTRACEPTION Effective contraception must be used in women of child-bearing potential.

PREGNANCY Manufacturer advises avoid—teratogenic in animal studies.

BREAST FEEDING Manufacturer advises avoid—present in breast milk.

HEPATIC IMPAIRMENT Avoid in acute or chronic impairment. Do not initiate treatment if liver enzymes greater than 2 times the normal upper limit.

MONITORING REQUIREMENTS Monitor ECG before and one week after initiation, and then as clinically indicated thereafter.

Adrenal insufficiency Monitor adrenal function within one week of initiation, then regularly thereafter. When cortisol levels are normalised or close to target and effective dose established, monitor every 3–6 months as there is a risk of autoimmune disease development or exacerbation after normalisation of cortisol levels. If symptoms suggestive of adrenal insufficiency such as fatigue, anorexia, nausea, vomiting, hypotension, hyponatraemia, hyperkalaemia, and/or hypoglycaemia occur, measure cortisol levels and discontinue treatment temporarily (can be resumed thereafter at lower dose) or reduce dose and if necessary, initiate corticosteroid substitution.

Hepatotoxicity Monitor liver function before initiation of treatment, then weekly for 1 month after initiation, then monthly for 6 months—more frequently if dose adjusted or abnormal liver function detected. Reduce dose if liver enzymes increase less than 3 times the normal upper limit—consult product literature; if liver enzymes are raised to times the normal upper limit, discontinue dose and if necessary, initiate corticosteroid substitution.

PATIENT AND CARER ADVICE Dizziness and somnolence may affect the performance of skilled tasks (e.g. driving). Patients or their carers should also be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, jaundice, abdominal pain, or dark urine develop. Patients or their carers should also be told how to recognise signs of adrenal insufficiency.

PATIENT AND CARER ADVICE Resistance to Cushing syndrome (specialist supervision in hospital)

BY MOUTH

Adult: Usual dose 0.25–6 g daily, dose to be tailored to cortisol production, dose is either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed.

Resistant oedema due to increased aldosterone secretion in cirrhosis, nephrotic syndrome, and congestive heart failure (with glucocorticoid replacement therapy) (specialist supervision in hospital)

BY MOUTH

Adult: 3 g daily in divided doses

CONTRA-INDICATIONS Adrenocortical insufficiency

CAUTIONS Avoid in acute porphyrias p. 864 • gross hypopituitarism (risk of precipitating acute adrenal failure) • hypertension on long-term administration • hypothyroidism (delayed response)

INTERACTIONS Many drugs interfere with diagnostic estimation of steroids.

SIDE-EFFECTS

Rare Abdominal pain • allergic skin reactions • hirsutism • hypoadrenalism

Frequency not known Dizziness • headache • hypotension • nausea • sedation • vomiting

PREGNANCY Avoid (may impair biosynthesis of fetal-placental steroids).

BREAST FEEDING Avoid—no information available.

HEPATIC IMPAIRMENT Use with caution in hepatic impairment (delayed response).

PATIENT AND CARER ADVICE Drowsiness may affect the performance of skilled tasks (e.g. driving).

MEDIcINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS. 21

Ketoconazole (HRA Pharma UK Ltd)

Metyrapone 250 mg Metopirone 250 mg capsules 100 capsule £36.66

11/β-HYDROXYLASE INHIBITORS

Metyrapone

DRUG ACTION Metyrapone is a competitive inhibitor of 11β-hydroxylation in the adrenal cortex; the resulting inhibition of cortisol (and to a lesser extent aldosterone) production leads to an increase in ACTH production which, in turn, leads to increased synthesis and release of cortisol precursors. Metyrapone may be used as a test of anterior pituitary function.

INDICATIONS AND DOSE

Differential diagnosis of ACTH-dependent Cushing’s syndrome (specialist supervision in hospital)

BY MOUTH

Adult: 750 mg every 4 hours for 6 doses

MANAGEMENT OF CUSHING’S SYNDROME

Type 1 diabetes, (formerly referred to as insulin-dependent diabetes mellitus (IDDM)), occurs as a result of a deficiency of insulin following autoimmune destruction of pancreatic beta cells. Patients with type 1 diabetes require administration of insulin.

Type 2 diabetes, (formerly referred to as non-insulin-dependent diabetes (NIDDM)), is due to reduced secretion of insulin or to peripheral resistance to the action of insulin or to a combination of both. Although patients may be controlled on diet alone, many also require oral antidiabetic

3 Diabetes mellitus and hypoglycaemia

3.1 Diabetes mellitus

Diabetes

Diabetes mellitus occurs because of a lack of insulin or resistance to its action. It is diagnosed by measuring fasting or random blood-glucose concentration (and occasionally by oral glucose tolerance test). Although there are many subtypes, the two principal classes of diabetes are type 1 diabetes and type 2 diabetes.

Type 1 diabetes, (formerly referred to as insulin-dependent diabetes mellitus (IDDM)), occurs as a result of a deficiency of insulin following autoimmune destruction of pancreatic beta cells. Patients with type 1 diabetes require administration of insulin.

Type 2 diabetes, (formerly referred to as non-insulin-dependent diabetes (NIDDM)), is due to reduced secretion of insulin or to peripheral resistance to the action of insulin or to a combination of both. Although patients may be controlled on diet alone, many also require oral antidiabetic
drugs or insulin (or both) to maintain satisfactory control. In overweight individuals, type 2 diabetes may be prevented by losing weight and increasing physical activity; use of the anti-obesity drug orlistat p. 78 may be considered in obese patients.

**Treatment of diabetes**

Treatment of all forms of diabetes should be aimed at alleviating symptoms and minimising the risk of long-term complications; tight control of diabetes is essential.

Diabetes is a strong risk factor for cardiovascular disease. Other risk factors for cardiovascular disease such as smoking, hypertension, obesity, and hyperlipidaemia should be addressed. Cardiovascular risk in patients with diabetes can be further reduced by the use of an ACE inhibitor, low-dose aspirin p. 104 and a lipid-regulating drug.

**Prevention of diabetic complications**

Optimal glycaemic control in both type 1 diabetes and type 2 diabetes reduces, in the long term, the risk of microvascular complications including retinopathy, development of proteinuria and to some extent neuropathy. However, a temporary deterioration in established diabetic retinopathy may occur when normalising blood-glucose concentration. ACE inhibitors and angiotensin-II receptor antagonists may also have a role in the management of diabetic nephropathy. A measure of the total glycosylated (or glycated) haemoglobin (HbA1c) or a specific fraction (HbA1c) provides a good indication of glycaemic control over the previous 2–3 months. Overall it is ideal to aim for an HbA1c (glycosylated haemoglobin) concentration of 48–59 mmol/mol or less (reference range 20–42 mmol/mol) but this cannot always be achieved and for those using insulin there is a significantly increased risk of disabling hypoglycaemia; in those at risk of arterial disease, the aim should be to maintain the HbA1c concentration at 48 mmol/mol or less. HbA1c should be measured every 3–6 months.

**Measurement of HbA1c**

HbA1c values are expressed in mmol of glycosylated haemoglobin per mol of haemoglobin (mmol/mol), a standardised unit specific for HbA1c, created by the International Federation of Clinical Chemistry and Laboratory Medicine (IFCC). HbA1c values were previously aligned to the assay used in the Diabetes Control and Complications Trial (DCCT) and expressed as a percentage.

</table>

Laboratory measurement of serum-fructosamine concentration is technically simpler and cheaper than the measurement of HbA1c, and can be used to assess control over short periods of time, particularly when HbA1c monitoring is invalid (e.g. disturbed erythrocyte turnover or abnormal haemoglobin type).

Tight control of blood pressure in hypertensive patients with type 2 diabetes reduces mortality and protects visual acuity (by reducing considerably the risks of maculopathy and retinal photocoagulation).

**Driving**

Drivers with diabetes may be required to notify the Driver and Vehicle Licensing Agency (DVLA) of their condition depending on their treatment, the type of licence, and whether they have diabetic complications. Detailed guidance on eligibility to drive, and precautions required, is available from the DVLA (www.gov.uk/government/publications/at-a-glance).

Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems. Drivers treated with insulin should normally check their blood-glucose concentration before driving and, on long journeys, at 2-hour intervals as specified by DVLA guidance; depending on the type of licence, monitoring may also be necessary for drivers taking oral antidiabetic drugs which carry a risk of hypoglycaemia (e.g. sulfonylureas, nateglinide p. 507, repaglinide p. 608). Drivers treated with insulin should ensure that a supply of sugar is always available in the vehicle and they should avoid driving if their meal is delayed. If hypoglycaemia occurs, or warning signs develop, the driver should:

- stop the vehicle in a safe place;
- switch off the ignition and move from the driver’s seat;
- eat or drink a suitable source of sugar;
- wait until 45 minutes after blood glucose has returned to normal, before continuing journey.

**Diabetic nephropathy**

Regular review of diabetic patients should include an annual test for urinary protein (using Albustix®) and serum creatinine measurement. If the urinary protein test is negative, the urine should be tested for microalbuminuria (the earliest sign of nephropathy). If reagent strip tests (Microtest II® or Microbumintest®) are used and prove positive, the result should be confirmed by laboratory analysis of a urine sample. Provided there are no contra-indications, all diabetic patients with nephropathy causing proteinuria or with established microalbuminuria (at least 3 positive tests) should be treated with an ACE inhibitor or an angiotensin-II receptor antagonist even if the blood pressure is normal; in any case, to minimise the risk of renal deterioration, blood pressure should be carefully controlled. Patients with diabetic nephropathy are particularly susceptible to developing hyperkalaemia and should not be given an ACE inhibitor together with an angiotensin-II receptor antagonist.

ACE inhibitors can potentiate the hypoglycaemic effect of insulin and oral antidiabetic drugs; this effect is more likely during the first weeks of combined treatment and in patients with renal impairment. See also treatment of hypertension in diabetes.

**Diabetic neuropathy**

Optimal diabetic control is beneficial for the management of painful neuropathy in patients with type 1 diabetes. Paracetamol p. 354 or a non-steroidal anti-inflammatory drug such as ibuprofen p. 927 may relieve mild to moderate pain.

Duloxetine p. 288 is effective for the treatment of painful diabetic neuropathy; amitriptyline hydrochloride p. 292 [unlicensed use] can be used if duloxetine is ineffective or unsuitable. Nortriptyline p. 298 [unlicensed use] may be better tolerated than amitriptyline hydrochloride. If treatment with amitriptyline hydrochloride or duloxetine is inadequate, treatment with pregabalin p. 400 should be tried. Combination therapy of duloxetine or amitriptyline hydrochloride with pregabalin can be used if monotherapy at the maximum tolerated dose does not control symptoms. Neuropathic pain may respond to opioid analgesics. There is evidence of efficacy for tramadol hydrochloride p. 373, morphine p. 367, and oxycodone hydrochloride p. 369; however treatment with morphine or oxycodone hydrochloride should be initiated only under specialist supervision. Tramadol hydrochloride can be prescribed while the patient is waiting for assessment by a specialist if other treatments have been unsuccessful.
Diabetic ketoacidosis, management

- To restore circulating volume if systolic blood pressure is below 90 mmHg (adjusted for age, sex, and medication as appropriate), give 500 mL sodium chloride 0.9% by intravenous infusion over 10–15 minutes; repeat if blood pressure remains below 90 mmHg and seek senior medical advice.
- When blood pressure is over 90 mmHg, sodium chloride 0.5% should be given by intravenous infusion at a rate that replaces deficit and provides maintenance; see guideline or suggested regimen.
- Include potassium chloride in the fluids unless anuria is suspected; adjust according to plasma-potassium concentration (measure at 60 minutes, 2 hours, and 2 hourly thereafter; measure hourly if outside the normal range).
- Start an intravenous insulin infusion: soluble insulin should be diluted (and mixed thoroughly) with sodium chloride 0.5% intravenous infusion to a concentration of 1 unit/mL; infuse at a fixed rate of 0.1 units/kg/hour.
- Established subcutaneous therapy with long-acting insulin analogues (insulin detemir or insulin glargine) should be continued during treatment of diabetic ketoacidosis.
- Monitor blood-ketone and blood-glucose concentrations hourly and adjust the insulin infusion rate accordingly. Blood-ketone concentration should fall by at least 0.5 mmol/litre/hour and blood-glucose concentration should fall by at least 3 mmol/litre/hour.
- Once blood-glucose concentration falls below 14 mmol/litre, glucose 10% should be given by intravenous infusion (into a large vein through a large-gauge needle) at a rate of 125 mL/hour, in addition to the sodium chloride 0.9% infusion.
  - Continue insulin infusion until blood-ketone concentration is below 0.3 mmol/litre, blood pH is above 7.3 and the patient is able to eat and drink; ideally give subcutaneous fast-acting insulin and a meal, and stop the insulin infusion 1 hour later.

The management of hyperosmolar hyperglycaemic state or hyperosmolar hyperglycaemic nonketotic coma is similar to that of diabetic ketoacidosis, although lower rates of insulin infusion are usually necessary and slower rehydration may be required.

Insulins and anti-diabetic drugs

Insulins

Insulin plays a key role in the regulation of carbohydrate, fat, and protein metabolism. It is a polypeptide hormone of complex structure. There are differences in the amino-acid sequence of animal insulins, human insulins and the human insulin analogues. Insulin may be extracted from pork pancreas and purified by crystallisation; it may also be extracted from beef pancreas, but beef insulins are now rarely used. Human sequence insulin may be produced semisynthetically by enzymatic modification of porcine insulin (emp) or biosynthetically by recombinant DNA technology using bacteria (crb, prb) or yeast (pyr).

All insulin preparations are to a greater or lesser extent immunogenic in man but immunological resistance to insulin action is uncommon. Preparations of human sequence insulin should theoretically be less immunogenic, but no real advantage has been shown in trials.

Insulin is inactivated by gastro-intestinal enzymes, and must therefore be given by injection; the subcutaneous route is ideal in most circumstances. Insulin is usually injected into the upper arms, thighs, buttocks, or abdomen; absorption from a limb site may be increased if the limb is used in strenuous exercise after the injection. Generally subcutaneous insulin injections cause few problems; lipodystrophy may occur but can be minimised by using different injection sites in rotation. Local allergic reactions are rare.

Insulin is needed by all patients with ketoacidosis, and it is likely to be needed by most patients with:
- rapid onset of symptoms;
- substantial loss of weight;
- weakness;
- ketonuria;
- a first-degree relative who has type 1 diabetes.

Insulin is also needed for type 2 diabetes when other methods have failed to achieve good control, and temporally in the presence of intercurrent illness or peri-operatively. Pregnant women with type 2 diabetes may be treated with insulin when diet alone fails. Antidiabetic drugs have a role in the management of diabetes in pregnancy.

Safe and Effective Use of Insulin in Hospitalised Patients (March 2010)

Management of diabetes with insulin

The aim of treatment is to achieve the best possible control of blood-glucose concentration without making the patient obsessional and to avoid disabling hypoglycaemia; close cooperation is needed between the patient and the medical team because good control reduces the risk of complications.

Insulin preparations can be divided into 3 types:
- those of short duration which have a relatively rapid onset of action, namely soluble insulin and the rapid-
hypopituitarism), or in coeliac disease.

Infections, stress, accidental or surgical trauma, and during puberty. Requirements may be increased by infection, stress, accidental or surgical trauma, and during puberty.

Mixtures of insulin preparations may be required and appropriate combinations have to be determined for the individual patient. Treatment should be started with a short-acting insulin (e.g. soluble insulin) or a rapid-acting insulin analogue (e.g. insulin aspart) given before meals with intermediate-acting or long-acting insulin once or twice daily. Alternatively, for those who have difficulty with, or prefer not to use, multiple injection regimens, a mixture of premixed short-acting insulin or rapid-acting insulin analogue with an intermediate-acting or long-acting insulin (most commonly in a proportion of 30% soluble insulin and 70% isophane insulin) can be given once or twice daily. The dose of short-acting or rapid-acting insulin (or the proportion of the short-acting soluble insulin component in premixed insulin) can be increased in those with excessive postprandial hyperglycaemia. The dose of insulin is increased gradually according to the patient’s individual requirements, taking care to avoid troublesome hypoglycaemic reactions.

Insulin requirements may be increased by infection, stress, accidental or surgical trauma, and during puberty. Requirements may be decreased in those with certain endocrine disorders (e.g. Addison’s disease, hypopituitarism), or in coeliac disease.

Examples of recommended insulin regimens

- Multiple injection regimen: short-acting insulin or rapid-acting insulin analogue, before meals. With intermediate-acting or long-acting insulin, once or twice daily;
- Short-acting insulin or rapid-acting insulin analogue mixed with intermediate-acting or long-acting insulin, once or twice daily (before meals);
- Intermediate-acting or long-acting insulin, once or twice daily. With or without short-acting insulin or rapid-acting insulin analogue, before meals;
- Continuous subcutaneous insulin infusion.

Hypoglycaemia

Loss of warning of hypoglycaemia among insulin-treated patients can be a serious hazard, especially for drivers and those in dangerous occupations. Very tight control of diabetes lowers the blood-glucose concentration needed to trigger hypoglycaemic symptoms; an increase in the frequency of hypoglycaemic episodes may reduce the warning symptoms experienced by the patient. Beta-blockers can also blunt hypoglycaemic awareness (and also delay recovery).

To restore the warning signs, episodes of hypoglycaemia must be minimised; this involves appropriate adjustment of insulin type, dose and frequency together with suitable timing and quantity of meals and snacks.

Some patients have reported loss of hypoglycaemia warning after transfer to human insulin. Clinical studies do not confirm that human insulin decreases hypoglycaemia awareness. If a patient believes that human insulin is responsible for the loss of warning it is reasonable to revert to animal insulin and essential to educate the patient about avoiding hypoglycaemia. Great care should be taken to specify whether a human or an animal preparation is required.

Few patients are now treated with beef insulin; when undertaking conversion from beef to human insulin, the total dose should be reduced by about 10% with careful monitoring for the first few days. When changing between pork and human-sequence insulins, a dose change is not usually needed, but careful monitoring is still advised.

Diabetes and surgery

Perioperative control of blood-glucose concentrations in patients with type 1 diabetes is achieved via an adjustable, continuous, intravenous infusion of insulin. Detailed local protocols should be available to all healthcare professionals involved in the treatment of these patients; in general, the following steps should be followed:

- give an injection of the patient’s usual insulin on the night before the operation;
- early on the day of the operation, start an intravenous infusion of glucose containing potassium chloride (provided that the patient is not hyperkalaemic) and infuse at a constant rate appropriate to the patient’s fluid requirements (usually 125 mL per hour); make up a solution of soluble insulin in sodium chloride 0.9% and infuse intravenously using a syringe pump piggybacked to the intravenous infusion. Glucose and potassium infusions, and insulin infusions should be made up according to locally agreed protocols;
- the rate of the insulin infusion should be adjusted according to blood-glucose concentration (frequent monitoring necessary) in line with locally agreed protocols. Other factors affecting the rate of infusion include the patient’s volume depletion, cardiac function, and age.

Protocols should include specific instructions on how to manage resistant cases (such as patients who are in shock or severely ill or those receiving corticosteroids or sympathomimetics) and those with hypoglycaemia.

If a syringe pump is not available, soluble insulin should be added to the intravenous infusion of glucose and potassium chloride (provided the patient is not hyperkalaemic), and the infusion run at the rate appropriate to the patient’s fluid requirements (usually 125 mL per hour) with the insulin dose adjusted according to blood-glucose concentration in line with locally agreed protocols.

Once the patient starts to eat and drink, give subcutaneous insulin before breakfast and stop intravenous insulin 30 minutes later; the dose may need to be 10–20% more than usual if the patient is still in bed or unwell. If the patient was not previously receiving insulin, an appropriate initial dose is 20–40 units daily in four divided doses using soluble insulin before meals and intermediate-acting insulin at bedtime and the dose adjusted from day to day. Patients with hyperglycaemia often relapse after conversion back to subcutaneous insulin calling for one of the following approaches:

- additional doses of soluble insulin at any of the four injection times (before meals or bedtime) or
- temporary addition of intravenous insulin infusion (while continuing the subcutaneous regimen) until blood-glucose concentration is satisfactory or
- complete reversion to the intravenous regimen (especially if the patient is unwell).

Short-acting insulins

Soluble insulin is a short-acting form of insulin. For maintenance regimens it is usual to inject it 15 to 30 minutes before meals.

Soluble insulin is the most appropriate form of insulin for use in diabetic emergencies e.g. diabetic ketoacidosis (see Diabetic ketoacidosis, management p. 590) and at the time of surgery. It can be given intravenously and intramuscularly, as well as subcutaneously.

When injected subcutaneously, soluble insulin has a rapid onset of action (30 to 60 minutes), a peak action between 2 and 4 hours, and a duration of action of up to 8 hours.

When injected intravenously, soluble insulin has a very short half-life of only about 5 minutes and its effect disappears within 30 minutes.
The rapid-acting human insulin analogues, insulin aspart, insulin glulisine, and insulin lispro have a faster onset and shorter duration of action than soluble insulin; as a result, compared to soluble insulin, fasting and preprandial blood-glucose concentrations are a little higher, postprandial blood-glucose concentration is a little lower, and hypoglycaemia occurs slightly less frequently. Subcutaneous injection of insulin analogues may be convenient for those who wish to inject shortly before or, when necessary, shortly after a meal. They can also help those susceptible to hypoglycaemia before lunch and those who eat late in the evening and are prone to nocturnal hypoglycaemia. They can also be administered by subcutaneous infusion. Insulin aspart and insulin lispro can be administered intravenously and can be used as alternatives to soluble insulin for diabetic emergencies and at the time of surgery.

Intermediate- and long-acting insulins

When given by subcutaneous injection, intermediate- and long-acting insulins have an onset of action of approximately 1–2 hours, a maximal effect at 4–12 hours, and a duration of 16–42 hours. Some are given twice daily in conjunction with short-acting (soluble) insulin, and others are given once daily, particularly in elderly patients. Soluble insulin can be mixed with intermediate and long-acting insulins (except insulin detemir, insulin glargine, and insulin degludec) in the syringe, essentially retaining the properties of the two components, although there may be some blunting of the initial effect of the soluble insulin component (especially on mixing with protamine zinc insulin).

Isophane insulin is a suspension of insulin with protamine; it is of particular value for initiation of twice-daily insulin regimens. Patients usually mix isophane with soluble insulin but ready-mixed preparations may be appropriate (biphasic isophane insulin, biphasic insulin aspart, or biphasic insulin lispro).

Insulin zinc suspension (30% amorphous, 70% crystalline) has a more prolonged duration of action.

Protamine zinc insulin is usually given once daily with short-acting (soluble) insulin. It has the drawback of binding with the soluble insulin when mixed in the same syringe and is now rarely used.

Insulin glargine and insulin detemir are both long-acting human insulin analogues with a prolonged duration of action; insulin glargine is given once daily and insulin detemir is given once or twice daily. NICE (December 2002) has recommended that insulin glargine should be available as an option for patients with type 1 diabetes.

NICE (May 2009) has recommended that, if insulin is required in patients with type 2 diabetes, insulin detemir or insulin glargine may be considered for those:

- who require assistance with injecting insulin or
- whose lifestyle is significantly restricted by recurrent symptomatic hypoglycaemia or
- who would otherwise need twice–daily basal insulin injections in combination with oral antidiabetic drugs or
- who cannot use the device needed to inject isophane insulin.

Insulin detemir is also licensed as add-on therapy in patients receiving treatment with lixisenatide.

Insulin degludec is a long-acting human insulin analogue for once daily subcutaneous administration.

Hypodermic equipment

Patients should be advised on the safe disposal of lancets, single-use syringes, and needles. Suitable arrangements for the safe disposal of contaminated waste must be made before these products are prescribed for patients who are carriers of infectious diseases.

Lancets, needles, syringes, and accessories are listed under Hypodermic Equipment in Part IXA of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 3 of the Scottish Drug Tariff). The drug Tariffs can be accessed online at:

- National Health Service Drug Tariff for England and Wales: www.ppa.org.uk/ppa/edt_intro.htm
- Health and Personal Social Services for Northern Ireland Drug Tariff: www.dhsspsni.gov.uk/ps-tariff
- Scottish Drug Tariff: www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/

Antidiabetic drugs

Oral antidiabetic drugs are used for the treatment of type 2 diabetes mellitus. They should be prescribed only if the patient fails to respond adequately to at least 3 months’ restriction of energy and carbohydrate intake and an increase in physical activity. They should be used to augment the effect of diet and exercise, and not to replace them.

For patients not adequately controlled by diet and oral hypoglycaemic drugs, insulin may be added to the treatment regimen or substituted for oral therapy. When insulin is added to oral therapy, it is generally given at bedtime as isophane or long-acting insulin, and when insulin replaces an oral regimen it may be given as twice-daily injections of a biphasic insulin (or isophane insulin p. 607 mixed with soluble insulin), or a multiple injection regimen. Weight gain and hypoglycaemia may be complications of insulin therapy but weight gain may be reduced if the insulin is given in combination with metformin hydrochloride p. 594.

Pregnancy and breast-feeding

During pregnancy, women with pre-existing diabetes can be treated with metformin hydrochloride [unlicensed use], either alone or in combination with insulin. Metformin hydrochloride can be continued, or glibenclamide p. 611 resumed, during breast-feeding for those with pre-existing diabetes. Women with gestational diabetes may be treated, with or without concomitant insulin, with glibenclamide from 11 weeks gestation (after organogenesis) [unlicensed use] or with metformin [unlicensed use]. Women with gestational diabetes should discontinue hypoglycaemic treatment after giving birth.

Sulfonylureas

The sulfonylureas act mainly by augmenting insulin secretion and consequently are effective only when some residual pancreatic beta-cell activity is present; during long-term administration they also have an extrapancreatic action. All may cause hypoglycaemia but this is uncommon and usually indicates excessive dosage. Sulfonylurea-induced hypoglycaemia may persist for many hours and must always be treated in hospital.

Sulfonylureas are considered for patients who are not overweight, or in whom metformin hydrochloride is contraindicated or not tolerated. Several sulfonylureas are available and choice is determined by side-effects and the duration of action as well as the patient’s age and renal function. Glibenclamide, a long-acting sulfonylurea, is associated with a greater risk of hypoglycaemia; for this reason it should be avoided in the elderly, and shorter-acting alternatives, such as gliclazide p. 611 or tolbutamide p. 613, should be used instead.

When the combination of strict diet and sulfonylurea treatment fails, other options include:

- combining with metformin;
- combining with pioglitazone;
- combining with alogliptin, lixisenatide, saxagliptin, sitagliptin, or vildagliptin;
- combining with canagliflozin, dapagliflozin or empagliflozin;
- combining with exenatide, lixisenatide, or liraglutide;
- combining with acarbose, which may have a small beneficial effect, but flatulence can be a problem;
• combining with bedtime isophane insulin but weight gain and hypoglycaemia can occur.
Insulin therapy should be instituted temporarily during intercurrent illness (such as myocardial infarction, coma, infection, and trauma). Sulfonylureas should be omitted on the morning of surgery; insulin is required because of the ensuing hyperglycaemia in these circumstances.

**Biguanides**

Metformin hydrochloride, the only available biguanide, has a different mode of action from the sulfonylureas, and is not interchangeable with them.
Metformin hydrochloride is the drug of first choice in overweight patients in whom strict dieting has failed to control diabetes, if appropriate it may also be considered as an option in patients who are not overweight. It is also used when diabetes is inadequately controlled with sulfonylurea treatment. When the combination of strict diet and metformin hydrochloride treatment fails, other options include:
- combining with a sulfonylurea;
- combining with pioglitazone;
- combining with repaglinide or nateglinide;
- combining with alogliptin, linagliptin, saxagliptin, sitagliptin, or vildagliptin;
- combining with canagliflozin, dapagliflozin or empagliflozin;
- combining with exenatide, liraglutide, or lixisenatide;
- combining with acarbose, which may have a small beneficial effect, but flatulence can be a problem;
- combining with insulin but weight gain and hypoglycaemia can be problems (weight gain minimised if insulin given at night).
Insulin treatment is almost always required in medical and surgical emergencies; insulin should also be substituted before elective surgery (omit metformin hydrochloride on the morning of surgery and give insulin if required).

Hypoglycaemia does not usually occur with metformin hydrochloride; other advantages are the lower incidence of weight gain and lower plasma-insulin concentration. It does not exert a hypoglycaemic action in non-diabetic subjects unless given in overdose.
Metformin hydrochloride is used for the symptomatic management of polycystic ovary syndrome [unlicensed indication]; however, treatment should be initiated by a specialist. Metformin hydrochloride improves insulin sensitivity, may aid weight reduction, helps to normalise menstrual cycle (increasing the rate of spontaneous ovulation), and may improve hirsutism.

**Other antidiabetic drugs**

Use of acarbose p. 594 is usually reserved for when other oral hypoglycaemics are not tolerated or are contra-indicated. Postprandial hyperglycaemia in type 1 diabetes can be reduced by acarbose, but it has been little used for this purpose. Flatulence deters some from using acarbose although this side-effect tends to decrease with time.

Nateglinide p. 607 and repaglinide p. 608 stimulate insulin secretion. Both drugs have a rapid onset of action and short duration of activity, and should be administered shortly before each main meal. Repaglinide may be given as monotherapy for patients who are not overweight or for those in whom metformin hydrochloride is contra-indicated or not tolerated, or it may be given in combination with metformin hydrochloride. Nateglinide is licensed only for use with metformin hydrochloride.

Pioglitazone p. 613 can be used alone or in combination with metformin hydrochloride or with a sulfonylurea (if metformin hydrochloride inappropriate), or with both; the combination of pioglitazone plus metformin hydrochloride is preferred to pioglitazone plus sulfonylurea, particularly for obese patients. Inadequate response to a combination of metformin hydrochloride and sulfonylurea may indicate failing insulin release; the introduction of pioglitazone has a limited role in these circumstances and the initiation of insulin is often more appropriate. Pioglitazone is also licensed in combination with insulin, in patients who have not achieved adequate glycaemic control with insulin alone, when metformin hydrochloride is inappropriate. Blood-glucose control may deteriorate temporarily when pioglitazone is substituted for an oral antidiabetic drug that is being used in combination with another. Long-term benefits of pioglitazone have not yet been demonstrated. NICE (May 2009) has recommended that, when glycaemic control is inadequate with existing treatment, pioglitazone can be added to:
- a sulfonylurea, if metformin hydrochloride is contra-indicated or not tolerated;
- metformin, if risks of hypoglycaemia with sulfonylurea are unacceptable or a sulfonylurea is contra-indicated or not tolerated;
- a combination of metformin hydrochloride and a sulfonylurea, if insulin is unacceptable because of lifestyle or other personal issues, or because the patient is obese.
NICE has recommended that treatment with pioglitazone is continued only if HbA1c concentration is reduced by at least 0.5 percentage points within 6 months of starting treatment.

Linagliptin p. 596 is licensed for use in type 2 diabetes as monotherapy (if metformin hydrochloride inappropriate), or in combination with metformin hydrochloride (when treatment with metformin hydrochloride alone fails to achieve adequate glycaemic control), or both metformin hydrochloride and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control). Linagliptin may also be used in combination with insulin (with or without metformin hydrochloride p. 594) when a stable dose of insulin has not provided adequate glycaemic control.

Saxagliptin p. 597 and vildagliptin p. 598 are licensed for use in type 2 diabetes as monotherapy (if metformin hydrochloride inappropriate), or in combination with metformin hydrochloride or a sulfonylurea (if metformin hydrochloride inappropriate), or pioglitazone (when treatment with metformin hydrochloride alone fails to achieve adequate glycaemic control), and also in combination with both metformin hydrochloride and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control). The combination of either saxagliptin or vildagliptin, and insulin (with or without metformin hydrochloride) is also licensed for use when a stable dose of insulin has not provided adequate glycaemic control.

Alogliptin p. 596 is also licensed for use as triple therapy in combination with metformin hydrochloride and either pioglitazone or insulin.

NICE (May 2009) has recommended that, when glycaemic control is inadequate with existing treatment:
- sitagliptin or vildagliptin (instead of a sulfonylurea) can be added to metformin, if there is a significant risk of hypoglycaemia or if a sulfonylurea is contra-indicated or not tolerated;
- sitagliptin or vildagliptin can be added to a sulfonylurea, if metformin is contra-indicated or not tolerated;
- sitagliptin can be added to both metformin and a sulfonylurea, if insulin is unacceptable because of lifestyle or other personal issues, or because the patient is obese.
NICE has recommended that treatment with sitagliptin or vildagliptin is continued only if HbA1c concentration is reduced by at least 0.5 percentage points within 6 months of starting treatment.

Treatment with exenatide p. 599, liraglutide p. 600, and lixisenatide p. 601 is associated with the prevention of
weight gain and possible promotion of weight loss which can be beneficial in overweight patients. They are given by subcutaneous injection for the treatment of type 2 diabetes mellitus.

Exenatide is licensed in combination with metformin hydrochloride or a sulfonylurea, or both, or with pioglitazone, or with both metformin hydrochloride and pioglitazone, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination; standard-release exenatide is also licensed in combination with basal insulin alone or with metformin hydrochloride or pioglitazone (or both).

NICE (May 2009) has recommended that, when glycaemic control is inadequate with metformin hydrochloride and sulfonylurea treatment, the addition of standard-release exenatide may be considered if the patient has:

- a body mass index of 35 kg/m² or over and is of European descent (with appropriate adjustment for other ethnic groups) and weight-related psychological or medical problems or
- a body mass index less than 35 kg/m², and insulin would be unacceptable for occupational reasons or weight loss would benefit other significant obesity-related comorbidities.

NICE has recommended that treatment with standard release exenatide is continued only if HbA₁c concentration is reduced by at least 1 percentage point and a weight loss of at least 3% is achieved within 6 months of starting treatment.

Liraglutide is licensed for the treatment of type 2 diabetes mellitus in combination with metformin hydrochloride or a sulfonylurea, or both, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination. Liraglutide is also licensed for use in combination with basal insulin or both metformin hydrochloride and pioglitazone when dual therapy with these drugs fails to achieve adequate glycaemic control. Lixisenatide is licensed for the treatment of type 2 diabetes mellitus in combination with oral antidiabetic drugs (e.g. metformin hydrochloride, pioglitazone, or a sulfonylurea) or basal insulin, or both, when adequate glycaemic control has not been achieved with these drugs;lixisenatide should not be used in combination with both basal insulin and a sulfonylurea because of an increased risk of hypoglycaemia. Canagliflozin p. 608 and dapagliflozin p. 609, and empagliflozin p. 610 are licensed for use in type 2 diabetes as monotherapy (if metformin hydrochloride inappropriate), or in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control). Dapagliflozin is not recommended in combination with pioglitazone.

### ALPHA GLUCOSIDASE INHIBITORS

**Acarbose**

- **DRUG ACTION** Acarbose, an inhibitor of intestinal alpha glucosidases, delays the digestion and absorption of starch and sucrose; it has a small but significant effect in lowering blood glucose.

**INDICATIONS AND DOSE**

**Diabetes mellitus inadequately controlled by diet or by diet with oral antidiabetic drugs**

**BY MOUTH**

- Adult: Initially 50 mg daily, then increased to 50 mg 3 times a day for 6–8 weeks, then increased if necessary to 100 mg 3 times a day (max. per dose 200 mg 3 times a day)

**SIDE-EFFECTS**

- Common or very common Abdominal distention and pain • diarrhea (may need to reduce dose or withdraw) • flatulence • soft stools

- Rare Abnormal liver function tests • nausea • skin reactions

**SIDE-EFFECTS, FURTHER INFORMATION**

**Antacids** Antacids unlikely to be beneficial for treating side effects.

**PREGNANCY** Avoid.

**BREAST FEEDING** Avoid.

**HEPATIC IMPAIRMENT** Avoid.

**RENAL IMPAIRMENT** Avoid if eGFR less than 25 mL/minute/1.73 m².

**MONITORING REQUIREMENTS** Monitor liver function.

**DIRECTIONS FOR ADMINISTRATION** Tablets should be chewed with first mouthful of food or swallowed whole with a little liquid immediately before food.

**PATIENT AND CARER ADVICE** Antacids unlikely to be beneficial for treating side-effects. To counteract possible hypoglycaemia, patients receiving insulin or a sulfonylurea as well as acarbose need to carry glucose (not sucrose—acarbose interferes with sucrose absorption). Patients should be given advice on how to administer acarbose tablets.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **ACARBOSE (Non-proprietary)**
  - Acarbose 50 mg | 90 tablet "price £9.65 DT price £9.65
  - Acarbose 100 mg | 90 tablet "price £16.42 DT price £16.42

- **Glucobay (Bayer Plc)**
  - Acarbose 50 mg | 90 tablet "price £7.35 DT price £7.35
  - Acarbose 100 mg | 90 tablet "price £13.50 DT price £13.50

**BIGUANIDES**

**Metformin hydrochloride**

- **DRUG ACTION** Metformin exerts its effect mainly by decreasing gluconeogenesis and by increasing peripheral utilisation of glucose; since it acts only in the presence of endogenous insulin it is effective only if there are some residual functioning pancreatic islet cells.

**INDICATIONS AND DOSE**

**Diabetes mellitus**

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- Adult: Initially 500 mg once daily for at least 1 week, dose to be taken with breakfast, then 500 mg twice daily for at least 1 week, dose to be taken with breakfast and evening meal, then 500 mg 3 times a day, dose to be taken with breakfast, lunch and evening meal; maximum 2 g per day

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- Adult: Initially 500 mg once daily, then increased if necessary up to 2 g once daily, dose increased...
gradually, every 10–15 days, dose to be taken with evening meal, alternatively increased to 1 g twice daily, dose to be taken with meals, alternative dose only to be used if control not achieved with once daily dose regimen. If control still not achieved then change to standard release tablets

**Polycystic ovary syndrome**

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- **Adult:** Initially 500 mg once daily for 1 week, dose to be taken with breakfast, then 500 mg twice daily for 1 week, dose to be taken with breakfast and evening meal, then 1.5–1.7 g daily in 2–3 divided doses

- **UNLICENSED USE** Doses in the BNF may differ from those in the product literature. Not licensed for polycystic ovary syndrome.

- **CONTRA-INDICATIONS** Ketoacidosis - use of general anaesthesia (suspend metformin on the morning of surgery and restart when renal function returns to baseline)

**CONTRA-INDICATIONS, FURTHER INFORMATION**

- **Iodine-containing X-ray contrast media** Intravenous administration of iodinated contrast agents can cause renal failure, which can increase the risk of lactic acidosis with metformin. Suspend metformin prior to the test; restart no earlier than 48 hours after the test if renal function has returned to baseline.

- **CAUTIONS** Can provoke lactic acidosis

- **INTERACTIONS** Appendix 1 (antidiabetics).

- **SIDE-EFFECTS**
  - Common or very common Abdominal pain - anorexia - diarrhoea (usually transient) - nausea - taste disturbance - vomiting
  - Rare Decreased vitamin-B₁₂ absorption - erythema - lactic acidosis (withdraw treatment) - pruritus - urticaria
  - Frequency not known Hepatitis

**Gastro-intestinal effects** Gastro-intestinal side-effects are initially common with metformin, and may persist in some patients, particularly when very high doses are given. A slow increase in dose may improve tolerability.

- **PREGNANCY** Can be used in pregnancy for both pre-existing and gestational diabetes. Women with gestational diabetes should discontinue treatment after giving birth.

- **BREAST FEEDING** May be used during breast-feeding in women with pre-existing diabetes.

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (September 2009) that Glucophage® SR is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in adult patients who are intolerant of standard-release metformin, and in whom the prolonged-release tablet allows the use of a dose of metformin not previously tolerated, or in patients for whom a once daily preparation offers a clinically significant benefit.

- **HEPATIC IMPAIRMENT** Withdraw if tissue hypoxia likely.

- **RENAI IMPAIRMENT** Use with caution in renal impairment— increased risk of lactic acidosis.

Lactic acidosis Withdraw or interrupt treatment in those at risk of tissue hypoxia or sudden deterioration in renal function, such as those with dehydration, severe infection, shock, sepsis, acute heart failure, respiratory failure or hepatic impairment, or those who have recently had a myocardial infarction.

**NICE (clinical guideline 87 (May 2009): Type 2 diabetes:** The management of type 2 diabetes) recommends that the dose should be reviewed if eGFR less than 45 mL/minute/1.73 m² and to avoid if eGFR less than 30 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Determine renal function before treatment and at least annually (at least twice a year in patients with additional risk factors for renal impairment, or if deterioration suspected).

**PRESCRIBING AND DISPENSING INFORMATION** Patients taking up to 2 g daily of the standard-release metformin may start with the same daily dose of metformin modified release; not suitable if dose of standard-release tablets more than 2 g daily.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, capsule

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 21**

- **METFORMIN HYDROCHLORIDE (Non-proprietary)**
  - Metformin hydrochloride 500 mg Metformin 500mg tablets | 28 tablet (P) £1.55 DT price = £1.47 | 84 tablet (P) £4.41 | 500 tablet (P) £2.25
  - Metformin hydrochloride 850 mg Metformin 850mg tablets | 56 tablet (P) £2.48 DT price = £1.86 | 60 tablet (P) no price available | 300 tablet (P) £10.12
  - Glucophage (Merck Serono Ltd)
  - Metformin hydrochloride 500 mg Glucophage 500mg tablets | 84 tablet (P) £2.88

  - Metformin hydrochloride 1 gram Metformin 1g oral powder sachets sugar free (sugar-free) | 30 sachet (P) no price available

Also available in combination with alogliptin, p. 596; canagliflozin, p. 609; dapagliflozin, p. 610; linagliptin, p. 597; pioglitazone, p. 614; saxagliptin, p. 597; sitagliptin, p. 598; vildagliptin, p. 599
Alogliptin

**INDICATIONS AND DOSE**
Type 2 diabetes as dual therapy in combination with either metformin, pioglitazone, a sulfonylurea, or insulin (when treatment with these drugs alone fails to achieve adequate glycaemic control), or as triple therapy in combination with metformin and either pioglitazone or insulin.

**BY MOUTH**
- **Adult:** 25 mg once daily

**Dose adjustments due to interactions**
Dose of concomitant sulfonylurea or insulin may need to be reduced. Caution with use in combination with both metformin and pioglitazone—risk of hypoglycaemia (dose of metformin or pioglitazone may need to be reduced).

**SIDE-EFFECTS**
- **Common or very common**
  - Abdominal pain
  - Nasopharyngitis
  - Pruritus
  - Upper respiratory tract infection

**SIDE-EFFECTS, FURTHER INFORMATION**
- **Pancreatitis** Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain).

**CONTRA-INDICATIONS**
- Ketoacidosis

**CAUTIONS**
- History of pancreatitis: Avoid use.

**INTERACTIONS**
- Avoid in combination with metformin when addition of a sulfonylurea is inappropriate (January 2013, and in combination with metformin when addition of a sulfonylurea is inappropriate (December 2011).

**MEDICATION FORMS**
- Available in different presentations.

**Linagliptin**

**INDICATIONS AND DOSE**
Type 2 diabetes mellitus as monotherapy (if metformin inappropriate), or in combination with metformin (when treatment with metformin alone fails to achieve adequate glycaemic control), or both metformin and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control). Type 2 diabetes mellitus in combination with insulin (with or without metformin) when a stable dose of insulin has not provided adequate glycaemic control.

**BY MOUTH**
- **Adult:** 5 mg once daily

**Dose adjustments due to interactions**
Dose of concomitant sulfonylurea or insulin may need to be reduced.

**SIDE-EFFECTS**
- **Uncommon** Cough, nasopharyngitis

**SIDE-EFFECTS, FURTHER INFORMATION**
- **Pancreatitis** Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain).

**PRECAUTIONARY AND ADVISORY LABELS**
- **Avoid**—present in milk in animal studies.

**MEDICATION FORMS**
- Available in different presentations.

**Linagliptin with metformin**

The properties listed below are those particular to the combination only. For the properties of the components please consider, alogliptin above, metformin hydrochloride p. 594.
Linagliptin with metformin

The properties listed below are those particular to the combination only. For the properties of the components please consider, linagliptin p. 596, metformin hydrochloride p. 594.

**INDICATIONS AND DOSE**
Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulfonylurea or insulin

**BY MOUTH**
- Adult: 1 tablet twice daily, based on patient’s current metformin dose

**INTERACTIONS**
Dose of concomitant sulfonylurea or insulin may need to be reduced.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

Saxagliptin

**DRUG ACTION**
Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

**INDICATIONS AND DOSE**
Type 2 diabetes mellitus as monotherapy (if metformin inappropriate), or in combination with metformin or a sulfonylurea (if metformin inappropriate), or pioglitazone (when treatment with either metformin or a sulfonylurea or pioglitazone fails to achieve adequate glycaemic control), and also in combination with both metformin and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control) | Type 2 diabetes mellitus in combination with insulin (with or without metformin) when a stable dose of insulin has not provided adequate glycaemic control

**BY MOUTH**
- Adult: 5 mg once daily

**Dose adjustments due to interactions**
Dose of concomitant sulfonylurea or insulin may need to be reduced.

**CAUTIONS**
Elderly

**INTERACTIONS**
Appendix 1 (antidiabetics).

**SIDE-EFFECTS**
- Common or very common: Dizziness, dyspepsia, fatigue, gastritis, gastroenteritis, headache, hypoglycaemia, myalgia, nasopharyngitis, peripheral oedema, sinusitis, upper respiratory tract infection, urinary tract infection, vomiting
- Uncommon: Anaphylaxis, arthralgia, dyslipidaemia, erectile dysfunction, hypersensitivity reactions, hypertriglyceridaemia, pancreatitis
- Frequency not known: Rash

**SIDE-EFFECTS, FURTHER INFORMATION**
pancreatitis: Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain).

**ALLERGY AND CROSS-SENSITIVITY**
Contraindicated if patient has a history of serious hypersensitivity to dipeptidylpeptidase-4 inhibitors.

**PREGNANCY**
Avoid unless essential—toxicity in animal studies.

Metformin with saxagliptin

The properties listed below are those particular to the combination only. For the properties of the components please consider, metformin hydrochloride p. 594, saxagliptin above.

**INDICATIONS AND DOSE**
Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulfonylurea or insulin

**BY MOUTH**
- Adult: 1 tablet twice daily, based on patient’s current metformin dose

**INTERACTIONS**
Dose of concomitant sulfonylurea or insulin may need to be reduced.

**NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised that saxagliptin (Onglyza®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus as triple therapy in combination with metformin and a sulfonylurea, as an alternative to existing dipeptidyl peptidase-4 inhibitors, when treatment with metformin and a sulfonylurea is inadequate (November 2013).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

INDICATIONS AND DOSE
Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulfonylurea or insulin

Adult: 1 tablet twice daily, based on patient’s current metformin dose

INTERACTIONS Dose of concomitant sulfonylurea or insulin may need to be reduced.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium (SMC) has advised (June 2008) that Eucreas® is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in patients unable to achieve adequate glycaemic control with metformin alone or those already treated with vildagliptin and metformin as separate tablets.
SIDE-EFFECTS, FURTHER INFORMATION

Pancreatitis Severe pancreatitis (sometimes fatal), including haemorrhagic or necrotising pancreatitis, has been reported rarely;discontinue permanently if pancreatitis is diagnosed.

- CONCEPTION AND CONTRACEPTION Women of childbearing age should use effective contraception during treatment with modified-release exenatide and for 12 weeks after discontinuation.

- PREGNANCY Avoid—toxicity in animal studies.

- BREAST FEEDING Avoid—no information available.

- RENAL IMPAIRMENT For standard-release injection, use with caution if eGFR 30–50 mL/minute/1.73 m². For standard-release injection, avoid if eGFR less than 30 mL/minute/1.73 m². For modified-release injection, avoid if eGFR less than 50 mL, only when glycaemic control is inadequate and the patient has:
  - a body mass index (BMI) 35 kg/m² (in those of European descent, with appropriate adjustment for other ethnic groups) and weight-related psychological or medical problems, or
  - a BMI 35 kg/m², and insulin would be unacceptable for occupational reasons, or weight loss would benefit other significant obesity-related comorbidities.

Treatment with modified-release exenatide in a triple therapy regimen should be continued only if Hba1c concentration is reduced by at least 1 percentage point and a weight loss of at least 3% is achieved within 6 months of starting treatment.

Modified-release exenatide in dual therapy regimens (in combination with metformin or a sulphonylurea) is recommended only if:

- treatment with metformin or a sulphonylurea is contra-indicated or not tolerated, and
- treatment with thiazolidinediones and dipeptidylpeptidase-4 inhibitors is contra-indicated or not tolerated.

Modified-release exenatide in dual therapy regimens should be continued only if Hba1c concentration is reduced by at least 1 percentage point within 6 months of starting treatment. www.nice.org.uk/TA248

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (June 2007) that standard-release exenatide (Byetta) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with metformin or sulphonylurea (or both), as an alternative to treatment with insulin in patients where treatment with metformin or sulphonylurea (or both) at maximally tolerated doses has been inadequate, and treatment with insulin would be the next option.

The Scottish Medicines Consortium has also advised (February 2011) that standard-release exenatide (Byetta) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with metformin and pioglitazone as a third-line pre-insulin treatment option.

The Scottish Medicines Consortium has advised (December 2011) that modified-release exenatide (Bydureon) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes as a third-line treatment option.

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

**CAUTIONARY AND ADVISORY LABELS 1D**

- Byetta (AstraZeneca UK Ltd)
  - Exenatide 250 microgram per 1 ml Byetta 10micrograms/0.04ml solution for injection 2.4ml pre-filled disposable devices | 1 prefilled disposable injection \( \text{PDr} \) £68.24 DT price = £68.24
  - Byetta 5micrograms/0.02ml solution for injection 1.2ml pre-filled disposable devices | 1 prefilled disposable injection \( \text{PDr} \) £68.24 DT price = £68.24

**Powder and solvent for suspension for injection**

**CAUTIONARY AND ADVISORY LABELS 1D**

    - Nasal congestion
    - Nausea
    - Tachycardia
    - Vomiting

- Uncommon
  - Acute renal failure
  - Dehydration
  - Renal impairment
Liraglutide for the treatment of type 2 diabetes mellitus in combination with oral antidiabetic drugs (e.g. metformin, pioglitazone, or a sulfonylurea) or basal insulin, or both, when adequate glycaemic control has not been achieved with these drugs by subcutaneous injection

- **CONTRA-INDICATIONS** Ketoacidosis • severe gastro-intestinal disease

- **INTERACTIONS** Appendix 1 (antidiabetics). Other drugs administered orally may need to be taken at least 1 hour before or 4 hours after lixisenatide injection, or taken with a meal when lixisenatide is not administered, to minimise possible interference with absorption.

- **SIDE-EFFECTS**
  - Common or very common
    - Diarrhoea • dizziness • drowsiness • dyspepsia • headache • hypoglycaemia • injection-site reactions • nausea • palpitation • vomiting
  - Uncommon
    - Tachycardia • urticaria

**SIDE-EFFECTS, FURTHER INFORMATION**

**PANCREATITIS** Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain).

**RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².

**HEPATIC IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².

**BREAST FEEDING** Avoid—no information available.

**NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

- Liraglutide for the treatment of type 2 diabetes mellitus (October 2010) NICE TA203
- Liraglutide in triple therapy regimens (in combination with metformin and a sulfonylurea, or metformin and a thiazolidinedione) is recommended for the treatment of type 2 diabetes, only when glycaemic control is inadequate, and the patient has:
  - a body mass index of 35 kg/m² or over and is of European descent (with appropriate adjustment for other ethnic groups) and weight-related psychological or medical problems, or
  - a body mass index of less than 35 kg/m², and insulin would be unacceptable for occupational reasons or weight loss would benefit other significant obesity-related comorbidities.

Treatment with liraglutide in a triple therapy regimen should be continued only if HbA1c concentration is reduced by at least 1 percentage point and a weight loss of at least 3% is achieved within 6 months of starting treatment.

Liraglutide in dual therapy regimens (in combination with metformin or a sulfonylurea) is recommended only if:

- treatment with metformin or a sulfonylurea is contraindicated or not tolerated, and
- treatment with thiazolidinediones and dipeptidylpeptidase-4 inhibitors is contra-indicated or not tolerated.

Liraglutide, in combination with metformin or a sulfonylurea should be continued only if HbA1c concentration is reduced by at least 1 percentage point within 6 months of starting treatment. Liraglutide 1.8 mg daily is not recommended.

**BREAST FEEDING** Avoid—no information available.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (August 2013) that lixisenatide (Lyxumia®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with oral antidiabetic drugs or basal insulin (or both), when adequate glycaemic control has not been achieved with these drugs; use is restricted to patients in whom a GLP-1 agonist is appropriate, as an alternative to an existing GLP-1 agonist (exenatide or liraglutide).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **LYXUMIA (Sanofi)**
  - Lixisenatide 50 microgram per 1 ml: Lyxumia 10 micrograms/0.2 ml solution for injection 3 ml pre-filled pen | 1 pre-filled disposable injection no price available | 47707 DT price = £27.07
  - Lixisenatide 20 microgram/0.2 ml solution for injection 3 ml pre-filled pen | 1 pre-filled disposable injection no price available | 1 pre-filled disposable injection £5.44

**CAUTIONARY AND ADVISORY LABELS**

10
INSULINS

Insulins

- **SIDE-EFFECTS**
  - **Common or very common** Fat hypertrophy at injection site · local reactions at injection site · transient oedema
  - **Rare** Hypersensitivity reactions · rash · urticaria
  - **Overdose** Overdose causes hypoglycaemia.

- **PREGNANCY** During pregnancy, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician. The dose of insulin generally needs to be increased in the second and third trimesters of pregnancy.

- **BREAST FEEDING** During breast-feeding, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician.

- **HEPATIC IMPAIRMENT** Insulin requirements may be decreased in patients with hepatic impairment.

- **RENAL IMPAIRMENT** Insulin requirements may decrease in patients with renal impairment and therefore dose reduction may be necessary. The compensatory response to hypoglycaemia is impaired in renal impairment.

- **MONITORING REQUIREMENTS**
  - Many patients now monitor their own blood-glucose concentrations; all carers and children need to be trained to do this.
  - Since blood-glucose concentration varies substantially throughout the day, ‘normoglycaemia’ cannot always be achieved throughout a 24-hour period without causing damaging hypoglycaemia.
  - It is therefore best to recommend that patients should maintain a blood-glucose concentration of between 4 and 9 mmol/litre for most of the time (4–7 mmol/litre before meals and less than 9 mmol/litre after meals).
  - While accepting that on occasions, for brief periods, the blood-glucose concentration will be above these values; strenuous efforts should be made to prevent it from falling below 4 mmol/litre. Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen. The intake of energy and of simple and complex carbohydrates should be adequate to allow normal growth and development but obesity must be avoided.

- **DIRECTIONS FOR ADMINISTRATION** Insulin is generally given by subcutaneous injection; the injection site should be rotated to prevent lipodystrophy. Injection devices (‘pens’), which hold the insulin in a cartridge and meter the required dose, are convenient to use. Insulin syringes (for use with needles) are required for insulins not available in cartridge form, but are less popular with children and carers. For intensive insulin regimens multiple subcutaneous injections (3 or more times daily) are usually recommended.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Units The word ‘unit’ should not be abbreviated.
  - Show container to patient or carer and confirm the expected version is dispensed.

- **PATIENT AND CARER ADVICE** Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

- **Insulin Passport** Insulin Passports and patient information booklets should be offered to patients receiving insulin. The Insulin Passport provides a record of the patient’s current insulin preparations and contains a section for emergency information. The patient information booklet provides advice on the safe use of insulin. They are available for purchase from:
  - 3M Security Print and Systems Limited
    - Gorse Street, Chadderton
    - Oldham OL9 9QH
    - 0845 610 1112
  - GP practices can obtain supplies through their Local Area Team stores.
  - NHS Trusts can order supplies from www.nhsforms.co.uk or by emailing nhsforms@mmm.com. Further information is available at www.npsa.nhs.uk.

**Hypoglycaemia**

Hypoglycaemia is a potential problem with insulin therapy. All patients must be carefully instructed on how to avoid it; this involves appropriate adjustment of insulin type, dose and frequency together with suitable timing and quantity of meals and snacks.

### Biphasic insulin aspart
**(Intermediate-acting insulin)**

**INDICATIONS AND DOSE**

**Diabetes mellitus**

**BY SUBCUTANEOUS INJECTION**

- **Child:** Administer dose up to 10 minutes before or soon after a meal, according to requirements
- **Adult:** Administer dose up to 10 minutes before or soon after a meal, according to requirements

- **INTERACTIONS** → Appendix 1 (antidiabetics).

- **SIDE-EFFECTS** Protamine may cause allergic reactions

**PRESCRIBING AND DISPENSING INFORMATION** Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

- **NovoMix 30 FlexPen** (Novo Nordisk Ltd)
  - Insulin aspart 30 unit per 1 ml, Insulin aspart (as Insulin aspart protamine) 70 unit per 1 ml NovoMix 30 FlexPen 100 units/ml suspension for injection 3 ml pre-filled pen | 5 pre-filled disposable injection £29.89
- **NovoMix 30 Penfill** (Novo Nordisk Ltd)
  - Insulin aspart 30 unit per 1 ml, Insulin aspart (as Insulin aspart protamine) 70 unit per 1 ml NovoMix 30 Penfill 100 units/ml suspension for injection 3 ml cartridges | 5 cartridge £28.79

### Biphasic insulin lispro
**(Intermediate-acting insulin)**

**INDICATIONS AND DOSE**

**Diabetes mellitus**

**BY SUBCUTANEOUS INJECTION**

- **Child:** Administer up to 15 minutes before or soon after a meal, according to requirements
- **Adult:** Administer up to 15 minutes before or soon after a meal, according to requirements

- **CAUTIONS** Children under 12 years (use only if benefit likely compared to soluble insulin)

- **INTERACTIONS** → Appendix 1 (antidiabetics).

- **SIDE-EFFECTS** Protamine may cause allergic reactions

**PRESCRIBING AND DISPENSING INFORMATION** Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).
which the proportions are stated may not be the same in other countries).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

► Humalog Mix25 (Eli Lilly and Company Ltd)
Insulin lispro 25 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 75 unit per 1 ml Humalog Mix25 100units/ml suspension for injection 3ml cartridges | 5 cartridge (Pos) £16.61
Humalog Mix25 100units/ml suspension for injection 3ml cartridges | 5 cartridge (Pos) £29.46
► Humalog Mix25 KwikPen (Eli Lilly and Company Ltd)
Insulin lispro 25 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 75 unit per 1 ml Humalog Mix25 KwikPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection (Pos) £30.98
► Humalog Mix50 (Eli Lilly and Company Ltd)
Insulin lispro 50 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 50 unit per 1 ml Humalog Mix50 100units/ml suspension for injection 3ml cartridges | 5 cartridge (Pos) £20.46
► Humalog Mix50 KwikPen (Eli Lilly and Company Ltd)
Insulin lispro 50 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 50 unit per 1 ml Humalog Mix50 KwikPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection (Pos) £30.98

Biphasic isophane insulin
(Biphasic Isophane Insulin injection—intermediate acting)

INDICATIONS AND DOSE

Diabetes mellitus

BY SUBCUTANEOUS INJECTION

► Child: According to requirements
► Adult: According to requirements

● INTERACTIONS → Appendix 1 (antidiabetics).

● SIDE-EFFECTS

Protamine may cause allergic reactions

● PRESCRIBING AND DISPENSING INFORMATION

A sterile buffered suspension of either porcine or human insulin complexed with protamine sulfate (or another suitable protamine) in a solution of insulin of the same species.

Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

► Humulin M3 (Eli Lilly and Company Ltd)
Insulin human (as Insulin soluble human) 70 unit per 1 ml, Insulin human (as insulin soluble human) 30 unit per 1 ml Humulin M3 100units/ml suspension for injection 3ml cartridges | 5 cartridge (Pos) £19.08
Humulin M3 100units/ml suspension for injection 10ml vials | 1 vial (Pos) £15.68
► Humulin M3 KwikPen (Eli Lilly and Company Ltd)
Insulin human (as Insulin soluble human) 70 unit per 1 ml, Insulin human (as insulin soluble human) 30 unit per 1 ml Humulin M3 KwikPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection (Pos) £21.70
► Hypurin Porcine 30/70 Mix (Wockhardt UK Ltd)
Insulin porcine (as Insulin isophane porcine) 70 unit per 1 ml, Insulin porcine (as insulin soluble porcine) 30 unit per 1 ml Hypurin Porcine 30/70 Mix 100units/ml suspension for injection 3ml cartridges | 5 cartridge (Pos) £37.80
Hypurin Porcine 30/70 Mix 100units/ml suspension for injection 10ml vials | 1 vial (Pos) £23.20
► Insulan Comb 15 (Sanofi)
Insulin human (as Insulin isophane human) 85 unit per 1 ml, Insulin human (as insulin soluble human) 15 unit per 1 ml Insulan Comb 15 100units/ml suspension for injection 3ml cartridges | 5 cartridge (Pos) £17.50
► Insulan Comb 25 (Sanofi)
Insulin human (as insulin isophane human) 75 unit per 1 ml, Insulin human (as insulin soluble human) 25 unit per 1 ml Insulan Comb 25 100units/ml suspension for injection 5ml vials | 1 vial (Pos) £5.61
Insulan Comb 25 100units/ml suspension for injection 3ml pre-filled SoloStar pen | 5 pre-filled disposable injection (Pos) £13.80
Insulan Comb 25 100units/ml suspension for injection 3ml cartridges | 5 cartridge (Pos) £17.50
► Insulan Comb 50 (Sanofi)
Insulin human (as insulin isophane human) 50 unit per 1 ml, Insulin human (as insulin soluble human) 50 unit per 1 ml Insulan Comb 50 100units/ml suspension for injection 3ml cartridges | 5 cartridge (Pos) £17.50

Insulin
(Insulin Injection; Neutral Insulin; Soluble Insulin)

INDICATIONS AND DOSE

Diabetes mellitus

BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION

OR BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

► Adult: According to requirements

Diabetic ketoacidosis | Diabetes during surgery

► INTRAVENOUS INFUSION

► Adult: (consult local protocol)

● INTERACTIONS → Appendix 1 (antidiabetics).

● DIRECTIONS FOR ADMINISTRATION

Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team. Some insulin preparations are not recommended for use in subcutaneous insulin infusion pumps—may precipitate in catheter or needle—consult product literature.

For intravenous infusion give continuously in Sodium chloride 0.9%. Adsorbed to some extent by plastic infusion set; ensure insulin is not injected into ‘dead space’ of injection port of the infusion bag.

● PRESCRIBING AND DISPENSING INFORMATION

A sterile solution of insulin (i.e. bovine or porcine) or of human insulin; pH 6.6–8.0.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

► Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151
Continuous subcutaneous insulin infusion is recommended as an option in adults and children over 12 years with type 1 diabetes:

● who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens, or

● whose glycaemic control remains inadequate (HbA1c over 8.5% [69 mmol/mol]) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).

Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate.

Children on insulin pumps should undergo a trial of
multiple-injection therapy between the ages of 12 and 18 years. www.nice.org.uk/TA151

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for injection**

- Actrapid (Novo Nordisk Ltd)
  - Insulin human (as insulin soluble human) 100 unit per 1 ml
    - Actrapid 100units/ml solution for injection 10ml vials | 1 vial £7.48
  - Humulin S (Eli Lilly and Company Ltd)
    - Insulin human (as insulin soluble human) 100 unit per 1 ml
      - Humulin S 100units/ml solution for injection 10ml vials | 1 vial £15.68
      - Humulin S 100units/ml solution for injection 3ml cartridges | 5 cartridge £19.08
  - Hypurin Bovine Neutral (Wockhardt UK Ltd)
    - Insulin bovine (as Insulin soluble bovine) 100 unit per 1 ml
      - Hypurin Bovine Neutral 100units/ml solution for injection 10ml vials | 1 vial £27.72
  - Hypurin Porcine Neutral (Wockhardt UK Ltd)
    - Hypurin Porcine Neutral 100units/ml solution for injection 10ml vials | 1 vial £25.20
  - Hypurin Porcine Neutral 100units/ml solution for injection 3ml cartridges | 5 cartridge £37.80
  - Insulan Rapid (Sanofi)
    - Insulin human (as insulin soluble human) 100 unit per 1 ml
      - Insulan Rapid 100unit/ml solution for injection 3ml cartridges | 5 cartridge £17.50

**Insulin aspart**

*(Recombinant human insulin analogue)*

**INDICATIONS AND DOSE**

**Diabetes mellitus**

**BY SUBCUTANEOUS INJECTION**

- Adult: Administer immediately before meals or when necessary shortly after meals, according to requirements

**BY SUBCUTANEOUS INFUSION OR BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION**

- Child 2-17 years: According to requirements

- Adult: According to requirements

**INTERACTIONS** → Appendix 1 (antidiabetics).

**PREGNANCY** Not known to be harmful—may be used during pregnancy.

**BREAST FEEDING** Not known to be harmful—may be used during lactation.

**DIRECTIONS FOR ADMINISTRATION** Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team.

- In adults For *intravenous infusion*, give continuously in Glucose 5% or Sodium chloride 0.9%; dilute to 0.05-1 unit/ml with infusion fluid; adsorbed to some extent by plastics of infusion set.

- In children For *intravenous infusion*, dilute to a concentration of 0.05–1 unit/ml with Glucose 5% or Sodium Chloride 0.9% and mix thoroughly; insulin may be adsorbed by plastics, flush giving set with 5 mL of infusion fluid containing insulin.

**Insulin degludec**

*(Recombinant human insulin analogue—long acting)*

**INDICATIONS AND DOSE**

**Diabetes mellitus**

**BY SUBCUTANEOUS INJECTION**

- Adult: Dose to be given according to requirements

**INTERACTIONS** → Appendix 1 (antidiabetics).

**PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.

**PRESCRIBING AND DISPENSING INFORMATION** Insulin degludec (*Tresiba®*) is available in strengths of 100 units/mL (allows 1-unit dose adjustment) and 200 units/mL (allows 2-unit dose adjustment)—ensure correct strength prescribed.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Tresiba FlexTouch (Novo Nordisk Ltd)
  - Insulin human (as Insulin degludec) 100 unit per 1 ml Tresiba FlexTouch 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection £72.00
Insulin degludec with liraglutide

The properties listed below are those particular to the combination only. For the properties of the components please consider, insulin degludec p. 604, liraglutide p. 600.

INDICATIONS AND DOSE

As add-on to oral antidiabetics in type 2 diabetes mellitus not controlled by oral antidiabetics alone or by oral antidiabetics in combination with basal insulin

BY SUBCUTANEOUS INJECTION

- Adult: Initially 10 dose-steps once daily, adjusted according to response; maximum 50 dose-steps per day

When transferring from basal insulin in type 2 diabetes mellitus not controlled by oral antidiabetics alone or by oral antidiabetics in combination with basal insulin

BY SUBCUTANEOUS INJECTION

- Adult: Initially 16 dose-steps once daily, adjusted according to response; maximum 50 dose-steps per day

- INTERACTIONS Dose of concomitant sulfonylurea may need to be reduced.
- PATIENT AND CARER ADVICE Counselling advised on administration. Show container to patient and confirm that patient is expecting the version dispensed.

Insulin zinc suspension
(Insulin Zinc Suspension (Mixed)—long acting)

INDICATIONS AND DOSE
Diabetes mellitus
BY SUBCUTANEOUS INJECTION
Child: According to requirements
Adult: According to requirements

INTERACTIONS ➔ Appendix 1 (antidiabetics).

PREGNANCY Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin below is recommended where longer-acting insulins are needed; insulin detemir p. 605 may also be considered.

PRESCRIBING AND DISPENSING INFORMATION A sterile neutral suspension of bovine or porcine insulin or of human insulin in the form of a complex obtained by the addition of a suitable zinc salt; consists of rhombohedral crystals (10–40 microns) and of particles of no uniform shape (not exceeding 2 microns).

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection
- Hypurin Bovine Lente (Workdhart UK Ltd)
  Insulin bovine (as Insulin zinc suspension mixed bovine) 100 unit per 1 ml Hypurin Bovine Lente 100units/ml suspension for injection 10ml vials | 1 vial (£) £27.72

Isophane insulin
(Isophane Insulin Injection; Isophane Protamine Insulin Injection; Isophane Insulin (NPH)—intermediate acting)

INDICATIONS AND DOSE
Diabetes mellitus
BY SUBCUTANEOUS INJECTION
Child: According to requirements
Adult: According to requirements

INTERACTIONS ➔ Appendix 1 (antidiabetics).

SIDE-EFFECTS Protamine may cause allergic reactions

PREGNANCY Recommended where longer-acting insulins are needed.

PRESCRIBING AND DISPENSING INFORMATION A sterile suspension of bovine or porcine insulin or of human insulin in the form of a complex obtained by the addition of protamine sulfate or another suitable protein.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection
- Humulin I (Eli Lilly and Company Ltd)
  Insulin human (as Insulin isophane human) 100 unit per 1 ml Humulin I 100units/ml suspension for injection 10ml vials | 1 vial (£) £15.68
  Humulin I 100units/ml suspension for injection 3ml cartridges | 5 cartridge (£) £19.08
- Humulin I KwikPen (Eli Lilly and Company Ltd)
  Insulin human (as Insulin isophane human) 100 unit per 1 ml Humulin I KwikPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection (£) £21.70
- Humyrin Bovine Isophane (Workdhart UK Ltd)
  Insulin bovine (as Insulin isophane bovine) 100 unit per 1 ml Humyrin Bovine Isophane 100units/ml suspension for injection 10ml vials | 1 vial (£) £27.72
  Humyrin Bovine Isophane 100units/ml suspension for injection 3ml cartridges | 5 cartridge (£) £41.58

- Hypurin Porcine Isophane (Wockhardt UK Ltd)
  Insulin porcine (as Insulin isophane porcine) 100 unit per 1 ml Hypurin Porcine Isophane 100units/ml suspension for injection 3ml cartridges | 5 cartridge (£) £37.80
  Hypurin Porcine Isophane Porcine 100units/ml suspension for injection 10ml vials | 1 vial (£) £25.20
- Insulatard (Novo Nordisk Ltd)
  Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulatard 100units/ml suspension for injection 10ml vials | 1 vial (£) £7.48
- Insulatard InnoLet (Novo Nordisk Ltd)
  Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulatard Penfill (Novo Nordisk Ltd)
  Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulatard Penfill 100units/ml suspension for injection 3ml cartridges | 5 cartridge (£) £22.90
- Insuman Basal (Sanofi)
  Insulin human (as Insulin isophane human) 100 unit per 1 ml Insuman Basal 100units/ml suspension for injection 3ml pre-filled Solostar pen | 5 pre-filled disposable injection (£) £19.80
  Insuman Basal 100units/ml suspension for injection 10ml vials | 1 vial (£) £5.61
  Insuman Basal 100units/ml suspension for injection 3ml cartridges | 5 cartridge (£) £17.50

Protamine zinc insulin
(Protamine Zinc Insulin Injection—long acting)

INDICATIONS AND DOSE
Diabetes mellitus
BY SUBCUTANEOUS INJECTION
Child: According to requirements
Adult: According to requirements

INTERACTIONS ➔ Appendix 1 (antidiabetics).

SIDE-EFFECTS Protamine may cause allergic reactions

PREGNANCY Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin above is recommended where longer-acting insulins are needed; insulin detemir p. 605 may also be considered.

PRESCRIBING AND DISPENSING INFORMATION A sterile suspension of insulin in the form of a complex obtained by the addition of a suitable protamine and zinc chloride; this preparation was included in BP 1980 but is not included in BP 1988.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection
- Hypurin Bovine Protamine Zinc (Wockhardt UK Ltd)
  Insulin bovine (as Insulin protamine zinc bovine) 100 unit per 1 ml Hypurin Bovine Protamine Zinc 100units/ml suspension for injection 10ml vials | 1 vial (£) £27.72

MEGGLITINIDES

Nateglinide

DRUG ACTION Nateglinide stimulates insulin secretion.

INDICATIONS AND DOSE
Type 2 diabetes mellitus in combination with metformin when metformin alone inadequate
BY MOUTH
Adult: Initially 60 mg 3 times a day (max. per dose 180 mg), adjusted according to response, to be taken within 30 minutes before main meals

CONTRA-INDICATIONS Ketoacidosis
Repaglinide

**DRUG ACTION** Repaglinide stimulates insulin secretion.

**INDICATIONS AND DOSE**

Type 2 diabetes mellitus (as monotherapy or in combination with metformin when metformin alone inadequate)

**BY MOUTH**

- Adult 18–74 years: Initially 500 micrograms (max. per dose 4 mg), adjusted according to response, dose to be taken within 30 minutes before main meals and adjusted at intervals of 1–2 weeks; maximum 16 mg per day
- Adult 75 years and over: Not recommended

Type 2 diabetes mellitus (as monotherapy or in combination with metformin when metformin alone inadequate), if transferring from another oral hypoglycaemic drug

**BY MOUTH**

- Adult 18–74 years: Initially 1 mg (max. per dose 4 mg), adjusted according to response, dose to be taken within 30 minutes before main meals and adjusted at intervals of 1–2 weeks; maximum 16 mg per day
- Adult 75 years and over: Not recommended

**CONTRA-INDICATIONS** Ketoacidosis

**CAUTIONS** Debilitated patients, elderly, malnourished patients

**CAUTIONS, FURTHER INFORMATION**

Substitute insulin during intercurrent illness (such as myocardial infarction, coma, infection, and trauma) and during surgery (omit repaglinide on morning of surgery and recommence when eating and drinking normally).

**INTERACTIONS** → Appendix 1 (antidiabetics).

**SIDE-EFFECTS**

- Common or very common Abdominal pain, constipation, diarrhoea, nausea, vomiting
- Rare Hypersensitivity reactions, hypoglycaemia, pruritus, rashes, urticaria, vasculitis, visual disturbances
- **PREGNANCY** Avoid.

**BREAST FEEDING** Avoid—poison in milk in animal studies.

**HEPATIC IMPAIRMENT** Avoid in severe liver disease.

**RENAL IMPAIRMENT** Use with caution.

**PATIENT AND CARER ADVICE** Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Starlix** (Novartis Pharmaceuticals UK Ltd)
  - Nateglinide 60 mg Starlix 60 mg tablets | 84 tablet DT price = £22.71
  - Nateglinide 120 mg Starlix 120 mg tablets | 84 tablet DT price = £25.88
  - Nateglinide 180 mg Starlix 180 mg tablets | 84 tablet DT price = £25.88

**SODIUM GLUCOSE CO-TRANSPORTER 2 INHIBITORS**

Canagliflozin

**DRUG ACTION** Reversibly inhibits sodium-glucose co-transporter 2 (SGLT2) in the renal proximal convoluted tubule to reduce glucose reabsorption and increase urinary glucose excretion.

**INDICATIONS AND DOSE**

Type 2 diabetes mellitus as monotherapy if metformin inappropriate | Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control)

**BY MOUTH**

- Adult: 100 mg once daily; increased if tolerated to 300 mg once daily if required, dose to be taken preferably before breakfast

**Dose adjustments due to interactions**

Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

**CONTRA-INDICATIONS** Ketoacidosis

**CAUTIONS** Cardiovascular disease (risk of hypotension) | elderly (risk of hypotension) | elevated haematocrit | history of hypotension

**CAUTIONS, FURTHER INFORMATION**

**Volume depletion** Correct hypovolaemia before starting treatment.

**INTERACTIONS** → Appendix 1 (antidiabetics).

**SIDE-EFFECTS**

- Common or very common Constipation, dyslipidaemia, genital infection, hypoglycaemia (in combination with insulin or sulfonylurea), nausea, polyuria, raised haematocrit, thirst, urinary frequency, urinary-tract infection
- Uncommon Dehydration, dizziness, hypovolaemia, postural hypotension, raised serum creatinine, raised serum urea, rash, syncope

**SIDE-EFFECTS, FURTHER INFORMATION**

**Volume depletion** Consider interrupting treatment if volume depletion occurs.

**PREGNANCY** Avoid—poison in milk in animal studies.
Canagliflozin with metformin

The properties listed below are those particular to the combination only. For the properties of the components please consider, canagliflozin p. 608, metformin hydrochloride p. 594.

**INDICATIONS AND DOSE**

Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with insulin or other antidiabetic drugs

**BY MOUTH**

- Adult: 1 tablet twice daily, dose based on patient’s current metformin dose, daily dose of metformin should not exceed 2 g

Dose adjustments due to interactions

Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

**RENAI IMPAIRMENT** Avoid if eGFR less than 50 mL/minute/1.73 m².

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (December 2014) that Vokanamet® is accepted for restricted use within NHS Scotland in patients with type 2 diabetes mellitus for whom a combination of canagliflozin and metformin is an appropriate choice of therapy.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**
  - CAUTIONARY AND ADVISORY LABELS 21
    - Vokanamet (Janssen-Cilag Ltd)
    - Canagliflozin (as Canagliflozin hemihydrate) 50 mg, Metformin hydrochloride 850 mg Vokanamet 50mg/850mg tablets | 60 tablet (POM) £39.20 DT price = £39.20
    - Canagliflozin (as Canagliflozin hemihydrate) 50 mg, Metformin hydrochloride 1 gram Vokanamet 50mg/1000mg tablets | 60 tablet (POM) £39.20 DT price = £39.20

Dapagliflozin

- **DRUG ACTION** Reversibly inhibits sodium-glucose co-transporter 2 (SGLT2) in the renal proximal convoluted tubule to reduce glucose reabsorption and increase urinary glucose excretion.

**INDICATIONS AND DOSE**

Type 2 diabetes mellitus as monotherapy if metformin is not appropriate | Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control)

**BY MOUTH**

- Adult 18-74 years: 10 mg once daily
- Adult 75 years and over: Initiation not recommended

Dose adjustments due to interactions

Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

**CONTRA-INDICATIONS** Ketoacidosis

**CAUTIONS** Cardiovascular disease (risk of hypotension) - elderly (risk of hypotension) - electrolyte disturbances - hypotension - raised haematocrit

**CAUTIONS, FURTHER INFORMATION**

Volume depletion Correct hypovolaemia before starting treatment.

**INTERACTIONS** → Appendix 1 (antidiabetics).

**SIDE-EFFECTS**

- Common or very common Back pain - constipation - dyslipidaemia - dysuria - genital infection - hypoglycaemia (in combination with insulin or sulphonylurea) - polyuria - sweating - thirst - urinary-tract infection
- Uncommon Dehydration - dizziness - hypotension - hypovolaemia - nausea - nocturia - raised serum creatinine - raised serum urea - rash
Diabetes mellitus and hypoglycaemia

**SIDE-EFFECTS, FURTHER INFORMATION**

**Volume depletion** Consider interrupting treatment if volume depletion occurs.

**PREGNANCY** Avoid—toxicity in animal studies.

**BREAST FEEDING** Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT** Initial dose 5 mg daily in severe impairment, increased according to response.

**RENAL IMPAIRMENT** Avoid if eGFR less than 60 mL/minute/1.73 m² (ineffective).

**MONITORING REQUIREMENTS** Determine renal function before treatment and at least annually thereafter.

**NATIONAL FUNDING/ACCESS DECISIONS**

* NICE technology appraisals (TAs)
  - Dapagliflozin in combination therapy for treating type 2 diabetes (June 2013) NICE TA288
  - Dapagliflozin in a dual therapy regimen in combination with metformin is recommended for the treatment of type 2 diabetes, only if glycaemic control is inadequate, and the patient has a significant risk of hypoglycaemia or if a sulfonylurea is contra-indicated or not tolerated. Dapagliflozin in combination with insulin (alone or with other antidiabetic drugs) is an option for the treatment of type 2 diabetes. Dapagliflozin in combination with metformin and a sulfonylurea as triple therapy is not recommended for the treatment of type 2 diabetes except as part of a clinical trial. Patients currently receiving dapagliflozin in a dual or triple therapy regimen that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA288

* Scottish Medicines Consortium (SMC) Decisions
  - The Scottish Medicines Consortium has advised that dapagliflozin (Forxiga®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with metformin, when treatment with metformin alone is inadequate and a sulfonylurea is inappropriate (December 2012), or in combination with insulin when treatment with insulin alone is inadequate (February 2014).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

* Tablet
  - Forxiga (AstraZeneca UK Ltd)
    - Dapagliflozin 5 mg: Forxiga 5mg tablets | 28 tablet (POM) £36.59 OT price = £36.59
    - Dapagliflozin 10 mg: Forxiga 10mg tablets | 28 tablet (POM) £36.59 OT price = £36.59

**NATIONAL FUNDING/ACCESS DECISIONS**

* Scottish Medicines Consortium (SMC) Decisions
  - The Scottish Medicines Consortium has advised (July 2014) that dapagliflozin plus metformin (Xigduo®) is accepted for restricted use within NHS Scotland in patients for whom a combination of dapagliflozin and metformin is an appropriate choice of therapy i.e when metformin alone does not provide adequate glycemic control and a sulfonylurea is inappropriate, or in combination with insulin, when insulin and metformin does not provide adequate control, or in combination with a sulphonylurea, when a sulfonylurea and metformin does not provide adequate control.

Empagliflozin

**DRUG ACTION** Reversibly inhibits sodium-glucose co-transporter 2 (SGLT2) in the renal proximal convoluted tubule to reduce glucose reabsorption and increase urinary glucose excretion.

**INDICATIONS AND DOSE**

Type II diabetes as monotherapy (if metformin inappropriate) / Type II diabetes in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycemic control)

**BY MOUTH**
  - Adult 18-84 years: 10 mg once daily, increased to 25 mg once daily if necessary and if tolerated
  - Adult 85 years and over: Initiation not recommended

**Dose adjustments due to interactions**

Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

**CONTRA-INDICATIONS** Diabetic ketoacidosis

**CAUTIONS** Cardiovascular disease (increased risk of volume depletion) - complicated urinary tract infections—consider temporarily interrupting treatment - concomitant antihypertensive therapy (increased risk of volume depletion) - elderly patients aged over 75 years (increased risk of volume depletion) - heart failure - history of hypotension (increased risk of volume depletion) - patients at increased risk of volume depletion - predisposition to fluid disturbances e.g. gastro-intestinal illness, concomitant use of diuretics (increased risk of volume depletion)

**CAUTIONS, FURTHER INFORMATION**

**Volume depletion** Correct hypovolaemia before starting treatment. Consider interrupting treatment if volume depletion occurs.

**INTERACTIONS** → Appendix 1 (antidiabetics).

**SIDE-EFFECTS**
  - Common or very common Genital infection - hypoglycaemia (in combination with insulin or sulfonylurea) - polyuria - pruritus - urinary tract infection
  - Uncommon Dysuria - volume depletion

**PREGNANCY** Manufacturer advises avoid—severe hypoglycaemia may occur.

**BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

**Dapagliflozin with metformin**

The properties listed below are those particular to the combination only. For the properties of the components please consider, dapagliflozin p. 609, metformin hydrochloride p. 594.

**INDICATIONS AND DOSE**

Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with insulin or other antidiabetic drugs

**BY MOUTH**
  - Adult 18-74 years: 1 tablet twice daily, based on patient’s current metformin dose
  - Adult 75 years and over: Initiation not recommended

**INTERACTIONS** Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

**HEPATIC IMPAIRMENT** Avoid.

**CONTRA-INDICATIONS** Diabetic ketoacidosis

**CAUTIONS** Cardiovascular disease (increased risk of volume depletion) - complicated urinary tract infections—consider temporarily interrupting treatment - concomitant antihypertensive therapy (increased risk of volume depletion) - elderly patients aged over 75 years (increased risk of volume depletion) - heart failure - history of hypotension (increased risk of volume depletion) - patients at increased risk of volume depletion - predisposition to fluid disturbances e.g. gastro-intestinal illness, concomitant use of diuretics (increased risk of volume depletion)

**CAUTIONS, FURTHER INFORMATION**

**Volume depletion** Correct hypovolaemia before starting treatment. Consider interrupting treatment if volume depletion occurs.

**INTERACTIONS** → Appendix 1 (antidiabetics).

**SIDE-EFFECTS**
  - Common or very common Genital infection - hypoglycaemia (in combination with insulin or sulfonylurea) - polyuria - pruritus - urinary tract infection
  - Uncommon Dysuria - volume depletion

**PREGNANCY** Manufacturer advises avoid—severe hypoglycaemia may occur.

**BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
● **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.

● **RENAL IMPAIRMENT** Reduce dose to 10 mg once daily if eGFR falls persistently below 60 mL/minute/1.73 m². Avoid initiation if eGFR below 60 mL/minute/1.73 m². Avoid if eGFR is persistently below 45 mL/minute/1.73 m².

● **MONITORING REQUIREMENTS** Determine renal function before treatment and before initiation of concomitant drugs that may reduce renal function, then at least annually thereafter.

● **NATIONAL FUNDING/ACCESS DECISIONS**

  NICE technology appraisals (TAs)
  - Empagliflozin in combination therapy for treating type 2 diabetes (March 2015) NICE TA336
  - Empagliflozin in a dual therapy regimen in combination with metformin is an option for the treatment of type 2 diabetes, only if:
    - a sulfonylurea is contraindicated or not tolerated, or
    - the patient is at significant risk of hypoglycaemia or its consequences.
  - Empagliflozin in a triple therapy regimen is an option for the treatment of type 2 diabetes in combination with:
    - metformin and a sulfonylurea or
    - metformin and a thiazolidinedione.
  - Empagliflozin in combination with insulin with or without other antidiabetic drugs is an option for the treatment of type 2 diabetes.
  - Patients currently receiving empagliflozin whose disease does not meet the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA336

● **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**
  - Jardiance (Boehringer Ingelheim Ltd)
  - Empagliflozin 10 mg Jardiance 10mg tablets | 28 tablet (POM) £36.59 DT price = £36.59
  - Empagliflozin 25 mg Jardiance 25mg tablets | 28 tablet (POM) £36.59 DT price = £36.59

**SULFONYLUREAS**

**Sulfonylureas**

- **DRUG ACTION** The sulfonylureas act mainly by augmenting insulin secretion and consequently are effective only when some residual pancreatic beta-cell activity is present; during long-term administration they also have an extrapancreatic action.

- **CONTRA-INDICATIONS** Presence of ketoacidosis

- **CAUTIONS** Can encourage weight gain (should be prescribed only if poor control and symptoms persist despite adequate attempts at dieting) • elderly • G6PD deficiency

- **SIDE-EFFECTS**
  - Uncommon Hypoglycaemia
  - Rare Agranulocytosis • aplastic anaemia • Blood disorders • cholestatic jaundice • haemolytic anaemia • hepatic failure • hepatitis • leucopenia • pancytopenia • thrombocytopenia • Frequency not known Allergic skin reactions (usually in the first 6–8 weeks of therapy) • constipation • diarrhoea • disturbance in liver function • erythema multiforme (usually in the first 6–8 weeks of therapy) • exfoliative dermatitis (usually in the first 6–8 weeks of therapy) • fever (usually in the first 6–8 weeks of therapy) • gastrointestinal disturbances • Hypersensitivity reactions (usually in the first 6–8 weeks of therapy) • jaundice (usually in the first 6–8 weeks of therapy) • nausea • vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

**Hypoglycaemia** This is uncommon and usually indicates excessive dosage. Sulfonylurea-induced hypoglycaemia may persist for many hours and must always be treated in hospital.

- **HEPATIC IMPAIRMENT** Sulfonylureas should be avoided or a reduced dose should be used in severe hepatic impairment, because there is an increased risk of hypoglycaemia. Jaundice may occur.

- **RENAL IMPAIRMENT** Sulfonylureas should be used with care in those with mild to moderate renal impairment, because of the hazard of hypoglycaemia. Care is required to use the lowest dose that adequately controls blood glucose. Avoid where possible in severe renal impairment.

- **PATIENT AND CARER ADVICE** Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems. The risk of hypoglycaemia associated with sulfonylureas should be discussed with the patient, especially when concomitant glucose-lowering drugs are prescribed.

**Glibenclamide**

**INDICATIONS AND DOSE**

**Type 2 diabetes mellitus**

- **BY MOUTH**
  - Adult: Initially 5 mg daily, adjusted according to response, dose to be taken with or immediately after breakfast; maximum 15 mg per day

- **CONTRA-INDICATIONS** Avoid where possible in Acute porphyrias p. 864

- **INTERACTIONS** → Appendix 1 (antidiabetics).

- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia; however, glibenclamide can be used during the second and third trimesters of pregnancy in women with gestational diabetes.

- **BREAST FEEDING** Glibenclamide can be used during breast-feeding in women with pre-existing diabetes.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

**Tablet**

- Glibenclamide (Non-proprietary)
  - Glibenclamide 2.5 mg Glibenclamide 2.5mg tablets | 28 tablet (POM) £15.48 DT price = £9.22
  - Glibenclamide 5 mg Glibenclamide 5mg tablets | 28 tablet (POM) £19.99 DT price = £11.09

**Gliclazide**

**INDICATIONS AND DOSE**

**Type 2 diabetes mellitus**

- **INITIALLY BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Adult: Initially 40–80 mg daily, adjusted according to response, (by mouth) increased if necessary up to 160 mg once daily, dose to be taken with breakfast, doses higher than 160 mg to be given in divided doses; maximum 320 mg per day

continued →
Glimepiride

Indications and Dose
Type 2 diabetes mellitus

By Mouth
- Adult: Initially 1 mg daily, adjusted according to response, then increased in steps of 1 mg every 1–2 weeks, increased to 4 mg daily, dose to be taken shortly before or with first main meal, the daily dose may be increased further, in exceptional circumstances; maximum 20 mg per day

Caution, Further Information
Porphyria Sulfonylureas should be avoided where possible in Acute porphyrias p. 864 but glimepiride is thought to be safe.

Interactions
- Appendix 1 (antidiabetics).

Side-effects
- Hyponatraemia

Pregnancy
The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.

Breast Feeding
Avoid—theoretical possibility of hypoglycaemia in the infant.

Medicinal Forms
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet
- Glimepiride (Non-proprietary)
  - Glimepiride 1 mg Glimepiride 1mg tablets | 30 tablet [POD] £2.00 DT price = £1.13
  - Glimepiride 2 mg Glimepiride 2mg tablets | 30 tablet [POD] £2.75 DT price = £1.23
  - Glimepiride 3 mg Glimepiride 3mg tablets | 30 tablet [POD] £9.67 DT price = £9.16
  - Glimepiride 4 mg Glimepiride 4mg tablets | 30 tablet [POD] £5.25 DT price = £1.52
- Amaryl (Zentiva)
  - Glimepiride 1 mg Amaryl 1mg tablets | 30 tablet [POD] £4.33 DT price = £1.13
  - Glimepiride 2 mg Amaryl 2mg tablets | 30 tablet [POD] £7.13 DT price = £1.23
  - Glimepiride 3 mg Amaryl 3mg tablets | 30 tablet [POD] £10.75 DT price = £9.16
  - Glimepiride 4 mg Amaryl 4mg tablets | 30 tablet [POD] £14.24 DT price = £1.52

Glipizide

Indications and Dose
Type 2 diabetes mellitus

By Mouth
- Adult: Initially 2.5–5 mg daily, adjusted according to response, dose to be taken shortly before breakfast or lunch, doses up to 15 mg may be given as a single dose, higher doses to be given in divided doses; maximum 20 mg per day

Caution, Further Information
Porphyria Sulfonylureas should be avoided where possible in Acute porphyrias p. 864 but glipizide is thought to be safe.

Interactions
- Appendix 1 (antidiabetics).

Side-effects
- Rare Photosensitivity
- Frequency not known Dizziness - drowsiness - hyponatraemia

Pregnancy
The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.

Breast Feeding
Avoid— the theoretical possibility of hypoglycaemia in the infant.

Medicinal Forms
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension

Tablet
- Glipizide (Non-proprietary)
  - Glipizide 5 mg Glipizide 5mg tablets | 28 tablet [POD] £3.23 DT price = £3.23 | 56 tablet [POD] £13.44
- Minodiol (Pfizer Ltd)
  - Glipizide 5 mg Minodiol 5mg tablets | 28 tablet [POD] £1.26 DT price = £1.23
**Tolbutamide**

**INDICATIONS AND DOSE**

Type 2 diabetes mellitus

**BY MOUTH**

- Adult: 0.5–1.5 g daily in divided doses (max. per dose 2 g), dose to be taken with or immediately after meals, alternatively 0.5–1.5 g once daily (max. per dose 2 g), dose to be taken with or immediately after breakfast.

- **CONTRA-INDICATIONS** Avoid where possible in Acute porphyrias p. 864
- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **SIDE-EFFECTS** Headache · tinnitus
- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
- **BREAST FEEDING** The use of sulfonylureas in breastfeeding should be avoided because there is a theoretical possibility of hypoglycaemia in the infant.
- **RENAI IMPAIRMENT** If necessary, the short-acting drug tolbutamide can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension
- **Tablet**
  - TOLBUTAMIDE (Non-proprietary)
    - Tolbutamide 500 mg Tolbutamide 500mg tablets \[28 tablet \(\text{P}35\) £42.50 DT price × £20.50 | 112 tablet \(\text{P}6\) £82.00–£94.48

**THIIZOLIDINEDIONES**

**Pioglitazone**

- **DRUG ACTION** The thiazolidinedione, pioglitazone, reduces peripheral insulin resistance, leading to a reduction of blood-glucose concentration.

**INDICATIONS AND DOSE**

Type 2 diabetes mellitus (alone or combined with metformin or a sulfonylurea, or with both, or with insulin)

**BY MOUTH**

- Adult: Initially 15–30 mg once daily, adjusted according to response to 45 mg once daily, in elderly patients, initiate with lowest possible dose and increase gradually; review treatment after 3–6 months and regularly thereafter.

**Dose adjustments due to interactions**

Dose of concomitant sulfonylurea or insulin may need to be reduced.

**Important safety information**

MHRA/CHM ADVICE: PIOGLITAZONE CARDIOVASCULAR SAFETY (DECEMBER 2007 AND JANUARY 2011)

Incidence of heart failure is increased when pioglitazone is combined with insulin especially in patients with predisposing factors e.g. previous myocardial infarction. Patients who take pioglitazone should be closely monitored for signs of heart failure; treatment should be discontinued if any deterioration in cardiac status occurs.

Pioglitazone should not be used in patients with heart failure or a history of heart failure.

PIOGLITAZONE: RISK OF BLADDER CANCER (JULY 2011)

The European Medicines Agency has advised that there is a small increased risk of bladder cancer associated with pioglitazone use. However, in patients who respond adequately to treatment, the benefits of pioglitazone continue to outweigh the risks.

Pioglitazone should not be used in patients with active bladder cancer or a past history of bladder cancer, or in those who have uninvestigated macroscopic haematuria. Pioglitazone should be used with caution in elderly patients as the risk of bladder cancer increases with age.

Before initiating treatment with pioglitazone, patients should be assessed for risk factors of bladder cancer (including age, smoking status, exposure to certain occupational or chemotherapy agents, or previous radiation therapy to the pelvic region) and any macroscopic haematuria should be investigated. The safety and efficacy of pioglitazone should be reviewed after 3–6 months and pioglitazone should be stopped in patients who do not respond adequately to treatment.

Patients already receiving treatment with pioglitazone should be assessed for risk factors of bladder cancer and treatment should be reviewed after 3–6 months, as above.

Patients should be advised to report promptly any haematuria, dysuria, or urinary urgency during treatment.

- **CONTRA-INDICATIONS** History of heart failure · previous or active bladder cancer · uninvestigated macroscopic haematuria
- **CAUTIONS** Avoid in Acute porphyrias p. 864 · cardiovascular disease or in combination with insulin (risk of heart failure) · elderly (increased risk of heart failure, fractures, and bladder cancer) · increased risk of bone fractures, particularly in women · risk factors for bladder cancer

**CAUTIONS, FURTHER INFORMATION**

Substitute insulin during peri-operative period (omit pioglitazone on morning of surgery and recommence treatment).

**INTERACTIONS** → Appendix 1 (antidiabetics).

**SIDE-EFFECTS**

- **Common or very common** Anaemia · arthralgia · dizziness · gastro-intestinal disturbances · haematuria · headache · hypoaesthesia · impotence · oedema · vertigo · visual disturbances · weight gain
- **Uncommon** Altered blood lipids · bladder cancer · fatigue · hypoglycaemia · insomnia · proteinuria · sweating
- **Rare** Liver dysfunction

**SIDE-EFFECTS, FURTHER INFORMATION**

Liver toxicity Rare reports of liver dysfunction; discontinue if jaundice occurs.

- **PREGNANCY** Avoid—toxicity in animal studies.
- **BREAST FEEDING** Avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Avoid.
- **MONITORING REQUIREMENTS** Monitor liver function before treatment and periodically thereafter.
- **PATIENT AND CARER ADVICE**

Liver toxicity Patients should be advised to seek immediate medical attention if symptoms such as nausea, vomiting, abdominal pain, fatigue and dark urine develop.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium accepts use of pioglitazone (February 2007) with metformin and a sulfonylurea, for patients (especially if overweight) whose glycaemic control is inadequate despite the use of 2 oral hypoglycaemic drugs and who are unable or unwilling to take insulin; treatment should be initiated and monitored by an experienced diabetes physician.
Endocrine system

Inappropriate action. Normal fluctuations in blood glucose can lead to confusion on the results obtained. Inadequate understanding of the glucose monitoring systems and to take appropriate action measure of the glucose concentration at the time of the test.

Blood glucose monitoring using a meter gives a direct measurement of the blood-glucose concentration during activities, including driving.

In the UK blood-glucose concentration is expressed in mmol/litre and Diabetes UK advises that these units should be used for self-monitoring of blood glucose. In other European countries units of mg/100 mL (or mg/dL) are commonly used.

It is advisable to check that the meter is pre-set in the correct units.

If the patient is unwell and diabetic ketoacidos is suspected, blood ketones should be measured according to local guidelines. Patients and their carers should be trained in the use of blood ketone monitoring systems and to take appropriate action on the results obtained, including when to seek medical attention.

**Metformin with pioglitazone**

The properties listed below are those particular to the combination only. For the properties of the components please consider, metformin hydrochloride p. 594, pioglitazone p. 613.

**INDICATIONS AND DOSE**

Type 2 diabetes not controlled by metformin alone

**BY MOUTH**

► Adult: 1 tablet twice daily, titration with the individual components (pioglitazone and metformin) desirable before initiation.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CoWEX†

**3.2 Diabetes mellitus, diagnosis and monitoring**

**Diabetes mellitus, diagnostic and monitoring devices**

**Urinalysis**

Reagent strips are available for measuring for glucose in the urine. Tests for ketones by patients are rarely required unless they become unwell—see Blood Monitoring. Microalbuminuria can be detected with *Micral-Test II* but this should be followed by confirmation in the laboratory, since false positive results are common.

**Blood monitoring**

Blood glucose monitoring using a meter gives a direct measure of the glucose concentration at the time of the test and can detect hypoglycaemia as well as hyperglycaemia. Patients should be properly trained in the use of blood glucose monitoring systems and to take appropriate action on the results obtained. Inadequate understanding of the normal fluctuations in blood glucose can lead to confusion and inappropriate action.

Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen.

Self-monitoring of blood-glucose concentration is appropriate for patients with type 2 diabetes:

► who are treated with insulin;

► who are treated with oral hypoglycaemic drugs e.g. sulfonylureas, to provide information on hypoglycaemia;

► to monitor changes in blood-glucose concentration resulting from changes in lifestyle or medication, and during intercurrent illness;

► to ensure safe blood-glucose concentration during activities, including driving.

In the UK blood-glucose concentration is expressed in mmol/litre and Diabetes UK advises that these units should be used for self-monitoring of blood glucose. In other European countries units of mg/100 mL (or mg/dL) are commonly used.

It is advisable to check that the meter is pre-set in the correct units.

If the patient is unwell and diabetic ketoacidosis is suspected, blood ketones should be measured according to local guidelines. Patients and their carers should be trained in the use of blood ketone monitoring systems and to take appropriate action on the results obtained, including when to seek medical attention.

**Oral glucose tolerance test**

The oral glucose p. 852 tolerance test is used mainly for diagnosis of impaired glucose p. 852 tolerance; it is not recommended or necessary for routine diabetic use when severe symptoms of hyperglycaemia are present. In patients who have less severe symptoms and blood glucose levels that do not establish or exclude diabetes (e.g. impaired fasting glycaemia), an oral glucose p. 852 tolerance test may be required. It is also used to establish the presence of gestational diabetes. The oral glucose p. 852 tolerance test generally involves giving anhydrous glucose p. 852 by mouth to the fasting patient, and measuring blood-glucose concentrations at intervals.

The appropriate amount of glucose p. 852 should be given with 200–300 mL fluid. Anhydrous glucose p. 852 may alternatively be given as 113 mL *Polycal*® with extra fluid to administer a total volume of 200–300 mL, or as *Rapilose*® *OGTT* oral solution.

    1 pack - NHS indicative price = £43.80 - Drug Tariff (Part IXa)
3.3 Hypoglycaemia

Hypoglycaemia

Treatment of hypoglycaemia

Initially glucose p. 852 10–20 g is given by mouth either in liquid form or as granulated sugar or sugar lumps. Approximately 10 g of glucose is available from non-diet versions of Lucozade® Energy Original 55 mL, Coca-Cola® 100 mL, Ribena® Blackcurrant 19 mL (to be diluted), 2 teaspoons of sugar, and also from 3 sugar lumps. Proprietary products of quick-acting carbohydrate (e.g. GlucoJet®, Dextrogel®, GSF-Syrup®, Rapilose® gel) are available on prescription for the patient to keep to hand in case of hypoglycaemia. If necessary this may be repeated in 10–15 minutes. After initial treatment, a snack providing sustained availability of carbohydrate (e.g. a sandwich, fruit, milk, or biscuits) or the next meal, if it is due, can prevent blood-glucose concentration from falling again.

Hypoglycaemia which causes unconsciousness is an emergency. Glucagon, a polypeptide hormone produced by the alpha cells of the islets of Langerhans, increases plasma-glucose concentration by mobilising glycogen stored in the liver. In hypoglycaemia, if sugar cannot be given by mouth, glucagon can be given by injection. Carbohydrates should be given as soon as possible to restore liver glycogen; glucagon is not appropriate for chronic hypoglycaemia. Glucagon may be issued to close relatives of insulin-treated patients for emergency use in hypoglycaemic attacks. It is often advisable to prescribe on an ‘if necessary’ basis to hospitalised insulin-treated patients, so that it may be given rapidly by the nurses during an hypoglycaemic emergency. If not effective in 10 minutes intravenous glucose should be given.

Alternatively, glucose intravenous infusion 20% may be given intravenously into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs. Glucose intravenous infusion 10% may also be used but larger volumes are needed. Glucose intravenous infusion 5% is not recommended because of the higher risk of extravasation injury and because administration is difficult. Close monitoring is necessary in the case of an overdose with a long-acting insulin because further administration of glucose may be required. Patients whose hypoglycaemia is caused by an oral antidiabetic drug should be transferred to hospital because the hypoglycaemic effects of these drugs may persist for many hours.

See also emergency management of hypoglycaemia in dental practice for further advice.

Chronic hypoglycaemia

Diazoxide p. 619, administered by mouth, is useful in the management of patients with chronic hypoglycaemia from excess endogenous insulin secretion, either from an islet cell tumour or islet cell hyperplasia. It has no place in the management of acute hypoglycaemia.

GLYCOGENOLYTIC HORMONES

Glucagon

INDICATIONS AND DOSE

Insulin-induced hypoglycaemia

By subcutaneous injection or by intramuscular injection

- Child 1 month–1 year: 500 micrograms
- Child 2–17 years (body-weight up to 25 kg): 500 micrograms, if no response within 10 minutes intravenous glucose must be given
- Child 2–17 years (body-weight 25 kg and above): 1 mg, if no response within 10 minutes intravenous glucose must be given
- Adult: 1 mg, if no response within 10 minutes intravenous glucose must be given

Beta-blocker poisoning (cardiogenic shock unresponsive to atropine)

Initially by intravenous injection

- Child: 50–150 micrograms/kg (max. per dose 10 mg), to be administered in glucose 5% (with precautions to protect the airway in case of vomiting), followed by (by intravenous infusion) 50 micrograms/kg/hour
- Adult: 2–10 mg, to be administered in glucose 5% (with precautions to protect the airway in case of vomiting), followed by (by intravenous infusion) 50 micrograms/kg/hour

Dose equivalence and conversion

1 unit of glucagon = 1 mg of glucagon.

UNLICENSED USE

Dose and indication for cardiogenic shock unresponsive to atropine in beta-blocker overdose not licensed.

- In children Unlicensed for growth hormone test and hyperinsulinism.

CONTRA-INDICATIONS

Phaeochromocytoma

CAUTIONS

Glucagonoma - ineffective in chronic hypoglycaemia, starvation, and adrenal insufficiency · insulinoma - when used in the diagnosis of growth hormone secretion, delayed hypoglycaemia may result — deaths reported (ensure a meal is eaten before discharge)

SIDE-EFFECTS

- Rare Hypersensitivity reactions
**Disorders of bone metabolism**

### 4 Disorders of bone metabolism

#### Bone metabolism

##### Osteoporosis

Osteoporosis occurs most commonly in postmenopausal women and in those taking long-term oral corticosteroids (glucocorticosteroids). Other risk factors for osteoporosis include low body weight, cigarette smoking, excess alcohol intake, lack of physical activity, family history of osteoporosis, and early menopause.

Those at risk of osteoporosis should maintain an adequate intake of calcium and vitamin D and any deficiency should be corrected by increasing dietary intake or taking supplements.

Elderly patients, especially those who are housebound or live in residential or nursing homes, are at increased risk of calcium and vitamin D deficiency and may benefit from supplements. Reversible secondary causes of osteoporosis such as hyperthyroidism, hyperparathyroidism, osteomalacia or hypogonadism should be excluded, in both men and women, before treatment for osteoporosis is initiated.

**Postmenopausal osteoporosis**

The **bisphosphonates** (such as alendronate and risedronate) are effective for preventing postmenopausal osteoporosis.

**Hormone replacement therapy (HRT)** is an option where other therapies are contra-indicated, cannot be tolerated, or if there is a lack of response. The CSM has advised that HRT should **not** be considered for women at higher risk of osteoporosis. HRT is of most benefit for the prophylaxis of postmenopausal osteoporosis if started early in menopause and continued for up to 5 years, but bone loss resumes (possibly at an accelerated rate) on stopping HRT. Women of Afro-Caribbean origin appear to be less susceptible to osteoporosis than those who are white or of Asian origin.

Postmenopausal osteoporosis may be **treated with a bisphosphonate**. The bisphosphonates (such as alendronate or risedronate) decrease the risk of vertebral fracture; alendronate and risedronate have also been shown to reduce non-vertebral fractures. If bisphosphonates are unsuitable, calcitriol, p. 885 or **strontium ranelate** may be considered. Calcitriol (salmon)/salcatonin [unlicensed indication] has been used for pain relief for up to 3 months after a vertebral fracture when other analgesics were ineffective, but the benefits of treatment should be balanced against the risks.

**Parathyroid hormone, and teriparatide** have been introduced for the treatment of postmenopausal osteoporosis.

**Raloxifene** is licensed for the prophylaxis and treatment of vertebral fractures in postmenopausal women.

#### Corticosteroid-induced osteoporosis

To reduce the risk of osteoporosis doses of oral corticosteroids should be as low as possible and courses of treatment as short as possible. The risk of osteoporosis may be related to cumulative dose of corticosteroids; even

  - **Diazoxide 50 mg** Eudeme 50mg tablets | 100 tablet **£46.45**

---

### 3.4 Hypoglycaemia, chronic

#### THIAZIDES AND RELATED DIURETICS

**Diazoxide**

**INDICATIONS AND DOSE**

**Chronic intractable hypoglycaemia**

**BY MOUTH**

- Adult: Initially 5 mg/kg daily in 2–3 divided doses, adjusted according to response; maintenance 3–8 mg/kg daily in 2–3 divided doses

**CAUTIONS**

- Aortic coarctation • aortic stenosis • arteriovenous shunt • heart failure • hyperuricaemia • impaired cardiac circulation • impaired cerebral circulation

**INTERACTIONS**

- Appendix 1 (diazoxide).

**SIDE-EFFECTS**

- Abdominal pain • anaemia • anorexia (prolonged use) • bleeding • constipation • decreased libido • dermatitis • diarrhoea • dizziness • dyspnoea • eosinophilia • extrapyramidal effects • galactorrhoea • headache • heart failure • hyperglycaemia • hyperosmolar non-ketotic coma • hypertrichosis • hyperuricaemia • hyperuricaemia (prolonged use) • hypotension • ileus • lacrimation • leucopenia • lichenoid eruption • musculoskeletal pain • nausea • pancreatitis • pruritus • pulmonary hypertension • raised serum creatinine • raised serum urea • reversible nephritic syndrome • sodium and fluid retention • taste disturbance • thrombocytopenia • tinnitus • transient cataracts • visual disturbances • vomiting

**PREGNANCY**

Use only if essential; alopecia and hypertrichosis reported in neonates with prolonged use; may inhibit uterine activity during labour.

**BREAST FEEDING**

Manufacturer advises avoid — no information available.

**RENAL IMPAIRMENT**

Dose reduction may be required.

**MONITORING REQUIREMENTS**

- Monitor blood pressure.
- Monitor white cell and platelet count during prolonged use.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, capsule
intermittent courses can therefore increase the risk. The greatest rate of bone loss occurs during the first 6–12 months of corticosteroid use and so early steps to prevent the development of osteoporosis are important. Long-term use of high-dose inhaled corticosteroids may also contribute to corticosteroid-induced osteoporosis. Patients taking (or who are likely to take) an oral corticosteroid for 3 months or longer should be assessed and where necessary given prophylactic treatment; those aged over 65 years are at greater risk. Patients taking oral corticosteroids who have sustained a low trauma fracture should receive treatment for osteoporosis. The therapeutic options for prophylaxis and treatment of corticosteroid-induced osteoporosis are the same:

- a bisphosphonate;
- calcitriol [unlicensed indication];
- hormone replacement (HRT in women, testosterone in men [unlicensed indication]).

Calcitonin and parathyroid hormone

Calcitonin is involved with parathyroid hormone in the regulation of bone turnover and hence in the maintenance of calcium balance and homeostasis. Calcitonin (salmon)/salcatonin (synthetic or recombinant salmon calcitonin) is used to lower the plasma-calcium concentration in patients with hypercalcaemia associated with malignancy. Calcitonin (salmon)/salcatonin is also licensed for treatment of Paget’s disease of bone when other treatments are ineffective or inappropriate; it is also licensed for the prevention of acute bone loss due to sudden immobility. Calcitonin (salmon)/salcatonin is no longer recommended for the prevention or treatment of postmenopausal osteoporosis because the benefits are outweighed by the risk of malignancy associated with long-term use.

Recombinant parathyroid hormone is used for the treatment of postmenopausal osteoporosis. Teriparatide p. 629 (a recombinant fragment of parathyroid hormone) is used for the treatment of postmenopausal osteoporosis, osteoporosis in men at increased risk of fracture, and corticosteroid-induced osteoporosis. Cinacalcet p. 855 is licensed for the treatment of hypercalcaemia in parathyroid carcinoma.

Bisphosphonates

Bisphosphonates have an important role in the prophylaxis and treatment of osteoporosis and corticosteroid-induced osteoporosis; alendronic acid p. 621 or risedronate sodium p. 624 are considered the drugs of choice for these conditions. Bisphosphonates are also used in the treatment of Paget’s disease, hypercalcaemia of malignancy, and in bone metastases in breast cancer.

Strontium ranelate

Strontium ranelate treatment has been associated with an increased risk of serious cardiovascular disease, including myocardial infarction, and the risk should be assessed before treatment and regularly during treatment. Strontium ranelate should be initiated only by specialists for the treatment of severe osteoporosis in postmenopausal women or men at high risk of fracture for whom other treatments are contra-indicated or not tolerated.

See also calcium, phosphorus, vitamin D and oestrogens in postmenopausal osteoporosis.

Drugs used for Disorders of bone metabolism not listed below: Calcitriol, p. 885

ANABOLIC STEROIDS

Nandrolone

INDICATIONS AND DOSE

Osteoporosis in postmenopausal women (but not recommended)

BY DEEP INTRAMUSCULAR INJECTION

> Adult: 50 mg every 3 weeks.

- CONTRA-INDICATIONS Acute porphyrias p. 864, male breast cancer, prostate cancer
- CAUTIONS Cardiac impairment, diabetes mellitus, epilepsy, hypertension, migraine, skeletal metastases (risk of hypercalcaemia)
- INTERACTIONS → Appendix 1 (anabolic steroids).
- SIDE-EFFECTS Abnormal liver-function tests (with high doses), acne, amenorrhoea, inhibition of spermatogenesis, liver tumours (with prolonged treatment with anabolic steroids), premature epiphyseal closure, sodium retention with oedema, virilisation (with high doses including voice changes—sometimes irreversible)
- HEPATIC IMPAIRMENT Use in severe hepatic impairment only if benefit outweighs risk.
- RENAL IMPAIRMENT Use with caution—may cause sodium and water retention.
- MONITORING REQUIREMENTS Monitor skeletal maturation in young patients.
- LESS SUITABLE FOR PRESCRIBING Nandrolone injection is less suitable for prescribing.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXPICIENTS: May contain Arachis (peanut) oil, benzyl alcohol

Deca-Durabolin (Aspen Pharma Trading Ltd)

Nandrolone decanoate 50 mg per 1 ml Deca-Durabolin 50mg/1ml solution for injection ampoules | 1 ampoule £17 Schedule 4 (CD Anab)

BISPHOSPHONATES

Bisphosphonates

> DRUG ACTION Bisphosphonates are adsorbed onto hydroxyapatite crystals in bone, slowing both their rate of growth and dissolution, and therefore reducing the rate of bone turnover.

Important safety information

MHRA/CHM ADVICE: BISPHOSPHONATES: ATYPICAL FEMORAL FRACTURES (JUNE 2011)

Atypical femoral fractures have been reported rarely with bisphosphonate treatment, mainly in patients receiving long-term treatment for osteoporosis. The need to continue bisphosphonate treatment for osteoporosis should be re-evaluated periodically based on an assessment of the benefits and risks of treatment for individual patients, particularly after 5 or more years of use.

Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate. Discontinuation of bisphosphonate treatment in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

BISPHOSPHONATES: OSTEONECROSIS OF THEjaw

The risk of osteonecrosis of the jaw is substantially greater for patients receiving intravenous...
bisdiphosphonates in the treatment of cancer than for patients receiving oral bisphosphonates for osteoporosis or Paget’s disease.

Risk factors for developing osteonecrosis of the jaw that should be considered are: potency of bisphosphonate (highest for zoledronate), route of administration, cumulative dose, duration and type of malignant disease, concomitant treatment, smoking, comorbid conditions, and history of dental disease.

All patients should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment, or as soon as possible after starting treatment. During bisphosphonate treatment patients should maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms.

PATIENT AND CARER ADVICE
Atypical femoral fractures Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate. Osteonecrosis of the jaw During bisphosphonate treatment patients should maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms.

Alendronic acid (Alendronate)

INDICATIONS AND DOSE
Treatment of postmenopausal osteoporosis
BY MOUTH
- Adult: 10 mg daily, alternatively 70 mg once weekly.

Treatment of osteoporosis in men
BY MOUTH
- Adult: 10 mg daily.

Prevention and treatment of corticosteroid-induced osteoporosis in postmenopausal women not receiving hormone replacement therapy
BY MOUTH
- Adult: 10 mg daily.

CONTRA-INDICATIONS Abnormalities of oesophagus - hypocalcaemia - other factors which delay emptying (e.g. stricture or achalasia)

CAUTIONS Active gastro-intestinal bleeding - atypical femoral fractures - duodenitis - dysphagia - exclude other causes of osteoporosis - gastritis - history (within 1 year) of ulcers - surgery of the upper gastro-intestinal tract - symptomatic oesophageal disease - ulcers - upper gastrointestinal disorders

INTERACTIONS • Appendix 1 (bisphosphonates).

SIDE-EFFECTS
- Common or very common Abdominal distension - abdominal pain - alopecia - asthenia - constipation - diarrhea - dizziness - dyspepsia - flatulence - headache - joint swelling - musculoskeletal pain - oesophageal reactions - peripheral oedema - pruritus - regurgitation - vertigo
- Uncommon Dysgeusia - episceratitis - erythema - gastritis - malaise (on initiation) - melena - myalgia (on initiation) - nausea - rash - scleritis - uveitis - vomiting
- Rare Atypical femoral fractures with long-term use - fever (on initiation) - hypocalcaemia - osteonecrosis of the jaw - photosensitivity - severe skin reactions - Stevens-Johnson syndrome - toxic epidermal necrolysis

SIDE-EFFECTS, FURTHER INFORMATION
Oesophageal reactions Severe oesophageal reactions (oesophagitis, oesophageal ulcers, oesophageal stricture and oesophageal erosions) have been reported; patients should be advised to stop taking the tablets and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.

PREGNANCY Avoid.

BREAST FEEDING Manufacturer advises avoid—no information available.

RENAL IMPAIRMENT Avoid if eGFR less than 35 mL/minute/1.73 m².

MONITORING REQUIREMENTS Correct disturbances of calcium and mineral metabolism (e.g. vitamin-D deficiency, hypocalcaemia) before starting treatment. Monitor serum-calcium concentration during treatment.

DIRECTIONS FOR ADMINISTRATION Tablets should be swallowed whole and oral solution should be swallowed as a single 100 mL dose. Doses should be taken with plenty of water while sitting or standing, on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after administration.

PATIENT AND CARER ADVICE Patients or their carers should be given advice on how to administer alendronic acid tablets and oral solution. Oesophageal reactions Patients (or their carers) should be advised to stop taking alendronic acid and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.

NATIONAL FUNDING/ACCESS DECISIONS
NICE technology appraisals (TAs)
- Alendronate, etidronate, risedronate, raloxifene and strontium ranelate for the primary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA160

Alendronate is recommended as a treatment option for the primary prevention of osteoporotic fractures in the following susceptible postmenopausal women:
- Women over 70 years who have an independent risk factor for fracture (parental history of hip fracture, alcohol intake of 4 or more units per day, or rheumatoid arthritis) or an indicator of low bone mineral density (body mass index under 22 kg/m², ankylosing spondylitis, Cohn’s disease, prolonged immobility, untreated premature menopause, or rheumatoid arthritis) and confirmed osteoporosis.
- Women aged 65–69 years who have an independent risk factor for fracture and confirmed osteoporosis.
- Women under 65 years who have an independent risk factor for fracture and at least one additional indicator of low bone mineral density and confirmed osteoporosis. www.nice.org.uk/TA160
- Alendronate, etidronate, risedronate, raloxifene, strontium ranelate, and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA161

This guideline recommends treatment options for the secondary prevention of osteoporotic fractures in postmenopausal women with confirmed osteoporosis who have also sustained a clinically apparent osteoporotic fracture.

Alendronate is recommended as a treatment option for the secondary prevention of osteoporotic fractures in susceptible postmenopausal women. www.nice.org.uk/TA161
622 Disorders of bone metabolism

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Tablet
- ALENDRONIC ACID (Non-proprietary)
  Alendronic acid (as Alendronate sodium) 10 mg 10mg tablets | 28 tablet [P] £3.75 DT price = £1.64
  Alendronic acid (as Alendronate sodium) 70 mg 70mg tablets | 4 tablet [P] £22.80 DT price = £1.03
  Fosamax (Merck Sharp & Dohme Ltd)
  Alendronic acid (as Alendronate sodium) 10 mg Fosamax 10mg tablets | 28 tablet [P] £23.12 DT price = £1.64
  Alendronic acid (as Alendronate sodium) 70 mg Fosamax Once Weekly 70mg tablets | 4 tablet [P] £22.80 DT price = £1.03

Oral solution
- ALENDRONIC ACID (Non-proprietary)
  Alendronic acid 700 microgram per 1 ml 10 mg tablets 70mg/100ml oral solution unit dose sugar free (sugar-free) | 4 unit dose [P] £22.80 DT price = £22.80

Alendronic acid with calciferol
The properties listed below are those particular to the combination only. For the properties of the components please consider, alendronic acid p. 621, calciferol p. 886.

INDICATIONS AND DOSE
Treatment of postmenopausal osteoporosis in women at risk of vitamin D deficiency
BY MOUTH
- Adult: 1 tablet once weekly.

DIRECTIONS FOR ADMINISTRATION
Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet.

PATIENT AND CARER ADVICE
Patients or carers should be given advice on how to administer alendronic acid with calciferol tablets.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet
- Fosavance (Merck Sharp & Dohme Ltd)
  Alendronic acid (as Alendronate sodium) 70 mg, Calciferol 70 microgram Fosavance tablets | 4 tablet [P] £22.80 DT price = £22.80

Ibandronic acid

INDICATIONS AND DOSE
Reduction in bone damage in bone metastases in breast cancer
INITIALLY BY MOUTH
- Adult: 50 mg daily, alternatively (by intravenous infusion) 6 mg every 3–4 weeks

HYPERCALCAEMIA OF MALIGNANCY
BY INTRAVENOUS INFUSION
- Adult: 2–4 mg as a single infusion, dose to be adjusted according to serum calcium concentration

TREATMENT OF POSTMENOPAUSAL OSTEOPOROSIS
INITIALLY BY MOUTH
- Adult: 150 mg once a month, alternatively (by intravenous injection) 3 mg every 3 months, to be administered over 15–30 seconds.

CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS:
Hypocalcaemia

SPECIFIC CONTRA-INDICATIONS:
- With oral use Abnormalities of the oesophagus - other factors which delay emptying (e.g. stricture or achalasia)
- CAUTIONS Atypical femoral fractures - cardiac disease (avoid fluid overload)
- INTERACTIONS → Appendix 1 (bisphosphonates).

SIDE-EFFECTS

GENERAL SIDE-EFFECTS
- Common or very common Abdominal pain - asthenia - bone pain - chills - diarrhoea - dyspepsia - fever - gastritis - headache - hypocalcaemia - hypophosphataemia - influenza-like symptoms - muscle pain - nausea - pharyngitis - rash - vomiting
- Rare Anaemia - angioedema - atypical femoral fractures - bronchospasm - hypersensitivity reactions - injection-site reactions - pruritus - urticaria
- Very rare Osteonecrosis of the jaw

SPECIFIC SIDE-EFFECTS
- Common or very common
- With oral use Severe oesophageal reactions (discontinue)
- PREGNANCY Avoid.

BREAST FEEDING
Avoid—present in milk in animal studies.

RENAI IMPAIRMENT
- With intravenous use When used for bone metastases, if eGFR 30–50 mL/minute/1.73 m² reduce dose to 4 mg and infuse over 1 hour; if eGFR less than 30 mL/minute/1.73 m² reduce dose to 2 mg and infuse over 1 hour.
- With oral use When used for bone metastases, if eGFR 30–50 mL/minute/1.73 m² reduce dose to 50 mg on alternative days; if eGFR less than 30 mL/minute/1.73 m² reduce dose to 50 mg once weekly. When used for postmenopausal osteoporosis, avoid if eGFR less than 30 mL/minute/1.73 m².

MONITORING REQUIREMENTS
Monitor renal function and serum calcium, phosphate and magnesium.

DIRECTIONS FOR ADMINISTRATION
Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet.

For intravenous infusion (Bonviva®), give intermittently in Glucose 5% or Sodium chloride 0.9%; dilute requisite dose in 500 mL infusion fluid and give over 1–2 hours.

PATIENT AND CARER ADVICE
Patients or carers should be given advice on how to administer ibandronic acid tablets. Oesophageal reactions Patients and carers should be advised to stop tablets and seek medical attention for symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet
- IBANDRONIC ACID (Non-proprietary)
  Ibandronic acid (as Ibandronic sodium monohydrate) 50 mg Ibandronic acid 50mg tablets | 28 tablet [P] £174.51 DT price = £10.76
  Ibandronic acid (as Ibandronic sodium monohydrate) 150 mg Ibandronic acid 150mg tablets | 1 tablet [P] £18.40 DT price = £1.68 | 3 tablet [P] £55.21
Disorders of bone metabolism 623

Pamidronate disodium
(Formerly called aminohydroxypropylidenediphosphonate disodium (APD))

INDICATIONS AND DOSE

Hypercalcaemia of malignancy

BY INTRAVENOUS INFUSION

Adult: 15–60 mg, to be given (via cannula in a relatively large vein) as a single infusion or in divided doses over 2–4 days, dose adjusted according to serum calcium concentration; maximum 90 mg per course

Osteolytic lesions and bone pain in bone metastases associated with breast cancer or multiple myeloma

BY INTRAVENOUS INFUSION

Adult: 90 mg every 4 weeks, to be administered via cannula in a relatively large vein, dose may alternatively be administered every 3 weeks, to coincide with chemotherapy in breast cancer

Paget’s disease of bone

BY INTRAVENOUS INFUSION

Adult: 30 mg every 1 week for a 6 week course (total dose 180 mg), alternatively initially 30 mg once weekly for 1 week, then increased to 60 mg every 2 weeks (max. per dose 60 mg) for a 6 week course (total dose 210 mg), to be administered via cannula in a relatively large vein, course may be repeated every 6 months; maximum 360 mg per course

CAUTIONS

Atypical femoral fractures - cardiac disease (especially in elderly) - ensure adequate hydration - previous thyroid surgery (risk of hypocalcaemia)

INTERACTIONS  Appendix 1 (bisphosphonates).

Avoid concurrent use with other bisphosphonates.

SIDE-EFFECTS

Common or very common - Abdominal pain - anaemia - anorexia - arthralgia - bone pain - constipation - diarrhea - drowsiness - fever - headache - hypertension - hypomagnesaemia - hypophosphataemia - influenza - like symptoms (sometimes accompanied by malaise, rigors, fatigue and flushed) - insomnia - lymphocytopenia - myalgia - nausea - paraesthesia - rash - symptomatic hypocalcaemia - tetany - thrombocytopenia - vomiting

Frequency not known - Atrial fibrillation - injection-site reactions - reactivation of herpes simplex - reactivation of herpes zoster

SIDE-EFFECTS, FURTHER INFORMATION

Calcium and vitamin D supplements Oral supplements are advised to minimise potential risk of hypocalcaemia for those with mainly lytic bone metastases or multiple myeloma at risk of calcium or vitamin D deficiency (e.g. through malabsorption or lack of exposure to sunlight) and in those with Paget’s disease.

PREGNANCY Avoid—toxicity in animal studies.

BREAST FEEDING Avoid.

HEPATIC IMPAIRMENT Caution in severe hepatic impairment—no information available.

RENAL IMPAIRMENT Max. infusion rate 20 mg/hour. Avoid if eGFR less than 30 mL/minute/1.73 m², except in life-threatening hypercalcaemia if benefit outweighs risk. If renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value.

MONITORING REQUIREMENTS

- Monitor serum electrolytes, calcium and phosphate—possibility of convulsions due to electrolyte changes.
- Assess renal function before each dose.

DIRECTIONS FOR ADMINISTRATION

- With intravenous use For slow intravenous infusion (Aredia®, Pamidronate disodium, Hospira, Medac, Wockhardt), give intermittently in Glucose 5% or Sodium chloride 0.9%; give at a rate not exceeding 1 mg/minute; not to be given with infusion fluids containing calcium. For Aredia®, reconstitute initially with water for injections (15 mg in 5 mL, 30 mg or 90 mg in 10 mL), then dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL. For Pamidronate disodium (Wockhardt), dilute with infusion fluid to a concentration of not more than 60 mg in 250 mL or for Pamidronate disodium (Medac, Hospira) dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL.

PATIENT AND CARER ADVICE Patients should be warned against performing skilled tasks (e.g. cycling, driving or operating machinery) immediately after treatment (somnolence or dizziness may occur).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

PAMIDRONATE DISODIUM (Non-proprietary)

Pamidronate disodium 3 mg per 1 ml Pamidronate disodium 15mg/5ml solution for infusion vials | 1 vial (Roche Products Ltd) £18.40
Pamidronate disodium 6 mg per 1 ml Pamidronate disodium 6mg/2ml solution for infusion vials | 1 vial (Roche Products Ltd) £29.36 (Hospital only)
Pamidronate disodium 9 mg per 1 ml Pamidronate disodium 9mg/3ml solution for infusion vials | 1 vial (Roche Products Ltd) £48.64

Solution for infusion

Pamidronate disodium 3 mg per 1 ml Pamidronate disodium 3mg/3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (Roche Products Ltd) £18.60
Pamidronate disodium 6 mg per 1 ml Pamidronate disodium 6mg/3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (Roche Products Ltd) £36.40

BY INTRAVENOUS INFUSION

Pamidronate disodium (as Ibandronic sodium monohydrate) 1 mg per 1 ml Ibandronic acid 1 mg per 1 ml solution for infusion pre-filled vials | 1 vial (Roche Products Ltd) £65.20
Pamidronate disodium (as Ibandronic sodium monohydrate) 1 mg per 1 ml Ibandronic acid 1 mg per 1 ml solution for infusion pre-filled vials | 1 vial (Roche Products Ltd) £69.50

† Bondronat (Roche Products Ltd)
Ibandronic acid (as Ibandronic sodium monohydrate)

Bonviva (Roche Products Ltd)
Ibandronic acid (as Ibandronic sodium monohydrate)
150 mg Bondviva 150mg tablets | 1 tablet (Roche Products Ltd) £18.40 DT price = £1.68

† Brands may include latisbon; Quodiorx

Solution for injection

Ibandronic acid (as Ibandronic sodium monohydrate) 1 mg per 1 ml Ibandronic acid 1 mg/ml solution for injection pre-filled vials | 1 vial (Roche Products Ltd) £183.69
Pamidronate disodium (as Ibandronic sodium monohydrate) 1 mg per 1 ml Pamidronate disodium 1 mg/ml solution for injection pre-filled vials | 1 vial (Roche Products Ltd) £183.69

Monitrol.

Cautions

Ensure adequate hydration with infusion fluids containing calcium. For Aredia®, give at a rate not exceeding 1 mg/minute; not to be given with infusion fluids containing calcium. For Aredia®, reconstitute initially with water for injections (15 mg in 5 mL, 30 mg or 90 mg in 10 mL), then dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL. For Pamidronate disodium (Wockhardt), dilute with infusion fluid to a concentration of not more than 60 mg in 250 mL or for Pamidronate disodium (Medac, Hospira) dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL.
**Indications and Dose**

**Paget’s disease of bone**

**By mouth**

- **Adult**: 30 mg daily for 2 months, course may be repeated if necessary after at least 2 months.

**Treatment of postmenopausal osteoporosis to reduce risk of vertebral or hip fractures**

**By mouth**

- **Adult**: 5 mg daily, alternatively 35 mg once weekly.

**Prevention of osteoporosis (including corticosteroid-induced osteoporosis) in postmenopausal women**

**By mouth**

- **Adult**: 5 mg daily.

**Treatment of osteoporosis in men at high risk of fractures**

**By mouth**

- **Adult**: 35 mg once weekly.

**Contra-indications**

- Hypocalcaemia

**Caution**

- Atypical femoral fractures - oesophageal abnormalities - other factors which delay transit or emptying (e.g. stricture or achalasia)

**Interactions**

- **Common or very common**: Abdominal pain - constipation - diarrhoea - dyspepsia - headache - musculoskeletal pain - nausea

- **Uncommon**: Duodenitis - dysphagia - gastritis - oesophageal ulcer - oesophagitis - uveitis

- **Rare**: Atypical femoral fractures - glossoitis - oesophageal stricture

- **Frequency not known**: Cutaneous vasculitis - gastroduodenal ulceration - hair loss - hepatic disorders - osteonecrosis of the jaw - Stevens-Johnson syndrome - toxic epidermal necrolysis

**Pregnancy**

Avoid.

**Breast feeding**

Avoid.

**Renal Impairment**

Avoid if eGFR less than 30 mL/minute/1.73 m².

**Monitoring Requirements**

- Correct hypocalcaemia before starting.

- Correct other disturbances of bone and mineral metabolism (e.g. vitamin D deficiency) at onset of treatment.

**Directions for Administration**

Swallow tablets whole with full glass of water; on rising, take on an empty stomach at least 30 minutes before first food or drink of the day or, if taking at any other time of the day, avoid food and drink for at least 2 hours before or after risedronate (particularly avoid calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids); stand or sit upright for at least 30 minutes; do not take tablets at bedtime or before rising.

**Patient and carer advice**

Patients or carers should be given advice on how to administer risedronate sodium tablets.

Oesophageal reactions: Patients should be advised to stop taking the tablets and seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn.

**National Funding/Access Decisions**

**NICE technology appraisals (TAs)**

- Alendronate, etidronate, risedronate, raloxifene and strontium ranelate for the primary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA160

Risedronate is recommended as an alternative for women:

- in whom alendronate is contra-indicated or not tolerated and

- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance. [www.nice.org.uk/TA160](http://www.nice.org.uk/TA160)

- Alendronate, etidronate, risedronate, raloxifene, and strontium ranelate, and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA161

This guideline recommends treatment options for the secondary prevention of osteoporotic fractures in postmenopausal women with confirmed osteoporosis who have also sustained a clinically apparent osteoporotic fracture.

Risedronate is recommended as an alternative for women:

- in whom alendronate is contra-indicated or not tolerated and

- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture (parental history of hip fracture, alcohol intake of 4 or more units per day, or rheumatoid arthritis, as indicated in the full NICE guidance. [www.nice.org.uk/TA161](http://www.nice.org.uk/TA161)

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include oral solution, oral suspension.

**Tablet**

- **Risedronate Sodium (Non-proprietary)**
  - **Risedronate sodium 5 mg**
    - Risedronate sodium 5 mg tablets | 28 tablet [BNF] £16.52 DT price = £14.95

    - **Risedronate sodium 35 mg**
      - Actonel Once a Week 35 mg tablets | 4 tablet [BNF] £19.12 DT price = £1.27
      - Actonel 35 mg tablets | 4 tablet [BNF] no price available DT price = £1.27

**Risedronate with calcium carbonate and colecalciferol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, calcium carbonate p. 856, colecalciferol p. 886, risedronate sodium above.
INDICATIONS AND DOSE

Sodium clodronate

Treat Osteolytic lesions, hypercalcaemia and bone pain associated with skeletal metastases in patients with breast cancer or multiple myeloma

Adult: 1.6 g daily in 1–2 divided doses, then increased if necessary up to 3.2 g daily in 2 divided doses

LORON 520®

Osteolytic lesions, hypercalcaemia and bone pain associated with skeletal metastases in patients with breast cancer or multiple myeloma

Adult: Initially 2 tablets daily in 1–2 divided doses, increased if necessary up to 4 tablets daily

CONTRA-INDICATIONS
Acute gastrointestinal inflammatory conditions

CAUTIONS
Atypical femoral fractures • maintain adequate fluid intake during treatment

INTERACTIONS → Appendix 1 (bisphosphonates).
Renal dysfunction reported in patients receiving concomitant NSAIDs.

SIDE-EFFECTS
Common or very common Bronchospasm • diarrhoea • nausea • skin reactions • vomiting
Rare Atypical femoral fractures
Very rare Osteonecrosis of the jaw
Frequency not known Renal impairment • uveitis
PREGNANCY Avoid.

BREAST FEEDING
Manufacturer advises avoid—no information available.

RENAL IMPAIRMENT
Max. initial dose 1200 mg daily if eGFR 30–50 mL/minute/1.73 m². Use half normal dose if eGFR 10–30 mL/minute/1.73 m². Avoid if eGFR less than 10 mL/minute/1.73 m².

MONITORING REQUIREMENTS
Monitor renal function, serum calcium and serum phosphate before and during treatment.

Zoledronic acid

INDICATIONS AND DOSE

ZOMETA® INFUSION

Reduction of bone damage in advanced malignancies involving bone

BY INTRAVENOUS INFUSION

Adult: 4 mg every 3–4 weeks, to be administered over at least 15 minutes, calcium 500 mg daily and vitamin D 400 units daily should also be taken

Hypercalcaemia of malignancy

BY INTRAVENOUS INFUSION

Adult: 4 mg for 1 dose, to be administered over at least 15 minutes

ACLASTA®

Treatment of Paget’s disease of bone

BY INTRAVENOUS INFUSION

Adult: 5 mg 1 times yearly, to be administered over at least 15 minutes, at least 500 mg elemental calcium twice daily (with vitamin D) for at least 10 days is recommended following infusion

Treatment of postmenopausal osteoporosis and osteoporosis in men (including corticosteroid-induced osteoporosis)

BY INTRAVENOUS INFUSION

Adult: 5 mg 1 times yearly, to be administered over at least 15 minutes, in patients with a recent low-trauma hip fracture, the dose should be given 2 or more weeks following hip fracture repair; before first infusion give 50000–125000 units of vitamin D

CAUTIONS
Atypical femoral fractures • cardiac disease (avoid fluid overload) • concomitant medicines that affect renal function

INTERACTIONS → Appendix 1 (bisphosphonates).

SIDE-EFFECTS

Common or very common Anaemia • arthralgia • atrial fibrillation • bone pain • conjunctivitis • dizziness • fever • gastrointestinal disturbances • headache •
hypophosphataemia · influenza · like symptoms · myalgia · renal impairment · rigors

- **Uncommon** Angioedema · anorexia · anxiety · asthenia · blurred vision · chest pain · cough · dry mouth · dyspnoea · haematuria · hypersensitivity reactions · hypertension · hypokalaemia · hypomagnesaemia · hypotension · injection-site reactions · lethargy · leucopenia · muscle cramps · paraesthesia · peripheral oedema · proteinuria · pruritus · rash · sleep disturbance · stomatitis · sweating · taste disturbance · thrombocytopenia · tremor · urinary frequency · weight gain

- **Rare** Acute renal failure · atypical femoral fractures · bradycardia · confusion · hyperkalaemia · hypokalaemia · hypophosphataemia · osteonecrosis of the jaw · pancytopenia

- **Very rare** Episcleritis · uveitis

### SIDE-EFFECTS, FURTHER INFORMATION

**Renal function** Renal impairment and renal failure have been reported; ensure patient is hydrated before each dose and assess renal function.

- **CONCEPTION AND CONTRA-IndICATIONS** Contra-indicated in women of child-bearing potential.

- **PREGNANCY** Avoid—toxicity in animal studies.

- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** Caution in severe hepatic impairment—limited information available.

- **RENAL IMPAIRMENT** In advanced malignancies involving bone, if eGFR 50–60 mL/minute/1.73 m² reduce dose to 3.5 mg every 3–4 weeks; if eGFR 40–50 mL/minute/1.73 m² reduce dose to 3.3 mg every 3–4 weeks; if eGFR 30–40 mL/minute/1.73 m² reduce dose to 3 mg every 3–4 weeks; if renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value. Avoid in tumour-induced hypercalcaemia if serum creatinine above 265 micromol/litre.

- **MONITORING REQUIREMENTS** Correct disturbances of calcium metabolism (e.g. vitamin D deficiency, hypocalcaemia) before starting. Monitor serum electrolytes, calcium, phosphate and magnesium.

- **Monitor renal function in patients at risk, such as those with pre-existing renal impairment, those of advanced age, those taking concomitant nephrotoxic drugs or diuretics, or those who are dehydrated.**

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Zometa®), give intermittently in Glucose 5% or Sodium chloride 0.9%; dilute requisite dose according to product literature; infuse over at least 15 minutes; administer as a single intravenous solution in a separate infusion line.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  - **Scottish Medicines Consortium (SMC) Decisions** The Scottish Medicines Consortium has advised (May 2002) that for the prevention of skeletal related events Zometa® is accepted for restricted use within NHS Scotland for the treatment of patients with breast cancer and multiple myeloma if prescribed by an oncologist.

  - **Scottish Medicines Consortium (SMC) Decisions** The Scottish Medicines Consortium has advised (February 2008) that in postmenopausal women Aclasta® is accepted for restricted use within the NHS Scotland for the treatment of osteoporosis in those for whom oral treatment options for osteoporosis are inappropriate and when initiated by a specialist.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Infusion

- **ZOLEDRONIC ACID (Non-proprietary)**
  - Zoledronic acid (as Zoledronic acid monohydrate) 40 microgram per 1 mL Zoledronic acid 4mg/100ml infusion bags | 1 bag (Pax) £174.14 (Hospital only) | 1 bag (Pax) £150.00
  - Zoledronic acid 4mg/100ml infusion bottles | 1 bottle (Pax) £165.00
  - Zoledronic acid (as Zoledronic acid monohydrate) 50 microgram per 1 mL Zoledronic acid 5mg/100ml infusion bags | 1 bag (Pax) £217.68
  - Aclasta (Novartis Pharmaceuticals UK Ltd) Zoledronic acid (as Zoledronic acid monohydrate) 50 microgram per 1 mL Aclasta 5mg/100ml infusion bottles | 1 bottle (Pax) £235.38
  - Zometa (Novartis Pharmaceuticals UK Ltd) Zoledronic acid (as Zoledronic acid monohydrate) 40 microgram per 1 mL Zometa 4mg/100ml infusion bottles | 1 bottle (Pax) £174.14

- **Brands may include Zerlinga**

#### Solution for infusion

- **ZOLEDRONIC ACID (Non-proprietary)**
  - Zoledronic acid (as Zoledronic acid monohydrate) 40 microgram per 1 mL Zoledronic acid 4mg/100ml solution for infusion vials | 1 vial (Pax) £174.14
  - Zoledronic acid (as Zoledronic acid monohydrate) 50 microgram per 1 mL Zoledronic acid 5mg/100ml solution for infusion vials | 1 vial (Pax) £215.37–£266.72
  - Zoledronic acid (as Zoledronic acid monohydrate) 800 microgram per 1 mL Zoledronic acid 4mg/5ml concentrate for solution for infusion vials | 1 vial (Pax) £174.14 (Hospital only) | 1 vial (Pax) £122.50–£174.17
  - Zoledronic acid 4mg/5ml solution for infusion vials | 1 vial (Pax) £85.63–£180.00
  - Zometa (Novartis Pharmaceuticals UK Ltd) Zoledronic acid (as Zoledronic acid monohydrate) 800 microgram per 1 mL Zometa 4mg/5ml solution for infusion vials | 1 vial (Pax) £174.17

### BONE FORMATION STIMULANTS

#### Strontium ranelate

- **DRUG ACTION** Stimulates bone formation and reduces bone resorption.

#### INDICATIONS AND DOSE

Treatment of severe osteoporosis in postmenopausal women or men at high risk of fracture for whom other treatments are contra-indicated or not tolerated (initiated under specialist supervision)

- **BY MOUTH**
  - Adult: 2 g once daily, dose to be taken in water, preferably at bedtime

- **CONTRA-INDICATIONS** Cerebrovascular disease · current or previous venous thromboembolic event · ischaemic heart disease · peripheral arterial disease · temporary or prolonged immobilisation · uncontrolled hypertension

- **CAUTIONS** Predisposition to cardiovascular disease—assess risk before and every 6–12 months during treatment

- **INTERACTIONS** Appendix 1 (strontium ranelate).

#### SIDE-EFFECTS

- **Common or very common** Dermatitis · diarrhoea · eczema · headache · myocardial infarction · nausea · venous thromboembolism

- **Very rare** Angioedema · hypersensitivity reactions · pruritus · rash · urticaria

- **Frequency not known** Abdominal pain · alopecia · bone marrow suppression · constipation · dyspepsia · flatulence · gastro-oesophageal reflux · peripheral oedema · stomatitis · vomiting
SIDE-EFFECTS, FURTHER INFORMATION

Severe allergic reactions
Severe allergic reactions, including drug rash with eosinophilia and systemic symptoms (DRESS), have been reported in patients taking strontium ranelate. DRESS starts with rash, fever, swollen glands, and increased white cell count, and it can affect the liver, kidneys and lungs; DRESS can also be fatal. Treatment with strontium ranelate should not be restarted.

- **RENAIМ IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m².
- **EFFECT ON LABORATORY TESTS** Interferes with colorimetric measurements of calcium in blood and urine.
- **DIRECTIONS FOR ADMINISTRATION** Avoid for 2 hours before and after taking granules, particularly calcium-containing products e.g. milk; also preferably avoid concomitant antacids containing aluminium and magnesium hydroxides for 2 hours after taking granules.
- **PATIENT AND CARER ADVICE** Severe allergic reactions Patients should be advised to stop taking strontium ranelate and consult their doctor immediately if skin rash develops. Patients or carers should be given advice on how to administer strontium ranelate granules.
- **NATIONAL FUNDING/ACCESS DECISIONS** NICE technology appraisals (TAs)
  - Alendronate, etidronate, risedronate, raloxifene and strontium ranelate for the primary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA160

**Strontium ranelate** is recommended as an alternative for women:
- in whom alendronate and risedronate are contra-indicated or not tolerated and
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance. www.nice.org.uk/TA160

- Alendronate, etidronate, risedronate, raloxifene, strontium ranelate, and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA161

This guideline recommends treatment options for the secondary prevention of osteoporotic fractures in postmenopausal women with confirmed osteoporosis who have also sustained a clinically apparent osteoporotic fracture.

**Strontium ranelate** is recommended as an alternative for women:
- in whom alendronate and risedronate are contra-indicated or not tolerated and
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance. www.nice.org.uk/TA161

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Granules**

| CAUTIONARY AND ADVISORY LABELS | 5, 13 |
| EXCipients: May contain Aspartame |

- Protelos (Servier Laboratories Ltd)
  - Strontium ranelate 2 gram Protelos 2g granules sachets (sugar-free) | 28 sachet [POT] £27.08 DT price = £27.08

**CALCITONINS**

**Calcitonin salmon** (Salcatonin)

**INDICATIONS AND DOSE**

- Hypercalcaemia of malignancy
  - **BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION**
    - Adult: 100 units every 6–8 hours (max. per dose 400 units every 6–8 hours), adjusted according to response
  - **BY INTRAVENOUS INFUSION**
    - Adult: Up to 10 units/kg, in severe or emergency cases, to be administered by slow intravenous infusion over at least 6 hours

- Paget’s disease of bone
  - **BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION**
    - Adult: Initially 100 units daily in 1–2 divided doses, then reduced to 50 units daily at the start of mobilisation, usual duration of treatment is 2 weeks; maximum 4 weeks

- **CONTRA-INDICATIONS** Hypocalcaemia
- **CAUTIONS** Heart failure - history of allergy (skin test advised) - risk of malignancy—avoid prolonged use (use lowest effective dose for shortest possible time)

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain - diarrhoea - dizziness - fatigue - flushing - headache - malignancy (with long-term use) - muscle-skeletal pain - nausea - taste disturbances - vomiting
- **Uncommon** Cough - hypersensitivity reactions - hypertension - injection-site reactions - oedema - polyuria - pruritus - rash - visual disturbances
- **Frequency not known** Tremor

- **PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in animal studies).
- **BREAST FEEDING** Avoid; inhibits lactation in animals.
- **RENAIМ IMPAIRMENT** Use with caution.

**DIRECTIONS FOR ADMINISTRATION**

- **For intravenous infusion** (Micalcic), give intermittently in Sodium chloride 0.9%. Diluted solution given without delay. Dilute in 500 mL, give over at least 6 hours; glass or hard plastic containers should not be used; some loss of potency on dilution and administration.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Micalcic (Novartis Pharmaceuticals UK Ltd)
  - Calcitonin (salmon) 50 unit per 1 ml Micalcic 50units/1ml solution for injection ampoules | 5 ampoule [POT] £17.10
  - Calcitonin (salmon) 100 unit per 1 ml Micalcic 100units/1ml solution for injection ampoules | 5 ampoule [POT] £34.21

- Calcitonin (salmon) 200 unit per 1 ml Micalcic 400units/2ml multidose solution for injection vials | 1 vial [POT] £24.60
**MONOCLONAL ANTIBODIES**

**Denosumab**

**DRUG ACTION** Denosumab is a human monoclonal antibody that inhibits osteoclast formation, function, and survival, thereby decreasing bone resorption.

**INDICATIONS AND DOSE**

**XGEVA®**

Prevention of skeletal related events in patients with bone metastases from solid tumours

BY SUBCUTANEOUS INJECTION

- **Adult:** 120 mg every 4 weeks, supplementation of at least Calcium 500 mg and vitamin D 400 units daily should also be taken unless hypercalcaemia is present

Treatment of giant cell tumour of bone that is unresectable or where surgical resection is likely to result in severe morbidity in adults and skeletally mature adolescent

BY SUBCUTANEOUS INJECTION

- **Adult:** 120 mg every 4 weeks, give additional dose on days 8 and 15 of the first month of treatment only, supplementation of at least Calcium 500 mg and vitamin D 400 units daily should also be taken unless hypercalcaemia is present

**PROLIA®**

Treatment of osteoporosis in postmenopausal women and in men at increased risk of fractures | Treatment of bone loss associated with hormone ablation in men with prostate cancer at increased risk of fractures

BY SUBCUTANEOUS INJECTION

- **Adult:** 60 mg every 6 months, supplement with calcium and vitamin D

---

**Important safety information**

**MHRA/CHM ADVICE: DENOSUMAB: ATYPICAL FEMORAL FRACTURES (FEBRUARY 2013)**

Atypical femoral fractures have been reported rarely in patients receiving denosumab for the long-term treatment (2.5 or more years) of postmenopausal osteoporosis.

Patients should be advised to report any new or unusual thigh, hip, or groin pain during treatment with denosumab.

Discontinuation of denosumab in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

**MHRA/CHM ADVICE: DENOSUMAB: MINIMISING THE RISK OF OSTEONECROSIS OF THE JAW; MONITORING FOR HYPOCALCAEMIA—UPDATED RECOMMENDATIONS (SEPTEMBER 2014)**

Denosumab is associated with a risk of osteonecrosis of the jaw (ONJ) and with a risk of hypocalcaemia.

**Osteonecrosis of the jaw**

Osteonecrosis of the jaw is a well-known and common side-effect in patients receiving denosumab 120 mg for cancer. Risk factors include smoking, old age, poor oral hygiene, invasive dental procedures (including tooth extractions, dental implants, oral surgery), comorbidity (including dental disease, anaemia, coagulopathy, infection), advanced cancer, previous treatment with bisphosphonates, and concomitant treatments (including chemotherapy, anti-angiogenic biologics, corticosteroids, and radiotherapy to head and neck).

The following precautions are now recommended to reduce the risk of ONJ:

- Denosumab 120 mg (cancer indication)
  - A dental examination and appropriate preventative dentistry before starting treatment are now recommended for all patients

- Do not start denosumab in patients with a dental or jaw condition requiring surgery, or in patients who have not recovered following oral surgery
- Check for ONJ risk factors before starting treatment. A dental examination and appropriate preventative dentistry are now recommended for patients with risk factors
- All patients should be informed to maintain good oral hygiene, receive routine dental check-ups, and immediately report any oral symptoms such as dental mobility, pain, or swelling to a doctor and dentist.

**Hypocalcaemia**

Denosumab is associated with a risk of hypocalcaemia. This risk increases with the degree of renal impairment.

Hypocalcaemia usually occurs in the first weeks of denosumab treatment, but it can also occur later in treatment.

Plasma-calcium concentration monitoring is recommended for denosumab 120 mg (cancer indication):

- before the first dose
- within two weeks after the initial dose
- if suspected symptoms of hypocalcaemia occur
- consider monitoring more frequently in patients with risk factors for hypocalcaemia (e.g. severe renal impairment, creatinine clearance less than 30 mL/minute)

Plasma-calcium concentration monitoring is recommended for denosumab 60 mg (osteoporosis indication):

- before each dose
- within two weeks after the initial dose in patients with risk factors for hypocalcaemia (e.g. severe renal impairment, creatinine clearance less than 30 mL/minute)
- if suspected symptoms of hypocalcaemia occur

All patients should be advised to report symptoms of hypocalcaemia to their doctor (e.g. muscle spasms, twitches, cramps, numbness or tingling in the fingers, toes, or around the mouth).

**CONTRA-INDICATIONS** Hypocalcaemia

**CAUTIONS** Atypical femoral fractures • hypocalcaemia • osteonecrosis of the jaw—consider temporary interruption of treatment if occurs

**SIDE-EFFECTS**

- **Common or very common** Abdominal discomfort • constipation • diarrhoea • dysphoena • eczema
- hypocalcaemia (fatal cases reported) • hypophosphataemia • musculoskeletal pain • osteonecrosis of the jaw • pain in extremity • rash • sciatica • sweating • upper respiratory tract infection • urinary tract infection
- **Uncommon** Cellulitis (seek prompt medical attention) • diverticulitis • ear infection • skin infections (seek prompt medical attention)

**Rare** Atypical femoral fractures • osteonecrosis of the jaw

**CONCEPTION AND CONTRACEPTION** Ensure effective contraception in women of child-bearing potential, during treatment and for at least 5 months after stopping treatment.

**PREGNANCY** Avoid—toxicity in animal studies; risk of toxicity increases with each trimester—advise women who become pregnant during treatment to enrol in the manufacturer’s Pregnancy Surveillance Programme (consult product literature).

**BREAST FEEDING** Avoid (if women do decide to breastfeed during treatment, they should enrol in the manufacturer’s Lactation Surveillance Programme—consult product literature).
PARATHYROID HORMONES AND ANALOGUES

Parathyroid hormone
(Human recombinant parathyroid hormone)

INDICATIONS AND DOSE
Treatment of osteoporosis in postmenopausal women at high risk of fractures (to reduce the risk of vertebral fractures)

BY SUBCUTANEOUS INJECTION

- Adult: 100 micrograms daily for maximum duration of treatment 24 months

CONTRA-INDICATIONS
- Hyperparathyroidism - metabolic bone disease - Paget’s disease - pre-existing hypercalcemia - previous radiation therapy to skeleton - unexplained raised levels of alkaline phosphatase
- CAUTIONS
  - Active urolithiasis - previous urolithiasis
- INTERACTIONS
  - Use with caution with concomitant cardiac glycosides.

SIDE-EFFECTS
- Common or very common
  - Asthenia - back pain - constipation - diarrhoea - dizziness - dyspepsia - fatigue - headache - hypercalcemia - injection-site reactions - muscle cramp - nausea - pain in extremities - palpitation - transient hypercalcemia - vomiting
- Uncommon
  - Abdominal pain - altered sense of smell - anorexia - hyperuricaemia - influenza - taste disturbance
- PREGNANCY
  - Avoid.
- BREAST FEEDING
  - Avoid.
- HEPATIC IMPAIRMENT
  - Avoid.
- RENAL IMPAIRMENT
  - Avoid if eGFR less than 30 mL/minute/1.73 m².
- MONITORING REQUIREMENTS
  - Monitor serum or urinary calcium concentration at 1, 3 and 6 months after initiation of treatment (consult product literature for guidance if serum-calcium concentration raised).
- PRESCRIBING AND DISPENSING INFORMATION
  - Preotact® cartridges are for use with Preotact® pen device.
- NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium, has advised (February 2007) that parathyroid hormone (Preotact®) should be initiated by specialists experienced in the treatment of osteoporosis.

MEDICINAL FORMS
Medicines not identified.

Teriparatide

INDICATIONS AND DOSE
Treatment of osteoporosis in postmenopausal women and in men at increased risk of fractures | Treatment of corticosteroid-induced osteoporosis

BY SUBCUTANEOUS INJECTION

- Adult: 20 micrograms daily for maximum duration of treatment 24 months (course not to be repeated)

CONTRA-INDICATIONS
- Bone metastases
- hyperparathyroidism - metabolic bone diseases - Paget’s
Dopamine-responsive conditions

DOPAMINE RECEPTOR AGONISTS

Dopamine-receptor agonists

Bromocriptine p. 333 is used for the treatment of galactorrhoea, and for the treatment of prolactinomas (when it reduces both plasma prolactin concentration and tumour size). Bromocriptine also inhibits the release of growth hormone and is sometimes used in the treatment of acromegaly, but somatostatin analogues (such as octreotide p. 789) are more effective.

Cabergoline p. 334 has similar side-effects to bromocriptine, however patients intolerant of bromocriptine may be able to tolerate cabergoline (and vice versa).

Quinagolide has actions and uses similar to those of ergot-derived dopamine agonists, but its side-effects differ slightly.

Suppression of lactation

Although bromocriptine and cabergoline are licensed to suppress lactation, they are not recommended for routine suppression (or for the relief of symptoms of postpartum pain and engorgement) that can be adequately treated with simple analgesics and breast support. If a dopamine-receptor agonist is required, cabergoline is preferred. Quinagolide is not licensed for the suppression of lactation.

Drugs used for Dopamine responsive conditions not listed below: Bromocriptine, p. 333 - Cabergoline, p. 334

Quinagolide

- **DRUG ACTION** Quinagolide is a non-ergot dopamine D₂ agonist.

**INDICATIONS AND DOSE**

Hyperprolactinaemia

**BY MOUTH**

- Adult: Initially 25 micrograms daily for 3 days, dose to be taken at bedtime, increased in steps of 25 micrograms every 3 days; usual dose 75–150 micrograms daily, for doses higher than 300 micrograms daily increase in steps of 75–150 micrograms at intervals of not less than 4 weeks

- **UNLICENSED USE** Not licensed for the suppression of lactation.

- **CAUTIONS** Acute porphyrias.

- **CAUTIONS, FURTHER INFORMATION**

Hyperprolactinaemic patients In hyperprolactinaemic patients, the source of the hyperprolactinaemia should be established (i.e. exclude pituitary tumour before treatment).

- **INTERACTIONS** Appendix 1 (quinagolide).

- **SIDE-EFFECTS**

  - **Common or very common** Abdominal pain - anorexia - constipation or diarrhoea - dizziness - fatigue - flushing - headache - hypotension - insomnia - nasal congestion - nausea - oedema - syncope - vomiting

  - **Very rare** Psychosis

  - **SIDE-EFFECTS, FURTHER INFORMATION**

Gastro-intestinal bleeding Treatment should be withdrawn if gastro-intestinal bleeding occurs.

- **ALLERGY AND CROSS-SENSITIVITY** Quinagolide should not be used in patients with hypersensitivity to quinagolide (does not apply to hypersensitivity to ergot alkaloids).

- **CONCEPTION AND CONTRACEPTION** Advise non-hormonal contraception if pregnancy not desired.

- **PREGNANCY** Discontinue when pregnancy confirmed unless medical reason for continuing (specialist advice needed).

- **BREAST FEEDING** Supresses lactation.

- **HEPATIC IMPAIRMENT** Avoid—no information available.
**6 Gonadotrophin responsive conditions**

**Gonadotrophins**

**Drugs affecting gonadotrophins**

Danazol p. 636 is licensed for the treatment of endometriosis and for the relief of severe pain and tenderness in benign fibrocystic breast disease where other measures have proved unsatisfactory. It may also be effective in the long-term management of hereditary angioedema [unlicensed indication].

Cetrorelix p. 636 and ganirelix p. 636 are luteinisin hormone releasing hormone antagonists, which inhibit the release of gonadotrophins (luteinizin hormone and follicle stimulating hormone). They are used in the treatment of infertility by assisted reproductive techniques.

**Gonadorelin analogues**

Gonadorelin analogues are used in the treatment of endometriosis, precocious puberty, infertility, male hyposexualitly with severe sexual deviation, anaemia due to endometriosis, precocious puberty, infertility, male

**MONITORING REQUIREMENTS**

Monitor blood pressure for a few days after starting treatment and following dosage increase.

**PATIENT AND CARER ADVICE**

Sudden onset of sleep Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or comitant medication. Patients should be counselled on improving sleep behavour.

**Hypotensive reactions** Hypotensive reactions can be disturbing in some patients during the first few days of treatment with dopamine-receptor agonists, particular care should be exercised when driving or operating machinery.

**RENAL IMPAIRMENT** Avoid—no information available.

**DRUG ACTION**

Administration of gonadorelin analogues produces a initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which ultimately lead to inhibition of androgen and oestrogen production.

**INDICATIONS AND DOSE**

**Endometriosis**

**BY INTRANASAL ADMINISTRATION**

- Adult: 300 micrograms 3 times a day maximum duration of treatment 6 months (do not repeat), to be started on days 1 or 2 of menstruation; administer one 150 microgram spray into each nostril

**Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (under expert supervision)**

**BY SUBCUTANEOUS INJECTION**

- Adult: 200–500 micrograms once daily, increased if necessary up to 500 micrograms twice daily, starting in early follicular phase (day 1) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually 1–3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on administration of chorionic gonadotrophin at appropriate stage of follicular development)

**BY INTRANASAL ADMINISTRATION**

- Adult: 150–300 micrograms 4 times a day, (150 micrograms equivalent to one spray), to be administered during waking hours. Start in early follicular phase (day 1) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually about 2–3 weeks) then maintained during gonadotrophin administration (stopping continued
gonadotrophin responsive conditions

Advanced prostate cancer

INITIALLY BY SUBCUTANEOUS INJECTION

- Adult: 500 micrograms every 8 hours for 7 days, then (by intranasal administration) 200 micrograms 6 times a day, (a single 100 microgram spray to be administered into each nostril)

CONTRA-INDICATIONS

- When used for endometriosis Hormone dependent tumours - undiagnosed vaginal bleeding - use longer than 6 months (do not repeat)
- When used for pituitary desensitisation Hormone dependent tumours - undiagnosed vaginal bleeding

CAUTIONS

Depression - diabetes - hypertension - patients with metabolic bone disease (decrease in bone mineral density can occur) - polycystic ovarian disease

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

SPECIFIC SIDE-EFFECTS

With intranasal use Altered sense of taste and smell - nasal irritation - nose bleeds

SIDE-EFFECTS, FURTHER INFORMATION

When used for Advanced prostate Cancer

Tumour flare During the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour ‘flare’ may cause spinal cord compression, ureteric obstruction or increased bone pain. When such problems are anticipated, alternative treatments (e.g. orchidectomy) or concomitant use of an anti-androgen such as cyprotorexin acetate or flutamide are recommended; anti-androgen treatment should be started before the gonadorelin analogue.

CONCEPTION AND CONTRACEPTION

Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

PREGNANCY

Avoid.

BREAST FEEDING

Avoid.

DIRECTIONS FOR ADMINISTRATION

With intranasal use Avoid use of nasal decongestants before and for at least 30 minutes after treatment.

With subcutaneous use Rotate injection site to prevent atrophy and nodule formation.

PATIENT AND CARER ADVICE

Patients or carers should be given advice on how to administer buserelin nasal spray.

MATERIAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- Suprecur (Sanofi) Buserelin (as Buserelin acetate) 1 mg per 1 ml Suprecur 5.5mg/5.5ml solution for injection vials | 2 vial £27.52
- Suprefact (Sanofi) Buserelin (as Buserelin acetate) 1 mg per 1 ml Suprefact 5.5mg/5.5ml solution for injection vials | 2 vial £28.64
- Spray

- Suprecur (Sanofi) Buserelin (as Buserelin acetate) 150 microgram per 1 dose Suprecur 150micrograms/dose nasal spray | 168 dose £87.63
- Suprefact (Sanofi) Buserelin (as Buserelin acetate) 100 microgram per 1 dose Suprefact 100micrograms/dose nasal spray | 336 dose £101.87

Goserelin

DRUG ACTION

Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

INDICATIONS AND DOSE

ZOLADEX®

Locally advanced prostate cancer as an alternative to surgical castration | Adjutant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer | Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer | Metastatic prostate cancer | Advanced breast cancer | Oestrogen-receptor-positive early breast cancer

BY SUBCUTANEOUS INJECTION

- Adult: 3.6 mg every 28 days, to be administered into the anterior abdominal wall

Endometriosis

BY SUBCUTANEOUS INJECTION

- Adult: 3.6 mg every 28 days maximum duration of treatment 6 months (do not repeat), to be administered into the anterior abdominal wall

Endometrial thinning before intra-uterine surgery

BY SUBCUTANEOUS INJECTION

- Adult: 3.6 mg, dose may be repeated after 28 days if uterus is large or to allow flexible surgical timing, to be administered into the anterior abdominal wall

Before surgery in women who have anaemia due to uterine fibroids

BY SUBCUTANEOUS INJECTION

- Adult: 3.6 mg every 28 days maximum duration of treatment 3 months, to be given with supplementary iron, to be administered into the anterior abdominal wall

Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (after exclusion of pregnancy) (under expert supervision)

BY SUBCUTANEOUS INJECTION

- Adult: 3.6 mg, dose given to achieve pituitary down-regulation (usually 1–3 weeks) then gonadotrophin is administered (stopping gonadotrophin on
Gonadotrophin responsive conditions

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Implant**

- Zoladex (AstraZeneca UK Ltd) 3.6 mg
- Zoladex 3.6 mg implant Safesystem pre-filled syringes | 1 pre-filled disposable injection (£55.00 DT price = £55.00)
- Zoladex LA (AstraZeneca UK Ltd) 10.8 mg
- Zoladex LA 10.8 mg implant Safesystem pre-filled syringes | 1 pre-filled disposable injection (£235.00 DT price = £235.00)

**Leuprolin acetate**

**DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

**INDICATIONS AND DOSE**

**PROSTAP 3 DCS**

**Endometriosis**

- **BY INTRAMUSCULAR INJECTION**
  - Adult: Initially 11.25 mg for 1 dose, dose to be given as a single dose in first 5 days of menstrual cycle, then 11.25 mg every 3 months for maximum 6 months (course not to be repeated)

**Locally advanced prostate cancer as an alternative to surgical castration**

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 10.8 mg every 12 weeks, to be administered into the anterior abdominal wall

**INDICATIONS AND DOSE**

**PROSTAP SR DCS**

**Endometriosis**

- **BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION**
  - Adult: Initially 3.75 mg for 1 dose, dose to be given as a single dose in first 5 days of menstrual cycle, then 3.75 mg every 1 month for maximum 6 months (course not to be repeated)

**Locally advanced prostate cancer as an alternative to surgical castration**

- **BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION**
  - Adult: Initially 3.75 mg every 1 month usually for 3–4 months (maximum 6 months)

**Locally advanced prostate cancer as an alternative to surgical castration**

- **BY SUBCUTANEOUS INJECTION OR BY INTRAMUSCULAR INJECTION**
  - Adult: 3.75 mg every 1 month

**CONTRA-INDICATIONS**

**GENERAL CONTRA-INDICATIONS**

- Undiagnosed vaginal bleeding

**SPECIFIC CONTRA-INDICATIONS**

- When used for endometriosis Use longer than 6 months (do not repeat)
DIRECTIONS FOR ADMINISTRATION

Men at risk of tumour

BREAST FEEDING

When used for prostate cancer

Tumour flare In prostate cancer, during the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour ‘flare’ may cause spinal cord compression, ureteric obstruction or increased bone pain. When such problems are anticipated, alternative treatments (e.g. orchidectomy) or concomitant use of an anti-androgen such as cyproterone acetate or flutamide are recommended; anti-androgen treatment should be started before the gonadorelin analogue.

CONCEPTION AND CONTRACEPTION Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

PREGNANCY Avoid—teratogenic in animal studies.

BREAST FEEDING Avoid.

MONITORING REQUIREMENTS

Monitor liver function.

Men at risk of tumour ‘flare’ should be monitored closely during the first month of therapy.

DIRECTIONS FOR ADMINISTRATION Rotate injection site to prevent atrophy and nodule formation.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection

Prostap 3 DCS (Takeda UK Ltd)

Leuprorelin acetate 11.25 mg Prostap 3 DCS 11.25mg powder and solvent for suspension for injection pre-filled syringes | 1 pre-filled disposable injection £225.72 DT price = £225.72

Prostap SR DCS (Takeda UK Ltd)

Leuprorelin acetate 3.75 mg Prostap SR DCS 3.75mg powder and solvent for suspension for injection pre-filled syringes | 1 pre-filled disposable injection £75.24 DT price = £75.24

Nafarelin

DRUG ACTION Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

INDICATIONS AND DOSE

Endometriosis

BY INTRANASAL ADMINISTRATION

Adult: 200 micrograms twice daily for maximum 6 months (do not repeat), one spray in one nostril in the morning, and one spray in the other nostril in the evening (starting on days 2–4 of menstruation).

Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (under expert supervision)

BY INTRANASAL ADMINISTRATION

Adult: 400 micrograms twice daily, one spray in each nostril, to be started in early follicular phase (day 2) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down regulation achieved (usually within 4 weeks) then maintained (usually for 8–12 days) during gonadotrophin administration (stopping gonadotrophin and nafarelin on administration of choric gonadotropin at follicular maturity), discontinue if down-regulation not achieved within 12 weeks

CONTRA-INDICATIONS Undiagnosed vaginal bleeding - use longer than 6 months in the treatment of endometriosis (do not repeat)

CAUTIONS Patients with metabolic bone disease (decrease in bone mineral density can occur)

SIDE-EFFECTS, FURTHER INFORMATION

- When used for prostate cancer

Tumour flare In prostate cancer, during the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour ‘flare’ may cause spinal cord compression, ureteric obstruction or increased bone pain. When such problems are anticipated, alternative treatments (e.g. orchidectomy) or concomitant use of an anti-androgen such as cyproterone acetate or flutamide are recommended; anti-androgen treatment should be started before the gonadorelin analogue.

CONCESSION AND CONTRACEPTION Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

PREGNANCY Avoid—teratogenic in animal studies.

BREAST FEEDING Avoid.

**DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

**INDICATIONS AND DOSE**

### DECAPEPTYL® SR 3MG

**Endometriosis**

**BY INTRAMUSCULAR INJECTION**

- Adult: 3 mg every 4 weeks for at least 3 months, maximum duration of treatment 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

**Reduction in size of fibroids**

**BY INTRAMUSCULAR INJECTION**

- Adult: 3 mg every 4 weeks for at least 3 months, maximum duration of treatment 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

**Locally advanced non-metastatic prostate cancer as an alternative to surgical castration** | **Metastatic prostate cancer** | **Adjuvant treatment to radiotherapy in high-risk localised or locally advanced prostate cancer** | **Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer** | **Adjuvant treatment to radical prostatectomy in patients with locally advanced prostate cancer at high risk of disease progression**

**BY INTRAMUSCULAR INJECTION**

- Adult: 3 mg every 4 weeks

### DECAPEPTYL® SR 11.25MG

**Endometriosis**

**BY INTRAMUSCULAR INJECTION**

- Adult: 11.25 mg every 3 months for maximum 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

**Locally advanced non-metastatic prostate cancer as an alternative to surgical castration** | **Metastatic prostate cancer** | **Adjuvant treatment to radiotherapy in high-risk localised or locally advanced prostate cancer** | **Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer** | **Adjuvant treatment to radical prostatectomy in patients with locally advanced prostate cancer at high risk of disease progression**

**BY INTRAMUSCULAR INJECTION**

- Adult: 11.25 mg every 3 months

### DECAPEPTYL® SR 22.5MG

**Locally advanced non-metastatic prostate cancer as an alternative to surgical castration** | **Metastatic prostate cancer** | **Adjuvant treatment to radiotherapy in high-risk localised or locally advanced prostate cancer** | **Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer** | **Adjuvant treatment to radical prostatectomy in patients with locally advanced prostate cancer at high risk of disease progression**

**BY INTRAMUSCULAR INJECTION**

- Adult: 22.5 mg every 6 months

**SALVACYL®**

**Male hypersexuality with severe sexual deviation**

**BY INTRAMUSCULAR INJECTION**

- Adult: 11.25 mg every 12 weeks

---

**GONAPEPTYL DEPOT®**

**Endometriosis | Reduction in size of fibroids**

**BY SUBCUTANEOUS INJECTION OR BY DEEP INTRAMUSCULAR INJECTION**

- Adult: 3.75 mg every 4 weeks maximum duration of 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

**Advanced prostate cancer**

**BY SUBCUTANEOUS INJECTION OR BY DEEP INTRAMUSCULAR INJECTION**

- Adult: 3.75 mg every 4 weeks

**CONTRA-INDICATIONS** In endometriosis do not use for longer than 6 months (do not repeat) - undiagnosed vaginal bleeding

**SALVACYL®** Severe osteoporosis

**CAUTIONS**

**GENERAL CAUTIONS**

Patients with metabolic bone disease (decrease in bone mineral density can occur)

**SPECIFIC CAUTIONS**

- When used for prostate cancer risk factors for osteoporosis - risk of spinal cord compression in men - risk of ureteric obstruction in men

**SALVACYL®** Increased risk of sensitivity to restored testosterone if treatment interrupted—consider administration of an antiandrogen before stopping treatment - transient increase in serum testosterone occurs on initiation—consider administration of an antiandrogen

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

Anaphylaxis - arthralgia - asthenia - asthma - breast tenderness (males and females) - changes in blood pressure - changes in breast size - changes in scalp and body hair - depression - gastro-intestinal disturbances - headache - hot flushes - hypersensitivity reactions - increased sweating - local reactions at injection site - mood changes - ovarian cysts (may require withdrawal) - paraesthesia - pruritus - rash - urticaria - visual disturbances - weight changes

**SPECIFIC SIDE-EFFECTS**

- When used for prostate cancer Dizziness - dry mouth - hair loss - increased dysuria - myalgia - peripheral oedema - sexual dysfunction - sleep disorders

- When used for reduction in size of uterine fibroids Bleeding associated with fibroid degeneration - decrease in trabecular bone density - dyspareunia - loss of libido - menopausal-like symptoms - migraine - musculoskeletal pain - musculoskeletal weakness - oedema of the face and extremities - palpitation - vaginal dryness - withdrawal bleeding (may occur in the first month of treatment)

- When used for endometriosis Decrease in trabecular bone density - dyspareunia - loss of libido - menopausal-like symptoms - migraine - musculoskeletal pain - musculoskeletal weakness - oedema of the face and extremities - palpitation - vaginal dryness - withdrawal bleeding (may occur in the first month of treatment)

- When used for endometriosis Décrease in trabecular bone density - dyspareunia - loss of libido - menopausal-like symptoms - migraine - musculoskeletal pain - musculoskeletal weakness - oedema of the face and extremities - palpitation

- When used for gonadotrophin-dependent precocious puberty Decrease in trabecular bone density - dyspareunia - loss of libido - menopausal-like symptoms - migraine - musculoskeletal pain - musculoskeletal weakness - oedema of the face and extremities - palpitation - vaginal dryness - withdrawal bleeding (may occur in the first month of treatment)
**Cetrorelix**

- **INDICATIONS AND DOSE**
  - Adjuvant in the treatment of female infertility (under expert supervision)

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 250 micrograms daily, dose to be injected preferably into the upper leg (rotate injection sites to prevent lipoatrophy), dose to be administered in the morning (or each afternoon) starting on day 5 or day 6 of ovarian stimulation with gonadotrophins, continue throughout administration of gonadotrophins including day of ovulation induction (if administering in afternoon, give last dose in afternoon before ovulation induction)

- **SIDE-EFFECTS**
  - Very rare: Facial oedema, hypersensitivity reactions, rash
  - Frequency not known: Dyspnoea, headache, injection-site reactions, malaise, nausea

- **PREGNANCY**
  - Avoid in confirmed pregnancy—tocicity in animal studies.

- **BREAST FEEDING**
  - Avoid—no information available.

- **HEPATIC IMPAIRMENT**
  - Avoid in moderate or severe hepatic impairment.

- **RENAI IMPAIRMENT**
  - Avoid in moderate to severe renal impairment.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug

- **Powder and solvent for solution for injection**
  - Cetrorelix (as Cetrorelix acetate) 250 microgram

- **Solution for injection**
  - Ganirelix 500 microgram per 1 ml

**Gonadotrophin-responsive conditions**

**SIDE-EFFECTS, FURTHER INFORMATION**

- When used for prostate cancer
  - Tumour flare in prostate cancer: During the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour ‘flare’ may cause spinal cord compression, ureteric obstruction or increased bone pain. When such problems are anticipated, alternative treatments (e.g. orchidectomy) or concomitant use of an anti-androgen such as cyproterone acetate or flutamide are recommended; anti-androgen should be started before the gonadorelin analogue.

- **CONCEPTION AND CONTRACEPTION**
  - Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

- **PREGNANCY**
  - Avoid.

- **BREAST FEEDING**
  - Avoid.

- **MONITORING REQUIREMENTS**
  - When used for prostate cancer: Men at risk of tumour ‘flare’ should be monitored closely during the first month of therapy.

- **DIRECTIONS FOR ADMINISTRATION**
  - Rotate injection site to prevent atrophy and nodule formation.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - **DECAPTEYL® PREPARATIONS**
    - Each strength of vial includes an overage to allow accurate administration of the required dose.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Powder and solvent for suspension for injection**
  - Decapeptyl SR
    - Triptorelin (as Triptorelin acetate) 3 mg
      - Decapeptyl SR 3mg powder and solvent for suspension for injection vials | 1 vial (£22.61)
      - £69.00
    - Triptorelin (as Triptorelin acetate) 11.25 mg
      - Decapeptyl SR 11.25mg powder and solvent for suspension for injection vials | 1 vial (£22.61)
      - £207.00
    - Triptorelin (as Triptorelin embonate) 22.5 mg
      - Decapeptyl SR 22.5mg powder and solvent for suspension for injection vials | 1 vial (£22.61)

    - Gonapeteryl Depot
      - Triptorelin (as Triptorelin acetate) 3.75 mg
        - Gonapeteryl Depot 3.75mg powder and solvent for suspension for injection pre-filled disposable devices | 1 pre-filled disposable injection (£22.61)
        - £81.69
    - Salvacyl
      - Triptorelin (as Triptorelin embonate) 11.25 mg
        - Salvacyl 11.25mg powder and solvent for suspension for injection vials | 1 vial (£22.61)
        - £248.00

**GONADOTROPHIN-RELEASING HORMONE ANTAGONISTS**

**Cetrorelix**

- **INDICATIONS AND DOSE**
  - Adjuvant in the treatment of female infertility (initiated under specialist supervision)

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 250 micrograms once daily, dose to be administered in the morning, starting on day 5 or 6 of ovarian stimulation with gonadotrophins (or each evening starting on day 5 of ovarian stimulation), continue throughout administration of gonadotrophin including day of ovulation induction (or evening before ovulation induction), dose to be injected into the lower abdominal wall.

  **SIDE-EFFECTS**
  - Common or very common: Headache, injection site reactions, nausea
  - Rare: Hypersensitivity reactions

  **PREGNANCY**
  - Avoid in confirmed pregnancy.

  **BREAST FEEDING**
  - Avoid.

  **HEPATIC IMPAIRMENT**
  - Avoid in moderate or severe liver impairment.

  **RENAI IMPAIRMENT**
  - Avoid in moderate or severe renal impairment.

**Medicinal forms**

- There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

- Cetrorelix (as Cetrorelix acetate) 250 microgram
  - Cetrotide (Merck Serono Ltd)
  - 250 microgram powder and solvent for solution for injection vials | 1 vial (£22.61) | 7 vial (£158.26)

**Ganirelix**

- **INDICATIONS AND DOSE**
  - Adjunct in the treatment of female infertility (under expert supervision)

- **BY SUBCUTANEOUS INJECTION**
  - Adult: 250 micrograms daily, to be injected preferably into the upper leg (rotate injection sites to prevent lipoatrophy, dose to be administered in the morning (or each afternoon) starting on day 5 or day 6 of ovarian stimulation with gonadotrophins, continue throughout administration of gonadotrophins including day of ovulation induction (if administering in afternoon, give last dose in afternoon before ovulation induction)

  **SIDE-EFFECTS**
  - Very rare: Facial oedema, hypersensitivity reactions, rash
  - Frequency not known: Dyspnoea, headache, injection-site reactions, malaise, nausea

  **PREGNANCY**
  - Avoid in confirmed pregnancy—tocicity in animal studies.

  **BREAST FEEDING**
  - Avoid—no information available.

  **HEPATIC IMPAIRMENT**
  - Avoid in moderate or severe hepatic impairment.

  **RENAI IMPAIRMENT**
  - Avoid in moderate to severe renal impairment.

**Medicinal forms**

- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Orgalutran (Merck Sharp & Dohme Ltd)
  - Ganirelix 500 microgram per 1 ml
  - Orgalutran 250 micrograms/0.5 ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (£22.61)
  - £21.48

**6.1 Hereditary angioedema**

**GONADOTROPHIN-RELEASING HORMONE ANTAGONISTS**

**Danazol**

- **DRUG ACTION**
  - Danazol inhibits pituitary gonadotrophins; it combines androgenic activity with antiestrogenic and antiprogesteronic activity.
**INDICATIONS AND DOSE**

**Endometriosis**

**BY MOUTH**

- Adult: 200–800 mg daily in up to 4 divided doses usually for 3–6 months, dose to be adjusted to achieve amenorrhoea, in women of child-bearing potential, treatment should start during menstruation, preferably on day 1.

Severe pain and tenderness in benign fibrocystic breast disease not responding to other treatment

**BY MOUTH**

- Adult: 300 mg daily in divided doses usually for 3–6 months, in women of child-bearing potential, treatment should start during menstruation, preferably on day 1.

**Hereditary angiodema**

**BY MOUTH**

- Adult: Initially 100–200 mg daily, dose to be reduced according to response, in women of child-bearing potential, treatment should start during menstruation, preferably on day 1.

**SIDE-EFFECTS**

- Rare Benign hepatic adenomata · cholestatic jaundice · clitoral hypertrophy · pancreatitis · polycystic ovaries

**Frequency not known**

- Acne · androgenic effects · anxiety · backache · changes in libido · dizziness · eosinophilia · epigastric pain · exfoliative dermatitis · fatigue · fever · flushing and reduction in breast size · hair loss · headache · headache (may indicate benign intracranial hypertension) · hirsutism · insulin resistance · joint pain · joint swelling · leucopenia · menstrual disturbances · mood changes · musculo-skeletal spasm · nausea · nervousness · oedema · oily skin · pleuritic pain · rashes · reversible erythrocytosis · reversible polycythaemia · skin reactions · temporary alteration in lipoproteins and other metabolic changes · thrombocytopenia · thrombotic events · vaginal dryness · vaginal irritation · vertigo · visual disturbances (may indicate benign intracranial hypertension) · voice changes · weight gain

**SIDE-EFFECTS, FURTHER INFORMATION**

**Viralisation** Withdraw if viralisation effects occur—may be irreversible on continued use.

**CONCEPTION AND CONTRACEPTION** Ensure patients with amenorrhoea are not pregnant. Non-hormonal contraceptive methods should be used, if appropriate.

**PREGNANCY** Avoid; has weak androgenic effects and virilisation of female fetus reported.

**BREAST FEEDING** No data available but avoid because of possible androgenic effects in infant.

**HEPATIC IMPAIRMENT** Caution in hepatic impairment (avoid if severe).

**RENAL IMPAIRMENT** Caution in renal impairment (avoid if severe).

**UNLICENSED USE** Not licensed for use in hereditary angioedema.

**CONTRA-INDICATIONS** Acute porphyrias p. 864 · androgen-dependent tumours · thromboembolic disease · undiagnosed genital bleeding

**CAUTIONS** Cardiac impairment (avoid if severe) · diabetes mellitus · elderly · epilepsy · history of thrombosis or thromboembolic disease · hypertension · lipoprotein disorder · migraine · polycythaemia

**INTERACTIONS** → Appendix 1 (danazol).

**7 Hypothalamic and anterior pituitary hormone related disorders**

**Hypothalamic and anterior pituitary hormones**

**Anterior pituitary hormones**

Tetracosactide (tetracosactrin), an analogue of corticotropin (ACTH), is used to test adrenocortical function; failure of the plasma cortisol concentration to rise after administration of tetracosactide indicates adrenocortical insufficiency.

Both corticotropin and tetracosactide were formerly used as alternatives to corticosteroids in conditions such as Crohn’s disease or rheumatoid arthritis; their value was limited by the variable and unpredictable therapeutic response and by the waning of their effect with time.

**Gonadotrophins**

Follicle-stimulating hormone (FSH) and luteinising hormone (LH) together, follicle-stimulating hormone alone (as in follicitropin), or chorionic gonadotrophin p. 639, are used in the treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene citrate p. 659, or in superovulation treatment for assisted conception (such as in vitro fertilisation).

The gonadotrophins are also occasionally used in the treatment of hypogonadotropic hypogonadism and associated oligospernia. There is no justification for their use in primary gonadal failure.

Chorionic gonadotrophin has also been used in delayed puberty in the male to stimulate endogenous testosterone production, but has little advantage over testosterone.

**Growth hormone**

Growth hormone is used to treat deficiency of the hormone in children and in adults. In children it is used in Prader-Willi syndrome, Turner syndrome, chronic renal insufficiency, short children considered small for gestational age at birth, and short stature homeobox-containing gene (SHOX) deficiency.

Growth hormone of human origin (HGH; somatotrophin) has been replaced by a growth hormone of human DNA sequence, somatropin p. 642, produced using recombinant DNA technology.

Mecasermin, a human insulin-like growth factor-1 (rhIGF-I), is licensed to treat growth failure in children and adolescents with severe primary insulin-like growth factor-I deficiency.

**Hypothalamic hormones**

Gonadorelin p. 639 when injected intravenously in normal subjects leads to a rapid rise in plasma concentrations of both luteinising hormone (LH) and follicle-stimulating...
hormone (FSH). It has not proved to be very helpful, however, in distinguishing hypothalamic pituitary lesions. Gonadorelin analogues are indicated in endometriosis and infertility and in breast and prostate cancer.

## 7.1 Adrenocortical function testing

### CORTICOTROPHINS

#### Tetracosactide

*(Tetracosactrin)*

**INDICATIONS AND DOSE**

- **Diagnosis of adrenocortical insufficiency (diagnostic 30-minute test)**
  - By intravenous injection or by intramuscular injection
    - Adult: 250 micrograms for 1 dose
  - Diagnosis of adrenocortical insufficiency (diagnostic 5-hour test)
    - By intramuscular injection using depot injection
      - Adult: 1 mg for 1 dose

#### Alternative to corticosteroids in conditions such as Crohn's disease or rheumatoid arthritis (formerly used but value was limited by the variable and unpredictable therapeutic response and by the waning of effect with time)

- **INITIALLY BY INTRAMUSCULAR INJECTION USING DEPOT INJECTION**
  - Adult: Initially 1 mg daily, alternatively (by intramuscular injection) initially 1 mg every 12 hours, (in acute cases), then (by intramuscular injection) reduced to 1 mg every 2–3 days, followed by (by intramuscular injection) 1 mg once weekly, alternatively (by intramuscular injection) 500 micrograms every 2–3 days

#### SIDE-EFFECTS

- Abdominal distention • abscess • acne • anaphylactic shock • angioneurotic oedema • aseptic necrosis of femoral and humeral heads • benign intracranial pressure increased with papilloedema • calcium deficiency • cardiac disorders • convulsions • Cushing's syndrome • decreased carbohydrate tolerance • dizziness • dyspepsia • ecchymosis • erythema • euphoria • fluid retention • flushing • glaucoma • growth retardation • headache • hirsutism • hyperglycaemia • hyperhidrosis • hypersensitivity reactions (tend to be more severe in patients susceptible to allergies, especially asthma) • hypertension • hypokalaemia • hypokalaemic alkalosis • impaired healing • increased appetite • increased intraocular pressure • infection susceptibility increased • insomnia • irregular menstruation • leukocytosis • malaise • manifestations of latent diabetes mellitus • mood swings • muscle atrophy • muscular weakness • myopathy • nausea • necrotising vasculitis • negative nitrogen balance • osteoporosis • pancreatitis • pathological fracture of long bones • peptic ulcer • personality changes • petechiae • posterior subcapsular cataracts • pruritis • psychotic manifestations • Quincke’s oedema • secondary adrenocortical unresponsiveness • secondary pituitary unresponsiveness • severe depression • skin atrophy • skin hyperpigmentation • skin reactions at injection site • sodium retention • spinal compression fractures • tendon rupture • thromboembolism • ulcerative oesophagitis • uticaria • vertigo • vomiting • weight increase

#### ALLERGY AND CROSS-SENSITIVITY

- Contraindicated in patients with history of hypersensitivity to tetracosactide/corticotrophins or excipients.
- **PREGNANCY** Avoid (but may be used diagnostically if essential).
- **BREAST FEEDING** Avoid (but may be used diagnostically if essential).
- **HEPATIC IMPAIRMENT** An enhanced effect of tetracosactide therapy may occur in patients with cirrhosis of the liver. Use with caution in hepatic impairment. Monitor hepatic function closely during treatment.
- **RENAL IMPAIRMENT** Use with caution in patients with renal impairment.
- **EFFECT ON LABORATORY TESTS** May suppress skin test reactions. Post administration total plasma cortisol levels during 30-minute test for diagnosis of adrenocortical insufficiency might be misleading due to altered cortisol binding globulin levels in some special clinical situations including, patients on oral contraceptives, post-operative patients, critical illness, severe liver disease and nephrotic syndrome.
- **MEDICINAL FORMS**

- **Tetracosactide acetate 1 mg per 1 ml** Synacthen 250 micrograms/1ml solution for injection ampoules | 5 ampoule £30.00
- **Tetracosactide acetate 1 mg per 1 ml** Synacthen Depot 1mg/1ml suspension for injection ampoules | 10 ampoule £41.83

### Contra-Indications

- Acute psychosis • adrenogenital syndrome • allergic disorders • asthma • avoid injections containing benzy alcohol in neonates • Cushing's syndrome • infectious diseases • peptic ulcer • primary adrenocortical insufficiency • refractory heart failure

### Caution

- Active infectious diseases (should not be used unless adequate disease-specific therapy is being given) • active systemic diseases (should not be used unless adequate disease-specific therapy is being given) • diabetes mellitus • diverticulitis • history of asthma • history of atopic allergy • history of eczema • history of hayfever • history of hypersensitivity • hypertension • latent amoebiasis (may become activated) • latent tuberculosis (may become activated) • myasthenia gravis • ocular herpes simplex • osteoporosis • predisposition to thromboembolic • psychological disturbances may be triggered • recent intestinal anastomosis • reduced immune response (should not be used unless adequate disease-specific therapy is being given) • ulcerative colitis

### Risk of anaphylaxis

- Should only be administered under medical supervision. Consult product literature.

### Hypertension

- Patients already receiving medication for moderate to severe hypertension must have their dosage adjusted if treatment started.

### Diabetes mellitus

- Patients already receiving medication for diabetes mellitus must have their dosage adjusted if treatment started.

### Interactions

- Appendix 1 (corticosteroids).
7.2 Assessment of pituitary function

GONADOTROPHIN-RELEASING HORMONE ANALOGUES

Gonadorelin
(Gonadotrophin-releasing hormone; GnRH; LH-RH)

INDICATIONS AND DOSE
Assessment of pituitary function
BY SUBCUTANEOUS INJECTION OR BY INTRAVENOUS INJECTION
▶ Adult: 100 micrograms for 1 dose

● CAUTIONS Pituitary adenoma
● SIDE-EFFECTS Abdominal pain, headache, hypersensitivity reaction on repeated administration of large doses, increased menstrual bleeding, irritation at injection site, nausea
● PREGNANCY Avoid.
● BREAST FEEDING Avoid.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.
EXCIPIENTS: May contain Benzyl alcohol
▶ GONADORELIN (Non-proprietary)
Gonadorelin (as Gonadorelin hydrochloride) 100 microgram
Gonadorelin 100 microgram powder and solvent for solution for injection vials | 1 vial (£31.38 Schedule 4 (CD Aban)

7.3 Gonadotrophin replacement therapy

GONADOTROPHINS

Chorionic gonadotrophin alfa
(Human chorionic gonadotrophin)

INDICATIONS AND DOSE
Treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene
Supervoluation treatment for assisted conception (such as in vitro fertilisation)
BY SUBCUTANEOUS INJECTION
▶ Adult: Adjusted according to response.

● CONTRA-INDICATIONS Active thromboembolic disorders - ectopic pregnancy in previous 3 months - hypothalamic malignancy - mammary malignancy - ovarian enlargement or cyst (unless caused by polycystic ovarian disease) - ovarian malignancy - pituitary malignancy - uterine malignancy
● CAUTIONS Acute porphyrias p. 864
● SIDE-EFFECTS Abdominal pain, breast pain, depression, diarrhoea, ectopic pregnancy, headache, injection-site reactions, irritability, nausea, ovarian hyperstimulation syndrome, ovarian torsion, tiredness, vomiting

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Chorionic gonadotrophin
(Human Chorionic Gonadotrophin; HCG)

DRUG ACTION A preparation of a glycoprotein fraction secreted by the placenta and obtained from the urine of pregnant women having the action of the pituitary luteinising hormone.

INDICATIONS AND DOSE
Treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene
Supervoluation treatment for assisted conception (such as in vitro fertilisation)
BY INTRAMUSCULAR INJECTION OR BY SUBCUTANEOUS INJECTION
▶ Adult: Adjusted according to response.

● CONTRA-INDICATIONS Androgen-dependent tumours
● CAUTIONS Asthma, cardiac impairment, epilepsy, migraine, prepubertal boys (risk of premature epiphyseal closure or precocious puberty)
● SIDE-EFFECTS Gynaecomastia, headache, local reactions, may aggravate ovarian hyperstimulation syndrome (particularly in males—reduce dose) - tiredness
● RENAL IMPAIRMENT Use with caution.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection
▶ Choragon (Ferring Pharmaceuticals Ltd)
Chorionic gonadotrophin human 5000 unit Choragon 5,000 unit powder and solvent for solution for injection ampoules | 3 ampoules (£31.38 Schedule 4 (CD Aban)
Chorionic gonadotrophin human 1500 unit Pregnyl 1,500 unit powder and solvent for solution for injection ampoules | 1 ampoule (£31.38 Schedule 4 (CD Aban)
Chorionic gonadotrophin human 5000 unit Pregnyl 5,000 unit powder and solvent for solution for injection ampoules | 1 ampoule (£31.38 Schedule 4 (CD Aban)

Corifollitropin alfa

INDICATIONS AND DOSE
Controlled ovarian stimulation in combination with a gonadotrophin-releasing hormone antagonist
BY SUBCUTANEOUS INJECTION
▶ Adult (body-weight up to 60 kg): 100 micrograms
▶ Adult (body-weight 60 kg and above): 150 micrograms

● CONTRA-INDICATIONS History of ovarian hyperstimulation syndrome - ovarian enlargement or cyst - polycystic ovarian syndrome - tumours of breast - tumours of hypothalamus - tumours of ovaries - tumours of pituitary - tumours of uterus - vaginal bleeding of unknown cause
● CAUTIONS Acute porphyrias p. 864 - risk factors for thromboembolism - risk of ovarian hyperstimulation syndrome
● SIDE-EFFECTS
▶ Common or very common Breast pain, fatigue, headache, nausea, ovarian hyperstimulation, pelvic pain
**Follitropin alfa** (Recombinant human follicle stimulating hormone)

**INDICATIONS AND DOSE**
Infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)

BY SUBCUTANEOUS INJECTION
- Adult: Adjusted according to response.

**CONTRA-INDICATIONS**
- Ovarian cysts (not caused by polycystic ovarian syndrome) - tumours of breast - tumours of hypothalamus - tumours of ovaries - tumours of pituitary - tumours of prostate - tumours of testes - tumours of uterus - vaginal bleeding of unknown cause

**CAUTIONS**
- Acute porphyrias p. 864

**SIDE-EFFECTS**
- Fever - gastro-intestinal disturbances - headache - hypersensitivity reactions - injection site reactions - joint pain - ovarian hyperstimulation
- Very rare: Thromboembolism
- Frequency not known: Acne - gynaecomastia - increased risk of miscarriage - increased risk of multiple pregnancy - weight gain

**PREGNANCY**
- Avoid.

**BREAST FEEDING**
- Avoid.

**PATIENT AND CARER ADVICE**
Patients planning to conceive should be warned that there is a risk of multiple pregnancy.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Follitropin alfa (Non-proprietary)**
- Follitropin alfa 600 unit per 1 ml
  - Bemfola 225units/0.375ml solution for injection pre-filled pen | 1 pre-filled disposable injection (PSN) £70.50
  - Bemfola 300units/0.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection (PSN) £94.00
  - Bemfola 150units/0.25ml solution for injection pre-filled pen | 1 pre-filled disposable injection (PSN) £47.00
  - Bemfola 75units/0.125ml solution for injection pre-filled pen | 1 pre-filled disposable injection (PSN) £23.50
  - Bemfola 450units/0.75ml solution for injection pre-filled pen | 1 pre-filled disposable injection (PSN) £141.00

- Gonal-f (Merck Serono Ltd)
  - Follitropin alfa 600 unit per 1 ml
    - Gonal-f 450units/0.75ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (PSN) £141.00
    - Gonal-f 900units/1.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (PSN) £282.00
    - Gonal-f 300units/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (PSN) £94.00

**Powder and solvent for solution for injection**
- Gonal-f (Merck Serono Ltd)
- Follitropin alfa 75 unit
  - Gonal-f 75unit powder and solvent for solution for injection vials | 1 vial (PSN) £21.02 | 5 vial (PSN) £107.20
- Follitropin alfa 450 unit
  - Gonal-f 450unit powder and solvent for solution for injection vials | 1 vial (PSN) £126.10
- Follitropin alfa 1050 unit
  - Gonal-f 1,050unit powder and solvent for solution for injection vials | 1 vial (PSN) £294.22

**Follitropin beta** (Recombinant human follicle stimulating hormone)

**INDICATIONS AND DOSE**
Infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)

BY SUBCUTANEOUS INJECTION
- Adult: Adjusted according to response.

**CONTRA-INDICATIONS**
- Ovarian cysts (not caused by polycystic ovarian syndrome) - tumours of breast - tumours of hypothalamus - tumours of ovaries - tumours of pituitary - tumours of prostate - tumours of testes - tumours of uterus - vaginal bleeding of unknown cause

**CAUTIONS**
- Acute porphyrias p. 864

**SIDE-EFFECTS**
- Fever - gastro-intestinal disturbances - headache - hypersensitivity reactions - injection site reactions - joint pain - ovarian hyperstimulation
- Very rare: Thromboembolism
- Frequency not known: Acne - gynaecomastia - increased risk of miscarriage - increased risk of multiple pregnancy - weight gain

**PREGNANCY**
- Avoid.
Menotrophin

**INDICATIONS AND DOSE**

Infertility in women with proven hypopituitarism or who have not responded to clomifene | Suproovulation treatment for assisted conception (such as in vitro fertilisation)

**BY SUBCUTANEOUS INJECTION OR BY DEEP INTRAMUSCULAR INJECTION**

**Adult:** Adjusted according to response.

Menotrophin

**INDICATIONS AND DOSE**

Infertility in women with proven hypopituitarism or who have not responded to clomifene | Suproovulation treatment for assisted conception (such as in vitro fertilisation)

**BY SUBCUTANEOUS INJECTION OR BY DEEP INTRAMUSCULAR INJECTION**

**Adult:** Adjusted according to response.

**EDUCATION AND FEEDING**

Avoid.

**DIRECTIONS FOR ADMINISTRATION**

Cartridges and vials are used for subcutaneous administration; vials are used for intramuscular injection.

**PATIENT AND CARER ADVICE**

Patients planning to conceive should be warned that there is a risk of multiple pregnancy.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

EXCIPIENTS: May contain Neomycin, streptomycin

- Puregon (Merck Sharp & Dohme Ltd)
  - Follitropin beta 100 unit per 1 ml Puregon 500units/0.5ml solution for injection vials | 1 vial | £18.03
  - Follitropin beta 200 unit per 1 ml Puregon 1000units/0.5ml solution for injection vials | 1 vial | £36.06
  - Follitropin beta 833 unit per 1 ml Puregon 900units/1.08ml solution for injection vials | 1 vial | £292.23
  - Puregon 600units/0.72ml solution for injection vials | 1 vial | £194.82 | | P33 10 | £97.41

**SIDE-EFFECTS**

Abdominal pain, adnexal torsion, breast pain, ecotopic pregnancy, haemoperitoneum, headache, injection-site reactions, nausea, ovarian cyst, ovarian hyperstimulation syndrome, pelvic pain, somnolence, thromboembolism, vomiting

**CONTRA-INDICATIONS**

Acute porphyrias p. 684

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Puregon (Merck Sharp & Dohme Ltd)
  - Menotrophin 150 unit Menotrophin 150unit powder and solvent for solution for injection vials | 1 vial | £163.80
  - Menotrophin 150 unit Menotrophin 150unit powder and solvent for solution for injection vials | 5 vial | £163.80 | | P33 10 | £327.60
  - Menotrophin 600 unit Menotrophin 600unit powder and solvent for solution for injection vials | 1 vial | £131.04
  - Menotrophin 1200 unit Menotrophin 1200unit powder and solvent for solution for injection vials | 1 vial | £262.08
  - Merional (IBSA Farmaceutici Italia Srl)
    - Menotrophin 75 unit Merional 75unit powder and solvent for solution for injection vials | 1 vial | £279.00
  - Menotrophin 150 unit Merional 150unit powder and solvent for solution for injection vials | 1 vial | £558.00

**Urofollitropin**

**INDICATIONS AND DOSE**

Infertility in women with proven hypopituitarism or who have not responded to clomifene | Suproovulation treatment for assisted conception (such as in vitro fertilisation)

**BY SUBCUTANEOUS INJECTION OR BY DEEP INTRAMUSCULAR INJECTION**

**Adult:** Adjusted according to response.

**CONTRA-INDICATIONS**

Ovarian cysts (not caused by polycystic ovarian syndrome) - tumours of breast - tumours of hypothalamus - tumours of ovaries - tumours of pituitary - tumours of prostate - tumours of testes - tumours of uterus - vaginal bleeding of unknown cause

**CAUTIONS**

Acute porphyrias p. 684

**SIDE-EFFECTS**

Very rare Thromboembolism

**Frequency not known**

Fever, gastro-intestinal disturbances, headache, hypersensitivity reactions, increased risk of miscarriage, increased risk of multiple

**Urofollitropin**

**INDICATIONS AND DOSE**

Infertility in women with proven hypopituitarism or who have not responded to clomifene | Suproovulation treatment for assisted conception (such as in vitro fertilisation)

**BY SUBCUTANEOUS INJECTION OR BY DEEP INTRAMUSCULAR INJECTION**

**Adult:** (consult product literature).
Hypothalamic and anterior pituitary hormone related disorders

7.4 Growth hormone disorders

GROWTH HORMONE RECEPTOR ANTAGONISTS

Pegvisomant

**DRUG ACTION** Pegvisomant is a genetically modified analogue of human growth hormone and is a highly selective growth hormone receptor antagonist.

**INDICATIONS AND DOSE**
Treatment of acromegaly in patients with inadequate response to surgery, radiation, or both, and to treatment with somatostatin analogues (initiated by a specialist)

**BY SUBCUTANEOUS INJECTION**
- Adult: Initially 80 mg for 1 dose, followed by 10 mg daily, then increased in steps of 5 mg daily, adjusted according to response; maximum 30 mg per day

**CAUTIONS**
- Diabetes mellitus (adjustment of antidiabetic therapy may be necessary) - liver disease
- **SIDE-EFFECTS**
  - **Uncommon** Bleeding tendency - leucocytosis - leucopenia - thrombocytopenia
  - **Frequency not known** Abdominal distension - arthralgia - asthenia - constipation - diarrhea - dizziness - drowsiness - dyspepsia - elevated liver enzymes - fatigue - flatulence - headache - hypercholesterolaemia - hyperglycaemia - hypertension - hypoglycaemia - influenza-like syndrome - injection-site reactions - myalgia - nausea - pruritus - rash - sleep disturbances - sweating - tremor - vomiting - weight gain

**SIDE-EFFECTS, FURTHER INFORMATION**

**Injection-site reactions** Rotate injection sites to avoid lipohypertrophy.

**CONCEPTION AND CONTRACEPTION** Possible increase in female fertility.

**PREGNANCY** Avoid.

**BREAST FEEDING** Avoid.

**MONITORING REQUIREMENTS** Monitor liver enzymes every 4–6 weeks for 6 months or if symptoms of hepatitis develop.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**
- Somavert (Pfizer Ltd)
  - Pegvisomant 10 mg Somavert 10 mg powder and solvent for solution for injection vials | 30 vial £1.500.00
  - Pegvisomant 15 mg Somavert 15 mg powder and solvent for solution for injection vials | 30 vial £2.250.00
  - Pegvisomant 20 mg Somavert 20 mg powder and solvent for solution for injection vials | 1 vial £100.00 | 30 vial £3.000.00

**HUMAN GROWTH HORMONES**

Somatropin

(Recombinant Human Growth Hormone)

**INDICATIONS AND DOSE**

_Gonadal dysgenesis (Turner syndrome)_

**BY SUBCUTANEOUS INJECTION**
- Adult: 1.4 mg/m² daily, alternatively
  - 45–50 micrograms/kg daily

_Deficiency of growth hormone_ **BY SUBCUTANEOUS INJECTION**
- Adult: Initially 150–300 micrograms daily, then increased if necessary up to 1 mg daily, dose to be increased gradually, use minimum effective dose (requirements may decrease with age)

Dose equivalence and conversion
Dose formerly expressed in units; somatropin 1 mg equivalent to 3 units.

**CONTRA-INDICATIONS**
Evidence of tumour activity (complete antitumour therapy and ensure intracranial lesions inactive before starting) - not to be used after renal transplantation - not to be used for growth promotion in children with closed epiphyses (or near closure in Prader-Willi syndrome) - severe obesity in Prader-Willi syndrome - severe respiratory impairment in Prader-Willi syndrome

**CAUTIONS**
Diabetes mellitus (adjustment of antidiabetic therapy may be necessary) - disorders of the epiphysis of the hip (monitor for limping) - history of malignant disease - hypothyroidism - manufacturers recommend periodic thyroid function tests but limited evidence of clinical value - initiation of treatment close to puberty not recommended in child born small for corrected gestational age - papilloedema - relative deficiencies of other pituitary hormones - resolved intracranial hypertension (monitor closely) - Silver-Russell syndrome

**INTERACTIONS**
- Appendix 1 (somatropin).

**SIDE-EFFECTS**
Antibody formation - arthralgia - benign intracranial hypertension - carpal tunnel syndrome - fluid retention (peripheral oedema) - headache - hyperglycaemia - hypoglycaemia - hypothyroidism - insulin resistance - leukaemia in children with growth hormone deficiency - myalgia - nausea - papilloedema - paraesthesia - reactions at injection site - visual problems - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

Papilloedema
Funduscopic for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported).

**PREGNANCY** Discontinue if pregnancy occurs—no information available.

**BREAST FEEDING** No information available. Absorption from milk unlikely.

**DIRECTIONS FOR ADMINISTRATION** Rotate subcutaneous injection sites to prevent lipohypertrophy.
Genotropin®, Humatrope cartridges, Norditropin®, NutropinAQ®, Omnitrope®, Saizen® and Zomacton® preparations
For use by subcutaneous injection.

**HUMATROPE® POWDER FOR RECONSTITUTION**
For use by subcutaneous or intramuscular injection.

- **PRESCRIBING AND DISPENSING INFORMATION**
  Medicinal products containing somatropin are not identical and although there should be no important differences in terms of safety and efficacy, when prescribing biological products it is good practice to use the brand name.

**GENOTROPIN® PREPARATIONS**
Cartridges are for use with Genotropin® Pen device (non-NHS but available free of charge from clinics).

**NORDITROPIN® PREPARATIONS**
Cartridges are for use with appropriate NordiPen® device (non-NHS but available free of charge from clinics). Multidose disposable prefilled pens for use with Novofine® or NovoTwist® needles.

**NUTRUPINAQ®**
For use with NutropinAQ® Pen device (non-NHS but available free of charge from clinics).

**OMNITROPE®**
For use with Omnitrope Pen 5° and Omnitrope Pen 10° devices (non-NHS but available free of charge from clinics).

**SAIZEN® POWDER AND SOLVENT FOR SOLUTION FOR INJECTION**
For use with one.click® autoinjector device or cool.click® needle-free autoinjector device or easypod® autoinjector device (non-NHS but available free of charge from clinics).

**SAIZEN® SOLUTION FOR INJECTION**
For use with cool.click® needle-free autoinjector device or easypod® autoinjector device (non-NHS but available free of charge from clinics).

**ZOMACTON®**
4mg vial for use with ZomaJet 2° Vision needle-free device (non-NHS but available free of charge from clinics) or with needles and syringes. 10mg vial for use with ZomaJet Vision X® needle-free device (non-NHS but available free of charge from clinics) or with needles and syringes.

**NATIONAL FUNDING/ACCESS DECISIONS**

- **NICE technology appraisals (TAs)**
  - Somatropin for adults with growth hormone deficiency (August 2003) NICE TA64
    Somatropin is recommended in adults only if the following 3 criteria are fulfilled:
    - Severe growth hormone deficiency, established by an appropriate method,
    - Impaired quality of life, measured by means of a specific questionnaire,
    - Already receiving treatment for another pituitary hormone deficiency.
    Somatropin treatment should be discontinued if the quality of life has not improved sufficiently by 9 months. Severe growth hormone deficiency developing after linear growth is complete but before the age of 25 years should be treated with growth hormone; treatment should continue until adult peak bone mass has been achieved. Treatment for adult-onset growth hormone deficiency should be stopped only when the patient and the patient’s physician consider it appropriate.
    Treatment with somatropin should be initiated and managed by a physician with expertise in growth hormone disorders; maintenance treatment can be prescribed in the community under a shared-care protocol. www.nice.org.uk/TA64

- Somatropin for the treatment of growth failure in children (May 2010) NICE TA188
  Somatropin is recommended for children with growth failure who:
  - have growth-hormone deficiency
  - have Turner syndrome
  - have Prader-Willi syndrome
  - have chronic renal insufficiency
  - are born small for gestational age with subsequent growth failure at 4 years of age or later
  - have short stature homeobox-containing gene (SHOX) deficiency.
  Treatment should be discontinued if growth velocity increases by less than 50% from baseline in the first year of treatment. www.nice.org.uk/TA188

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **EXCIPIENTS**: May contain Benzyl alcohol
  - Norditropin NordiFlex (Novo Nordisk Ltd)
    Somatropin (epr) 5 mg per 1 ml
    Norditropin NordiFlex

Sex hormone responsive conditions

8 Sex hormone responsive conditions

Sex hormones

Oestrogens and HRT

Oestrogens are necessary for the development of female secondary sexual characteristics; they also stimulate myometrial hypertrophy with endometrial hyperplasia. In terms of oestrogenic activity natural oestrogens (estradiol p. 649, estrone, and estriol p. 713) have a more appropriate profile for hormone replacement therapy (HRT) than synthetic oestrogens (ethinylestradiol p. 655 and mestranol). Tibolone p. 646 has oestrogenic, progestogenic and weak androgenic activity.

Oestrogen therapy is given cyclically or continuously for a number of gynaecological conditions. If long-term therapy is required in women with a uterus, a progestogen should normally be added to reduce the risk of cystic hyperplasia of the endometrium (or of endometriotic foci in women who have had a hysterectomy) and possible transformation to cancer.

Oestrogens are no longer used to suppress lactation because of their association with thromboembolism.

Hormone replacement therapy

Hormone replacement therapy (HRT) with small doses of an oestrogen (together with a progestogen in women with a uterus) is appropriate for alleviating menopausal symptoms such as vaginal atrophy or vasomotor instability. Oestrogen given systematically in the perimenopausal and postmenopausal period or tibolone given in the postmenopausal period also diminish postmenopausal osteoporosis but other drugs are preferred. Menopausal atrophic vaginitis may respond to a short course of a topical vaginal oestrogen preparation used for a few weeks and repeated if necessary.

Systemic therapy with an oestrogen or drugs with oestrogenic properties alleviates the symptoms of oestrogen deficiency such as vasomotor symptoms. Tibolone combines oestrogenic and progestogenic activity with weak androgenic activity; it is given continuously, without cyclical progestogen.

HRT may be used in women with early natural or surgical menopause (before age 45 years), since they are at high risk of osteoporosis. For early menopause, HRT can be given until the approximate age of natural menopause (i.e. until age 50 years). Alternatives to HRT should be considered if osteoporosis is the main concern.

Clonidine hydrochloride p. 137 may be used to reduce vasomotor symptoms in women who cannot take an oestrogen, but clonidine hydrochloride may cause unacceptable side-effects.

HRT increases the risk of venous thromboembolism, stroke, endometrial cancer (reduced by a progestogen), breast cancer, and ovarian cancer; there is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. For details of these risks see HRT Risk table.

The minimum effective dose of HRT should be used for the shortest duration. Treatment should be reviewed at least annually and for osteoporosis alternative treatments considered. HRT does not prevent coronary heart disease or protect against a decline in cognitive function and it should not be prescribed for these purposes. Experience of treating women over 65 years with HRT is limited.

For the treatment of menopausal symptoms the benefits of short-term HRT outweigh the risks in the majority of women, especially in those aged under 60 years.

Risk of breast cancer

It is estimated that using all types of HRT, including tibolone, increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping. Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use; tibolone has only a limited effect on mammographic density.

Risk of endometrial cancer

The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT. In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a...
Tibolone increases the risk of breast cancer but to a lesser extent than with combined HRT. Evidence suggests an increased risk of endometrial cancer with tibolone. After 2.7 years of use (in women of average age 68 years), 1 extra case of endometrial hyperplasia and 4 extra cases of endometrial cancer were diagnosed compared with placebo users. The risk of endometrial cancer cannot be reliably estimated in those using combined HRT because the addition of progestogen for at least 10 days per 28-day cycle greatly reduces the additional risk, and addition of a daily progestogen eliminates the additional risk. The risk of endometrial cancer in women who have not used HRT increases with body mass index (BMI); the increased risk of endometrial-only HRT or tibolone is more apparent in women who are not overweight. Limited data does not suggest an increased risk of thromboembolism with tibolone compared with combined HRT or women not taking HRT. Although the level of risk of thromboembolism associated with non-oral routes of administration of HRT has not been established, it may be lower for the transdermal route. Tibolone increases the risk of stroke about 2.2 times from the first year of treatment; risk of stroke is age-dependent and therefore the absolute risk of stroke with tibolone increases with age. There is insufficient data to draw a conclusion on the risk of coronary heart disease with tibolone.

### Risk of ovarian cancer
Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer; this excess risk disappears within a few years of stopping.

### Risk of venous thromboembolism
Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use. In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits. Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

### Risk of stroke
Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke. Tibolone increases the risk of stroke about 2.2 times from the first year of treatment.

### Risk of coronary heart disease
HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

### Choice
The choice of HRT for an individual depends on an overall balance of indication, risk, and convenience. A woman with a uterus normally requires oestrogen with cyclical progestogen for the last 12 to 14 days of the cycle or a preparation which involves continuous administration of an oestrogen and a progestogen (or one which provides both oestrogenic and progestogenic activity in a single preparation). Continuous combined preparations or tibolone are not suitable for use in the perimenopause or within 12 months of the last menstrual period; women who use such preparations may bleed irregularly in the early stages of treatment— if bleeding continues endometrial abnormality should be ruled out and consideration given to changing to cyclical HRT.

An oestrogen alone is suitable for use in women without a uterus. However, in endometriosis, endometrial foci may remain despite hysterectomy and the addition of a progestogen should be considered in these circumstances.

An oestrogen may be given by mouth or by transdermal administration, which avoids first-pass metabolism.

### Surgery
Major surgery under general anaesthesia, including orthopaedic and vascular leg surgery, is a predisposing factor for venous thromboembolism and it may be prudent to stop HRT 4–6 weeks before surgery; it should be restarted only after full mobilisation. If HRT is continued or if discontinuation is not possible (e.g. in non-elective
surgery), prophylaxis with unfractionated or low molecular weight heparin and graduated compression hosiery is advised.

Reasons to stop HRT
Hormone replacement therapy should be stopped (pending investigation and treatment), if any of the following occur:
- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;
- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;
- hepatitis, jaundice, liver enlargement;
- blood pressure above systolic 160 mmHg or diastolic 95 mmHg;
- prolonged immobility after surgery or leg injury;
- detection of a risk factor which contra-indicates treatment

Ethinylestradiol
Ethinylestradiol p. 655 (ethinylestrodiol) is licensed for short-term treatment of symptoms of oestrogen deficiency, for osteoporosis prophylaxis if other drugs cannot be used and for the treatment of female hypogonadism and menstrual disorders. Ethinylestradiol is occasionally used under specialist supervision for the management of hereditary haemorrhagic telangiectasia (but evidence of benefit is limited). It is also used licensed for the palliative treatment of prostate cancer.

Raloxifene
Raloxifene hydrochloride p. 659 is licensed for the treatment of postmenopausal osteoporosis; unlike hormone replacement therapy, raloxifene hydrochloride does not reduce menopausal vasomotor symptoms.

Raloxifene hydrochloride may reduce the incidence of oestrogen-receptor-positive breast cancer but its role in established breast cancer is not yet clear. The manufacturer advises avoiding its use during treatment for breast cancer.

Progestogens and progesterone receptor modulators
There are two main groups of progestogen, progesterone and its analogues (dydrogesterone and medroxyprogesterone acetate p. 695) and testosterone analogues (norethisterone p. 656 and norgestrel). The newer progestogens (desogestrel p. 691, norgestimate, and gestodene) are all derivatives of norgestrel; levonorgestrel p. 692 is the active isomer of norgestrel and has twice its potency. Progestogen p. 658 and its analogues are less androgenic than the testosterone derivatives and neither progestogen nor dydrogesterone causes virilisation.

Where endometriosis requires drug treatment, it may respond to a progestogen, e.g. norethisterone, administered on a continuous basis. Danazol p. 626 and gonadorelin analogues are also available.

Although oral progestogens have been used widely for menorrhagia they are relatively ineffective compared with tranexamic acid p. 95 or, particularly where dysmenorrhoea is also a factor, mefenamic acid p. 932; the levonorgestrel-releasing intra-uterine system may be particularly useful for women also requiring contraception. Oral progestogens have also been used for severe dysmenorrhoea, but where contraception is also required in younger women the best choice is a combined oral contraceptive.

Progestogens have also been advocated for the alleviation of premenstrual symptoms, but no convincing physiological basis for such treatment has been shown.

Progestogens have been used for the prevention of miscarriage in women with a history of recurrent miscarriage but there is no evidence of benefit and they are not recommended for this purpose. In pregnant women with antiphospholipid antibody syndrome who have suffered recurrent miscarriage, administration of low-dose aspirin p. 104 and a prophylactic dose of a low molecular weight heparin may decrease the risk of fetal loss (use under specialist supervision only).

Hormone replacement therapy
In women with a uterus a progestogen needs to be added to long-term oestrogen therapy for hormone replacement, to prevent cystic hyperplasia of the endometrium and possible transformation to cancer; it can be added on a cyclical or a continuous basis. Combined packs incorporating suitable progestogen tablets are available.

Oral contraception
Desogestrel, gestodene, levonorgestrel, norethisterone, and norgestimate are used in combined oral contraceptives and in progestogen-only contraceptives.

Cancer
Progestogens also have a role in neoplastic disease.

Progesterone receptor modulators
Ulipristal acetate p. 691 is a progesterone receptor modulator with a partial progesterone antagonist effect. Ulipristal acetate is used in the pre-operative treatment of moderate to severe symptoms of uterine fibroids; it is also used as an hormonal emergency contraceptive.

8.1 Female sex hormone responsive conditions

Drugs used for Female sex hormones responsive conditions not listed below; Medroxyprogesterone acetate, p. 695; Clonidine hydrochloride, p. 137

NORETYNODREL DERIVATIVES

Tibolone

INDICATIONS AND DOSE
Short-term treatment of symptoms of oestrogen deficiency (including women being treated with gonadotrophin releasing hormone analogues) | Osteoporosis prophylaxis in women at high risk of fractures when other prophylaxis contra-indicated or not tolerated

BY MOUTH
- Adult: 2.5 mg daily

CONTRA-INDICATIONS
Acute porphyrias p. 864 | acute or recent arterial thromboembolic disease (e.g. angina or myocardial infarction) | active thrombophlebitis | Dubin-Johnson and Rotor syndrome (or monitor closely) | history of breast cancer | history of cardiovascular disease | history of cerebrovascular disease | history of recurrent venous thromboembolism (unless already on anticoagulant treatment) | history of thromboembolism | history of thrombophlebitis | hormone-dependent tumours | liver disease (where liver function tests have failed to return to normal) | oestrogen-dependent cancer | thrombophilic disorder | uninvestigated or undiagnosed
vaginal bleeding • untreated endometrial hyperplasia • venous thromboembolism

- CAUTIONS Acute porphyrias p. 864 • diabetes (increased risk of heart disease) • epilepsy • factors predisposing to thromboembolism • history of breast nodules—closely monitor breast status (risk of breast cancer) • history of endometrial hyperplasia • history of fibrocystic disease—closely monitor breast status (risk of breast cancer) • history of liver disease • hypertriglyceridaemia • hypophysial tumours • migraine (or migraine-like headaches) • presence of antiphospholipid antibodies (increased risk of thrombotic events) • prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer • risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) • risk of stroke

CAUTIONS, FURTHER INFORMATION

Other conditions The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

- INTERACTIONS Appendix 1 (tibolone).

- SIDE-EFFECTS

  - Common or very common Abdominal pain • facial hair • leucorrhoea • vaginal bleeding • weight changes
  - Rare Amnesia
  - Frequency not known Arthralgia • breast cancer • depression • dizziness • gastro-intestinal disturbances • headache • increased risk of gall-bladder disease • migraine • myalgia • oedema • pruritus • rash • seborrhoeic dermatitis • symptoms of endometriosis may be exacerbated • uterine fibroids may increase in size • visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

Vaginal bleeding Investigate for endometrial cancer if bleeding continues beyond 6 months or after stopping treatment.

Reasons to withdraw treatment Withdraw treatment if signs of thromboembolic disease, abnormal liver function tests, or signs of cholestatic jaundice.

- PREGNANCY Avoid; toxicity in animal studies.

- BREAST FEEDING Avoid.

- HEPATIC IMPAIRMENT Avoid in acute liver disease or if history of liver disease and liver function tests not returned to normal.

- RENAL IMPAIRMENT Patients with renal impairment should be closely monitored (risk of fluid retention).

- PRESCRIBING AND DISPENSING INFORMATION Unsuitable for use in the premenopause (unless being treated with gonadotrophin-releasing hormone analogue) and as (or with) an oral contraceptive. Also unsuitable for use within 12 months of last menstrual period (may cause irregular bleeding). If transferring from cyclical HRT, start at end of regimen; if transferring from continuous-combined HRT, start at any time.

- MEDICINAL FORMS

  There can be variation in the licensing of different medicines containing the same drug.

Tablet

- TIBOLONE (Non-proprietary)

  Tibolone 2.5 mg | tablet 28 | price £10.36 DF
  Tibolone 2.5 mg | tablet 84 | price £31.08

  Livial 2.5 mg | tablet 28 | price £10.36 DF
  Livial 2.5 mg | tablet 84 | price £31.08

OESTROGENS

Conjugated oestrogens (equine)

INDICATIONS AND DOSE

PREMARIN® TABLETS

Menopausal symptoms

BY MOUTH

- Adult: 0.3–1.25 mg daily continuously; with cyclical progestogen for 12–14 days of each cycle in women with a uterus

Osteoporosis prophylaxis

BY MOUTH

- Adult: 0.625–1.25 mg daily continuously; with cyclical progestogen for 12–14 days of each cycle in women with a uterus

- CONTRA-INDICATIONS Active arterial thromboembolic disease (e.g. angina or myocardial infarction) • active thrombophlebitis • Dubin-Johnson syndromes (or monitor closely) • history of breast cancer • history of recurrent venous thromboembolism (unless already on anticoagulant treatment) • liver disease (where liver function tests have failed to return to normal) • oestrogen-dependent cancer • recent arterial thromboembolic disease (e.g. angina or myocardial infarction) • Rotor syndromes (or monitor closely) • thrombophilic disorder • undiagnosed vaginal bleeding • untreated endometrial hyperplasia • venous thromboembolism

- CAUTIONS Acute porphyrias p. 864 • diabetes (increased risk of heart disease) • factors predisposing to thromboembolism • history of breast nodules (closely monitor breast status—risk of breast cancer) • history of endometrial hyperplasia • history of fibrocystic disease (closely monitor breast status—risk of breast cancer) • hypophysial tumours • increased risk of gall-bladder disease reported • migraine • migraine-like headaches • presence of antiphospholipid antibodies (increased risk of thrombotic events) • risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) • risk of breast cancer

CAUTIONS, FURTHER INFORMATION

Risk of breast cancer It is estimated that using all types of HRT, including tibolone, increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping. Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use.

Risk of endometrial cancer The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT. In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

Risk of ovarian cancer Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.

Risk of venous thromboembolism Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use. In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is
prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits. Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

Risk of stroke Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke.

Risk of coronary heart disease HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

Other conditions The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

INTERACTIONS ➔ Appendix 1 (oestrogens).

SIDE-EFFECTS Abdominal bloating - abdominal cramps - altered blood lipids (may lead to pancreatitis, rashes and chloasma) - breast enlargement - breast tenderness - changes in libido - cholestatic jaundice - contact lenses may irritate - depression - dizziness - fluid retention - glucose intolerance - headache - headache (on vigorous exercise) - leg cramps (rule out venous thrombosis) - migraine - mood changes - nausea - premenstrual-like syndrome - prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer - sodium retention - symptoms of endometriosis may be exacerbated - uterine fibroids may increase in size - vaginal candidiasis - vomiting - weight changes

SIDE-EFFECTS, FURTHER INFORMATION Withdrawal bleeding Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. The aim of continuous combined HRT (where a combination of oestrogen and progestogen is taken, usually in a single tablet, throughout each 28-day treatment cycle) is to avoid bleeding, but irregular bleeding may occur during the early treatment stages (if it continues endometrial abnormality should be excluded and consideration given to cyclical HRT instead).

CONCEPTION AND CONTRACEPTION HRT does not provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary. Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant.

PREGNANCY Not known to be harmful.

BREAST FEEDING Avoid until weaning or for 6 months after birth (adverse effects on lactation).

HEPATIC IMPAIRMENT Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin–Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Tablet

- CONJUGATED OESTROGENS (EQUINE) (Non-proprietary)
  - Conjugated oestrogens 625 microgram Conjugated oestrogens 625 microgram tablets | 42 tablet (Pfizer) no price available | 84 tablet (Pfizer) no price available DT price = £4.02

---

**Endocrine system**
to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, therapy should be initiated with Evorel 50 patch; subsequently adjust according to response; dose may be reduced to Evorel 25 patch after first month if necessary for menopausal symptoms only

FEMSEVEN®

Menopausal symptoms | Osteoporosis prophylaxis
BY TRANSDERMAL APPLICATION
- Adult: Apply 1 patch once weekly continuously, to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with FemSeven 50 patches for the first few months, subsequently adjust according to response

PROGYNOVA® TS

Menopausal symptoms | Osteoporosis prophylaxis
BY TRANSDERMAL APPLICATION
- Adult: Apply 1 patch once weekly continuously, alternatively apply 1 patch once weekly for 3 weeks, followed by a 7-day patch-free interval (cyclical), to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with Progynova TS 50, subsequently adjust according to response; women receiving Progynova TS 100 patches for menopausal symptoms may continue with this strength for osteoporosis prophylaxis

OESTROGEL®

Menopausal symptoms
TO THE SKIN
- Adult: Apply 1.5 mg once daily continuously, increased if necessary up to 3 mg after 1 month continuously, to be applied over an area twice that of the template provided, starting within 5 days of menstruation (or anytime if cycles have ceased or are infrequent), to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus

Osteoporosis prophylaxis
TO THE SKIN
- Adult: Apply 1.5 mg once daily continuously, to be applied over an area twice that of the template provided, starting within 5 days of menstruation (or anytime if cycles have ceased or are infrequent), to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus

Dose equivalence and conversion
2 measures is equivalent to estradiol 1.5 mg

SANDRENA®

Menopausal symptoms
TO THE SKIN
- Adult: Apply 1 mg once daily, to be applied over area 1–2 sizes of hand; with cyclical progestogen for 12–14 days of each cycle in women with a uterus, dose may be adjusted after 2–3 cycles to lowest effective dose; usual dose 0.5–1.5 mg daily

ESTRING®

Postmenopausal urogenital conditions (not suitable for vasomotor symptoms or osteoporosis prophylaxis)
BY VAGINA
- Adult: To be inserted into upper third of vagina and worn continuously; replace after 3 months; max. duration of continuous treatment 2 years

VAGIFEM®

Improve the vaginal epithelium in menopausal atrophic vaginitis
BY VAGINA
- Adult: 1 tablet daily for 2 weeks, then reduced to 1 tablet twice weekly

● CONTRA-INDICATIONS
- Active arterial thromboembolic disease (e.g. angina or myocardial infarction) - active thrombophlebitis - Dubin-Johnson syndrome (or monitor closely) - history of breast cancer - history of recurrent venous thromboembolism (unless already on anticoagulant treatment) - oestrogen-dependent cancer - recent arterial thromboembolic disease (e.g. angina or myocardial infarction) - Rotor syndrome (or monitor closely) - thrombophilic disorder - undiagnosed vaginal bleeding - untreated endometrial hyperplasia - venous thromboembolism

● CAUTIONS

GENERAL CAUTIONS
- Acute porphyrias p. 864 - diabetes (increased risk of heart disease) - history of breast nodules—closely monitor breast status (risk of breast cancer) - history of endometrial hyperplasia; factors predisposing to thromboembolism - history of fibrocystic disease—closely monitor breast status (risk of breast cancer) - hypophyseal tumours - increased risk of gall-bladder disease - migraine (or migraine-like headaches) - presence of anti-phospholipid antibodies (increased risk of thrombotic events) - prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer - risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) - symptoms of endometriosis may be exacerbated - uterine fibroids may increase in size

SPECIFIC CAUTIONS
- With vaginal use Interrupt treatment periodically to assess need for continued treatment

CAUTIONS, FURTHER INFORMATION

Risk of breast cancer
- It is estimated that using all types of HRT increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping. Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use.

Risk of endometrial cancer
- The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT. In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

Risk of ovarian cancer
- Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.

Risk of venous thromboembolism
- Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use. In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits. Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

Risk of stroke
- Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke.

Risk of coronary heart disease
- HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little
information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women. 

**Other conditions** The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

**INTERACTIONS** → Appendix 1 (oestrogens).

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

Abdominal bloating - abdominal cramps - altered blood lipids (may lead to pancreatitis, rashes and chloasma) - breast enlargement - breast tenderness - changes in libido - cholestatic jaundice - contact lenses may irritate - depression - dizziness - fluid retention - glucose intolerance - headache - headache (on vigorous exercise) - leg cramps (rule out venous thrombosis) - migraine - mood changes - nausea - premenstrual-like syndrome - sodium retention - vaginal candidiasis - vomiting - weight changes

**SPECIFIC SIDE-EFFECTS**

- **With transdermal use** Cause contact sensitisation (possible severe hypersensitivity reaction on continued exposure)
- **With vaginal use** Local irritation

**SIDE-EFFECTS, FURTHER INFORMATION**

**Withdrawal bleeding** Cylindrical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. The aim of continuous combined HRT (where a combination of oestrogen and progestogen is taken, usually in a single tablet, throughout each 28-day treatment cycle) is to avoid bleeding, but irregular bleeding may occur during the early treatment stages (if it continues endometrial abnormality should be excluded and consideration given to cyclical HRT instead).

**CONCEPTION AND CONTRACEPTION** HRT does not provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary. Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant.

**VAGIFEM®** No evidence of damage to latex condoms and diaphragms.

**PREGNANCY** Not known to be harmful.

**BREAST FEEDING** Avoid; adverse effects on lactation.

**HEPATIC IMPAIRMENT** Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin–Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.

**MONITORING REQUIREMENTS**

- History of breast nodules or fibrocystic disease—closely monitor breast status (risk of breast cancer).
- The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

**DIRECTIONS FOR ADMINISTRATION**

- **With transdermal use** Patch should be removed after 3–4 days (or once a week in case of 7-day patch) and replaced with fresh patch on slightly different site; recommended sites: clean, dry, unbroken areas of skin on trunk below waistline; not to be applied on or near breasts or under waistband. If patch falls off in bath allow skin to cool before applying new patch.

**PATIENT AND CARER ADVICE**

- **With transdermal use** Patient counselling is advised for estradiol patches (administration).
- **With topical use** Patient counselling is advised for estradiol gels (administration).

**OSTROGEL®** Apply gel to clean, dry, intact skin such as arms, shoulders or inner thighs and allow to dry for 5 minutes before covering with clothing. Not to be applied on or near breasts or on vulval region. Avoid skin contact with another person (particularly male) and avoid other skin products or washing the area for at least 1 hour after application.

**SANDRENA®** Apply gel to intact areas of skin such as lower trunk or thighs, using right and left sides on alternate days. Wash hands after application. Not to be applied on the breasts or face and avoid contact with eyes. Allow area of application to dry for 5 minutes and do not wash area for at least 1 hour.

**INDICATIONS AND DOSE**

**Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously**

- **Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 12 months previously**
  - **BY MOUTH**
  - **Adult:** 1 tablet daily continuously, if changing from cyclical HRT begin treatment the day after finishing oestrogen plus progestogen phase

**CAUTIONS**

- **Use with care if an increased concentration of potassium might be hazardous**

**RENAI IMPAIRMENT**

- **Avoid if eGFR less than 30 mL/minute/1.73 m².**

**MEDICINAL FORMS**

- **There can be variation in the licensing of different medicines containing the same drug.**

**Tablet**

- **Angeliq (Bayer Plc)**
  - **Drospirenone 2 mg, Estradiol (as Estradiol hemihydrate) 1 mg**
  - **Angeliq tablets 84 tablet (Pf) £29.00**

**Drospirenone with estradiol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, estradiol p. 649.

**INDICATIONS AND DOSE**

**FEMOSTON®-CONTI 0.5 MG/2.5 MG**

- **Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously**

  - **BY MOUTH**
  - **Adult:** 1 tablet daily continuously, if changing from cyclical HRT begin treatment the day after finishing oestrogen plus progestogen phase

**FEMOSTON®-CONTI 1 MG/5 MG**

- **Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously**

  - **BY MOUTH**
  - **Adult:** 1 tablet daily continuously, if changing from cyclical HRT begin treatment the day after finishing oestrogen plus progestogen phase

**FEMOSTON® 1 MG/10 MG**

- **Menopausal symptoms in women with a uterus**

  - **BY MOUTH**
  - **Adult:** 1 tablet daily for 14 days, white tablet to be taken and started within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent), then 1 tablet daily for 14 days, grey tablet to be taken, subsequent courses repeated without interval, Femoston® 1 mg/10 mg given initially and Femoston® 2 mg/10 mg substituted if symptoms not controlled

**Osteoporosis prophylaxis in women with a uterus**

**BY MOUTH**

- **Adult:** 1 tablet daily for 14 days, white tablet to be taken and started within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent), then 1 tablet daily for 14 days, grey tablet to be taken, subsequent courses repeated without interval

**Dydrogesterone with estradiol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, estradiol p. 649.

**INDICATIONS AND DOSE**

**FEMOSTON®-CONTI Protection**

- **Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously**

  - **BY MOUTH**
  - **Adult:** 1 tablet daily continuously, if changing from cyclical HRT begin treatment the day after finishing oestrogen plus progestogen phase

**FEMOSTON®-CONTI Protection 1 MG/5 MG**

- **Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously**

  - **BY MOUTH**
  - **Adult:** 1 tablet daily continuously, if changing from cyclical HRT begin treatment the day after finishing oestrogen plus progestogen phase
 Estradiol with estriol and estrone

**BY MOUTH**

- Adult: 1 tablet daily for 14 days, red tablet to be taken and started within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent), then 1 tablet daily for 14 days, yellow tablet to be taken, subsequent courses repeated without interval.

**INTERACTIONS**

- **CONTRA-INDICATIONS** Acute porphyrias p. 864, genital or breast cancer - history during pregnancy of idiopathic jaundice, severe pruritus, or pemphigoid gestationis, history of liver tumours, severe arterial disease, undiagnosed vaginal bleeding.
- **CAUTIONS** Conditions that may worsen with fluid retention e.g. epilepsy, hypertension, migraine, asthma, or cardiac dysfunction - diabetes (progestogens can decrease glucose tolerance), history of depression - in those susceptible to thromboembolism (particular caution with high dose).
- **SIDE-EFFECTS** Acne, alopecia, anaphylactoid reactions, bloating, breast tenderness, change in libido, depression, dizziness, drowsiness, fluid retention, headache, hirsutism, insomnia, jaundice, menstrual disturbances, nausea, premenstrual-like syndrome, pruritus, rash, skin reactions, utricaria, weight change.
- **HEPATIC IMPAIRMENT** Avoid.
- **RENAL IMPAIRMENT** Use with caution.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **DYDROGESTERONE WITH ESTRADIOL (Non-proprietary)**
  - Dydrogesterone 10 mg, Estradiol 2 mg
  - Dydrogesterone 10 mg tablets / 42 tablet (POM) no price available
  - Dydrogesterone 10 mg, Estradiol 1 mg
  - Estradiol 2 mg / Dydrogesterone 10mg tablets / 42 tablet (POM) no price available
  - Femoston-conti (BGP Products Ltd)
    - Dydrogesterone 2.5 microgram, Estradiol 500 microgram
    - Femoston-conti 0.5mg/2.5mg tablets / 84 tablet (POM) £24.43
    - Dydrogesterone 5 mg, Estradiol 1 mg
    - Femoston-conti 1mg/5mg tablets / 84 tablet (POM) £24.43
    - Femoston 1/10 (BGP Products Ltd)
      - Femoston 1/10 tablets / 84 tablet (POM) £16.16
    - Femoston 2/10 (BGP Products Ltd)
      - Femoston 2/10 tablets / 84 tablet (POM) £16.16

**Medically responsive conditions**

**Estradiol with levonorgestrel**

**INDICATIONS AND DOSE**

**FEMSEVEN CONTI**

Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously.

**BY TRANSDERMAL APPLICATION**

- Adult: Apply 1 patch once weekly continuously.

**FEMSEVEN SEQUI**

Menopausal symptoms in women with a uterus whose last menstrual period occurred over 3 years previously.

**BY TRANSDERMAL APPLICATION**

- Adult: Apply 1 phase 1 patch once weekly for 2 weeks, then apply 1 phase 2 patch once weekly for 2 weeks, subsequent courses are repeated without interval.

**PATIENT AND CARER ADVICE**

Patient counselling is advised for estradiol with levonorgestrel patches (application).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Transdermal patch**

- FemSeven Conti (Teva UK Ltd)
  - Estradiol 50 microgram per 24 hour, Levonorgestrel 7 microgram per 24 hour FemSeven Conti patches / 4 patch (POM) £15.48 / 12 patch (POM) £44.12
- FemSeven Sequi (Teva UK Ltd)
  - Estradiol 50 microgram per 24 hour, Levonorgestrel 7 microgram per 24 hour FemSeven Sequi patches / 4 patch (POM) £13.18 / 12 patch (POM) £37.54

**Estradiol with medroxyprogesterone**

The properties listed below are those particular to the combination only. For the properties of the components please consider, medroxyprogesterone acetate p. 695, estradiol p. 649.

**INDICATIONS AND DOSE**

**INDIVINA**

Menopausal symptoms in women with a uterus whose last menstrual period occurred over 3 years previously. Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 3 years previously.

**BY MOUTH**

- Adult: Initially 1/2.5 mg daily taken continuously, adjusted according to response, to be started at end of scheduled bleed if changing from cyclical HRT.

**TRIDESTRA**

Menopausal symptoms in women with a uterus. Osteoporosis prophylaxis in women with a uterus.

**BY MOUTH**

- Adult: 1 white tablet daily for 70 days, then 1 blue tablet daily for 14 days, then 1 yellow tablet daily for 7 days, subsequent courses are repeated without interval.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.
### Estradiol with norethisterone

The properties listed below are those particular to the combination only. For the properties of the components please consider, norethisterone p. 656, estradiol p. 649.

#### INDICATIONS AND DOSE

**CLIMAGEST® 1-MG**

**Menopausal symptoms**

**BY MOUTH**

- Adult: 1 grey tablet daily for 16 days, started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 white tablet daily for 12 days, subsequent courses are repeated without interval.

**CLIMAGEST® 2-MG**

**Menopausal symptoms (if symptoms not controlled with lower strength)**

**BY MOUTH**

- Adult: 1 blue tablet daily for 16 days, started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 white tablet daily for 12 days, subsequent courses are repeated without interval.

**CLIMESSE®**

**Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously**

**Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 12 months previously**

**BY MOUTH**

- Adult: 1 tablet daily continuously.

**CLINOCETTE®**

**Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus**

**BY MOUTH**

- Adult: 1 white tablet daily for 16 days, starting on day 5 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 pink tablet daily for 12 days, subsequent courses repeated without interval.

**ELLESTE-DUET® CONTI**

**Menopausal symptoms in women with a uterus whose last menstrual period occurred over 12 months previously | Osteoporosis prophylaxis in women with a uterus whose last menstrual period occurred over 12 months previously**

**BY MOUTH**

- Adult: 1 tablet daily continuous basis, if changing from cyclical HRT begin treatment at the end of scheduled bleed.

**ELLESTE-DUET® 1-MG**

**Menopausal symptoms**

**BY MOUTH**

- Adult: 1 white tablet daily for 16 days, started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 green tablet daily for 12 days, subsequent courses are repeated without interval.
PATIENT AND CARER ADVICE

EVOREL® SEQUI

Patients and carers should be advised on the application of Evorel® Sequi patches.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Estradiol with norgestrel

The properties listed below are those particular to the combination only. For the properties of the components please consider, estradiol p. 649.

INDICATIONS AND DOSE

Cyclo-Progynova® 2MG TABLETS

Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus

BY MOUTH

- Adult: 1 white tablet daily for 11 days; started on day 5 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 brown tablet daily for 10 days, followed by a 7-day tablet free interval

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- Cyclo-Progynova (Meda Pharmaceuticals Ltd)
  Cyclo-Progynova 2mg tablets | 21 tablet (POD) £3.11

Ethinylestradiol

(Ethinyleoestradiol)

INDICATIONS AND DOSE

Short-term treatment of symptoms of oestrogen deficiency | Osteoporosis prophylaxis if other drugs cannot be used

BY MOUTH

- Adult: 10–50 micrograms daily for 21 days, repeated after 7-day tablet-free period, to be given with progestogen for 12–14 days per cycle in women with intact uterus.

Female hypogonadism

BY MOUTH

- Adult: 10–50 micrograms daily usually on cyclical basis, initial oestrogen therapy should be followed by combined oestrogen and progestogen therapy.

Menstrual disorders

BY MOUTH

- Adult: 20–50 micrograms daily from day 5 to 25 of each cycle, to be given with progestogen, added either throughout the cycle or from day 15 to 25.

Palliative treatment of prostate cancer

BY MOUTH

- Adult: 0.15–1.5 mg daily.

CONTRA-INDICATIONS

Acute porphyrias p. 864 - active or recent arterial thromboembolic disease (e.g. angina or myocardial infarction) - active thrombophlebitis - Dubin-Johnson and Rotor syndromes (or monitor closely) - gallstones - heart disease associated with pulmonary hypertension - heart disease associated with risk of embolus - history during pregnancy of cholestatic jaundice - history during pregnancy of oestrogen-dependent cancer - history during pregnancy of phegmphoid gastropathies - history during pregnancy of pruritus - history of breast cancer - history of haemolytic uraemic syndrome - liver disease (where liver function tests have failed to return to normal) - migraine with aura - oestrogen-dependent cancer - sclerosing treatment for varicose veins - severe or multiple risk factors for arterial disease - severe or multiple risk factors for venous thromboembolism - systemic lupus erythematosus with (or unknown) antiphospholipid antibodies - thrombophilic disorder - transient cerebral ischaemic attacks without headaches - undiagnosed vaginal bleeding - untreated endometrial hyperplasia - venous thromboembolism, or history of recurrent venous thromboembolism (unless already on anticoagulant treatment)

CAUTIONS

Active trophoblastic disease (until return to normal of urine - and plasma-gonadotrophin concentration) - seek specialist advice - cardiovascular disease (sodium retention with oedema, thromboembolism) - Crohn’s disease - diabetes (increased risk of heart disease) - gene mutations associated with breast cancer (e.g. BRCA 1) - history of breast nodules or fibrocystic disease - history of severe depression especially if induced by hormonal contraception - hyperprolactinaemia (seek specialist advice) - hypophysial tumours - increased risk of gall-bladder disease - inflammatory bowel disease - migraine (migraine-like headaches) - personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) - presence of antiphospholipid antibodies (increased risk of thrombotic events) - prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer - risk factors for arterial disease - risk factors for migraine - risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) - risk factors for venous thromboembolism - sickle-cell disease - undiagnosed breast mass
CAUTIONS, FURTHER INFORMATION

Other conditions

The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present, see above). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

Risk of venous thromboembolism

Use with caution if any of following factors present but avoid if two or more factors present:

- family history of venous thromboembolism in first-degree relative aged under 45 years (avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies including lupus anticoagulant);
- obesity—body mass index ≥30 kg/m² (avoid if body mass index ≥35 kg/m² unless no suitable alternative); (In adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
- long-term immobilisation e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
- history of superficial thrombophlebitis;
- age over 35 years (avoid if over 50 years);
- smoking.

Risk factors for arterial disease

Use with caution if any one of following factors present but avoid if two or more factors present:

- family history of arterial disease in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
- diabetes mellitus (avoid if diabetes complications present);
- hypertension—blood pressure above systolic 140 mmHg or diastolic 90 mmHg (avoid if blood pressure above systolic 160 mmHg or diastolic 95 mmHg); (In adolescents, caution if blood pressure very high);
- smoking (avoid if smoking 40 or more cigarettes daily);
- age over 35 years (avoid if over 50 years);
- obesity (avoid if body mass index ≥35 kg/m² unless no suitable alternative); (In adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
- migraine without aura (avoid if migraine with aura (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).

Migraine

Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour).

INTERACTIONS

Appendix 1 (oestrogens).

SIDE-EFFECTS

- Rare
- Gallstones • systemic lupus erythematosus
- Frequency not known
- Abdominal bloating • abdominal cramps • absence of withdrawal bleeding • altered blood lipids (may lead to pancreatitis) • amenorrhoea after discontinuation • breast enlargement • breast secretion • breast tenderness • cervical erosion • changes in libido • changes in lipid metabolism • changes in vaginal discharge • chloasma • cholestatic jaundice • chorea • contact lenses may irritate • depression • dizziness • feminising effects • fluid retention • glucose intolerance • headache • hepatic tumours • hypertension • irritability • leg cramps (rule out venous thrombosis) • liver impairment • migraine • mood changes • nausea • nervousness • photosensitivity • premenstrual-like syndrome • rash • reduced menstrual loss • skin reactions • sodium retention • symptoms of endometriosis may be exacerbated • thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB) • uterine fibroids may increase in size • vaginal candidiasis • visual disturbances • vomiting • weight changes • ‘spotting’ in early cycles

SIDE-EFFECTS, FURTHER INFORMATION

Withdrawal bleeding

Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. The aim of continuous combined HRT (where a combination of oestrogen and progestogen is taken, usually in a single tablet, throughout each 28-day treatment cycle) is to avoid bleeding, but irregular bleeding may occur during the early treatment stages (if it continues endometrial abnormality should be excluded and consideration given to cyclical HRT instead).

- PREGNANCY
- Not known to be harmful.
- BREAST FEEDING
- Avoid until weaning or for 6 months after birth (adverse effects on lactation).
- HEPATIC IMPAIRMENT
- Avoid.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, capsule

Tablet

- ETHINYLESTRADIOL (Non-proprietary)

DIFFERENTIATED PROGESTOGENS

Norethisterone

INDICATIONS AND DOSE

Endometriosis

BY MOUTH

- Adult: 10–15 mg daily for 4–6 months or longer, to be started on day 5 of cycle; increased to 20–25 mg daily if required, dose only increased if spotting occurs and reduced once bleeding has stopped

Dysfunctional uterine bleeding (to arrest bleeding)

BY MOUTH

- Adult: 5 mg 3 times a day 10 days

Dysfunctional uterine bleeding (to prevent bleeding)

BY MOUTH

- Adult: 5 mg twice daily, to be taken from day 19 to day 26 of cycle

Dysmenorrhoea

BY MOUTH

- Adult: 5 mg 3 times a day for 3–4 cycles, to be taken from day 5–24 of cycle

Premenstrual syndrome (but not recommended)

BY MOUTH

- Adult: 5 mg 2–3 times a day for several cycles, to be taken from day 19–26 of cycle

Postponement of menstruation

BY MOUTH

- Females of childbearing potential: 5 mg 3 times a day, to be started 3 days before expected onset (menstruation occurs 2–3 days after stopping)
Breast cancer
BY MOUTH
▶ Adult: 40 mg daily, increased if necessary to 60 mg daily

Short-term contraception
BY DEEP INTRAMUSCULAR INJECTION
▶ Females of childbearing potential: 200 mg, to be administered within first 5 days of cycle or immediately after parturition (duration 8 weeks), then 200 mg after 8 weeks if required

Contraception
BY MOUTH
▶ Females of childbearing potential: 350 micrograms daily, dose to be taken at same time each day, starting on day 1 of cycle then continuously, if administration delayed for 3 hours or more it should be regarded as a ‘missed pill’

CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS
Avoid in patients with a history of liver tumours - breast cancer (unless progestogens are being used in the management of this condition) - genital cancer (unless progestogens are being used in the management of this condition) - history during pregnancy of idiopathic jaundice - history during pregnancy of phephigoid gestationis (non-contraceptive indications) - history during pregnancy of severe pruritus (non-contraceptive indications) - when used as a contraceptive, history of breast cancer (can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable)

SPECIFIC CONTRA-INDICATIONS
▶ With oral use Acute porphyrias p. 864 - severe arterial disease - undiagnosed vaginal bleeding

CAUTIONS

GENERAL CAUTIONS
Asthma - cardiac dysfunction - conditions that may worsen with fluid retention - diabetes (progestogens can decrease glucose tolerance—monitor patient closely) - epilepsy - history of depression - hypertension - migraine - susceptibility to thromboembolism (particular caution with high dose)

SPECIFIC CAUTIONS
▶ When used for contraception Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice - arterial disease - functional ovarian cysts - history of jaundice in pregnancy - malabsorption syndromes - past ectopic pregnancy - sex-steroid dependent cancer - systemic lupus erythematosus with positive (or unknown) anti-phospholipid antibodies with intramuscular use for contraception disturbances of lipid metabolism - history during pregnancy of deterioration of otosclerosis - history during pregnancy of pruritus - possible risk of breast cancer

CAUTIONS, FURTHER INFORMATION
Use as a contraceptive in co-morbidities The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.

Breast cancer risk with contraceptive use There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

INTERACTIONS
▶ Appendix 1 (progestogens).

With intramuscular use Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. The effectiveness of norethisterone intramuscular injection is not affected by enzyme-inducing drugs and may be continued as normal during courses of these drugs.

SIDE-EFFECTS

GENERAL SIDE-EFFECTS
Acne - alopecia - anaphylactoid reactions - breast tenderness - change in libido - depression - disturbance of appetite - dizziness - fluid retention - headache - hirsutism - insomnia (non-contraceptive indications) - jaundice - menstrual disturbances - nausea - premenstrual-like syndrome - pruritus - rash - skin reactions - urticaria - vomiting - weight change

SPECIFIC SIDE-EFFECTS
▶ With intramuscular use Injection-site reactions

SIDE-EFFECTS, FURTHER INFORMATION
Cervical cancer Use of injectable progestogen-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives (use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years). The risk of cervical cancer with other progestogen-only contraceptives is not yet known.

PREGNANCY Masculinisation of female fetuses and other defects reported with non-contraceptive use.

BREAST FEEDING Progestogen-only contraceptives do not affect lactation. Higher doses (used in malignant conditions) may suppress lactation and alter milk composition—use lowest effective dose.

With intramuscular use Withhold breast-feeding for neonates with severe or persistent jaundice requiring medical treatment.

HEPATIC IMPAIRMENT When used as a contraceptive; caution in severe liver disease and recurrent cholestatic jaundice, avoid in liver tumour. Avoid in non-contraceptive indications.

RENAL IMPAIRMENT Use with caution in non-contraceptive indications.

PATIENT AND CARER ADVICE
Missed oral contraceptive pill The following advice is recommended: ‘If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days.’

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

Diarrhoea and vomiting with oral contraceptives Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.
Starting routine for oral contraceptives. One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not necessary when initiating treatment.

Changing from a combined oral contraceptive: start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth: oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days. Contraceptives by injection: Full counselling backed by patient information leaflet required before administration—likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

- **Primolut N (Bayer Plc)**
  - Primolut N 5 mg tablets | 30 tablet | £0.50 DT price | £2.35
  - Ulotvlan (Pfizer Ltd)
  - Norethisterone 5 mg tablets | 30 tablet | £0.50 DT price | £2.35

#### Solution for injection

- **Noristerat** (Bayer Plc)
  - Norethisterone enantate 200 mg per 1 ml injection ampoules | 1 ampoule | £0.55

Also available in combination with estradiol, p. 654

### SIDE-EFFECTS

- Acne
- Alopecia
- Anaphylactoid reactions
- Gastro-intestinal disturbances
- Headache
- Hirsutism
- Insomnia
- Jaundice
- Menstrual disturbances
- Nausea
- Premenstrual-like syndrome
- Pruritus
- Rash
- Skin reactions
- Urticaria
- Weight change

### CONTRA-INDICATIONS

- Acute porphyrias p. 864
- Av avoidance in patients with a history of liver tumours—breast cancer (unless progestogens are being used in the management of this condition)—genital cancer (unless progestogens are being used in the management of this condition)—history during pregnancy of idiopathic jaundice—history during pregnancy of pemphigoid gestationis—history during pregnancy of severe pruritus—Incomplete miscarriage—missed miscarriage—severe arterial disease—undiagnosed vaginal bleeding

### CAUTIONS

- Asthma
- Cardiac dysfunction—conditions that may worsen with fluid retention—diabetes (progestogens can decrease glucose tolerance—monitor patient closely)
- Epilepsy
- History of depression
- Hypertension
- Migraine
- Susceptibility to thromboembolism (particular caution with high dose)

### INTERACTIONS

- 

### ESTRADIOL

#### INSTRUCTIONS

- 

### DIRECTIONS FOR ADMINISTRATION

Capsules should be taken at bedtime on an empty stomach.

### PATIENT AND CARER ADVICE

Patient counselling is advised for progesterone capsules (administration).
Anti-oestrogens 659

### 8.2 Anti-oestrogens

#### Clomifene citrate (Clomiphene citrate)

- **Drug action** Anti-oestrogen which induces gonadotrophin release by occupying oestrogen receptors in the hypothalamus, thereby interfering with feedback mechanisms; choriionic gonadotrophin is sometimes used as an adjunct.

#### Indications and dose

**Treatment of female infertility due to oligomenorrhoea or secondary amenorrhoea (e.g. associated with polycystic ovarian disease)**

- **By mouth**
  - Adult: 50 mg daily for 5 days, to be started within about 5 days of onset of menstruation (preferably on 2nd day) or at any time (normally preceded by a progesterone induced withdrawal bleed) if cycles have ceased, followed by 100 mg daily if required for a further 5 days, this second course may be given in absence of ovulation; most patients who are going to respond will do so to first course, 2 courses should constitute adequate therapeutic trial; long-term cyclical therapy not recommended.

#### Important safety information

The CSM has recommended that clomifene should not normally be used for longer than 6 cycles (possibly increased risk of ovarian cancer).
CONTRA-INDICATIONS Abnormal uterine bleeding of undetermined cause • hormone-dependent tumours • ovarian cysts

CAUTIONS Ectopic pregnancy • incidence of multiple births increased (consider ultrasound monitoring) • ovarian hyperstimulation syndrome • polycystic ovary syndrome (cysts may enlarge during treatment, also risk of exaggerated response to usual doses) • uterine fibroids

SIDE-EFFECTS Abdominal discomfort • breast tenderness • convulsions • depression • diziness • endometriosis • hair loss • headache • hot flushes • insomnia • intermenstrual spotting • menorrhagia • nausea • ovarian hyperstimulation (withdraw) • rashes • visual disturbances (withdraw and initiate ophthalmological examination) • vomiting • weight gain

CONCEPTION AND CONTRACEPTION Exclude pregnancy before treatment.

PREGNANCY Possible effects on fetal development.

BREAST FEEDING May inhibit lactation.

HEPATIC IMPAIRMENT Avoid in severe liver disease.

PATIENT AND CARER ADVICE Patients planning to conceive should be warned that there is a risk of multiple pregnancy (rarely more than twins).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- Clomifene citrate (Non-proprietary)
  Clomifene citrate 50 mg (Clomifene 50mg tablets | 30 tablet [PAR])
  £21.74 DT price = £21.74
- Clomid (Sanofi)
  Clomifene citrate 50 mg Clomid 50mg tablets | 30 tablet [PAR]
  £8.46 DT price = £21.74

8.3 Male sex hormone responsive conditions

Androgens, anti-androgens and anabolic steroids

Androgens

Androgens cause masculinisation; they may be used as replacement therapy in castrated adults and in those who are hypogonadal due to either pituitary or testicular disease. In the normal male they inhibit pituitary gonadotrophin secretion and depress spermatogenesis. Androgens also have an anabolic action which led to the development of anabolic steroids.

Androgens are useless as a treatment of impotence and impaired spermatogenesis unless there is associated hypogonadism; they should not be given until the hypogonadism has been properly investigated. Treatment should be under expert supervision.

When given to patients with hypopituitarism they can lead to normal sexual development and potency but not to fertility. If fertility is desired, the usual treatment is with gonadotrophins or pulsatile gonadotrophin-releasing hormone which will stimulate spermatogenesis as well as androgen production.

Intramuscular depot preparations of testosterone esters are preferred for replacement therapy. Testosterone enantate, propionate or undecanoate, or alternatively Sustanon® — which consists of a mixture of testosterone esters and has a longer duration of action, may be used.

Anti-androgens

Cyproterone acetate

Cyproterone acetate p. 662 is an anti-androgen used in the treatment of severe hypersexuality and sexual deviation in the male. It inhibits spermatogenesis and produces reversible infertility (but is not a male contraceptive); abnormal sperm forms are produced. Fully informed consent is recommended and an initial spermatogram. As hepatic tumours have been produced in animal studies, careful consideration should be given to the risk/benefit ratio before treatment. Cyproterone acetate is also licensed for use alone in patients with metastatic prostate cancer refractory to gonadorelin analogue therapy and has been used as an adjunct in prostatic cancer and in the treatment of acne and hirsutism in women.

Dutasteride and finasteride

Dutasteride p. 676 and finasteride p. 676 are alternatives to alpha-blockers particularly in men with a significantly enlarged prostate. Finasteride is also licensed for use with doxazosin in the management of benign prostatic hyperplasia.

A low strength of finasteride is licensed for treating male-pattern baldness in men.

Anabolic steroids

Anabolic steroids have some androgenic activity but they cause less virilisation than androgens in women. They are used in the treatment of some aplastic anaemias. Anabolic steroids have been given for osteoporosis in women but they are no longer advocated for this purpose.

The protein-building properties of anabolic steroids have not proved beneficial in the clinical setting. Their use as body builders or tonics is unjustified; some athletes abuse them.

ANDROGENS

Androgens

CONTRA-INDICATIONS Breast cancer in males • history of liver tumours • hypercalcaemia • prostate cancer

CAUTIONS Cardiac impairment • diabetes mellitus • elderly • epilepsy • hypertension • ischaemic heart disease • migraine • pre-pubertal boys (fusion of epiphyses is hastened and may result in short stature)—statural growth and sexual development should be monitored • skeletal metastases—risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored) • sleep apnoea • stop treatment or reduce dose if severe polycythaemia occurs • tumours—risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored)

INTERACTIONS → Appendix 1 (testosterone).

SIDE-EFFECTS

Common or very common Acne • androgenic effects (to be assessed regularly in women) • anxiety • arthralgia • asthenia • changes in libido • cholestasis • jaundice • depression • electrolyte disturbances • excessive duration of penile erection • excessive frequency of penile erection • gastro-intestinal bleeding • gynaecomastia • headache • hirsutism • hypercalcaemia • hypertension • increased bone growth • irritability • male-pattern baldness • muscle cramps • nausea • nervousness • oedema • paraesthesia • polycystaemia • precocious sexual development in pre-pubertal males • premature closure of epiphyses in pre-pubertal males • prostate abnormalities • prostate cancer • pruritus • seborrhoea • sodium retention • suppression of virilism in women • vomiting • weight gain
**Testosterone**

**INDICATIONS AND DOSE**

- **TESTIM®**
  - **Hypogonadism due to testosterone deficiency in men**
  - **BY TRANSDERMAL APPLICATION**
    - Adult: Apply 50 mg once daily, subsequent application adjusted according to response; maximum 100 mg per day
  
  **Dose equivalence and conversion**
  - One tube of 5 g contains 50 mg testosterone.

- **TESTOGEL®**
  - **Hypogonadism due to androgen deficiency in men**
  - **BY TRANSDERMAL APPLICATION**
    - Adult: Apply 50 mg once daily; increased in steps of 25 mg, adjusted according to response; maximum 100 mg per day
  
  **Dose equivalence and conversion**
  - One sachet of 5 g contains 50 mg of testosterone.

- **TOSTRAN®**
  - **Hypogonadism due to testosterone deficiency in men**
  - **BY TRANSDERMAL APPLICATION**
    - Adult: Apply 60 mg once daily, subsequent application adjusted according to response; maximum 80 mg per day
  
  **Dose equivalence and conversion**
  - 1 g of gel contains 20 mg testosterone.

**SIDE-EFFECTS**

- Suppression of spermatogenesis - allergic reactions - local irritation

**DIRECTIONS FOR ADMINISTRATION**

- With topical use: Avoid skin contact with gel application sites to prevent testosterone transfer to other people, especially pregnant women and children—consult product literature.

- **TESTIM®**
  - Squeeze entire content of tube on to one palm and apply as a thin layer on clean, dry, healthy skin of shoulder or upper arm, preferably in the morning after washing or bathing (if 2 tubes required use 1 per shoulder or upper arm); rub in and allow to dry before putting on clothing to cover site; wash hands with soap after application; avoid washing application site for at least 6 hours.

- **TESTOGEL®**
  - Apply thin layer of gel on clean, dry, healthy skin such as shoulders, arms or abdomen, immediately after sachet is opened. Not to be applied on genital area as high alcohol content may cause local irritation. Allow to dry for 3–5 minutes before dressing. Wash hands with soap and water after applying gel; avoid washing application site for at least 2 hours. Not to be applied on genital area.

- **TOSTRAN®**
  - Apply gel on clean, dry, intact skin of abdomen or both inner thighs, preferably in the morning. Gently rub in with a finger until dry before dressing. Wash hands with soap and water after applying gel; avoid washing application site for at least 2 hours. Not to be applied on genital area.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Testosterone enanate**

**INDICATIONS AND DOSE**

- **Hypogonadism**
  - **BY INTRAMUSCULAR INJECTION**
    - Adult: Initially 250 mg every 2–3 weeks; maintenance 250 mg every 3–6 weeks
  - Breast cancer
    - **BY INTRAMUSCULAR INJECTION**
      - Adult: 250 mg every 2–3 weeks

- **SIDE-EFFECTS**
  - Suppression of spermatogenesis

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **TESTOSTERONE ENANTATE (Non-proprietary)**
  - Testosterone enanate 250 mg per 1 ml
  - Testosterone enanate 250 mg/1 ml solution for injection ampoules | 3 ampoule
  - £68.00 Dose price + £68.00 Schedule 4 (CD Anab)
Testosterone propionate

**INDICATIONS AND DOSE**

**Androgen deficiency**

- **BY INTRAMUSCULAR INJECTION**
  - Adult: 50 mg 2–3 times a week

- **Delayed puberty in males**
  - **BY INTRAMUSCULAR INJECTION**
    - Adult: 50 mg once weekly

- **Breast cancer in women**
  - **BY INTRAMUSCULAR INJECTION**
    - Adult: 100 mg 2–3 times a week

**SIDE-EFFECTS** Suppression of spermatogenesis

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, cream.

Testosterone decanoate, isocaproate, phenylpropionate and propionate

The properties listed below are those particular to the combination only. For the properties of the components please consider, testosterone propionate above.

**INDICATIONS AND DOSE**

**Androgen deficiency**

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 1 ml every 3 weeks

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Capsule containing the same drug.** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, cream.

Testosterone undecanoate

**INDICATIONS AND DOSE**

**Androgen deficiency**

- **BY MOUTH**
  - Adult: 120–160 mg daily for 2–3 weeks; maintenance 40–120 mg daily

**Hypogonadism**

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Adult: 1 g every 10–14 weeks, to be given over 2 minutes, if necessary, second dose may be given after 6 weeks to achieve rapid steady state plasma testosterone levels and then every 10–14 weeks.

**SIDE-EFFECTS** Suppression of spermatogenesis

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- CAUTIONARY AND ADVISORY LABELS 21, 25
  - Restandol (Merck Sharp & Dohme Ltd)

- **Testosterone undecanoate 40 mg**
  - Restandol 40mg Testocaps | 30 capsule [POM] £8.55 Schedule 4 (CD Anab) | 60 capsule [POM] £17.10 DT price = £17.10 Schedule 4 (CD Anab)

Solution for injection

- **Nebido** (Bayer Plc)
  - Testosterone undecanoate 250 mg per 1 ml Nebido 1000mg/4ml solution for injection ampoules | 1 ampoule [POM] £80.00 DT price = £80.00 Schedule 4 (CD Anab)

- **Nebido** 1000mg/4ml solution for injection vials | 1 vial [POM] £80.00 Schedule 4 (CD Anab)

8.4 Male sex hormone antagonism

**ANTIOANDROGENS**

Cyproterone acetate

**INDICATIONS AND DOSE**

**Hypersexuality | Sexual deviation**

- **BY MOUTH**
  - Adult: 50 mg twice daily, to be taken after food.

- **Prevention of tumour flare with initial gonadorelin analogue therapy**

- **BY MOUTH**
  - Adult: 200 mg daily in 2–3 divided doses for 5–7 days before initiation of gonadorelin analogue, followed by 200 mg daily in 2–3 divided doses for 3–4 weeks after initiation of gonadorelin analogue; maximum 300 mg per day.

- **Long-term palliative therapy where gonadorelin analogues or orchiectomy contra-indicated, not tolerated, or where oral therapy preferred**

- **BY MOUTH**
  - Adult: 200–300 mg daily in 2–3 divided doses.

- **Hot flushes with gonadorelin analogue therapy or after orchiectomy**

- **BY MOUTH**
  - Adult: Initially 50 mg daily, then adjusted according to response to 50–150 mg daily in 1–3 divided doses.

**CONTRA-INDICATIONS** In hypersexuality, Dubin-Johnson syndrome - in hypersexuality, history of thromboembolic disorders - in hypersexuality, liver disease - in hypersexuality, malignant diseases - in hypersexuality, previous or existing liver tumours - in hypersexuality, Rotor syndrome - in hypersexuality, severe depression - in hypersexuality, severe diabetes (with vascular changes) - in hypersexuality, sickle-cell anaemia - in hypersexuality, wasting diseases - meningioma or history of meningioma - youths under 18 years (may arrest bone maturation and testicular development)

**CAUTIONS** Diabetes mellitus - in prostate cancer, severe depression - in prostate cancer, sickle-cell anaemia - ineffective for male hypersexuality in chronic alcoholism (relevance to prostate cancer not known)

**SIDE-EFFECTS**

- Rare Hypersensitivity reactions - osteoporosis - rash

- **Frequency not known** Breathlessness - changes in hair pattern - fatigue - gynaecomastia (rarely leading to galactorrhoea and benign breast nodules) - hepatic failure - hepatitis - hepatotoxicity - inhibition of spermatogenesis - jaundice - lassitude - reduced sebum production (may clear acne) - risk of recurrence of thromboembolic disease - weight changes

**SIDE-EFFECTS, FURTHER INFORMATION**

**Hepatotoxicity** Direct hepatic toxicity including jaundice, hepatitis and hepatic failure have been reported (fatalities reported, usually after several months, at dosages of 100 mg and above). If hepatotoxicity is confirmed, cyproterone should normally be withdrawn unless the hepatotoxicity can be explained by another cause such as
metastatic disease (in which case cyproterone should be continued only if the perceived benefit exceeds the risk).

- **HEPATIC IMPAIRMENT** Avoid (unless used for prostate cancer)—dose-related toxicity.

- **MONITORING REQUIREMENTS**
  - Monitor blood counts initially and throughout treatment.
  - Monitor adrenocortical function regularly.
  - Monitor hepatic function regularly—liver function tests should be performed before and regularly during treatment and whenever symptoms suggestive of hepatotoxicity occur.

- **PATIENT AND CARER ADVICE** Fatigue and lassitude may impair performance of skilled tasks (e.g. driving).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, tablet, capsule.
  - **Tablet**
    - **CAUTIONARY AND ADVISORY LABELS**
    - **21**
      - **Cyproterone Acetate (Non-proprietary)**
      - **Cyproterone acetate 50 mg** Cyproterone 50mg tablets | 56 tablet £48.95 | 168 tablet £87.00 DT price = £87.00
      - **Cyproterone acetate 100 mg** Cyproterone 100mg tablets | 84 tablet £132.57 DT price = £55.19
      - **Androcur (Bayer Plc)**
        - Cyproterone acetate 50 mg Androcur 50mg tablets | 56 tablet £29.25
      - **Cyprostat (Bayer Plc)**
        - Cyproterone acetate 50 mg Cyprostat 50mg tablets | 168 tablet £87.00 DT price = £87.00
        - **Cyproterone acetate 100 mg** Cyprostat 100mg tablets | 84 tablet £132.57 DT price = £55.19

9 Thyroid disorders

**THYROID STIMULATING HORMONES**

**Thyrotropin alfa**
(Recombinant human thyroid stimulating hormone; rhTSH)

- **DRUG ACTION** Thyrotropin alfa is a recombinant form of thyrotrophin (thyroid stimulating hormone).

- **INDICATIONS AND DOSE**
  - Detection of thyroid remnants and thyroid cancer in post-thyroidectomy patients, together with serum thyroglobulin testing (with or without radioiodine imaging) to increase radio-iodine uptake for the ablation of thyroid remnant tissue in suitable post-thyroidectomy patients

- **BY INTRAMUSCULAR INJECTION**
  - Adult: 900 micrograms every 24 hours for 2 doses, dose to be administered into the gluteal muscle, consult product literature for further information on indications and dose

- **CAUTIONS** Presence of thyroglobulin autoantibodies may give false negative results

- **SIDE-EFFECTS**
  - **Common or very common** Dizziness, fatigue, headache, nausea, vomiting
  - **Uncommon** Asthenia, back pain, influenza-like symptoms, paraesthesia, rash, urticaria
  - **Rare** Diarrhoea
  - **Very rare** Arthralgia, dyspnnea, flushing, hyperhidrosis, injection-site pain, injection-site pruritus, injection-site rash, injection-site reactions, myalgia, pain at site of metastases, palpitation, tremor

- **ALLERGY AND CROSS-SENSITIVITY** Contraindicated if previous hypersensitivity to bovine or human thyrotrophin.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Powder for solution for injection**
    - **Thyrogen** (Genzyme Therapeutics Ltd)
      - Thyrotropin alfa 900 microgram Thyrogen 900microgram powder for solution for injection vials | 2 vial £583.04

9.1 Hyperthyroidism

**Antithyroid drugs**

Antithyroid drugs are used for hyperthyroidism either to prepare patients for thyroidectomy or for long-term management. In the UK carbimazole is the most commonly used drug. Propylthiouracil p. 664 should be reserved for patients who are intolerant of carbimazole or for those who experience sensitivity reactions to carbimazole (sensitivity is not necessarily displayed to both drugs), and for whom other treatments are inappropriate. Both drugs act primarily by interfering with the synthesis of thyroid hormones.

Over-treatment with antithyroid drugs can result in the rapid development of hypothyroidism and should be avoided particularly during pregnancy because it can cause fetal goitre.

A combination of carbimazole with levothyroxine sodium daily p. 665, may be used in a blocking-replacement regimen; therapy is usually given for 18 months. The blocking-replacement regimen is not suitable during pregnancy.

**Iodine** has been used as an adjunct to antithyroid drugs for 10 to 14 days before partial thyroidectomy; however, there is little evidence of a beneficial effect. Iodine should not be used for long-term treatment because its antithyroid action tends to diminish.

Radioactive sodium iodide ($^{131}$I) solution is used increasingly for the treatment of thyrotoxicosis at all ages, particularly where medical therapy or compliance is a problem, in patients with cardiac disease, and in patients who relapse after thyroidectomy.

Propranolol hydrochloride p. 146 is useful for rapid relief of thyrotoxic symptoms and may be used in conjunction with antithyroid drugs or as an adjunct to radioactive iodine. Beta-blockers are also useful in neonatal thyrotoxicosis and in supraventricular arrhythmias due to hyperthyroidism. Propranolol hydrochloride p. 146 has been used in conjunction with iodine to prepare mildly thyrotoxic patients for surgery but it is preferable to make the patient euthyroid with carbimazole. Laboratory tests of thyroid function are not altered by beta-blockers. Most experience in treating thyrotoxicosis has been gained with propranolol hydrochloride but nadolol p. 145 is also used.

**Thyrotoxic crisis** (‘thyroid storm’) requires emergency treatment with intravenous administration of fluids, propranolol hydrochloride and hydrocortisone p. 583 (as sodium succinate), as well as oral iodine solution and carbimazole or propylthiouracil which may need to be administered by nasogastric tube.

**Pregnancy**

Radioactive iodine therapy is contra-indicated during pregnancy. Propylthiouracil and carbimazole can be given but the blocking-replacement regimen is not suitable. Rarely, carbimazole has been associated with congenital defects, including aplasia cutis of the neonate, therefore
propylthiouracil remains the drug of choice during the first trimester of pregnancy. In the second trimester, consider switching to carbimazole because of the potential risk of hepatotoxicity with propylthiouracil. Both propylthiouracil and carbimazole cross the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves’ disease tend to fall during pregnancy).

Drugs used for Hyperthyroidism not listed below; Metoprolol tartrate, p. 144; Nadolol, p. 145; Propranolol hydrochloride, p. 146

Antithyroids
Carbamazole

Indications and dose
Hyperthyroidism

- Adult: 15–40 mg daily continue until the patient becomes euthyroid, usually after 4 to 8 weeks, higher doses should be prescribed under specialist supervision only, then reduced to 5–15 mg daily, reduce dose gradually, therapy usually given for 12 to 18 months

Hyperthyroidism (blocking-replacement regimen) in combination with levothyroxine

- Adult: 40–60 mg daily, therapy usually given for 18 months

Dose equivalence and conversion
When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

Important safety information
Neutropenia and agranulocytosis
Doctors are reminded of the importance of recognising bone marrow suppression induced by carbimazole and the need to stop treatment promptly.
- Patient should be asked to report symptoms and signs suggestive of infection, especially sore throat.
- A white blood cell count should be performed if there is any clinical evidence of infection.
- Carbimazole should be stopped promptly if there is clinical or laboratory evidence of neutropenia.

- Contra-indications
  - Severe blood disorders

- Side-effects
  - Common or very common: Arthralgia, fever, headache, jaundice, malaise, mild gastrointestinal disturbances, nausea, pruritus, rash, taste disturbance
  - Rare: Agranulocytosis, alopecia, bone marrow suppression, jaundice, myopathy, pancytopenia

- Side-effects, further information
Rashes and pruritus are common with carbimazole but they can be treated with antihistamines without discontinuing therapy; alternatively propylthiouracil can be substituted.

- Pregnancy
  - Carbimazole can be given but the blocking-replacement regimen is not suitable. Rarely, carbimazole has been associated with congenital defects, including aplasia cutis of the neonate. Carbimazole crosses the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves’ disease tend to fall during pregnancy).

- Breast feeding
  - Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk may be sufficient to affect neonatal thyroid function therefore lowest effective dose should be used.

- Hepatic impairment
  - Use with caution in mild to moderate impairment. Avoid in severe impairment.

- Patient and carer advice
  - Warn patient or carers to tell doctor immediately if sore throat, mouth ulcers, bruising, fever, malaise, or non-specific illness develops.

- Medicinal forms
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, capsule

Tablet
- Carbimazole (Non-proprietary)
  - Carbimazole 5 mg Carbimazole 5mg tablets | 100 tablet
    - DT price = £93.84
  - Carbimazole 20 mg Carbimazole 20mg tablets | 100 tablet
    - DT price = £208.17

Propylthiouracil

Indications and dose
Hyperthyroidism

- Adult: Initially 200–400 mg daily in divided doses until the patient becomes euthyroid, then reduced to 50–150 mg daily in divided doses, initial dose should be gradually reduced to the maintenance dose

Dose equivalence and conversion
When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

- Side-effects
  - Common or very common: Arthralgia, fever, headache, jaundice, leucopenia, malaise, mild gastro-intestinal disturbances, nausea, pruritus, rash, taste disturbance
  - Rare: Agranulocytosis, alopecia, aplastic anaemia, bone marrow suppression, cutaneous vasculitis, encephalopathy, hepatic disorders, hepatic failure, hepatic necrosis, hepatitis, hypeprothrombinaemia, jaundice, lupus erythematos-like syndromes, myopathy, nephritis, pancytopenia, thrombocytopenia

- Side-effects, further information
Hepatotoxicity
Severe hepatic reactions have been reported, including fatal cases and cases requiring liver transplant—discontinue if significant liver-enzyme abnormalities develop.

- Pregnancy
  - Propylthiouracil can be given but the blocking-replacement regimen is not suitable. Propylthiouracil crosses the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves’ disease tend to fall during pregnancy).

- Breast feeding
  - Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk may be sufficient to affect neonatal thyroid function therefore lowest effective dose should be used.

- Hepatic impairment
  - Reduce dose.

- Renal impairment
  - Use three-quarters normal dose if eGFR 10–50 mL/minute/1.73 m². Use half normal dose if eGFR less than 10 mL/minute/1.73 m².

- Monitoring requirements
  - Monitor for hepatotoxicity.
Hypothyroidism 665

Liothyronine sodium by intravenous injection is the treatment of choice in hypothyroid coma. Adjunctive therapy includes intravenous fluids, hydrocortisone p. 583, and treatment of infection; assisted ventilation is often required.

THYROID HORMONES

Levothyroxine sodium (Thyroxine sodium)

INDICATIONS AND DOSE
Hypothyroidism
BY MOUTH
- Adult 18–49 years: Initially 50–100 micrograms once daily; adjusted in steps of 25–50 micrograms every 3–4 weeks, adjusted according to response; maintenance 100–200 micrograms once daily, dose to be taken preferably at least 30 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication
- Adult 50 years and over: Initially 25 micrograms once daily; adjusted in steps of 25 micrograms every 4 weeks, adjusted according to response; maintenance 50–200 micrograms once daily, dose to be taken preferably at least 30 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication

Hypothyroidism in patients with cardiac disease | Severe hypothyroidism
BY MOUTH
- Adult: Initially 25 micrograms once daily; adjusted in steps of 25 micrograms every 4 weeks, adjusted according to response; maintenance 50–200 micrograms once daily, dose to be taken preferably at least 30 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication

Hyperthyroidism (blocking-replacement regimen) in combination with carbimazole
BY MOUTH
- Adult: 50–150 micrograms daily therapy usually given for 18 months

CONTRA-INDICATIONS
Thyrotoxicosis

CAUTIONS
Cardiovascular disorders · diabetes insipidus · diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) · elderly · hypertension · long-standing hypothyroidism · myocardial infarction · myocardial insufficiency · panhypopituitarism (initiate corticosteroid therapy before starting levothyroxine) · predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting levothyroxine)

CAUTIONS, FURTHER INFORMATION
Cardiovascular disorders Baseline ECG is valuable because changes induced by hypothyroidism can be confused with ischaemia.

INTERACTIONS
- Appendix 1 (thyroid hormones).

SIDE-EFFECTS
Anginal pain (usually at excessive dosage) · arrhythmias (usually at excessive dosage) · diarrhoea (usually at excessive dosage) · excitability (usually at excessive dosage) · fever · flushing · headache · heat intolerance · hypersensitivity reactions · insomnia (usually at excessive dosage) · muscle cramp · muscular weakness · oedema · palpitation (usually at excessive dosage) · pruritus · rash · restlessness (usually at excessive dosage) · sweating · tachycardia (usually at excessive dosage) · transient hair loss in children · tremor (usually at excessive dosage) · vomiting (usually at excessive dosage) · weight-loss

9.2 Hypothyroidism

Thyroid hormones

Thyroid hormones are used in hypothyroidism (myxoedema), and also in diffuse non-toxic goitre, Hashimoto’s thyroiditis (lymphadenoid goitre), and thyroid carcinoma. Neonatal hypothyroidism requires prompt treatment for normal development. Liothyronine sodium below (thyroxine sodium) below is the treatment of choice for maintenance therapy.

In infants and children with congenital hypothyroidism and juvenile myxoedema, the dose of levothyroxine sodium should be titrated according to clinical response, growth assessment, and measurements of plasma thyroxine and thyroid-stimulating hormone.

Liothyronine sodium p. 666 has a similar action to levothyroxine sodium but is more rapidly metabolised and has a more rapid effect. Its effects develop after a few hours and disappear within 24 to 48 hours of discontinuing treatment. It may be used in severe hypothyroid states when a rapid response is desired.
666  Thyroid disorders

**SIDE-EFFECTS, FURTHER INFORMATION**

Initial dosage in patients with cardiovascular disorders  If metabolism increases too rapidly (causing diarrhoea, nervousness, rapid pulse, insomnia, tremors and sometimes anginal pain where there is latent myocardial ischaemia), reduce dose or withhold for 1–2 days and start again at a lower dose.

- **PREGNANCY**  Levotyroxine requirement may increase during pregnancy. Levotyroxine may cross the placenta. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus. Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of levotyroxine).

- **BREAST FEEDING**  Amount too small to affect tests for neonatal hypothyroidism.

- **MEDICINAL FORMS**  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: powder for solution for injection, oral suspension, oral solution, powder, capsule

  **Tablet**
  - **LEVOTHYROXINE SODIUM (Non-proprietary)**
    - Levothyroxine sodium anhydrous 12.5 microgram per 1 tablet  | 28 tablet  | £4.00 DT price = £2.95 | 500 tablet  | £42.32-52.68
    - Levothyroxine sodium anhydrous 25 microgram per 1 tablet  | 28 tablet  | £5.00 DT price = £3.80 | 1000 tablet  | £93.40
    - Levothyroxine sodium anhydrous 50 microgram per 1 tablet  | 28 tablet  | £7.00 DT price = £5.40 | 1000 tablet  | £130.51
  - **LEVOTHYROXINE SODIUM (Non-proprietary)**
    - Levothyroxine sodium anhydrous 40 microgram per 1 tablet  | 28 tablet  | £12.00 DT price = £9.20 | 1000 tablet  | £222.51
  - **LEVOTHYROXINE SODIUM (Non-proprietary)**
    - Levothyroxine sodium anhydrous 50 microgram per 1 tablet  | 28 tablet  | £13.00 DT price = £10.20 | 1000 tablet  | £223.51
  - **LEVOTHYROXINE SODIUM (Non-proprietary)**
    - Levothyroxine sodium anhydrous 62.5 microgram per 1 tablet  | 28 tablet  | £16.00 DT price = £12.40 | 1000 tablet  | £224.51
  - **LEVOTHYROXINE SODIUM (Non-proprietary)**
    - Levothyroxine sodium anhydrous 75 microgram per 1 tablet  | 28 tablet  | £20.00 DT price = £15.80 | 1000 tablet  | £225.51
  - **LEVOTHYROXINE SODIUM (Non-proprietary)**
    - Levothyroxine sodium anhydrous 100 microgram per 1 tablet  | 28 tablet  | £25.00 DT price = £19.80 | 1000 tablet  | £226.51
  - **LEVOTHYROXINE SODIUM (Non-proprietary)**
    - Levothyroxine sodium anhydrous 125 microgram per 1 tablet  | 28 tablet  | £30.00 DT price = £23.80 | 1000 tablet  | £227.51
  - **LEVOTHYROXINE SODIUM (Non-proprietary)**
    - Levothyroxine sodium anhydrous 150 microgram per 1 tablet  | 28 tablet  | £35.00 DT price = £27.80 | 1000 tablet  | £228.51

**Oral solution**

- **LEVOTHYROXINE SODIUM (Non-proprietary)**
  - Levothyroxine sodium anhydrous 5 microgram per 1 ml  | 100 ml  | £10.00 DT price = £7.65
  - Levothyroxine sodium anhydrous 2.5 microgram per 1 ml  | 100 ml  | £5.00 DT price = £3.20
  - Levothyroxine sodium anhydrous 2 microgram per 1 ml  | 100 ml  | £4.00 DT price = £2.90
  - Levothyroxine sodium anhydrous 1 microgram per 1 ml  | 100 ml  | £3.00 DT price = £2.20

**Dose equivalence and conversion**

- 20–25 micrograms of liothyronine sodium is equivalent to approximately 100 micrograms of levothyroxine sodium.

- Branded drugs may not be bioequivalent. Performance of some medications may be better in certain patients. If symptoms recur, try other preparations.

**RECOMMENDATIONS TO THE PATIENT**

- Avoid taking other medications with levotyroxine (e.g. synthetic thyroid hormones) unless approval is given by the prescribing doctor.

- 

**CONTRA-INDICATIONS**  Thyrotoxicosis

**INDICATIONS AND DOSE**

**Hypothyroidism**

- Adult: Initially 10–20 micrograms daily; increased to 60 micrograms daily in 2–3 divided doses, dose should be increased gradually, smaller initial doses given for the elderly

**Hypothyroid coma**

- **BY SLOW INTRAVENOUS INJECTION**
  - Adult: 5–20 micrograms every 12 hours, increased to 5–20 micrograms every 4 hours if required, alternatively initially 50 micrograms for 1 dose, then 25 micrograms every 8 hours, reduced to 25 micrograms twice daily

- **Dose equivalence and conversion**
  - 20–25 micrograms of liothyronine sodium is equivalent to approximately 100 micrograms of levotyroxine sodium.

- Brands without a UK licence may not be bioequivalent and dose adjustment may be necessary.

- **CONTRA-INDICATIONS**  Thyrotoxicosis

- **CAUTIONS**  Cardiovascular disorders - diabetes insipidus - diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) - elderly - hypertension - long-standing hypothyroidism - myocardial infarction - myocardial insufficiency - pancytopenia (initiate corticosteroid therapy before starting levotyroxine) - prediabetes to adrenal insufficiency (initiate corticosteroid therapy before starting levotyroxine)

- **INTERACTIONS**  → Appendix 1 (thyroid hormones).

- **SIDE-EFFECTS**  Anginal pain (usually at excessive dosage) - arrhythmias (usually at excessive dosage) - diarrhoea (usually at excessive dosage) - excitability (usually at excessive dosage) - fever - flushing - headache - heat intolerance - hypersensitivity reactions - insomnia (usually at excessive dosage) - muscle cramp - muscular weakness - oedema - palpitation (usually at excessive dosage) - pruritus - rash - restlessness (usually at excessive dosage) - sweating - tachycardia (usually at excessive dosage) - tremor (usually at excessive dosage) - vomiting (usually at excessive dosage) - weight-loss

**SIDE-EFFECTS, FURTHER INFORMATION**

Initial dosage in patients with cardiovascular disorders  If metabolism increases too rapidly (causing diarrhoea, nervousness, rapid pulse, insomnia, tremors and sometimes anginal pain where there is latent myocardial ischaemia), reduce dose or withhold for 1–2 days and start again at a lower dose.

- **PREGNANCY**  Liothyronine requirement may increase during pregnancy. Does not cross the placenta in significant amounts. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus. Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of liothyronine).

- **BREAST FEEDING**  Amount too small to affect tests for neonatal hypothyroidism.

- **PRESCRIBING AND DISPENSING INFORMATION**  Switching to a different brand  Patients switched to a different brand should be monitored (particularly if pregnant or if heart disease present) as brands without a UK licence may not be bioequivalent. Pregnant women or those with heart disease should undergo an early review of thyroid status, and other patients should have thyroid function assessed if experiencing a significant change in symptoms. If liothyronine is continued long-term, thyroid function tests should be repeated 1–2 months after any change in brand.

- **MEDIcINAL FORMS**  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, solution for injection, oral suspension, oral solution, capsule

  **Tablet**
  - **LIOTHYROXINE SODIUM (Non-proprietary)**
    - Levothyroxine sodium 20 microgram per 1 tablet  | 28 tablet  | £12.18 DT price = £10.51
  - **LIOTHYROXINE SODIUM (Non-proprietary)**
    - Levothyroxine sodium 10 microgram per 1 tablet  | 28 tablet  | £6.18 DT price = £5.35

  **Powder for solution for injection**
  - **LIOTHYROXINE SODIUM (Non-proprietary)**
    - Levothyroxine sodium 20 microgram per 1 vial  | 5 vial  | £1.425.00
The need for continuing antimuscarinic drug therapy should be licensed for urinary frequency, urgency, and incontinence.

Urinary frequency, enuresis, and incontinence

Chapter 7
Genito-urinary system

CONTENTS

1 Bladder and urinary disorders

1.1 Urinary frequency, enuresis, and incontinence

2 Bladder instillations and urological surgery

3 Contraception

3.1 Contraception, combined

3.2 Contraception, devices

3.3 Contraception, oral progestogen-only

3.4 Contraception, parenteral progestogen-only

3.5 Contraception, spermicidal

4 Erectile and ejaculatory conditions

1 Bladder and urinary disorders

1.1 Urinary frequency, enuresis, and incontinence

Urinary frequency, enuresis and incontinence

Urinary frequency and incontinence

Incontinence in adults which arises from detrusor instability is managed by combining drug therapy with conservative methods for managing urge incontinence such as pelvic floor exercises and bladder training; stress incontinence is generally managed by non-drug methods. Duloxetine p. 288 can be added and is licensed for the treatment of moderate to severe stress incontinence in women; it may be more effective when used as an adjunct to pelvic floor exercises.

Antimuscarinic drugs reduce symptoms of urgency and urge incontinence and increase bladder capacity. Oxybutynin hydrochloride p. 669 also has a direct relaxant effect on urinary smooth muscle. Side-effects limit the use of oxybutynin hydrochloride, but they may be reduced by starting at a lower dose. A modified-release preparation of oxybutynin hydrochloride is effective and has fewer side-effects; a transdermal patch is also available. The efficacy and side-effects of tolterodine tartrate p. 671 are comparable to those of modified-release oxybutynin hydrochloride. Flavoxate hydrochloride p. 669 has less marked side-effects but it is also less effective. Darifenacin p. 668, fesoterodine fumarate p. 668, propiverine hydrochloride p. 670, solifenacin succinate p. 670, and trospium chloride p. 671 are newer antimuscarinic drugs licensed for urinary frequency, urgency, and incontinence. The need for continuing antimuscarinic drug therapy should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

Propantheline bromide p. 74 and tricyclic antidepressants were used for urge incontinence but they are little used now because of their side-effects. The use of imipramine hydrochloride p. 296 is limited by its potential to cause cardiac side-effects.

Mirabegron p. 671, a selective beta, agonist, is licensed for the treatment of urinary frequency, urgency, and urge incontinence associated with overactive bladder syndrome.

Purified bovine collagen implant (Contigen®, Bard) is indicated for urinary incontinence caused by intrinsic sphincter deficiency (poor or non-functioning bladder outlet mechanism). The implant should be inserted only by surgeons or physicians trained in the technique for injection of the implant.

Nocturnal enuresis in children

Nocturnal enuresis is common in young children, but persists in a small proportion by 10 years of age. For children under 5 years, reassurance and advice on the management of nocturnal enuresis can be useful for some families. Treatment may be considered in children over 5 years depending on their maturity and motivation, the frequency of nocturnal enuresis, and the needs of the child and their family.

Initially, advice should be given on fluid intake, diet, toileting behaviour, and reward systems; for children who do not respond to this advice, further treatment may be necessary. An enuresis alarm should be first line treatment for motivated, well-supported children; alarms have a lower relapse rate than drug treatment when discontinued.

Treatment should be reviewed after 4 weeks, and, if there are early signs of response, continued until a minimum of 2 weeks’ uninterrupted dry nights have been achieved. If complete dryness is not achieved after 3 months, only continue if the condition is still improving and the child remains motivated to use the alarm. If initial alarm treatment is unsuccessful, consider combination treatment with desmopressin p. 574, or desmopressin alone if the alarm is no longer appropriate or desirable.

Desmopressin is given by oral or by sublingual administration. Desmopressin alone can be offered to children over 5 years of age if an alarm is inappropriate or undesirable, or when rapid or short-term results are the priority (for example to cover periods away from home); desmopressin alone can also be used if there has been a partial response to a combination of desmopressin and an alarm following initial treatment with an alarm. Treatment should be assessed after 4 weeks and continued for
Treatment should not normally exceed 3 months unless a physical examination is made and the child is fully reassessed; toxicity following overdosage with tricyclics is of particular concern.

**Antimuscarinics (systemic)**

- **CONTRA-INDICATIONS** Gastro-intestinal obstruction - intestinal atony - myasthenia gravis (but some antimuscarinics may be used to decrease muscarinic side-effects of anticholinesterases) - paralytic ileus - prostatic enlargement - pyloric stenosis - severe ulcerative colitis - significant bladder outflow obstruction - toxic megacolon - urinary retention

- **CAUTIONS** Acute myocardial infarction - arrhythmias (may be worsened) - autonomic neuropathy - cardiac insufficiency (due to association with tachycardia) - cardiac surgery (due to association with tachycardia) - conditions characterised by tachycardia - congestive heart failure (may be worsened) - coronary artery disease (may be worsened) - diarrhoea - elderly (especially if frail) - gastro-oesophageal reflux disease - hiatus hernia with reflux oesophagitis - hypertension - hypotension (due to association with tachycardia) - individuals susceptible to angle-closure glaucoma - prostatic hyperplasia - pyrexia - ulcereative colitis

- **INTERACTIONS** Appendix I (antimuscarinics).

Many drugs have antimuscarinic effects; concomitant use of two or more such drugs can increase side-effects such as dry mouth, urine retention, and constipation. Concomitant use of other drugs with antimuscarinic effects can also lead to confusion in the elderly.

- **SIDE-EFFECTS**
  - **Common or very common** Constipation - dilation of pupils with loss of accommodation - dry mouth - photophobia - reduced bronchial secretions - skin dryness - skin flushing - transient bradycardia (followed by tachycardia, palpitation and arrhythmias) - urinary retention - urinary urgency
  - **Uncommon** Confusion (particularly in the elderly) - giddiness - nausea - vomiting
  - **Very rare** Angle-closure glaucoma
  - **Frequency not known** Angioedema - blurred vision - blurred vision - central nervous system stimulation - convulsion - diarrhoea - difficulty in micturition - disorientation - dizziness - drowsiness - dry eyes - euphoria - fatigue - flatulence - hallucinations - headache - impaired memory - palpitation - photosensitivity - rash - reduced sweating (may lead to heat sensations and fainting in hot environments or patients with fever) - restlessness - taste disturbances

- **PATIENT AND CARER ADVICE** Antimuscarinics can affect the performance of skilled tasks (e.g. driving).

### Darifenacin

**INDICATIONS AND DOSE**

Urinary frequency | Urinary urgency | Incontinence

- **BY MOUTH**

  - **Adult:** Initially 7.5 mg once daily, increased if necessary to 15 mg after 2 weeks

- **SIDE-EFFECTS**
  - **Uncommon** Cough - dyspnoea - hypertension - impotence - insomnia - oedema - rhinitis - ulcerative stomatitis - vaginitis - weakness

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Present in milk in animal studies—manufacturer advises caution.

- **HEPATIC IMPAIRMENT** Max. 7.5 mg daily in moderate impairment. Avoid in severe impairment.

- **PRESCRIBING AND DISPENSING INFORMATION** The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Modified-release tablet**

  *Emselex (Merus Labs Luxco S.a R.L.)*

  **Darifenacin** (as Darifenacin hydrobromide) 7.5 mg

  *Emselex* 7.5 mg modified-release tablets | 28 tablet (P35) £25.48 DT price = £25.48

  **Darifenacin** (as Darifenacin hydrobromide) 15 mg

  *Emselex* 15 mg modified-release tablets | 28 tablet (P35) £25.48

### Fesoterodine fumarate

**INDICATIONS AND DOSE**

Urinary frequency | Urinary urgency | Urge incontinence

- **BY MOUTH**

  - **Adult:** 4 mg once daily, increased if necessary up to 8 mg once daily

- **Dose adjustments due to interactions**

  Max. 4 mg daily with concomitant atazanavir, clarithromycin, indinavir, laranconazole, ritonavir, saquinavir, or telithromycin

  In patients with hepatic or renal impairment, consult product literature before concomitant use with amprenavir, aripiprant, atazanavir, clarithromycin, diltiazem, erythromycin, fluconazole, fosamprenavir, indinavir, laranconazole, ritonavir, saquinavir, telithromycin, verapamil, or grapefruit juice

- **SIDE-EFFECTS**

  - **Common or very common** Insomnia
  - **Uncommon** Cough - nasal dryness - pharyngolaryngeal pain - vertigo

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises increase dose cautiously; max. 4 mg daily in moderate impairment. Avoid in severe impairment. Consult product literature before concomitant use of cytochrome P450 enzyme inhibitors.

- **RENAL IMPAIRMENT** Increase dose cautiously if eGFR 30–80 mL/minute/1.73m²; max. 4 mg daily if eGFR less than 30 mL/minute/1.73m². Consult product literature before concomitant use of cytochrome P450 enzyme inhibitors.
Flavoxate hydrochloride

**INDICATIONS AND DOSE**

Urinary frequency | Urinary incontinence | Dysuria | Urinary urgency | Bladder spasm due to catheterisation, cystoscopy, or surgery

**BY MOUTH**

- Adult: 200 mg 3 times a day

**CONTRA-INDICATIONS**

Gastro-intestinal haemorrhage

**SIDE-EFFECTS**

- Eosinophilia • erythema • leucopenia • pruritus • urticaria • vertigo

**PREGNANCY**

Manufacturer advises avoid unless no safer alternative.

**BREAST FEEDING**

Manufacturer advises caution—no information available.

**PRESCRIBING AND DISPENSING INFORMATION**

The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Modified-release tablet**

**CAUTIONARY AND ADVISORY LABELS**

3, 25

- Toviaz (Pfizer Ltd)
  - Fesoterodine fumarate 4 mg Toviaz 4 mg modified-release tablets | 28 tablet [PO] £25.78 DT price = £25.78
  - Fesoterodine fumarate 8 mg Toviaz 8 mg modified-release tablets | 28 tablet [PO] £25.78 DT price = £25.78

**Oxybutynin hydrochloride**

**INDICATIONS AND DOSE**

Urinary frequency | Urinary incontinence | Dysuria | Urinary urgency | Neurogenic bladder instability

**BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- Child 5-11 years: Initially 5 mg once daily, adjusted in steps of 5 mg every 1 week, adjusted according to response; maximum 15 mg per day
  - Adult: Initially 5 mg once daily, increased in steps of 5 mg every 1 week, adjusted according to response; maximum 20 mg per day

**BY TRANSDERMAL APPLICATION USING PATCHES**

- Adult: Apply 1 patch twice weekly, patch to be applied to clean, dry unbroken skin on abdomen, hip or buttock. Patch should be removed every 3–4 days and site replacement patch on a different area. The same area should be avoided for 7 days

**Nocturnal enuresis associated with overactive bladder**

**BY MOUTH USING MODIFIED-RELEASE TABLETS**

- Child 5-17 years: Initially 5 mg once daily, adjusted in steps of 5 mg every 1 week, adjusted according to response; maximum 15 mg per day

**Dose equivalence and conversion**

Patients taking immediate-release oxybutynin may be transferred to the nearest equivalent daily dose of **Lyrinel® XL**

**UNLICENSED USE**

**CAUTIONS**

Acute porphyrias p. 864

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Uncommon Anorexia • facial flushing
  - Rare Night terrors
  - Frequency not known Cognitive impairment

**SPECIFIC SIDE-EFFECTS**

- Rare
  - With transdermal use Application site reactions with patches

**PREGNANCY**

Manufacturers advise avoid unless essential—toxicity in animal studies.

**BREAST FEEDING**

Manufacturers advise avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution.

**RENAL IMPAIRMENT**

Manufacturer advises caution.

**DIRECTIONS FOR ADMINISTRATION**

- With transdermal use Apply patches to clean, dry, unbroken skin on abdomen, hip or buttock, remove after every 3–4 days and site replacement patch on a different area (avoid using same area for 7 days).

**PRESCRIBING AND DISPENSING INFORMATION**

- In adults The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.
  - In children The need for therapy for urinary indications should be reviewed soon after it has been commenced and then at regular intervals; a response usually occurs within 6 months but may take longer.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Oxybutynin for daytime urinary symptoms www.medicinesforchildren.org.uk/oxybutynin-for-daytime-urinary-symptoms

Patients or carers should be given advice on how to administer oxybutynin transdermal patches.

**NATIONAL FUNDING/ACCESS DECISIONS**

The Scottish Medicines Consortium (SMC) has advised (July 2005) that **Kentera®** should be restricted for use in adults who...
Genito-urinary system

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, modified-release tablets, transdermal patches, and oral solutions.

**OXYBUTYNIN HYDROCHLORIDE (Non-proprietary)**

- **Transdermal patch**
  - Propiverine hydrochloride 30 mg: Lyrinel XL 30mg capsules | 28 capsule (EMA) £24.45 DT price = £24.45
  - Propiverine hydrochloride 45 mg: Lyrinel XL 45mg capsules | 28 capsule (EMA) £27.00 DT price = £27.00

**Propiverine hydrochloride**

**INDICATIONS AND DOSE**

Urinary frequency, urgency and incontinence associated with overactive bladder

- **Initially by mouth using immediate-release medicines**
  - Adult: 15 mg 1–2 times a day, increased if necessary up to 15 mg 3 times a day

- **By mouth using modified-release capsules**
  - Adult: 30 mg once daily

Urinary frequency, urgency and incontinence associated with neurogenic bladder instability

- **By mouth using immediate-release medicines**
  - Adult: 15 mg 3 times a day

**PRECAUTIONS AND ADVISORY LABELS**

- **Cautions** Neurogenic bladder disorder - susceptibility to QT-interval prolongation
- **Side-effects**
  - Uncommon: Gastro-oesophageal reflux - oedema
  - Frequency not known: Dysphonia - hepatic impairment - hyperkalaemia - muscle weakness - reduced appetite - torsade de pointes
- **Pregnancy** Manufacturer advises caution—no information available.
- **Breastfeeding** Manufacturer advises avoid—present in milk in animal studies.
- **Hepatic impairment** Max. 5 mg daily in moderate impairment, avoid in moderate impairment in those already taking potent inhibitors of cytochrome P450 enzyme CYP3A4 (such as itraconazole, ketoconazole, or ritonavir).
- **Renal impairment** Max. 5 mg daily if eGFR less than 30 ml/minute/1.73 m²; avoid if eGFR less than 30 ml/minute/1.73 m² in those already taking potent inhibitors of cytochrome P450 enzyme CYP3A4 (such as itraconazole or ritonavir).
- **Prescribing and dispensing information**}

**Solifenacin succinate**

**INDICATIONS AND DOSE**

Urinary frequency | Urinary urgency | Urinary incontinence

- **By mouth**
  - Adult: 5 mg once daily, increased, if necessary to 10 mg once daily

**Dose adjustments due to interactions**

Max. 5 mg daily with concomitant potent inhibitors of cytochrome P450 enzyme CYP3A4 (such as itraconazole, ketoconazole, or ritonavir).

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

**Solifenacin succinate**

**INDICATIONS AND DOSE**

Urinary frequency | Urinary urgency | Urinary incontinence

- **By mouth**
  - Adult: 5 mg once daily, increased, if necessary to 10 mg once daily

**Dose adjustments due to interactions**

Max. 5 mg daily with concomitant potent inhibitors of cytochrome P450 enzyme CYP3A4 (such as itraconazole, ketoconazole, or ritonavir).

**Precautions and advisory labels**

- **Cautions** Neurogenic bladder disorder - susceptibility to QT-interval prolongation
- **Side-effects**
  - Uncommon: Gastro-oesophageal reflux - oedema
  - Frequency not known: Dysphonia - hepatic impairment - hyperkalaemia - muscle weakness - reduced appetite - torsade de pointes
- **Pregnancy** Manufacturer advises caution—no information available.
- **Breastfeeding** Manufacturer advises avoid—present in milk in animal studies.
- **Hepatic impairment** Max. 5 mg daily in moderate impairment, avoid in moderate impairment in those already taking potent inhibitors of cytochrome P450 enzyme CYP3A4 (such as itraconazole or ritonavir).
- **Renal impairment** Max. 5 mg daily if eGFR less than 30 ml/minute/1.73 m²; avoid if eGFR less than 30 ml/minute/1.73 m² in those already taking potent inhibitors of cytochrome P450 enzyme CYP3A4 (such as itraconazole or ritonavir).
- **Prescribing and dispensing information** The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.
**Tolterodine tartrate**

**INDICATIONS AND DOSE**

Urinary frequency | Urinary urgency | Urinary incontinence

**INITIALLY BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- Adults: 2 mg twice daily, reduced if not tolerated to 1 mg twice daily

**INITIALLY BY MOUTH USING MODIFIED-RELEASE CAPSULES**

- Adults: 4 mg once daily

**CAUTIONS**

- History of QT-interval prolongation
- Caution with concomitant use with other drugs known to prolong QT interval.

**INTERACTIONS**

- Caution with concomitant use with other drugs known to prolong QT interval.

**SIDE-EFFECTS**

- Uncommon
- Common or very common

- Bronchitis · chest pain · fatigue · paraesthesia · peripheral oedema · sinusitis · vertigo · weight gain

- Memory impairment
- Frequency not known
- Flushing
- Manufacturer advises avoid—toxicity in animal studies.

**PREGNANCY**

- Manufacturer advises caution.

**RENAL IMPAIRMENT**

- Reduce dose to 20 mg once daily or 20 mg on alternate days if eGFR 10–30 mL/minute/1.73 m². Use with caution. Avoid Regurin® XL.

**PRESCRIBING AND DISPENSING INFORMATION**

- The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, powder.

**Tablet**

- TOLTERODINE TARTRATE (Non-proprietary)

**INITIALLY BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- Adults: 20 mg twice daily, to be taken before food

**INITIALLY BY MOUTH USING MODIFIED-RELEASE MEDICINES**

- Adults: 60 mg once daily
1.2 Urinary retention

Drugs for urinary retention

Acute retention is painful and is treated by catheterisation. Chronic retention is painless and often long-standing. Catheterisation is unnecessary unless there is deterioration of renal function. After the cause has initially been established and treated, drugs may be required to increase detrusor muscle tone.

Benign prostatic hyperplasia is treated either surgically or medically with alpha-blockers. Dutasteride p. 676 and finasteride p. 676 are alternatives to alpha-blockers, particularly in men with a significantly enlarged prostate. Tadalafil p. 700, a phosphodiesterase type-5 inhibitor, may also be used in the management of benign prostatic hyperplasia.

Alpha-blockers

Parasympathomimetics

The parasympathomimetic bethanechol chloride p. 676 increases detrusor muscle contraction. However, it has only a limited role in the relief of urinary retention; its use has been superseded by catheterisation.
Doxazosin

INDICATIONS AND DOSE

Hypertension

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 1 mg once daily for 1–2 weeks, then increased to 2 mg once daily, then increased if necessary to 4 mg once daily; maximum 16 mg per day

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: Initially 4 mg once daily, dose can be adjusted after 4 weeks, then increased if necessary to 8 mg once daily

Benign prostatic hyperplasia

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 1 mg daily, dose may be doubled at intervals of 1–2 weeks according to response; usual maintenance 2–4 mg daily; maximum 8 mg per day

BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: Initially 4 mg once daily, dose can be adjusted after 4 weeks, then increased if necessary to 8 mg once daily

Dose adjustments due to interactions

Caution with concomitant antihypertensives in benign prostatic hyperplasia—reduced dosage and specialist supervision may be required

- CONTRA-INDICATIONS History of micturition syncope (in patients with benign prostatic hypertrophy) - history of postural hypotension - monotherapy in patients with overfull bladder or anuria

- CAUTIONS Care with initial dose (postural hypotension) - cataract surgery (risk of intra-operative floppy iris syndrome) - elderly - heart failure - pulmonary oedema due to aortic or mitral stenosis

- INTERACTIONS → Appendix 1 (alpha-blockers).

- SIDE-EFFECTS

  - Common or very common Anxiety, back pain, coughing, dyspnoea, fatigue, influenza-like symptoms, myalgia - paraesthesia - sleep disturbance - vertigo

  - Uncommon Agitation, angina, arthralgia, epistaxis, gout, hypoaesthesia, micturition disturbance, myocardial infarction, tinnitus, tremor, weight changes

  - Very rare Abnormal ejaculation, alopecia, arrhythmias, bradycardia, bronchospasm, cholestasis, gynaecomastia, hepatitis, hot flashes, jaundice, leucopenia, thrombocytopenia

  - Frequency not known Angioedema, asthenia, blurred vision, depression, dizziness, drowsiness, dry mouth, erectile disorders, gastro-intestinal disturbances, headache, hypersensitivity, hypotension, intra-operative floppy iris syndrome, oedema, palpitations, postural hypotension, priapism, pruritus, rash, rhinitis, syncope, tachycardia

  - PREGNANCY No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.

  - BREAST FEEDING Accumulates in milk in animal studies—manufacturer advises avoid.

  - HEPATIC IMPAIRMENT Use with caution. Manufacturer advises avoid in severe impairment—no information available.

- PATIENT AND CARER ADVICE May affect performance of skilled tasks e.g. driving. Patient counselling is advised for doxazosin tablets (initial dose).

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, capsule

Tablet

- DOXAZOSIN (Non-proprietary)
  - Ofdoxazosin (as Doxazosin mesilate) 1 mg | 28 tablet (Pfizer Ltd) DT price = £0.92
  - Ofdoxazosin (as Doxazosin mesilate) 2 mg | 28 tablet (Pfizer Ltd) DT price = £0.95
  - Ofdoxazosin (as Doxazosin mesilate) 4 mg | 28 tablet (Pfizer Ltd) DT price = £1.12
  - Cardura (Pfizer Ltd)
    - Ofdoxazosin (as Doxazosin mesilate) 1 mg | Cardura 1 mg tablets | 28 tablet (Pfizer Ltd) DT price = £0.92
    - Ofdoxazosin (as Doxazosin mesilate) 2 mg | Cardura 2 mg tablets | 28 tablet (Pfizer Ltd) DT price = £0.95

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 25

- Cardura XL (Pfizer Ltd)
  - Ofdoxazosin (as Doxazosin mesilate) 4 mg | Cardura XL 4 mg tablets | 28 tablet (Pfizer Ltd) DT price = £0.92
  - Ofdoxazosin (as Doxazosin mesilate) 8 mg | Cardura XL 8 mg tablets | 28 tablet (Pfizer Ltd) DT price = £0.98

- Brands may include Doxadura

Indoramin

INDICATIONS AND DOSE

Hypertension

BY MOUTH

- Adult: Initially 25 mg twice daily, increased in steps of 25–50 mg every 2 weeks, maximum daily dose should be given in divided doses; maximum 200 mg per day

Benign prostatic hyperplasia

BY MOUTH

- Adult: 20 mg twice daily, increased in steps of 20 mg every 2 weeks if required, increased if necessary up to 100 mg daily in divided doses
- Elderly: 20 mg daily, dose to be taken at night

Dose adjustments due to interactions

Caution with concomitant antihypertensives in benign prostatic hyperplasia—reduced dosage and specialist supervision may be required

- CONTRA-INDICATIONS Established heart failure - history micturition syncope (when used for benign prostatic hyperplasia) - history of postural hypotension (when used for benign prostatic hyperplasia)

- CAUTIONS Cataract surgery (risk of intra-operative floppy iris syndrome) - control incipient heart failure before initiating indoramin - elderly - epilepsy (convulsions in animal studies) - history of depression - Parkinson’s disease (extrapyramidal disorders reported)

- INTERACTIONS → Appendix 1 (alpha-blockers).

Avoid alcohol (enhances rate and extent of absorption).

- SIDE-EFFECTS

  - Common or very common Sedation

  - Uncommon Failure of ejaculation, fatigue, weight gain

  - Frequency not known Angioedema, asthenia, blurred vision, depression, dizziness, drowsiness, dry mouth, erectile disorders, extrapyramidal disorders, gastro-intestinal disturbances, headache, hypersensitivity reactions, hypotension, incontinence, intra-operative floppy iris syndrome, oedema, palpitations, postural hypotension, priapism, pruritus, rash, rhinitis, syncope, tachycardia, urinary frequency
Prazosin

**INDICATIONS AND DOSE**

**Hypertension**

**BY MOUTH**
- **Adult**: Initially 500 micrograms 2–3 times a day for 3–7 days, the initial dose should be taken on retiring to bed at night to avoid collapse, increased to 1 mg 2–3 times a day for a further 3–7 days, then increased if necessary up to 20 mg daily in divided doses

**Congestive heart failure (rarely used)**

**BY MOUTH**
- **Adult**: 500 micrograms 2–4 times a day, initial dose to be taken at bedtime, then increased to 4 mg daily in divided doses; maintenance 4–20 mg daily in divided doses

Raynaud’s syndrome (but efficacy not established)

**BY MOUTH**
- **Adult**: Initially 500 micrograms twice daily, initial dose to be taken at bedtime, dose may be increased after 3–7 days, then increased if necessary up to 1–2 mg twice daily

**Benign prostatic hyperplasia**

**BY MOUTH**
- **Adult**: Initially 500 micrograms twice daily for 3–7 days, subsequent doses should be adjusted according to response, maintenance 2 mg twice daily, initiate with lowest possible dose in elderly patients

**Dose adjustments due to interactions**

Caution with concomitant antihypertensives in benign prostatic hyperplasia—reduced dosage and specialist supervision may be required

Tamsulosin hydrochloride

**INDICATIONS AND DOSE**

**Benign prostatic hyperplasia**

**BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- **Adult**: 400 micrograms once daily

**CONTRA-INDICATIONS**

History of micturition syncope - history of postural hypotension

**CAUTIONS**

Cataract surgery (risk of intra-operative floppy iris syndrome) - concomitant antihypertensives (reduced dosage and specialist supervision may be required) - elderly

**INTERACTIONS**

Appendix 1 (alpha-blockers).

**SIDE-EFFECTS**

Angioedema - asthma - blurred vision - depression - dizziness - dry mouth - dyspnoea - gastro-intestinal disturbances - headache - nasal congestion - nervousness - oedema - palpitations - syncope - urinary frequency - vertigo - weakness

- **Uncommon** Arthralgia - epistaxis - eye disorders - insomnia - paraesthesia - pruritus - rash - sweating - tachycardia - tinnitus - urticaria
- **Rare** Alopecia - bradycardia - flushing - gynaecostasia - hallucinations - pancreatitis - priapism - urinary incontinence - vasculitis - worsening of narcolepsy

**FREQUENCY NOT KNOWN**

Angioedema - asthenia - erectile disorders - hypersensitivity reactions - hypotension - intra-operative floppy iris syndrome - postural hypotension - rhinitis

**SIDE-EFFECTS, FURTHER INFORMATION**

First dose effect

First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patients should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely.

**PREGNANCY**

No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.

**BREAST FEEDING**

Present in milk, amount probably too small to be harmful; manufacturer advises use with caution.

**HEPATIC IMPAIRMENT**

Initially 500 micrograms daily; increased with caution.

**RENAL IMPAIRMENT**

Initially 500 micrograms daily in moderate to severe impairment; increased with caution.

**PATIENT AND CARER ADVICE**

May affect performance of skilled tasks e.g. driving.

First dose effect

First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patients should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely.
**HEPATIC IMPAIRMENT**

Tamsulosin hydrochloride 400 microgram capsules can be sold to the public for the treatment of functional symptoms of benign prostatic hyperplasia in men aged 45–75 years to be taken for up to 6 weeks before clinical assessment by a doctor.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, powder

**Modified-release tablet**

CAUTIONARY AND ADVISORY LABELS 25

Tamsulosin hydrochloride 400 microgram: Tamsulosin 400 microgram modified-release tablets | 30 tablet (£10.47 DT price = £10.47

Flomaxtra XL: Flomaxtra XL 400 microgram | tablet (£10.47 DT price = £10.47

Brands may include Costam XL; Faramsil; Flectone XL

**Modified-release capsule**

CAUTIONARY AND ADVISORY LABELS 25

Dutasteride hydrochloride 400 microgram: Dutasteride 400 microgram modified-release capsules | 30 capsule (£6.15 DT price = £4.52

Brands may include Contiflo XL; Diffundox XL; Flomax MR; Galebon; Losinate MR; Pamsvax XL; Pemtye MR; Pintexel PR; Prosurin XL; Talamfex; Tamurex

---

**Dutasteride with tamsulosin**

The properties listed below are those particular to the combination only. For the properties of the components please consider, dutasteride p. 670, tamsulosin hydrochloride p. 674.

**INDICATIONS AND DOSE**

Benign prostatic hyperplasia

BY MOUTH

Adult (male): 1 capsule daily.

**PATIENT AND CARER ADVICE**

May affect performance of skilled tasks e.g. driving.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

CAUTIONARY AND ADVISORY LABELS 25

Combodart (GlaxoSmithKline UK Ltd)

Dutasteride 500 microgram, Tamsulosin hydrochloride 400 microgram: Combodart 0.5mg/0.4mg capsules | 30 capsule (£19.80 DT price = £19.80

**Solifenacin with tamsulosin**

The properties listed below are those particular to the combination only. For the properties of the components please consider, solifenacin succinate p. 670, tamsulosin hydrochloride p. 674.

**INDICATIONS AND DOSE**

Moderate to severe urinary frequency, urgency, and obstructive symptoms associated with benign prostatic hyperplasia when monotherapy ineffective

BY MOUTH

Adult (male): 1 tablet daily.

Dose adjustments due to interactions

Max. 1 Vesomni® tablet daily with concomitant potent inhibitors of cytochrome P450 enzyme CYP3A4 (such as itraconazole or ritonavir).

**HEPATIC IMPAIRMENT**

Max. 1 Vesomni® tablet daily in moderate impairment.

---

**Terazosin**

**INDICATIONS AND DOSE**

Mild to moderate hypertension

BY MOUTH

Adult: 1 mg daily for 7 days, then increased if necessary to 2 mg daily, dose should be taken at bedtime; maintenance 2–10 mg once daily, doses above 20 mg rarely improve efficacy

**Benign prostatic hyperplasia**

BY MOUTH

Adult: Initially 1 mg daily, dose should be taken at bedtime, if necessary dose may be doubled at intervals of 1–2 weeks according to response; maintenance 5–10 mg daily; maximum 10 mg per day

**CONTRA-INDICATIONS**

History of micturition syncope (in benign prostatic hyperplasia) - history of postural hypotension (in benign prostatic hyperplasia)

**CAUTIONS**

Cataract surgery (risk of intra-operative floppy iris syndrome) - elderly - first dose

**CAUTIONS, FURTHER INFORMATION**

First dose may cause collapse due to hypotension within 30–90 minutes, therefore should be taken on retiring to bed; may also occur with rapid dose increase.

**INTERACTIONS**

→ Appendix 1 (alpha-blockers).

**SIDE-EFFECTS**

**PREGNANCY**

No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.

**BREAST FEEDING**

No information available.

**PATIENT AND CARER ADVICE**

May affect performance of skilled tasks e.g. driving. Patient counselling is advised for terazosin tablets (initial dose).

First dose effect First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patient should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

TERAZOSIN (Non-proprietary)

Terazosin (as Terazosin hydrochloride) 2 mg Terazosin 2mg tablets | 28 tablet (£4.50 DT price = £2.45

Terazosin (as Terazosin hydrochloride) 5 mg Terazosin 5mg tablets | 28 tablet (£6.57 DT price = £2.80
Dutasteride

- **Medicinal forms**: Tablets 500 microgram daily, review treatment at 3–6 months and then every 6–12 months (may require several months treatment before benefit is obtained).

  - **Interactions**: Appendix 1 (dutasteride).
  - **Side-effects**: Breast enlargement, decreased libido, ejaculation disorders. Impotence.

- **Conception and contraception**: Dutasteride is excreted in semen and use of a condom is recommended if sexual partner is pregnant or likely to become pregnant.

- **Hepatic impairment**: Avoid in severe impairment—no information available.

- **Effect on laboratory tests**: May decrease serum concentration of prostate cancer markers such as prostate-specific antigen; reference values may need adjustment.

- **Handling and storage**: Women of childbearing potential should avoid handling leaking capsules of dutasteride.

- **Patient and carer advice**: Cases of male breast cancer have been reported. Patients or their carers should be told to promptly report to their doctor any changes in breast tissue such as lumps, pain, or nipple discharge.

- **Medicinal forms**: There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution.

  - **Capsule**: Bethanechol chloride 10 mg (Cheplapharm Arzneimittel GmbH) | 80 tablet | £2.60 DT price = £0.10

  - **Tablet**: Bethanechol chloride 10 mg (Cheplapharm Arzneimittel GmbH) | 30 tablet | £2.50 DT price = £0.08

  - **Tablet**: Bethanechol chloride 25 mg (Cheplapharm Arzneimittel GmbH) | 30 tablet | £2.50 DT price = £0.08

- **Drug action**: A specific inhibitor of the enzyme 5α-reductase, which metabolises testosterone into the more potent androgen, dihydrotestosterone.

- **Indications and dose**: Benign prostatic hyperplasia.

  - **By mouth**

    - **Adult**: 500 micrograms daily, review treatment at 3–6 months and then every 6–12 months (may require several months treatment before benefit is obtained).

- **Contraindications**: Bradycardia, heart block. There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution.

  - **Capsule**: Myotonine (Cheplapharm Arzneimittel GmbH) | 30 tablet | £2.60 DT price = £0.08

  - **Tablet**: Myotonine (Cheplapharm Arzneimittel GmbH) | 30 tablet | £2.60 DT price = £0.08

  - **Tablet**: Myotonine (Cheplapharm Arzneimittel GmbH) | 30 tablet | £2.60 DT price = £0.08

- **Drug action**: A specific inhibitor of the enzyme 5α-reductase, which metabolises testosterone into the more potent androgen, dihydrotestosterone.

- **Indications and dose**: Benign prostatic hyperplasia.

  - **By mouth**

    - **Adult**: 5 mg daily, review treatment at 3–6 months and then every 6–12 months (may require several months treatment before benefit is obtained).
PATIENT AND CARER ADVICE  Cases of male breast cancer have been reported. Patients or their carers should be told to promptly report to their doctor any changes in breast tissue such as lumps, pain, or nipple discharge.

NATIONAL FUNDING/ACCESS DECISIONS  NHS restrictions  Finasteride is not prescribable under the NHS for the treatment of androgenetic alopecia in men.

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, powder, tablet.

Tablet  
- FINASTERIDE (Non-proprietary)  
  Finasteride 5 mg  Finasteride 5mg tablets | 28 tablet  [PO] £12.20 DT price = £1.65
  - Aindeem (Actavis UK Ltd)  
    Finasteride 1 mg  Aindeem 1mg tablet | 28 tablet  [PO] £33.68 | 84 tablet  [PO] £88.40
  - Propecia (Merck Sharp & Dohme Ltd)  
    Finasteride 1 mg  Propecia 1mg tablets | 28 tablet  [PO] £29.99
  - Proscar (Merck Sharp & Dohme Ltd)  
    Finasteride 5 mg  Proscar 5mg tablets | 28 tablet  [PO] £13.94 DT price = £1.65

1.3 Urological pain

Urological pain  The acute pain of ureteric colic may be relieved with pethidine hydrochloride p. 372. Diclofenac by injection or as suppositories is also effective and compares favourably with pethidine hydrochloride; other non-steroidal anti-inflammatory drugs are occasionally given by injection.

Lidocaine hydrochloride gel p. 1116 is a useful topical application in urethral pain or to relieve the discomfort of catheterisation.

Alkalisation of urine  Alkalisation of urine can be undertaken with potassium citrate. The alkalisation action may relieve the discomfort of cystitis caused by lower urinary tract infections. Sodium bicarbonate p. 848 is used as a urinary alkalising agent in some metabolic and renal disorders.

Drugs used for Urological pain not listed below; Sodium bicarbonate, p. 848

ALKALINISING DRUGS

Citric acid with potassium citrate

INDICATIONS AND DOSE  
- Relief of discomfort in mild urinary-tract infections  
- Alkalisation of urine

BY MOUTH USING ORAL SOLUTION  
- Adult: 10 mL 3 times a day, diluted well with water

CAUTIONS  
- Cardiac disease  
- Elderly

INTERACTIONS  
- Appendix 1 (potassium salts).

SIDE-EFFECTS  
- Hyperkalaemia on prolonged high dosage  
- Mild diuresis

RENAL IMPAIRMENT  
- Avoid in severe impairment. Close monitoring required in renal impairment—high risk of hyperkalaemia.

PRESCRIBING AND DISPENSING INFORMATION  
- When prepared extemporaneously, the BP states Potassium Citrate Mixture BP consists of potassium citrate 30%,
Bladder instillations and urological surgery

Anethol with borneol, camphene, cineole, fenchone and pinene

**TERPENES**

**INDICATIONS AND DOSE**

Urolithiasis for the expulsion of calculi

**By mouth**

- Adult: 1–2 capsules 3–4 times a day, to be taken before food

**LESS SUITABLE FOR PRESCRIBING**

Preparation is less suitable for prescribing.

**PERCUSSION MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- **CAUTIONARY AND ADVISORY LABELS 25**
  - *Rowatinex* (Meadow Laboratories Ltd)
    - Anethol 4 mg, Borneol 10 mg, Camphene 15 mg, Cineole 3 mg, Fenchone 4 mg, Pinene 31 mg *Rowatinex* capsules | 50 capsule *Rowatinex* £7.35

**PRESCRIBING AND DISPENSING INFORMATION**

Sodium citrate 300 mmol/litre (88.2 mg/mL) oral solution is licensed for use before general anaesthesia for caesarean section (available from Viridian).

**EXCEPTIONS TO LEGAL CATEGORY**

Proprietary brands of sodium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include:

- **Granules**
  - **SODIUM CITRATE (Non-proprietary)**
    - Sodium citrate 4 gram Cystitis Relief 4g oral granules sachets | 6 sachet *GSK* £1.33
    - Lloydspharmacy Cystitis Relief 4g oral granules sachets | 6 sachet *GSK* no price available
  - **Brands may include Canesten Oasis, Cymalon (sodium citrate), Cystocolm**

- **Oral solution**
  - **SODIUM CITRATE (Non-proprietary)**
    - Sodium citrate 88.23 mg per 1 ml Sodium citrate 0.3M oral solution | 30 ml *Posa* £39.60
    - Sodium citrate 441.17mg/5ml oral solution | 30 ml *Posa* no price available

- **Enema**
  - **SODIUM CITRATE (Non-proprietary)**
    - Sodium citrate 90 mg per 1 ml Sodium citrate compound 5ml enema | 12 enema *P* no price available
  - **Micolette Micro-enema** (Wockhardt UK Ltd)
    - Sodium citrate 90 mg per 1 ml Micolette Micro-enema 5ml | 12 enema *P* £4.95
  - **Micralax Micro-enema** (Focus Pharmaceuticals Ltd)
    - Sodium citrate 90 mg per 1 ml Micralax Micro-enema 5ml | 12 enema *P* £4.87
  - **Relaxit** (Supra Enterprises Ltd)
    - Sodium citrate 90 mg per 1 ml Relaxit Micro-enema 5ml | 12 enema £3.21

**Irrigation solution**

- **SODIUM CITRATE (Non-proprietary)**
  - Sodium citrate 3% irrigation solution 1litre bags | 1 bag no price available

- **Powder**
  - **SODIUM CITRATE (Non-proprietary)**
    - Sodium citrate 4 gram Numark cystitis treatment 4g oral powder sachets | 6 sachet *GSK* £1.55
  - **SODIUM CITRATE (Non-proprietary)**
    - Sodium citrate 1 mg per 1 mg Sodium citrate powder | 500 gram *GSK* £5.28 0T price = £5.28

**2 Bladder instillations and urological surgery**

**Bladder instillations and urological surgery**

**Bladder infection**

Various solutions are available as irrigations or washouts. Aqueous chlorhexidine p. 1051 can be used in the management of common infections of the bladder but it is ineffective against most *Pseudomonas spp*. Solutions containing chlorhexidine 1 in 5000 (0.02%) are used but they may irritate the mucosa and cause burning and haematuria (in which case they should be discontinued); sterile sodium chloride solution 0.9% p. 851 (physiological saline) is usually adequate and is preferred as a mechanical irrigant.

Continuous bladder irrigation with amphotericin 50 micrograms/ml. p. 517 may be of value in mycotic infections in adults.

**Dissolution of blood clots**

Clot retention is usually treated by irrigation with sterile sodium chloride solution 0.9% but sterile sodium citrate solution for bladder irrigation 3% may also be helpful.

**Bladder cancer**

Bladder instillations of doxorubicin hydrochloride p. 754 and mitomycin p. 767 are used for recurrent superficial bladder tumours. Such instillations reduce systemic side-effects; adverse effects on the bladder (e.g. micturition disorders and reduction in bladder capacity) may occur.

Instillation of epirubicin hydrochloride p. 756 is used for treatment and prophylaxis of certain forms of superficial bladder cancer; instillation of doxorubicin hydrochloride p. 754 is also used for some papillary tumours.

Instillation of *BCG* (bacillus calmette-guérin p. 794), a live attenuated strain derived from *Mycobacterium bovis* is licensed for the treatment of primary or recurrent bladder carcinoma in-situ and for the prevention of recurrence following transurethral resection.

**Urological surgery**

Glycine irrigation solution 1.5% p. 679 is the irrigant of choice for transurethral resection of the prostate gland and bladder tumours; sterile sodium chloride solution 0.9% (physiological saline) is used for percutaneous renal surgery.

**Maintenance of indwelling urinary catheters**

The deposition which occurs in catheterised patients is usually chiefly composed of phosphate and to minimise this the irrigant of choice (if latex) should be changed at least as often as every 6 weeks. If the catheter is to be left for longer periods a silicone catheter should be used together with the appropriate use of catheter maintenance solutions. Repeated blockage usually indicates that the catheter needs to be changed.

**Chlorhexidine with lidocaine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, chlorhexidine p. 1051, lidocaine hydrochloride p. 1161.
**CONTRAINDICATIONS**

- Hypersensitivity to any component.
- Glaucoma.
- Pregnancy.
- Known or suspected breast cancer.
- Renal or hepatic impairment.
- Acute infection.

**MEDICINAL FORMS**

- **Gel**: May contain parabens (preservatives).
- **Instillagel**: Contains hydrochloric acid 20 mg per ml, Lidocaine hydrochloride 20 mg per ml, Chlorhexidine gluconate 500 microgram per ml.

**SIDE-EFFECTS**

- Hypersensitivity, including angio-oedema and anaphylaxis.
- Hypervolaemia.
- Renal failure.

**INTERACTIONS**

- **Cæsarean section**: Risk of uterine rupture.
- **Breast feeding**: Caution advised.
- **Contraception**: Does not contain a spermicide.
- **Combined oral contraceptives containing a progestogen** (e.g., Femidom, Femilon, Ovral, Ortho-Cycline, Ortho-Novum) are effective preparations for general use. Advantages of combined oral contraceptives include:
  - Reliable and reversible.
  - Reduced dysmenorrhoea and menorrhagia.
  - Reduced incidence of premenstrual tension.
  - Less symptomatic fibroids and functional ovarian cysts.
  - Less benign breast disease.
  - Reduced risk of ovarian and endometrial cancer.
  - Reduced risk of pelvic inflammatory disease.

**SIDE-EFFECTS**

- The risk of pelvic inflammatory disease is reduced.
- A transdermal patch and tablet are highly effective and can be reliable for well-motivated couples if used in conjunction with a spermicide.

**MONITORING REQUIREMENTS**

- Ophthalmic, renal and hepatic assessments at intervals of 6 months are required in long-term treatment.

**PRECAUTIONS**

- Avoid exposure to sunlight or ultraviolet light.
- The risk of pelvic inflammatory disease is reduced.

**PATIENT INFORMATION**

- A transdermal patch and tablet are highly effective and can be reliable for well-motivated couples if used in conjunction with a spermicide.

**CONTRAINDICATIONS**

- Pregnancy.

**MEDICINAL FORMS**

- **Gel**:
  - Contains parabens (preservatives).
- **Instillagel**:
  - Contains hydrochloric acid 20 mg per ml, Lidocaine hydrochloride 20 mg per ml, Chlorhexidine gluconate 500 microgram per ml.

**SIDE-EFFECTS**

- Hypersensitivity, including angio-oedema and anaphylaxis.
- Hypervolaemia.
- Renal failure.

**INTERACTIONS**

- **Cæsarean section**: Risk of uterine rupture.
- **Breast feeding**: Caution advised.
- **Contraception**: Does not contain a spermicide.
- **Combined oral contraceptives containing a progestogen** (e.g., Femidom, Femilon, Ovral, Ortho-Cycline, Ortho-Novum) are effective preparations for general use. Advantages of combined oral contraceptives include:
  - Reliable and reversible.
  - Reduced dysmenorrhoea and menorrhagia.
  - Reduced incidence of premenstrual tension.
  - Less symptomatic fibroids and functional ovarian cysts.
  - Less benign breast disease.
  - Reduced risk of ovarian and endometrial cancer.
  - Reduced risk of pelvic inflammatory disease.

**SIDE-EFFECTS**

- The risk of pelvic inflammatory disease is reduced.
- A transdermal patch and tablet are highly effective and can be reliable for well-motivated couples if used in conjunction with a spermicide.

**MONITORING REQUIREMENTS**

- Ophthalmic, renal and hepatic assessments at intervals of 6 months are required in long-term treatment.

**PRECAUTIONS**

- Avoid exposure to sunlight or ultraviolet light.
- The risk of pelvic inflammatory disease is reduced.

**PATIENT INFORMATION**

- A transdermal patch and tablet are highly effective and can be reliable for well-motivated couples if used in conjunction with a spermicide.

Choice
The majority of combined oral contraceptives contain ethinylestradiol p. 655 as the oestrogen component; mestranol and estradiol are also used. The ethinylestradiol content of combined oral contraceptives ranges from 20 to 40 micrograms. Generally a preparation with the lowest oestrogen and progestogen content which gives good cycle control and minimal side-effects in the individual woman is chosen. It is recommended that combined hormonal contraceptives are not continued beyond 50 years of age since more suitable alternatives exist.
**Low strength preparations** (containing ethinylestradiol 20 micrograms) are particularly appropriate for women with risk factors for circulatory disease, provided a combined oral contraceptive is otherwise suitable.

**Standard strength preparations** (containing ethinylestradiol 30 or 35 micrograms or in 30–40 microgram phased preparations) are appropriate for standard use. Phased preparations are generally reserved for women who either do not have withdrawal bleeding or who have breakthrough bleeding with monophasic products.

The progestogens desogestrel with ethinylestradiol p. 685, drospirenone with ethinylestradiol p. 686, and ethinylestradiol with gestodene p. 687 may be considered for women who have side-effects (such as acne, headache, depression, breast symptoms, and breakthrough bleeding) with other progestogens. Drospirenone, a derivative of spironolactone, has anti-androgenic and anti-mineralocorticoid activity; it should be used with care if an increased plasma-potassium concentration might be hazardous.

Dienogest with estradiol valerate p. 685 is in the combined oral contraceptive Qlaira®. Nomegestrol is the progestogen contained in the combined oral contraceptive Zoely®, in combination with estradiol.

The progestogen norelgestromin is combined with ethinylestradiol in a transdermal patch (Evra®). The vaginal contraceptive ring contains the progestogen etonogestrel combined with ethinylestradiol (NuvaRing®).

**Surgery**

Oestrogen-containing contraceptives should preferably be discontinued (and adequate alternative contraceptive arrangements made) 4 weeks before major elective surgery and all surgery to the legs or surgery which involves prolonged immobilisation of a lower limb; they should normally be recommenced at the first menses occurring at least 2 weeks after full mobilisation. A progestogen-only contraceptive may be offered as an alternative and the oestrogen-containing contraceptive restarted after mobilisation. When discontinuation of an oestrogen-containing contraceptive is not possible, e.g. after trauma or if a patient admitted for an elective procedure is still on an oestrogen-containing contraceptive, thromboprophylaxis (with unfractionated or low molecular weight heparin and graduated compression hose) is advised. These recommendations do not apply to minor surgery with short duration of anaesthesia, e.g. laparoscopic sterilisation or tooth extraction, or to women using oestrogen-free hormonal contraceptives.

**Reason to stop immediately**

Combined hormonal contraceptives or hormone replacement therapy (HRT) should be stopped pending investigation and treatment, if any of the following occur:

- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;
- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perception disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;
- hepatitis, jaundice, liver enlargement;
- blood pressure above systolic 160 mmHg or diastolic 95 mmHg; (in adolescents stop if blood pressure very high);
- prolonged immobility after surgery or leg injury;

- detection of a risk factor which contra-indicates treatment.

**Progestogen-only contraceptives**

**Oral progestogen-only contraceptives**

Oral progestogen-only preparations alter cervical mucus to prevent sperm penetration and may inhibit ovulation in some women; oral desogestrel-only preparations consistently inhibit ovulation and this is their primary mechanism of action. There is insufficient clinical trial evidence to compare the efficacy of oral progestogen-only contraceptives with each other or with combined hormonal contraceptives. Progestogen-only contraceptives offer a suitable alternative to combined hormonal contraceptives when oestrogens are contra-indicated (including those with venous thrombosis or a past history or predisposition to venous thrombosis, heavy smokers, those with hypertension above systolic 160 mmHg or diastolic 95 mmHg, valvular heart disease, diabetes mellitus with complications, and migraine with aura).

**Parenteral progestogen-only contraceptives**

Medroxyprogesterone acetate (Depo-Provera®, SAYANA PRESS®) p. 695 is a long-acting progestogen given by injection; it is at least as effective as the combined oral preparations but because of its prolonged action it should never be given without full counselling backed by the patient information leaflet. It may be used as a short-term or long-term contraceptive for women who have been counselled about the likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility. Troublesome bleeding has been reported in patients given medroxyprogesterone acetate in the immediate puerperium; delaying the first injection until 6 weeks after birth may minimise bleeding problems. If the woman is not breast-feeding, the first injection may be given within 5 days postpartum (she should be warned that the risk of troublesome bleeding may be increased).

In adolescents, medroxyprogesterone acetate (Depo-Provera®, SAYANA PRESS®) should be used only when other methods of contraception are inappropriate;

- in all women, the benefits of using medroxyprogesterone acetate beyond 2 years should be evaluated against the risks;

- in women with risk factors for osteoporosis, a method of contraception other than medroxyprogesterone acetate should be considered.

**Norethisterone enantate** (Noristerat®) is a long-acting progestogen given as an oily injection which provides contraception for 8 weeks; it is used as short-term interim contraception e.g. before vasectomy becomes effective. An etonogestrel-releasing implant (Nexplanon®) is also available. It is a highly effective long-acting contraceptive, consisting of a single flexible rod that is inserted subdermally into the lower surface of the upper arm and provides contraception for up to 3 years. The manufacturer advises that in heavier women, blood-etonogestrel concentrations are lower and therefore the implant may not provide effective contraception during the third year; they advise that earlier replacement may be considered in such patients—however, evidence to support this recommendation is lacking. Local reactions such as bruising and itching can occur at the insertion site. The contraceptive effect of etonogestrel is rapidly reversed on removal of the implant.

**Intra-uterine progestogen-only device**

The progestogen-only intra-uterine systems, Mirena® and Jaydess®, releases levonorgestrel p. 692 directly into the uterine cavity. Mirena® is licensed for use as a contraceptive, for the treatment of primary menorrhagia, and for the prevention of endometrial hyperplasia during
of oestrogen replacement therapy. Jaydess® is licensed for contraception. These may therefore be a contraceptive method of choice for women who have excessively heavy menses.

The effects of the progestogen-only intra-uterine system are mainly local and hormonal including prevention of endometrial proliferation, thickening of cervical mucous, and suppression of ovulation in some women (in some cycles). In addition to the progestogenic activity, the intra-uterine system itself may contribute slightly to the contraceptive effect. Return of fertility after removal is rapid and appears to be complete.

Advantages of the progestogen-only intra-uterine system over copper intra-uterine devices are that there may be an improvement in any dysmenorrhoea and a reduction in blood loss; there is also evidence that the frequency of pelvic inflammatory disease may be reduced (particularly in the youngest age groups who are most at risk).

In primary menorrhagia, menstrual bleeding is reduced significantly within 3–6 months of inserting the progestogen-only intra-uterine system, probably because it prevents endometrial proliferation. Another treatment should be considered if menorrhagia does not improve within this time.

**Surgery**

All progestogen-only contraceptives (including those given by injection) are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

**Emergency contraception**

**Hormonal methods**

Hormonal emergency contraceptives include levonorgestrel p. 692 and ulipristal acetate p. 691; either drug should be taken as soon as possible after unprotected intercourse to increase efficacy.

Levonorgestrel is effective if taken within 72 hours (3 days) of unprotected intercourse and may also be used between 72 and 96 hours after unprotected intercourse [unlicensed use], but efficacy decreases with time. Ulipristal acetate, a progestrone receptor modulator, is effective if taken within 120 hours (5 days) of unprotected intercourse.

Levonorgestrel is less effective than insertion of an intra-uterine device. Ulipristal acetate is as effective as levonorgestrel, but its efficacy compared to an intra-uterine device is not yet known.

**Intra-uterine device**

Insertion of an intra-uterine device is more effective than oral levonorgestrel p. 692 for emergency contraception. A copper intra-uterine contraceptive device can be inserted up to 120 hours (5 days) after unprotected intercourse; sexually transmitted infections should be tested for and insertion of the device should usually be covered by antibacterial prophylaxis (e.g. azithromycin p. 469). If intercourse has occurred more than 5 days previously, the device can still be inserted up to 5 days after the earliest likely calculated ovulation (i.e. within the minimum period before implantation), regardless of the number of episodes of unprotected intercourse earlier in the cycle.

**Contraceptives, interactions**

**Combined hormonal contraceptives interactions**

The effectiveness of combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, and vaginal rings can be considerably reduced by interaction with drugs that induce hepatic enzyme activity (e.g. carbamazepine p. 387, eslicarbazepine acetate p. 390, nevirapine p. 560, oxcarbazepine p. 397, phenytoin p. 398, phenobarbital p. 409, primidone p. 401, ritonavir p. 570, St John’s Wort, topiramate p. 406 and, above all, rifabutin p. 507 and rifampicin p. 508). A condom together with a long-acting method, such as an injectable contraceptive, may be more suitable for patients with HIV infection or at risk of HIV infection; advice on the possibility of interaction with antiretroviral drugs should be sought from HIV specialists.

Women taking combined hormonal contraceptives who require enzyme-inducing drugs should be advised to change to a contraceptive method that is unaffected by enzyme-inducers (e.g. some parenteral progestogen-only contraceptives, intra-uterine devices) for the duration of treatment and for 4 weeks after stopping. If a change in contraceptive method is undesirable or inappropriate the following options should be discussed:

- For a short course (2 months or less) of an enzyme-inducing drug, continue with a combined oral contraceptive providing ethinylestradiol 30 micrograms or more daily and use a ‘tricycling’ regimen (i.e. taking 3 packets of monophasic tablets without a break followed by a shortened tablet-free interval of 4 days [unlicensed use]). Additional contraceptive precautions should also be used whilst taking the enzyme-inducing drug and for 4 weeks after stopping. Another option (except for rifampicin or rifabutin) is to follow the advice for long-term courses.

  - For women using combined hormonal contraceptive patches or vaginal rings, additional contraceptive precautions are also required whilst taking the enzyme-inducing drug and for 4 weeks after stopping. If concomitant administration runs beyond the 3 weeks of patch or vaginal ring use, a new treatment cycle should be started immediately, without a patch-free or ring-free break.

  - For a long-term course (over 2 months) of an enzyme-inducing drug (except rifampicin or rifabutin), adjust the dose of combined oral contraceptive to provide ethinylestradiol 50 micrograms or more daily [unlicensed use] and use a ‘tricycling’ regimen; continue for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping. If breakthrough bleeding occurs (and all other causes are ruled out) it is recommended that the dose of ethinylestradiol is increased by increments of 10 micrograms up to a maximum of 70 micrograms daily [unlicensed use], or to use additional precautions, or to change to a method unaffected by enzyme-inducing drugs.

  - Contraceptive patches and vaginal rings are not recommended for women taking enzyme-inducing drugs over a long period.

- For a long-term course (over 2 months) of rifampicin or rifabutin, an alternative method of contraception (such as an IUD) is always recommended because they are such potent enzyme-inducing drugs; the alternative method of contraception should be continued for 4 weeks after stopping the enzyme-inducing drug.

**Antibacterials that do not induce liver enzymes**

Latest recommendations are that no additional contraceptive precautions are required when combined oral contraceptives are used with antibacterials that do not induce liver enzymes, unless diarrhoea or vomiting occur. These recommendations should be discussed with the woman, who should also be advised that guidance in patient information leaflets may differ.

It is also currently recommended that no additional contraceptive precautions are required when contraceptive patches or vaginal rings are used with antibacterials that do not induce liver enzymes. There have been concerns that some antibacterials that do not induce liver enzymes (e.g. ampicillin p. 483, doxycycline p. 496) reduce the efficacy of combined oral contraceptives by impairing the bacterial flora
lesions, which may increase the risk of acquiring these infections.

Products such as petroleum jelly (Vaseline®), baby oil and oil-based vaginal and rectal preparations are likely to damage condoms and contraceptive diaphragms made from latex rubber, and may render them less effective as a barrier method of contraception and as a protection from sexually transmitted infections (including HIV).

**Contraceptive devices**

The intra-uterine device (IUD) is a suitable contraceptive for women of all ages irrespective of parity; however, it is less appropriate for those with an increased risk of pelvic inflammatory disease e.g. women under 25 years.

The most effective intra-uterine devices have at least 380 mm² of copper and have bonded copper on the arms. Smaller devices have been introduced to minimise side-effects; these consist of a plastic carrier wound with copper wire or fitted with copper bands; some also have a central core of silver to prevent fragmentation of the copper.

Fertility declines with age and therefore a copper intra-uterine device which is fitted in a woman over the age of 40, may remain in the uterus until menopause.

A frameless, copper-bearing intra-uterine device (Gyne Fix®) is also available. It consists of a knotted, polypropylene thread with 6 copper sleeves; the device is anchored in the uterus by inserting the knot into the uterine fundus.

---

**3.1 Contraception, combined**

**OESTROGENS**

**Combined hormonal contraceptives**

- **CONTRA-INDICATIONS** Acute porphyrias p. 864; gallstones — heart disease associated with pulmonary hypertension or risk of embolus — history during pregnancy of cholestatic jaundice — history during pregnancy of chorea — history during pregnancy of pemphigoid gestationis — history during pregnancy of pruritus — history of breast cancer (but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable) — history of haemolytic uraemic syndrome — migraine with aura — personal history of venous or arterial thrombosis — sclerosing treatment for varicose veins — severe or multiple risk factors for arterial disease. Severe or multiple risk factors for venous thromboembolism — systemic lupus erythematosus with (or unknown) antiphospholipid antibodies — transient cerebral ischaemic attacks without headaches — undiagnosed vaginal bleeding

- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma- gonadotrophin concentration)— seek specialist advice — Crohn’s disease — genetic mutations associated with breast cancer (e.g. BRCA 1) — history of severe depression especially if induced by hormonal contraceptive — hyperprolactinaemia (seek specialist advice) — inflammatory bowel disease — migraine with aura — personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) — risk factors for arterial disease — risk factors for venous thromboembolism — sickle cell disease — undiagnosed breast mass

**CAUTIONS. FURTHER INFORMATION**

Risk of venous thromboembolism. There is an increased risk of venous thromboembolic disease in users of combined hormonal contraceptives particularly during the first year and possibly after restarting combined hormonal
contraceptives following a break of four weeks or more. This risk is considerably smaller than that associated with pregnancy (about 60 cases of venous thromboembolic disease per 100 000 pregnancies). In all cases the risk of venous thromboembolism increases with age and in the presence of other risk factors, such as obesity. The risk also varies depending on the type of progestogen. Provided that women are informed of the relative risks of venous thromboembolism and accept them, the choice of oral contraceptive is for the woman together with the prescriber jointly to make in light of her individual medical history and any contra-indications.

Combined hormonal contraceptives also slightly increase the risk of arterial thromboembolism; however, there is no evidence to suggest that this risk varies between different preparations.

**Risk factors for venous thromboembolism** Use with caution if any of following factors present but avoid if two or more factors present:
- family history of venous thromboembolism in first-degree relative aged under 45 years (avoid contraceptive containing desogestrel or gestodene, or avoid if known prothrombin coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
- obesity; body mass index ≥ 30 kg/m² (avoid if body mass index ≥ 35 kg/m² unless no suitable alternative); (in adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
- long-term immobilisation e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
- history of superficial thrombophlebitis;
- age over 35 years (avoid if over 50 years);
- smoking.

"Combined with ethinylestradiol" "Combined with estradiol"

**Risk factors for arterial disease** Use with caution if any one of following factors present but avoid if two or more factors present:
- family history of arterial disease in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
- diabetes mellitus (avoid if diabetes complications present);
- hypertension; blood pressure above systolic 140 mmHg or diastolic 90 mmHg (avoid if blood pressure above systolic 160 mmHg or diastolic 95 mmHg); (in adolescents, avoid if blood pressure very high);
- smoking (avoid if smoking 40 or more cigarettes daily);
- age over 35 years (avoid if over 50 years);
- obesity (avoid if body mass index ≥ 35 kg/m² unless no suitable alternative); (in adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
- migraine without aura (avoid if migraine with aura (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).

**Migraine** Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour). Combined hormonal contraceptives should be stopped (pending investigation and treatment), if serious neurological effects occur, including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body.

**INTERACTIONS** → Appendix 1 (oestrogens, progestogens).

**SIDE-EFFECTS**
- Rare: Gallstones • systemic lupus erythematosus
- Frequency not known: Abdominal cramps • absence of withdrawal bleeding • amenorrhoea after discontinuation • breast enlargement • breast secretion • breast tenderness • cervical erosion • changes in libido • changes in lipid metabolism • changes in vaginal discharge • chloasma • chorea • contact lenses may irritate • depression • fluid retention • headache • hepatic tumours • hypertension • irritability • leg cramps • liver impairment • nausea • nervousness • photosensitivity • reduced menstrual loss • skin reactions • thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB) • visual disturbances • vomiting • ‘spotting’ in early cycles

**SIDE-EFFECTS, FURTHER INFORMATION**

**Breast cancer** There is a small increase in the risk of having breast cancer diagnosed in women taking the combined oral contraceptive pill; this relative risk may be due to an earlier diagnosis. In users of combined oral contraceptive pills the cancers are more likely to be localised to the breast. The most important factor for diagnosing breast cancer appears to be the age at which the contraceptive is stopped rather than the duration of use; any increase in the rate of diagnosis diminishes gradually during the 10 years after stopping and disappears by 10 years.

**Cervical cancer** Use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years. The possible small increase in the risk of breast cancer and cervical cancer should be weighed against the protective effect against cancers of the ovary and endometrium.

**PREGNANCY** Not known to be harmful.

**BREAST FEEDING** Avoid until weaning or for 6 months after birth (adverse effects on lactation).

**HEPATIC IMPAIRMENT** Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), liver tumours.

**DIRECTIONS FOR ADMINISTRATION**
- With oral use Each tablet should be taken at approximately same time each day; if delayed, contraceptive protection may be lost. 21-day combined preparations, 1 tablet daily for 21 days; subsequent courses repeated after a 7-day
PATIENT AND CARER ADVICE

Missed pill

The critical time for loss of contraceptive protection is when a pill is omitted at the beginning or end of a cycle (which lengthens the pill-free interval).

If a woman forgets to take a pill, it should be taken as soon as she remembers, and the next one taken at the normal time (even if this means taking 2 pills together). A missed pill is one that is 24 or more hours late. If a woman misses only one pill, she should take an active pill as soon as she remembers and then resume normal pill-taking. No additional precautions are necessary. If a woman misses 2 or more pills (especially from the first 7 in a packet), she may not be protected. She should take an active pill as soon as she remembers and then resume normal pill-taking. In addition, she must either abstain from sex or use an additional method of contraception such as a condom for the next 7 days. If these 7 days run beyond the end of the packet, the next packet should be started at once, omitting the pill-free interval (or, in the case of everyday (ED) pills, omitting the 7 inactive tablets). Emergency contraception is recommended if 2 or more combined oral contraceptive tablets are missed from the first 7 tablets in a packet and unprotected intercourse has occurred since finishing the last packet.

Travel

Women taking oral contraceptives are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery. Diarrhoea and vomiting

Vomiting and persistent, severe diarrhoea can interfere with the absorption of combined oral contraceptives. If vomiting occurs within 2 hours of taking a combined oral contraceptive another pill should be taken as soon as possible. In cases of persistent vomiting or severe diarrhoea lasting more than 24 hours, additional precautions should be used during and for 7 days after recovery. If the vomiting and diarrhoea occur during the last 7 tablets, the next pill-free interval should be omitted (in the case of ED tablets the inactive ones should be omitted).
precautions (barrier methods) necessary during first 7 days, tablets should be taken at approximately the same time each day

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **Gedarel** (Consilient Health Ltd)
  - Desogestrel 150 microgram, Ethinylestradiol 20 microgram Gedarel 20microgram/150microgram tablets | £3 tablet (P St) £5.98

Estradiol with nomegestrol

The properties listed below are those particular to the combination only. For the properties of the components please consider, estradiol p. 649.

**INDICATIONS AND DOSE**

- **Contraception**
  - **BY MOUTH**
    - Females of childbearing potential: 1 active tablet daily for 24 days, followed by 1 inactive tablet daily for 4 days, to be started on day 1 of cycle with first active tablet (withdrawal bleeding occurs when inactive tablets being taken); subsequent courses repeated without interval

**DIRECTIONS FOR ADMINISTRATION**

**Zoely® (every day (ED) combined (monophasic) preparation)**, 1 active tablet daily for 24 days, followed by 1 inactive tablet daily for 4 days, starting on day 1 of cycle with first active tablet; subsequent courses repeated without interval (withdrawal bleeding occurs when inactive tablets being taken). Changing to combined preparation containing different progestogen If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start the first active tablet of new brand immediately.

- Changing to Zoely®: start the first active Zoely® tablet on the day after taking the last active tablet of the previous brand or, at the latest, the day after the tablet-free or inactive tablet interval of the previous brand

**PATIENT AND CARER ADVICE**

- **Missed dose** A missed pill for a patient taking Zoely® is one that is 12 hours or more late; for information on how to manage missed pills in women taking Zoely®, refer to product literature. Diarrhoea and vomiting In cases of persistent vomiting or severe diarrhoea lasting more than 12 hours in women taking Zoely®, refer to product literature.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **Zoely** (Merck Sharp & Dohme Ltd)
  - Estradiol (as Estradiol hemihydrate) 1.5 mg, Nomegestrol 2.5 mg Zoely 2.5mg/1.5mg tablets | 84 tablet (P St) £19.60 DT price + £13.80

Ethinylestradiol with etonogestrel

The properties listed below are those particular to the combination only. For the properties of the components please consider, ethinylestradiol p. 655, etonogestrol p. 695.

**INDICATIONS AND DOSE**

- **Contraception | Menstrual symptoms**
  - **BY VAGINA**
  - Females of childbearing potential: 1 unit, insert the ring into the vagina on day 1 of cycle and leave in for 3 weeks; remove ring on day 22; subsequent courses repeated after 7-day ring free interval (during which withdrawal bleeding occurs)

**DIRECTIONS FOR ADMINISTRATION**

Changing method of contraception to vaginal ring Insert ring at the latest on the day after the usual tablet-free, patch-free, or inactive-tablet interval. If previous contraceptive used correctly, or pregnancy can reasonably be excluded, can switch to ring on any day of cycle. Changing from progestogen-only method From an implant or intra-uterine progestogen-only device, insert ring on the day implanta or intra-uterine progestogen-only device removed; from an injection, insert ring when next injection due; from oral preparation, first ring may be inserted on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days. After first trimester abortion Start immediately. After childbirth (not breast-feeding) or second trimester abortion Start 4 weeks after birth or abortion; if started later than 4 weeks after birth or abortion, additional precautions (barrier methods) should be used for first 7 days.

**PATIENT AND CARER ADVICE**

- **Expulsion, delayed insertion or removal, or broken vaginal ring** If the vaginal ring is expelled for less than 3 hours, rinse the ring with cool water and reinsert immediately; no additional contraception is needed. If the ring remains outside the vagina for more than 3 hours or if the user does not know when the ring was expelled, contraceptive protection may be reduced:
  - If ring expelled during week 1 or 2 of cycle, rinse ring with cool water and reinsert; use additional precautions (barrier methods) for next 7 days;
  - If ring expelled during week 3 of cycle, either insert a new ring to start a new cycle or allow a withdrawal bleed and insert a new ring no later than 7 days after ring was expelled; latter option only available if ring was used continuously for at least 7 days before expulsion.
If insertion of a new ring at the start of a new cycle is delayed, contraceptive protection is lost. A new ring should be inserted as soon as possible; additional precautions (barrier methods) should be used for the first 7 days of the new cycle. If intercourse occurred during the extended ring-free interval, pregnancy should be considered. No additional contraception is required if removal of the ring is delayed by up to 1 week (4 weeks of continuous use). The 7-day ring-free interval should be observed and subsequently a new ring should be inserted. Contraceptive protection may be reduced with continuous use of the ring for more than 4 weeks—pregnancy should be ruled out before inserting a new ring. If the ring breaks during use, remove it and insert a new ring immediately; additional precautions (barrier methods) should be used for the first 7 days of the new cycle.

Patients or carers should be given advice on how to administer vaginal ring.

Counselling The presence of the ring should be checked regularly.

Travel Women using the vaginal ring are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Vaginal delivery system**

- **NuvaRing** (Merck Sharp & Dohme Ltd)
  - Ethinylestradiol 2.7 mg, Etonogestrel 11.7 mg NuvaRing 0.12mg/0.15mg per day vaginal delivery system | 3 system (POA) £29.70

Ethinylestradiol with norethisterone

The properties listed below are those particular to the combination only. For the properties of the components please consider, ethinylestradiol p. 655, norethisterone p. 656.

INDICATIONS AND DOSE
Contraception with 21-day combined preparations | Menstrual symptoms with 21-day combined preparations
BY MOUTH
- Females of childbearing potential: 1 tablet once daily for 21 days; subsequent courses repeated after 7-day interval, withdrawal bleeding occurs during the 7-day interval, if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at approximately the same time each day.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet
- Cilest (Janssen-Cilag Ltd)
  Ethinylestradiol 35 microgram, Norgestimate 250 microgram
  Tablet £1.16
- Rigevidon (Consilient Health Ltd)
  Ethinylestradiol 30 microgram, Levonorgestrel 150 microgram
  Tablet $2.82
- Brands may include Elevin; Erilibelle; Maexeni

Ethinylestradiol with norgestimate

The properties listed below are those particular to the combination only. For the properties of the components please consider, ethinylestradiol p. 655.

INDICATIONS AND DOSE
Contraception | Menstrual symptoms
BY TRANSDERMAL APPLICATION
- Females of childbearing potential. Apply 1 patch once weekly for 3 weeks, apply first patch on day 1 of cycle, change patch on days 8 and 15; remove third patch on day 22 and apply new patch after 7-day patch-free interval to start subsequent contraceptive cycle, subsequent courses repeated after a 7-day patch-free interval (during which withdrawal bleeding occurs)

DIRECTIONS FOR ADMINISTRATION
Adhesives or bandages should not be used to hold patch in place. If no longer sticky do not reapply but use a new patch.
Changing to a transdermal combined hormonal contraceptive
Changing from combined oral contraception
Apply patch on the first day of withdrawal bleeding; if no withdrawal bleeding within 5 days of taking last active tablet, rule out pregnancy before applying first patch. Unless patch is applied on first day of withdrawal bleeding, additional precautions (barrier methods) should be used concurrently for first 7 days.
Changing from progestogen-only method
- from an implant, apply first patch on the day implant removed
- from an injection, apply first patch when next injection due
- from oral progestogen, first patch may be applied on any day after stopping pill
For all methods additional precautions (barrier methods) should be used concurrently for first 7 days.

After childbirth (not breast-feeding)
Start 4 weeks after birth; if started later than 4 weeks after birth additional precautions (barrier methods) should be used for first 7 days.

After abortion or miscarriage
Before 20 weeks’ gestation start immediately; no additional contraception required if started immediately. After 20 weeks’ gestation start on day 21 after abortion or on the first day of first spontaneous menstruation; additional precautions (barrier methods) should be used for first 7 days after applying the patch.

PATIENT AND CARER ADVICE
Delayed application or detached patch
If a patch is partly detached for less than 24 hours, reapply to the same site or replace with a new patch immediately; no additional contraception is needed and the next patch should be applied on the usual ‘change day’. If a patch remains detached for more than 24 hours or if the user is not aware when the patch became detached, then stop the current contraceptive cycle and start a new cycle by applying a new patch, giving a new ‘Day 1’; an additional non-hormonal contraceptive must be used concurrently for the first 7 days of the new cycle.
If application of a new patch at the start of a new cycle is delayed, contraceptive protection is lost. A new patch should be applied as soon as remembered giving a new ‘Day 1’; additional non-hormonal methods of contraception should be used for the first 7 days of the
new cycle. If application of a patch in the middle of the cycle is delayed (i.e. the patch is not changed on day 8 or day 15):

- for up to 48 hours, apply a new patch immediately; next patch ‘change day’ remains the same and no additional contraception is required;
- for more than 48 hours, contraceptive protection may have been lost. Stop the current cycle and start a new 4-week cycle immediately by applying a new patch giving a new ‘Day 1’; additional non-hormonal contraception should be used for the first 7 days of the new cycle.

If the patch is not removed at the end of the cycle (day 22), remove it as soon as possible and start the next cycle on the usual ‘change day’, the day after day 28; no additional contraception is required.

Patients and carers should be given advice on how to administer patches.

- **Travel**
  - Women using patches are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  **Scottish Medicines Consortium (SMC) Decisions**
  The Scottish Medicines Consortium has advised (September 2003) that Evra® patches should be restricted for use in women who are likely to comply poorly with combined oral contraceptives.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Transdermal patch**
    - Evra® (Janssen-Cilag Ltd)
    - Ethinylestradiol 33.9 microgram per 24 hour, Norelgestromin 203 microgram per 24 hour
    - 9 patch pack £13.51
    - DT price = £13.51

**Mestranol with norethisterone**

The properties listed below are those particular to the combination only. For the properties of the components please consider, norethisterone p. 656.

- **INDICATIONS AND DOSE**
  - Contraception | Menstrual symptoms
  - **BY MOUTH**
    - Females of childbearing potential: 1 tablet once daily for 21 days; subsequent courses repeated after 7-day interval, withdrawal bleeding can occur during the 7-day interval, if reasonably certain woman is not pregnant, first course can be started on any day of cycle— if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at the same time each day

- **MEDICINAL FORMS**

  - **Tablet**
    - Norinyl®-1 (Pfizer Ltd)
    - Mestranol 50 microgram, Norethisterone 1 mg
    - Norinyl®-1 tablets | 63 tablet pack £2.19
    - DT price = £2.19

### 3.2 Contraception, devices

| Drugs used for Contraception, devices not listed below: | Levonorgestrel, p. 652 |

### CONTRACEPTIVE DEVICES

#### Intra-uterine contraceptive devices (copper)

- **INDICATIONS AND DOSE**
  - Contraception
  - **BY INTRA-UTERINE ADMINISTRATION**
  - Females of childbearing potential: (consult product literature)

- **CONTRA-INDICATIONS**
  - Active trophoblastic disease (until return to normal of urine and plasma-gonadotrophin concentration).
  - Distorted uterine cavity—established or marked immunosuppression.
  - Medical diathesis—pelvic inflammatory disease.
  - Recent sexually transmitted infection (if not fully investigated and treated).
  - Severe anaemia—small uterine cavity.
  - Unexplained uterine bleeding.

- **CAUTIONS**
  - Anaemia—anticoagulant therapy (avoid if possible).
  - Diabetes—disease-induced immunosuppression.
  - Drug-induced immunosuppression (risk of infection—avoid if marked immunosuppression).
  - Endometritis—epilepsy (risk of seizure at time of insertion).
  - Fertility problems—history of pelvic inflammatory disease.
  - Increased risk of expulsion if inserted before uterine involution.
  - Menorrhagia—progestogen intra-uterine system might be preferable.
  - Nulliparity—severe cervical stenosis.
  - Severe primary dysmenorrhoea.
  - Severely scarred uterus (including after endometrial resection).
  - Young age.

- **SIDE-EFFECTS**
  - Allergy—bleeding (on insertion).
  - Cervical perforation.
  - Displacement.
  - Dysmenorrhoea.
  - Expulsion.
  - Menorrhagia—occasionally epileptic seizure (on insertion).
  - Pain (on insertion, alleviated by NSAID such as ibuprofen 30 minutes before insertion).
  - Pelvic infection may be exacerbated.

- **PREGNANCY**
  - If an intra-uterine device fails and the patient has a copper allergy.
  - If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Remove
device; if pregnancy occurs, increased likelihood that it may be ectopic.

- **BREAST FEEDING** Not known to be harmful.
- **MONITORING REQUIREMENTS** Gynaecological examination before insertion, 6–8 weeks after insertion, then annually.
- **DIRECTIONS FOR ADMINISTRATION** The timing and technique of fitting an intra-uterine device are critical for its subsequent performance. The healthcare professional installing (or removing) the device should be fully trained in the technique and should provide full counselling backed, where available, by the patient information leaflet. Devices should not be fitted during the heavy days of the period; they are best fitted after the end of menstruation and before the calculated time of implantation.

- **PRESCRIBING AND DISPENSING INFORMATION**

  **ANCORA® 375 CU PRODUCTS**
  For uterine length over 6.5 cm; replacement every 5 years.
  **COPPER T380® PRODUCTS**
  For uterine length 6.5–9 cm; replacement every 10 years.

3.3 Contraception, oral progestogen-only

| Drugs used for Contraception, oral progestogen-only not listed below; Norethisterone, p. 656 |

Ulipristal acetate

- **DRUG ACTION** Ulipristal acetate is a progestosterone receptor modulator with a partial progestosterone antagonist effect.

**INDICATIONS AND DOSE**

**Emergency contraception**

- Females of childbearing potential: 30 mg for 1 dose, to be taken as soon as possible after coitus, but no later than within 120 hours
- Pre-operative treatment of moderate to severe symptoms of uterine fibroids

**BY MOUTH**

- Adults: 5 mg daily for up to 3 months starting during the first week of menstruation, course may be repeated once if necessary, starting during the second menstruation after the first course completed, maximum 2 courses of 3 months

- **CONTRA-INDICATIONS**
  - **GENERAL CONTRA-INDICATIONS**
    - Repeated use as an emergency contraceptive within a menstrual cycle
  - **SPECIFIC CONTRA-INDICATIONS**
    - When used for uterine fibroids: Breast cancer, cervical cancer, ovarian cancer, undiagnosed vaginal bleeding, uterine cancer, vaginal bleeding not caused by uterine fibroids
  - **CAUTIONS**
    - Uncontrolled severe asthma
  - **INTERACTIONS** → Appendix 1 (ulipristal).
    - The effectiveness of ulipristal as an emergency contraceptive is possibly reduced in women taking enzyme-inducing drugs (and possibly for 4 weeks after stopping); a copper intra-uterine device can be offered instead. There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers.

- **SIDE-EFFECTS**
  - Common or very common
  - When used for emergency contraception: Abdominal pain, back pain, diarrhoea, dizziness, fatigue, gastrointestinal disturbances, headache, menstrual irregularities, muscle spasms, nausea, vomiting
  - When used for uterine fibroids: Abdominal pain, acne, breast pain, dizziness, endometrial thickening, headache, hot flushes, hyperhidrosis, malaise, menstrual disturbances, myalgia, nausea, oedema, ovarian cyst (including rupture), pelvic pain, uterine haemorrhage
  - Uncommon
    - When used for emergency contraception: Blurred vision, breast tenderness, dry mouth, hot flushes, pruritus, rash, tremor, uterine spasm
  - When used for uterine fibroids: Anxiety, constipation, dry mouth, dyspepsia, epistaxis, flatulence, urinary incontinence

- **CONCEPTION AND CONTRACEPTION**
  - When ulipristal is given as an emergency contraceptive the effectiveness of combined hormonal and progestogen-only contraceptives may be reduced—additional precautions (barrier methods) required for 14 days for combined and parenteral progestogen-only hormonal contraceptives (16 days for Qlaira™) and 9 days for oral progestogen-only contraceptives. When ulipristal is given for uterine fibroids non-hormonal contraceptive methods (barrier methods or intra-uterine device) should be used both during treatment and for 12 days after stopping, if required.
  - **PREGNANCY**
    - Manufacturer advises avoid for uterine fibroids—no information available. Limited information available when used as an emergency contraceptive.
  - **BREASTFEEDING**
    - When used for uterine fibroids, manufacturer advises avoid—no information available. In emergency contraception manufacturer advises avoid for 1 week after administration—present in milk.
  - **HEPATIC IMPAIRMENT**
    - Caution with use in uterine fibroids in moderate to severe hepatic impairment—no information available. Manufacturer advises avoiding use as an emergency contraceptive in severe hepatic impairment—no information available.
  - **RENAL IMPAIRMENT**
    - Caution in severe renal impairment when used for uterine fibroids—no information available.
  - **PATIENT AND CARER ADVICE**
    - When ulipristal is given as an emergency contraceptive, if vomiting occurs within 3 hours of taking a dose, a replacement dose should be given. When prescribing or supplying hormonal emergency contraception, women should be advised:
      - that their next period may be early or late;
      - that a barrier method of contraception needs to be used until the next period;
      - to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy;
      - to return in 3 to 4 weeks if the subsequent menstrual bleed is abnormally light, heavy, or absent, or if she is otherwise concerned (if there is any doubt as to whether menstruation has occurred, a pregnancy test should be performed at least 3 weeks after unprotected intercourse).

- **MEDICAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - Ellane (HRA Pharma UK Ltd)
    - Ulipristal acetate 30 mg Ellane 30mg tablets | 1 tablet £14.05
    - Esmya (Gedeon Richter UK Ltd)
    - Ulipristal acetate 5 mg Esmya 5mg tablets | 28 tablet pack £114.13

**PROGESTOGENS**

Desogestrel

**INDICATIONS AND DOSE**

**Contraception**

**BY MOUTH**

- Females of childbearing potential: 75 micrograms daily, dose to be taken at same time each day, starting on day 1 of cycle then continuously, if administration delayed for 12 hours or more it should be regarded as a ‘missed pill’

- **CONTRA-INDICATIONS**
  - Acute porphyrias p. 864 - history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable - severe arterial disease - undiagnosed vaginal bleeding

- **CAUTIONS**
  - Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice - arterial disease - functional ovarian cysts - history of jaundice in pregnancy - malabsorption syndromes - past ectopic pregnancy - sex-steroid dependent cancer - systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies
Genito-urinary system

SIDE-EFFECTS, FURTHER INFORMATION

BREAST CANCER

There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

PREGNANCY

Not known to be harmful.

BREAST FEEDING

Progestogen-only contraceptives do not affect lactation.

HEPATIC IMPAIRMENT

Caution in severe liver disease and recurrent cholestatic jaundice. Avoid in liver tumour.

PATIENT AND CARER ADVICE

Missed pill

The following advice is recommended: 'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 4 hours (12 hours for desogestrel) overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days. The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours (12 hours for desogestrel) late and unprotected intercourse has occurred before 2 further tablets have been correctly taken. Surgery

All progestogen-only contraceptives (including those given by injection) are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb. Starting routine

One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours for desogestrel) contraceptive protection may be lost).

Additional contraceptive precautions are not necessary when initiating treatment. Changing from a combined oral contraceptive

Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth

Intra-uterine contraception

Conditions

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (September 2003) that Cerazette® should be restricted for use in women who cannot tolerate oestrogen-containing contraceptives or in whom such preparations are contra-indicated.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

Brands may include Aizea; Cerelle; Desomono; Desorex; Feanolla; Narrez; Zelleta

Levonorgestrel

INDICATIONS AND DOSE

Emergency contraception

BY MOUTH

Females of childbearing potential: 1.5 mg for 1 dose, taken as soon as possible after coitus, preferably within 12 hours but no later than after 72 hours

Contraception

BY MOUTH

Females of childbearing potential: 1 tablet daily starting on day 1 of the cycle then continuously, dose is to be taken at the same time each day, if administration delayed for 3 hours or more it should be regarded as a ‘missed pill’

JAYDESS® 13.5MG INTRA-UTERINE DEVICE

Contraception

BY VAGINA

Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or immediately after first-trimester termination; postpartum insertions should be delayed until at least 6 weeks after delivery (12 weeks if uterus involution is substantially delayed); effective for 3 years

MIRENA®20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE

Contraception | Menorrhagia

BY INTRA-UTERINE ADMINISTRATION

Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately after first-trimester termination by curettage; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years

Prevention of endometrial hyperplasia during oestrogen replacement therapy

BY INTRA-UTERINE ADMINISTRATION

Females of childbearing potential: Insert during last days of menstruation or withdrawal bleeding or at any time if amenorrhoic; effective for 4 years

CONTRA-INDICATIONS

With intra-uterine use: Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration; acute cervicitis; acute vaginitis; distorted uterine cavity; established immunosuppression; genital
Contraception, oral progestogen-only 693

When used orally as an emergency contraceptive, the effectiveness of levonorgestrel is reduced in women taking enzyme-inducing drugs (and possibly for 4 weeks after stopping); a copper intra-uterine device can be offered instead. If the copper intra-uterine device is undesirable or inappropriate, the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose [unlicensed dose—advise women accordingly]. There is no need to increase the dose for emergency contraception if the patient is taking antibiotics that are not enzyme inducers. With the progestogen-only intra-uterine device, levonorgestrel is released close to the site of the main contraceptive action (on cervical mucous and endometrium) and therefore progestogenic side-effects and interactions are less likely; in particular, enzyme-inducing drugs are unlikely to significantly reduce the progestational effect of the progestogen-only intra-uterine system and additional contraceptive precautions are not required.

### SIDE-EFFECTS

#### GENERAL SIDE-EFFECTS

- **Common or very common** Depression (sometimes severe) - headache - nausea
- **Frequency not known** Vomiting

#### SPECIFIC SIDE-EFFECTS

- **Common or very common**
  - With intra-uterine use Abdominal pain - acne - alopecia - back pain - breast pain - changes in the pattern and duration of menstrual bleeding (spotting or prolonged bleeding) - expulsion - hirsutism - migraine - nervousness - pelvic pain - peripheral oedema - salpingitis
  - **Uncommon**
  - With intra-uterine use Abdominal distension - cervicitis - eczema - pelvic inflammatory disease - pruritus - skin hyperpigmentation
- **Rare**
  - With intra-uterine use Rash - uterine perforation
- **Frequency not known**
  - With intra-uterine use Allergy - bleeding (on insertion) - cervical perforation - displacement - dysmenorrhoea - epileptic seizures (on insertion) - functional ovarian cysts - genitourinary system and additional contraceptive precautions are not required.
- **With oral use** Breast discomfort - breast tenderness - changes in libido - disturbances of appetite - dizziness - fatigue - menstrual irregularities - skin disorders
- **SIDE-EFFECTS, FURTHER INFORMATION**

Endometrial disorders should be ruled out before insertion and the patient should be fully counselled (and provided with a patient information leaflet). Improvement in progestogenic side-effects, such as mastalgia and in the bleeding pattern may often become very light or absent.

### Breast cancer

There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

Although the progestogen-only intra-uterine system produces little systemic progestogenic activity, it is usually avoided for 5 years after any evidence of breast cancer. However, the system can be considered for a

#### MIRENA® 30MICROGRAMS/24HOURS INTRA-UTERINE DEVICE

Advanced uterine atrophy

#### INTERACTIONS

- Appendix 1 (progestogens).

---

**INTERACTIONS**

- With oral use Acute porphyrias p. 864
- With oral use for contraception History of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable - severe arterial disease - undiagnosed vaginal bleeding
- **CAUTIONS**
  - With intra-uterine use Anaemia - anticoagulant therapy (avoid if possible) - diabetes - disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression) - drug-induced immunosuppression (risk of infection—avoid if marked immunosuppression) - endometriosis - epilepsy (risk of seizure at time of insertion) - fertility problems - history of pelvic inflammatory disease - increased risk of expulsion if inserted before uterine involution - menorrhagia (progestogen intra-uterine system might be preferable) - multiple cysts - severe cervical stenosis - severe primary dysmenorrhoea - severely scarred uterus (including after endometrial resection) - young age
  - With oral use for contraception Active trophoblastic disease (until return to normal of urine- and plasma-gondotrophin concentration)—seek specialist advice - arterial disease - functional ovarian cysts - history of jaundice in pregnancy - malabsorption syndromes - past ectopic pregnancy - sex-steroi dependent cancer - systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies
  - When used for emergency contraception Active trophoblastic disease (until return to normal of urine- and plasma-gondotrophin concentration)—seek specialist advice - past ectopic pregnancy - severe malabsorption syndromes

#### CAUTIONS, FURTHER INFORMATION

**Risk of infection with intra-uterine devices** The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:
- they are under 25 years old or
- they are over 25 years old and have a new partner or
- have had more than one partner in the past year or
- their regular partner has other partners.

In these women, pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, Neisseria gonorrhoeae) should be performed. If results are unavailable at the time of fitting a intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend as an emergency if she experiences sustained pain during the next 20 days. An intra-uterine device should not be removed in mid-cycle unless an additional contraceptive was used for the previous 7 days. If removal is essential post-coital contraception should be considered.

**With oral use** Use as a contraceptive in co-morbidities The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.

**MIRENA® 30MICROGRAMS/24HOURS INTRA-UTERINE DEVICE**

Advanced uterine atrophy

**INTERACTIONS**

- Appendix 1 (progestogens).
woman in long-term remission from breast cancer who has menorrhagia and requires effective contraception. Removal of the intra-uterine system should be considered if the patient experiences migraine or severe headache, jaundice, marked increase of blood pressure, or severe arterial disease.

- **PREGNANCY**
  - With oral use Not known to be harmful.
  - With vaginal use If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Avoid; if pregnancy occurs remove intra-uterine system.

- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.

- **HEPATIC IMPAIRMENT** Caution in severe liver disease and recurrent cholestatic jaundice. Avoid in liver tumour.

- **MONITORING REQUIREMENTS** Gynaecological examination before insertion, 4–6 weeks after insertion, then annually.

- **DIRECTIONS FOR ADMINISTRATION**
  - With intra-uterine use The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.

- **PRESCRIBING AND DISPENSING INFORMATION**

  - **JAYDESS® 13.5MG INTRA-UTERINE DEVICE**
    When system is removed (and not replaced immediately) and pregnancy is not desired, remove within 7 days of the onset of menstruation; additional precautions (e.g. barrier methods) should be used if the system is removed at some other time during the cycle and there is intercourse within 7 days.

  - **MIRENA® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE**
    When system is removed (and not immediately replaced) and pregnancy is not desired, remove during first few days of menstruation, otherwise additional precautions (e.g. barrier methods) should be used for at least 7 days before removal.

- **PATIENT AND CARER ADVICE**
  - Missed doses When used as an oral contraceptive, the following advice is recommended: if you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days. The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken. Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.
  - With oral use for Contraception starting routine One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not necessary when initiating treatment. Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones). After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.
  - With oral use for Emergency contraception If vomiting occurs within 2 hours of taking levonorgestrel, a replacement dose should be given. When prescribing or supplying hormonal emergency contraception, women should be advised:
    - that their next period may be early or late;
    - that a barrier method of contraception needs to be used until the next period;
    - to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy;
    - to return in 3 to 4 weeks if the subsequent menstrual bleed is abnormally light, heavy or heavy, or is absent, or if she is otherwise concerned (if there is any doubt as to whether menstruation has occurred, a pregnancy test should be performed at least 3 weeks after unprotected intercourse).
  - With intra-uterine use Counsel women to seek medical attention promptly in case of significant symptoms, especially pain. Patient counselling advised. Patient information leaflet to be provided.

- **EXCEPTIONS TO LEGAL CATEGORY** Levonelle® One Step can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

3.4 Contraception, parenteral progestogen-only

Drugs used for Contraception, parenteral progestogen-only not listed below; Norethisterone, p. 655
Medroxyprogesterone acetate

**INDICATIONS AND DOSE**

**Dysfunctional uterine bleeding**
- Adult: 2.5–10 mg daily for 5–10 days, repeated for 2 cycles, begin treatment on day 16–21 of cycle

**Secondary amenorrhoea**
- Adult: 2.5–10 mg daily for 5–10 days, repeated for 3 cycles, begin treatment on day 16–21 of cycle

**Mild to moderate endometriosis**
- Adult: 10 mg 3 times a day for 90 consecutive days, begin treatment on day 1 of cycle

**Progestogenic opposition of oestrogen HRT**
- Adult: 10 mg daily for the last 14 days of each 28-day oestrogen HRT cycle

**Endometrial cancer | Renal cell cancer**
- Adult: 200–600 mg daily

**Breast cancer**
- Adult: 0.4–1.5 g daily
Contraception

BY DEEP INTRAMUSCULAR INJECTION
- Females of childbearing potential: 150 mg, to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)

BY SUBCUTANEOUS INJECTION
- Females of childbearing potential: 104 mg, to be administered within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

Contraception (when patient changing from other hormonal contraception)
BY SUBCUTANEOUS INJECTION
- Females of childbearing potential: (consult product literature)

- CONTRA-INDICATIONS
  - GENERAL CONTRA-INDICATIONS
    - Acute porphyrias p. 864 - severe arterial disease - undiagnosed vaginal bleeding
  - SPECIFIC CONTRA-INDICATIONS
    - With intramuscular or subcutaneous use: History of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable
    - With oral use: Breast cancer (unless progestogens are being used in the management of this condition) - genital cancer (unless progestogens are being used in the management of this condition) - history of liver tumours

- CAUTIONS
  - GENERAL CAUTIONS:
    - Possible risk of breast cancer
  - SPECIFIC CAUTIONS:
    - With intramuscular or subcutaneous use: History during pregnancy in disturbances of lipid metabolism - history during pregnancy of pruritus
    - With oral use: Asthma - cardiac dysfunction - conditions that may worsen with fluid retention - diabetes (progestogens can decrease glucose tolerance—monitor patient closely) - epilepsy - history of depression - hypertension - migraine - susceptibility to thromboembolism (particular caution with high dose)

- INTERACTIONS → Appendix 1 (progestogens).
  - Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. The effectiveness of medroxyprogesterone acetate intramuscular and subcutaneous injections is not affected by enzyme-inducing drugs and they may be continued as normal during courses of these drugs.

- SIDE-EFFECTS
  - GENERAL SIDE-EFFECTS: Breast discomfort - changes in libido - depression - dizziness - headache - indigestion - loss of vision during treatment (discontinue treatment if papilloedema or retinal vascular lesions) - menstrual irregularities - nausea - pruritus - vomiting - weight gain

  - SPECIFIC SIDE-EFFECTS
    - Rare
    - With intramuscular or subcutaneous use: Osteoporosis - osteoporotic fractures
    - Frequency not known
      - With intramuscular or subcutaneous use: Disturbance of appetite - injection site-reactions - reduced bone mineral density - skin disorders
    - With oral use: Acne - adrenergic-like effects (when used for malignant disease) - alopecia - anaphylactoid reactions - bloating - breast tenderness - cervical erosions (when used for malignant disease) - confusion (when used for malignant disease) - congestive heart failure (when used for malignant disease) - constipation (when used for malignant disease) - diarrhoea (when used for malignant disease) - drowsiness - dry mouth (when used for malignant disease) - euphoria (when used for malignant disease) - fluid retention - galactorrhoea (when used for malignant disease) - glucocorticoid effects may lead to a cushingoid syndrome (with high doses for malignant disease) - hirsutism - hypercalcaemia (when used for malignant disease) - hyperpyrexia (when used for malignant disease) - hypertension (when used for malignant disease) - insomnia - jaundice - loss of concentration (when used for malignant disease) - nervousness (when used for malignant disease) - palpitation (when used for malignant disease) - premenstrual-like syndrome - raised platelet count (when used for malignant disease) - raised white blood cell count (when used for malignant disease) - rash - retinal thrombosis (when used for malignant disease) - skin reactions - tachycardia (when used for malignant disease) - urticaria - vision disorders (when used for malignant disease)

  - SIDE-EFFECTS, FURTHER INFORMATION
    - Cervical cancer: Use of injectable progestogen-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives. The risk of cervical cancer with other progestogen-only contraceptives is not yet known. Reduction in bone mineral density occurs in the first 2–3 years of use then stabilises.

  - CONCEPTION AND CONTRACEPTION
    - With intramuscular use: If interval between dose is greater than 12 weeks and 5 days (in long-term contraception), rule out pregnancy before next injection and advise patient to use additional contraceptive measures (e.g. barrier) for 14 days after the injection.
    - With subcutaneous use: If interval between dose is greater than 13 weeks and 7 days (in long-term contraception), rule out pregnancy before next injection.

  - PREGNANCY
    - With oral use: Avoid—genital malformations and cardiac defects reported.
    - With intramuscular use or subcutaneous use: Not known to be harmful.

  - BREAST FEEDING
    - Present in milk—no adverse effects reported. Progesterone-only contraceptives do not affect lactation.
    - With intramuscular use or subcutaneous use: The manufacturers advise that in women who are breast-feeding, the first dose should be delayed until 6 weeks after birth; however, evidence suggests no harmful effect to infant if given earlier. The benefits of using medroxyprogesterone acetate in breast-feeding women outweigh any risks.

  - HEPATIC IMPAIRMENT
    - With oral use: Avoid in hepatic impairment.
Erectile dysfunction

table or subcutaneous use. Caution in severe liver disease and recurrent cholestatic jaundice. Avoid in liver tumour.

- **RENAL IMPAIRMENT** Use with caution.
- **PREGNANCY**

- **SIDE-EFFECTS** Genital lesions
- **SIDE-EFFECTS, FURTHER INFORMATION** High frequency use of the spermicide nonoxinol-9 '9' has been associated with genital lesions, which may increase the risk of acquiring these infections.
- **CONCEPTION AND CONTRACEPTION** No evidence of harm to latex condoms and diaphragms.
- **PREGNANCY** Toxicity in *animal* studies.
- **BREAST FEEDING** Present in milk in *animal* studies.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - Forms available from special-order manufacturers include: oral suspension, oral solution.

**Tablet**
- **Climanor** (Resource Medical UK Ltd)
  - Medroxyprogesterone acetate 5 mg Climanor 5mg tablets | 28 tablet | £3.27
- **Provera** (Pfizer Ltd)
  - Medroxyprogesterone acetate 2.5 mg Provera 2.5mg tablets | 30 tablet | £1.84 DT price + £1.84
  - Medroxyprogesterone acetate 5 mg Provera 5mg tablets | 10 tablet | £1.23 DT price + £1.23 | 100 tablet | £12.32
  - Medroxyprogesterone acetate 10 mg Provera 10mg tablets | 10 tablet | £2.47 | 90 tablet | £22.16 DT price + £22.16 | 100 tablet | £24.73
- **Gygel** (Marbleborough Pharmaceuticals Ltd)
  - Nonoxinol-9 20 mg per 1 ml Gygel 2% contraceptive jelly | 30 gram | £4.25 | 81 gram | £11.00

**Suspension for injection**
- **Depo-Provera** (Pfizer Ltd)
  - Medroxyprogesterone acetate 150 mg per 1 ml Depo-Provera 150mg/1ml suspension for injection pre-filled syringes | 1 pre-filled disposable injection | £6.01 DT price + £6.01
  
- **Sayana Press** (Pfizer Ltd)
  - Medroxyprogesterone acetate 160 mg per 1 ml Sayana Press 160mg/0.65 ml suspension for injection pre-filled disposable devices | 1 pre-filled disposable injection | £6.90

3.5 Contraception, spermicidal

**SPERMICIDALS**

**Nonoxinol**

**INDICATIONS AND DOSE**
Spermicidal contraceptive in conjunction with barrier methods of contraception such as diaphragms or caps

**BY VAGINA**
- Females of childbearing potential: consult product literature
  
**SIDE-EFFECTS** Genital lesions

**SIDE-EFFECTS, FURTHER INFORMATION**
High frequency use of the spermicide nonoxinol-9 '9' has been associated with genital lesions, which may increase the risk of acquiring these infections.

**CONCEPTION AND CONTRACEPTION**
No evidence of harm to latex condoms and diaphragms.

**PREGNANCY**
Toxicity in *animal* studies.

**BREAST FEEDING**
Present in milk in *animal* studies.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

4 Erectile and ejaculatory conditions

4.1 Erectile dysfunction

**Erectile dysfunction**

Reasons for failure to produce a satisfactory erection include psychogenic, vascular, neurogenic, and endocrine abnormalities; impotence can also be drug-induced.

Intracavernosal, urethral or topical application of vasoactive drugs under careful medical supervision are used for the management of erectile dysfunction. Intracavernosal or intrurethral preparations can also be used in the diagnosis of erectile dysfunction.

Erectile disorders may also be treated with drugs given by mouth which increase the blood flow to the penis. Drugs should be used with caution if the penis is deformed (e.g. in angulation, cavernosal fibrosis, and Peyronie's disease).

**Priapism**
If priapism occurs with alprostadil p. 701, treatment should not be delayed more than 6 hours and is as follows:

- Initial therapy by penile aspiration; using aseptic technique a 19-21 gauge butterfly needle inserted into the corpus cavernosum and 20–50 ml of blood aspirated; if necessary the procedure may be repeated on the opposite side.
- If initial aspiration is unsuccessful a second 19–21 gauge butterfly needle can be inserted into the opposite corpus cavernosum and sterile physiological saline introduced through the first needle and drained through the second.
- If aspiration and lavage of corpora are unsuccessful, cautious intracavernosal injection of a sympathomimetic with action on alpha-adrenergic receptors, continuously monitoring blood pressure and pulse (extreme caution: coronary heart disease, hypertension, cerebral ischaemia or if taking antidepressant) can be given.
- If necessary the sympathomimetic injections can be followed by further aspiration of blood through the same butterfly needle.
- If sympathomimets unsuccessful, urgent surgical referral for management (possibly including shunt procedure).

**Prescribing on the NHS**
Some drug treatments for erectile dysfunction may only be prescribed on the NHS under certain circumstances; for details see the criteria listed in part XVIII of the Drug Tariff (Part XII of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The Drug Tariffs can be accessed online at: National Health Service Drug Tariff for England and Wales: www.jspa.org.uk/pja/edt_intro.htm

Health and Personal Social Services for Northern Ireland Drug Tariff: www.dhsspsni.gov.uk/pas-tariff

Scottish Drug Tariff: www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/
Erectile and ejaculatory conditions

**Avanafil**

**INDICATIONS AND DOSE**

**Erectile dysfunction**

- Adult: Initially 100 mg, to be taken approximately 30 minutes before sexual activity, then adjusted according to response to 50–200 mg (max. per dose 200 mg), to be taken as a single dose as needed; maximum 1 dose per day

**Erectile dysfunction in patients on alpha-blocker therapy**

- Adult: Initially 50 mg, to be taken approximately 30 minutes before sexual activity, then adjusted according to response to 50–200 mg (max. per dose 200 mg), to be taken as a single dose as needed; maximum 1 dose per day

**Dose adjustments due to interactions**

Max. 100 mg once every 48 hours with concomitant moderate inhibitors of cytochrome P450 enzyme CYP3A4 e.g. aprepitant, diltiazem, erythromycin, fluconazole, fosamprenavir, or verapamil.

Concomitant treatment with a phosphodiesterase type-5 inhibitor and an alpha-blocker can increase the risk of postural hypotension—initiate treatment with a phosphodiesterase type-5 inhibitor (at a low dose) only once the patient is stable on the alpha-blocker.

**CONTRA-INDICATIONS**

- Avoid if systolic blood pressure below 90 mmHg (no information available) - blood pressure > 170/100 mmHg - hereditary degenerative retinal disorders - history of non-articentric anterior ischaemic optic neuropathy - life-threatening arrhythmia in previous 6 months - mild to severe heart failure - patients in whom vasodilation or sexual activity are disadvantageous - recent history of myocardial infarction - recent history of stroke - recent unstable angina

**CAUTIONS**

- Active peptic ulceration - anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie’s disease) - bleeding disorders - cardiovascular disease - left ventricular outflow obstruction - predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia)

**SIDE-EFFECTS**

- Common or very common Back pain - dizziness - dyspepsia - flushing - headache - migraine - myalgia - nasal congestion - nausea - visual disturbances - vomiting

- Uncommon Drowsiness - epistaxis - hypertension - hypotension - malaise - painful red eyes - palpitation - tachycardia

- Rare Abdominal pain - diarrhoea - dry mouth - facial oedema - gastritis - genital irritation - gout - haematuria - hyperactivity - hyperbilirubinaemia - hypersensitivity - peripheral oedema - polymorphism - priapism - rash - Stevens-Johnson syndrome - syncope - weight gain

- Frequency not known Arrhythmia - myocardial infarction - non-articentric anterior ischaemic optic neuropathy (stop drug if sudden visual impairment occurs) - retinal vascular occlusion - seizures - serious cardiovascular events - sudden hearing loss (discontinue drug and seek medical advice) - unstable angina

**HEPATIC IMPAIRMENT**

Use lowest effective initial dose in mild to moderate impairment, adjusted according to response. Manufacturer advises avoid in severe impairment—no information available.

**RENAL IMPAIRMENT**

Avoid if eGFR less than 30 mL/minute/1.73 m².

**PATIENT AND CARER ADVICE**

Onset of effect may be delayed if taken with food.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NHS restrictions** Spedra® is not prescribable under the NHS for treatment of erectile dysfunction except in men who meet the criteria listed in part XVIIIB of the Drug Tariff (Part XII of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed 'SLS'.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Spedra (A. Menarini Farmaceutica Internazionale SRL) ▼
  - Avanafil 50 mg Spedra 50mg tablets | 4 tablet (PST) £10.94 | 8 tablet (PST) £19.70
  - Avanafil 100 mg Spedra 100mg tablets | 4 tablet (PST) £14.08 | 8 tablet (PST) £26.26
  - Avanafil 200 mg Spedra 200mg tablets | 4 tablet (PST) £21.90 | 8 tablet (PST) £39.40

**Sildenafil**

**INDICATIONS AND DOSE**

**Pulmonary arterial hypertension**

- Adult: 20 mg 3 times a day

**BY INTRAVENOUS INJECTION**

- Adult: 10 mg 3 times a day, use intravenous route when the oral route is not appropriate
Erectile dysfunction

BY MOUTH

► Adult: Initially 50 mg, to be taken approximately 1 hour before sexual activity, adjusted according to response to 25–100 mg (max. per dose 100 mg) as required, to be taken as a single dose; maximum 1 dose per day

► CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS
Hereditary degenerative retinal disorders - history of non-articent anterior ischaemic optic neuropathy - recent history of myocardial infarction - recent history of stroke

SPECIFIC CONTRA-INDICATIONS
► When used for erectile dysfunction Avoid if systolic blood pressure below 90 mmHg (no information available) - patients in whom vasodilatation or sexual activity are inadvisable - recent unstable angina
► When used for pulmonary arterial hypertension Sickle-cell anemia

► CAUTIONS

GENERAL CAUTIONS
Active peptic ulceration - bleeding disorders - cardiovascular disease - left ventricular outflow obstruction

SPECIFIC CAUTIONS
► When used for erectile dysfunction Anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie’s disease) - predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia)
► When used for pulmonary arterial hypertension Anatomical deformation of the penis - autonomic dysfunction
► Hypotension (avoid if systolic blood pressure below 90 mmHg) - intravenous volume depletion - predisposition to priapism - pulmonary veno-occlusive disease

► INTERACTIONS → Appendix 1 (sildenafil).

► SIDE-EFFECTS

GENERAL SIDE-EFFECTS
Back pain - dyspepsia - flushing - migraine - myalgia - nasal congestion - visual disturbances

► Frequency not known Non-articent anterior ischaemic optic neuropathy (discontinue if sudden visual impairment occurs) - sudden hearing loss (advise patient to seek medical help)

SPECIFIC SIDE-EFFECTS
► Common or very common
► When used for erectile dysfunction Nausea - dizziness - vomiting

► Uncommon
► When used for erectile dysfunction Chest pain - drowsiness - dry mouth - epistaxis - fatigue - hypertension - hypoaesthesia - hypotension - painful red eyes - palpitation - tachycardia - tinnitus - vertigo
► When used for pulmonary arterial hypertension Gynaecomastia - haematuria - penile haemorrhage - priapism

► Rare
► When used for erectile dysfunction Atrial fibrillation - cerebrovascular accident - facial oedema - hypersensitivity reactions - priapism - rash - Stevens-Johnson syndrome - syncope

► Frequency not known
► When used for erectile dysfunction Arrhythmia - myocardial infarction - seizures - unstable angina
► When used for pulmonary arterial hypertension Rash - retinal vascular occlusion

► PREGNANCY Use only if potential benefit outweighs risk—no evidence of harm in animal studies.

► BREAST FEEDING Manufacturer advises avoid—no information available.

► HEPATIC IMPAIRMENT In pulmonary arterial hypertension, if usual dose not tolerated, reduce oral dose to 20 mg twice daily and intravenous dose to 10 mg twice daily. For erectile dysfunction, use initial dose of 25 mg. Manufacturer advises avoid in severe impairment.

► RENAL IMPAIRMENT Use initial dose of 25 mg in erectile dysfunction if eGFR less than 30 mL/minute/1.73 m². In pulmonary hypertension, if usual dose not tolerated, reduce oral dose to 20 mg twice daily and intravenous dose to 10 mg twice daily.

► TREATMENT CESSATION
► When used for Pulmonary arterial hypertension Consider gradual withdrawal.

► PATIENT AND CARER ADVICE
► When used for Erectile dysfunction Onset of effect may be delayed if taken with food.

► NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (January 2010 and February 2011) that sildenafil tablets (Revatio®) should be initiated for patients with pulmonary arterial hypertension only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists and that sildenafil injection (Revatio®) should be prescribed only on the advice of specialists in the Scottish Pulmonary Vascular Unit or the Scottish Adult Congenital Cardiac Service.

NHS restrictions Viagra® is not prescribable under NHS for treatment of erectile dysfunction except in men who meet the criteria listed in part XVIIIB of the Drug Tariff (Part XIB of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed ‘SLS’. For more information see Prices in the BNF, under How to use BNF publications p. xi.

Brands may include Vizarsin
Tadalafil

**INDICATIONS AND DOSE**

**Pulmonary arterial hypertension**
- **BY MOUTH**
  - Adult: 40 mg once daily

**Erectile dysfunction**
- **BY MOUTH**
  - Adult: Initially 10 mg once daily (max. per dose 20 mg), to be taken at least 30 minutes before sexual activity, subsequent doses adjusted according to response, the effect of intermittent dosing may persist for longer than 24 hours, daily dose of 10–20 mg not recommended; maximum 1 dose per day
  - **Erectile dysfunction; for patients who anticipate sexual activity at least twice a week**
    - **BY MOUTH**
      - Adult: 5 mg once daily, reduced to 2.5 mg once daily, adjusted according to response, the effect of intermittent dosing may persist for longer than 24 hours
  - **Benign prostatic hyperplasia**
    - **BY MOUTH**
      - Adult: 5 mg once daily

**CONTRA-INDICATIONS**

**GENERAL CONTRA-INDICATIONS**
- History of non-arteritic anterior ischaemic optic neuropathy

**SPECIFIC CONTRA-INDICATIONS**
- When used for benign prostatic hyperplasia or erectile dysfunction
  - Hypotension (avoid if systolic blood pressure below 90 mmHg) - mild to severe heart failure - myocardial infarction - patients in whom vasodilation or sexual activity are inadvisable - recent stroke - uncontrolled arrhythmias - uncontrolled hypertension - unstable angina
- When used for pulmonary arterial hypertension
  - Acute myocardial infarction in past 90 days

**CAUTIONS**
- When used for benign prostatic hyperplasia or erectile dysfunction
  - Anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie’s disease) - cardiovascular disease - left ventricular outflow obstruction - predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia)
- When used for pulmonary arterial hypertension
  - Anatomical deformation of the penis - aortic and mitral valve disease - congestive cardiomyopathy - coronary artery disease - hereditary degenerative retinal disorders - hypertension (avoid if systolic blood pressure below 90 mmHg) - left ventricular dysfunction - life-threatening arrhythmias - pericardial constriction - predisposition to priapism - pulmonary veno-occlusive disease - uncontrolled hypertension

**INTERACTIONS**
- → Appendix 1 (tadalafil)

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
- Common or very common
  - Back pain - dyspepsia - flushing - headache - myalgia - nausea - vomiting
- Uncommon
  - Hypertension - tachycardia
- Frequency not known
  - Arrhythmia - myocardial infarction - non-arteritic anterior ischaemic optic neuropathy (stop drug if sudden visual impairment occurs) - retinal vascular occlusion - sudden hearing loss (discontinue drug and seek medical advice) - unstable angina

**SPECIFIC SIDE-EFFECTS**
- Common or very common
  - When used for benign prostatic hyperplasia or erectile dysfunction
    - Dizziness - migraine - nasal congestion - visual disturbances
- When used for pulmonary arterial hypertension
  - Blurred vision - chest pain - epistaxis - facial oedema - gastro-esophageal reflux - hypotension - increased uterine bleeding - limb pain - nasopharyngitis - palpitation - rash
- Uncommon
  - When used for benign prostatic hyperplasia or erectile dysfunction
    - Epistaxis - hypotension - painful red eyes - palpitation
  - When used for pulmonary arterial hypertension or erectile dysfunction
    - Amnesia - hyperhidrosis - priapism - seizures
  - Rare
  - When used for benign prostatic hyperplasia or erectile dysfunction
    - Facial oedema - hypersensitivity reactions - priapism - rash - Stevens-Johnson syndrome - syncope
  - Frequency not known
  - When used for benign prostatic hyperplasia or erectile dysfunction
    - Abdominal pain - increased sweating - seizures - serious cardiovascular events - transient amnesia
  - When used for pulmonary arterial hypertension
    - Stevens-Johnson syndrome - stroke - visual field defect

**PREGNANCY**
- Manufacturer advises avoid.

**BREAST FEEDING**
- Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**
- When used for pulmonary arterial hypertension use initial dose of 20 mg once daily in mild to moderate impairment and avoid in severe impairment. Use maximum dose of 10 mg in erectile dysfunction and benign prostatic hyperplasia. Manufacturer advises caution in severe impairment and for regular once-daily dosing in erectile dysfunction and benign prostatic hyperplasia—no information available.

**RENAL IMPAIRMENT**
- In pulmonary arterial hypertension for patients with mild to moderate impairment, initially use 20 mg once daily, increased to 40 mg once daily if tolerated; avoid in severe impairment. For erectile dysfunction and benign prostatic hyperplasia, maximum dose 10 mg if eGFR less than 30 mL/minute/1.73 m² (avoid regular once-daily dosing).

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions
- The Scottish Medicines Consortium has advised (June 2012) that tadalafil (Adcirca®) should be initiated only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists.

NHS restrictions
- Cialis® is not prescribable under the NHS for treatment of erectile dysfunction except in men who meet the criteria listed in part XVIII of the Drug Tariff (Part XII of the Northern Ireland Drug Tariff, Part 12 of...
**Erectile dysfunction**

**701**

- **Uncommon** Drowsiness - dyspnoea - epistaxis - hypertension - hypotension - increased lacrimation - painful red eyes - palpitation - photosensitivity - tachycardia
- **Rare** Anxiety - facial oedema - hypersensitivity reactions - hypertonia - priapism - raised intra-ocular pressure - rash - Stevens-Johnson syndrome - syncope - transient amnesia
- **Frequency not known** Arrhythmia - myocardial infarction - non-arteritic anterior ischaemic optic neuropathy (stop drug if sudden visual impairment occurs) - retinal vascular occlusion - seizures - serious cardiovascular events - sudden hearing loss (discontinue drug and seek medical advice) - unstable angina

**Hepatic impairment** Initial dose 5 mg in mild to moderate impairment, increased subsequently according to response (max. 10 mg in moderate impairment). Manufacturer advises avoid in severe impairment. Orodispersible tablets not suitable for patients with moderate hepatic impairment.

**Renal impairment** Initial dose 5 mg if eGFR less than 30 mL/minute/1.73 m². Orodispersible tablets not suitable if eGFR less than 30 mL/minute/1.73 m².

**Prescribing and dispensing information** Orodispersible tablets not suitable for initiation of therapy in patients taking alpha-blockers.

**National funding/access decisions**

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (September 2011) that vardenafil orodispersible tablets (Levitra®) are accepted for restricted use within NHS Scotland for men for whom an orodispersible tablet is an appropriate formulation.

NHS restrictions Levitra® is not prescribable under the NHS for the treatment of erectile dysfunction except in men who meet the criteria listed in part XVIIIB of the Drug Tariff (Part Xib of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed ‘SLS’. For more information see Prices in the BNF, under How to use BNF publications p. xi.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Adcirca** (Eli Lilly and Company Ltd)
- **Tadalafil 20 mg** Adcirca 20mg tablets | 56 tablet [PO] £491.22
- **Cialis** (Eli Lilly and Company Ltd)
- **Tadalafil 2.5 mg** Cialis 2.5mg tablets | 28 tablet [PO] £4.99 DT price = £4.99
- **Tadalafil 5 mg** Cialis 5mg tablets | 28 tablet [PO] £54.99 DT price = £54.99
- **Tadalafil 10 mg** Cialis 10mg tablets | 4 tablet [PO] £26.99 DT price = £26.99
- **Tadalafil 20 mg** Cialis 20mg tablets | 4 tablet [PO] £53.98

**Vardenafil**

**INDICATIONS AND DOSE**

**Erectile dysfunction**

**BY MOUTH USING TABLETS**

- **Adult**: Initially 10 mg (max. per dose 20 mg), to be taken approximately 25–60 minutes before sexual activity, subsequent doses adjusted according to response, onset of effect may be delayed if taken with high-fat meal; maximum 1 dose per day

**BY MOUTH USING ORODISPERISIBLE TABLET**

- **Adult**: 10 mg, to be taken approximately 25–60 minutes before sexual activity; maximum 10 mg per day

**Erectile dysfunction (patients on alpha-blocker therapy)**

**BY MOUTH USING TABLETS**

- **Adult**: Initially 5 mg (max. per dose 20 mg), to be taken approximately 25–60 minutes before sexual activity, subsequent doses adjusted according to response, onset of effect may be delayed if taken with high-fat meal; maximum 1 dose per day

**Dose adjustments due to interactions**

Concomitant treatment with phosphodiesterase type-5 inhibitor and an alpha-blocker can increase the risk of postural hypotension—initiate treatment with a phosphodiesterase type-5 inhibitor (at a low dose) only once the patient is stable on the alpha-blocker.

**Dose equivalence and conversion**

Levitra® 10 mg orodispersible tablets and Levitra® 10 mg film coated tablets are **not** bioequivalent.

**CONTRA-INDICATIONS** Avoid if systolic blood pressure below 90 mmHg · hereditary degenerative retinal disorders · myocardial infarction · patients in whom vasodilatation or sexual activity are inadvisable · previous history of non-arteritic anterior ischaemic optic neuropathy · recent stroke · unstable angina

**CAUTIONS** Active peptic ulceration · anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie’s disease) · bleeding disorders · cardiovascular disease · elderly · left ventricular outflow obstruction · predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia) · susceptibility to prolongation of QT interval

**INTERACTIONS** → Appendix 1 (vardenafil)
Caution with concomitant use of drugs which prolong QT interval. Avoid concomitant use of nitrates.

**SIDE-EFFECTS**

- **Common or very common** Back pain · dizziness · dyspepsia · flushing · headache · migraine · myalgia · nasal congestion · nausea · visual disturbances · vomiting

**Genito-urinary system**

- **Vardenafil**
- **Alprostadil**
- **Prostaglandins (Erectile Dysfunction)**
Aid to diagnosis of erectile dysfunction

**BY URETHRAL APPLICATION**

- Adult: 500 micrograms for 1 dose

**Erectile dysfunction**

**TO THE SKIN**

- Adult: Apply 300 micrograms, to the tip of the penis, 5–30 minutes before sexual activity; max 1 dose in 24 hours not more than 2–3 times per week

**VIRIDAL DUO STARTER PACK**

**Neurogenic erectile dysfunction**

**BY INTRACAVERNOSAL INJECTION**

- Adult: Initially 2.5 micrograms, increased in steps of 2.5–5 micrograms, to obtain dose suitable for producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 2–3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

**Erectile dysfunction**

**BY INTRACAVERNOSAL INJECTION**

- Adult: Initially 5 micrograms, increased in steps of 2.5–5 micrograms, to obtain dose suitable for producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 2–3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

**CAVERJECT DUAL CHAMBER**

**Erectile dysfunction**

**BY INTRACAVERNOSAL INJECTION**

- Adult: Initially 2.5 micrograms for 1 dose (first dose), followed by 5 micrograms for 1 dose (second dose), to be given if some response to first dose, alternatively 7.5 micrograms for 1 dose (second dose), to be given if no response to first dose, then increased in steps of 5–10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5–20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

**Erectile dysfunction associated with neurological dysfunction**

**BY INTRACAVERNOSAL INJECTION**

- Adult: Initially 1.25 micrograms for 1 dose (first dose), then 2.5 micrograms for 1 dose (second dose), then 5 micrograms for 1 dose (third dose), increased in steps of 5–10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5–20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

**Aid to diagnosis**

**BY INTRACAVERNOSAL INJECTION**

- Adult: 10–20 micrograms for 1 dose (consult product literature)

**Aid to diagnosis where evidence of neurological dysfunction**

**BY INTRACAVERNOSAL INJECTION**

- Adult: Initially 5 micrograms (max. per dose 10 micrograms) for 1 dose (consult product literature)

**VIRIDAL DUO CONTINUATION PACK**

**Erectile dysfunction**

**BY INTRACAVERNOSAL INJECTION**

- Adult: Initially 5 micrograms, increased in steps of 2.5–5 micrograms, to obtain dose suitable for producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 2–3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

**Neurogenic erectile dysfunction**

**BY INTRACAVERNOSAL INJECTION**

- Adult: Initially 2.5 micrograms, increased in steps of 2.5–5 micrograms, to obtain dose suitable for producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 2–3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

**CONTRA-INDICATIONS**

**GENERAL CONTRA-INDICATIONS**

Not for use in patients with penile implants or when sexual activity medically inadvisable (e.g. orthostatic hypotension, myocardial infarction, and syncope) • not for use with other agents for erectile dysfunction - predisposition to prolonged erection (as in thrombocytopenia, polycythemia, sickle cell anaemia,
multiple myeloma or leukaemia) • urethral application contra-indicated in balanitis • urethral application contra-indicated in severe curvature • urethral application contra-indicated in severe hypospadias • urethral application contra-indicated in urethritis

SPECIFIC CONTRA-INDICATIONS

• With topical use Balanitis • severe curvature • severe hypospadias • urethral stricture • urethritis

• CAUTIONS Anatomical deformations of penis (painful erection more likely)—follow up regularly to detect signs of penile fibrosis (consider discontinuation if angulation, cavernosal fibrosis or Peyronie’s disease develop) • priapism (patients should be instructed to report any erection lasting 4 hours or longer)

• INTERACTIONS → Appendix 1 (alprostadil).

• SIDE-EFFECTS

• Common or very common Dizziness • haematoma • haemosiderin deposits • headache • hypertension • hypotension • influenza-like syndrome • injection site reactions • other localised pain (buttocks, leg, testicular, abdominal) • penile fibrosis • penile oedema • penile pain • penile rash • urethral bleeding • urethral burning

• Uncommon Abnormal ejaculation • asthenia • balanitis • dry mouth • haematuria • irritation • leg cramps • local reactions • micturation difficulties • mydriasis • nausea • pelvic pain • penile numbness or sensitivity • penile warmth • phimosis • priapism • pruritus • rapid pulse • scrotal erythema • scrotal oedema • scrotal pain • supraventricular extrasystole • sweating • syncope • testicular oedema • testicular thickening • urethral stenosis • vasodilatation

• Rare Anaphylaxis • erythema • hypersensitivity reactions • rash • urinary-tract infection • urticaria • vertigo

• CONCEPTION AND CONTRACEPTION

• With urethral use If partner is pregnant, barrier contraception should be used. No evidence of harm to latex condoms and diaphragms.

• With topical use Condoms should be used to avoid exposure to women of child-bearing age, pregnant or lactating women. No evidence of harm to latex condoms.

• DIRECTIONS FOR ADMINISTRATION

• With intracavernosal use The first dose of the intracavernosal injection must be given by medically trained personnel; self-administration may only be undertaken after proper training.

• With urethral use During initiation of treatment the urethral application should be used under medical supervision; self-administration may only be undertaken after proper training.

• PATIENT AND CARER ADVICE Patients should be instructed to report any erection lasting 4 hours or longer.

• With topical use Counsel patients that condoms should be used to avoid local reactions and exposure of alprostadil to women of childbearing age, pregnant, or lactating women.

• NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions Caverject®, Viridal® Duo, Vitaros® and MUSE® are not prescribable under the NHS for treatment of erectile dysfunction except in men who meet the criteria listed in part XVIII of the Drug Tariff (Part Xib of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed ‘SLS’ For more information see Prices in the BNF, under How to use BNF publications p. xi

4.2 Premature ejaculation

SELECTIVE SEROTONIN RE-UPTAKE INHIBITORS

Dapoxetine

• DRUG ACTION Dapoxetine is a short-acting selective serotonin re-uptake inhibitor.

INDICATIONS AND DOSE

Premature ejaculation in men who meet all the following criteria: poor control over ejaculation, a history of premature ejaculation over the past 6 months, marked distress or interpersonal difficulty as a consequence of premature ejaculation, and an intravaginal ejaculatory latency time of less than two minutes.

BY MOUTH

• Adult: Initially 30 mg, to be taken approximately 1–3 hours before sexual activity, subsequent doses adjusted according to response; review treatment after 4 weeks (or 6 doses) and at least every 6 months thereafter, not recommended for adults 65 years and over; maximum 1 dose per day; maximum 60 mg per day continued →
Premature ejaculation in men who meet all the following criteria: poor control over ejaculation, a history of premature ejaculation over the past 6 months, marked distress or interpersonal difficulty as a consequence of premature ejaculation, and an intravaginal ejaculatory latency time of less than two minutes (with concomitant apreptitant, clarithromycin, diltiazem, erythromycin, fluconazole, fosamprenavir, and verapamil).

BY MOUTH
- Adult: Up to 30 mg, to be taken approximately 1–3 hours before sexual activity; review treatment after 4 weeks (or 6 doses) and at least every 6 months thereafter, not recommended for adults 65 years and over; maximum 1 dose per day.

Dose adjustments due to interactions
Max. single dose 30 mg with concomitant apreptitant, clarithromycin, diltiazem, erythromycin, fluconazole, fosamprenavir, and verapamil.

Use 60-mg dose with caution with concomitant potent inhibitors of cytochrome P450 enzyme CYP2D6.

- **CONTRA-INDICATIONS** History of bipolar disorder - history of mania - history of severe depression - history of syncope - significant cardiac disease - uncontrolled epilepsy
- **CAUTIONS** Bleeding disorders - epilepsy (discontinue if convulsions develop) - susceptibility to angle-closure glaucoma
- **INTERACTIONS** ▶ Appendix 1 (dapoxetine).
Caution with concomitant use of drugs that increase risk of bleeding.

- **SIDE-EFFECTS**
- **Common or very common** Abdominal distension - abdominal pain - abnormal dreams - agitation - anxiety - constipation - diarrhoea - dizziness - dry mouth - dyspepsia - flushing - headache - hypertension - impaired attention - irritability - malaise - nausea - paraesthesia - sexual dysfunction - sleep disturbances - sweating - tinnitus - tremor - visual disturbances - vomiting
- **Uncommon** Abnormal thoughts - bradycardia - bruxism - confusion - depression - eye pain - hypotension - mood disturbances - mydriasis - postural hypotension - pruritus - restlessness - sinus arrest - syncope - tachycardia - taste disturbances - vertigo
- **Rare** Defaecation urgency - sudden onset of sleep

SIDE-EFFECTS, FURTHER INFORMATION
Discontinue if psychiatric disorder develops. Avoid if postural hypotension occurs during test dose.

- **HEPATIC IMPAIRMENT** Use with caution if eGFR 30–80 mL/minute/1.73 m²; avoid if eGFR less than 30 mL/minute/1.73 m².

- **PRE-TREATMENT SCREENING** Test for postural hypotension before starting treatment.

- **PATIENT AND CARER ADVICE**
Postural hypotension and syncope Patients should be advised to maintain hydration and to sit or lie down until prodromal symptoms such as nausea, dizziness, and sweating abate.

5 Obstetrics

**Obstetrics**

**Prostaglandins and oxytocics**

Prostaglandins and oxytocics are used to induce abortion or induce or augment labour and to minimise blood loss from the placental site. They include oxytocin p. 705, carboprin p. 706, ergometrine maleate p. 707, and the prostaglandins. All induce uterine contractions with varying degrees of pain according to the strength of contractions induced.

**Induction of abortion**

Gemeprost p. 709, a prostaglandin administered vaginally as pessaries, is suitable for the medical induction of late therapeutic abortion; gemeprost is also used to ripen the cervix before surgical abortion, particularly in primigravida. The prostaglandin misoprostol p. 709 is given by mouth, buccally, sublingually, or vaginally, to induce medical abortion [unlicensed indication]. Intravaginal use ripens the cervix before surgical abortion [unlicensed indication]. Extra-amniotic dinoprostone p. 706 is rarely used nowadays.

Pre-treatment with mifepristone p. 708 can facilitate the process of medical abortion. It sensitises the uterus to subsequent administration of a prostaglandin and, therefore, abortion occurs in a shorter time and with a lower dose of prostaglandin.

**Induction and augmentation of labour**

Dinoprostone p. 706 is available as vaginal tablets, pessaries and vaginal gels for the induction of labour. The intravenous solution is rarely used; it is associated with more side-effects.

Oxytocin p. 705 ([Syntocinon]®) is administered by slow intravenous infusion, using an infusion pump, to induce or augment labour, usually in conjunction with amniotomy. Uterine activity must be monitored carefully and hyperstimulation avoided. Large doses of oxytocin may result in excessive fluid retention.

Misoprostol p. 709 is given orally or vaginally for the induction of labour [unlicensed indication].

**Prevention and treatment of haemorrhage**

Bleeding due to incomplete miscarriage or abortion can be controlled with ergometrine maleate and oxytocin ([Syntometrine]®) given intramuscularly. The dose is adjusted according to the patient’s condition and blood loss. This is commonly used before surgical evacuation of the uterus, particularly when surgery is delayed. Oxytocin and ergometrine maleate combined are more effective in early pregnancy than either drug alone.

Active management of the third stage of labour reduces the risk of postpartum haemorrhage; oxytocin is given by intramuscular injection [unlicensed] on delivery of the anterior shoulder or, at the latest, immediately after the baby is delivered. Alternatively, ergometrine maleate with oxytocin ([Syntometrine]®) can be given by intramuscular injection in the absence of hypertension; oxytocin alone causes less nausea, vomiting, and hypertension than when given with ergometrine maleate p. 707.

In excessive uterine bleeding, any placental products remaining in the uterus should be removed. Oxytocic drugs are used to treat postpartum haemorrhage caused by uterine atony; treatment options are as follows:

- oxytocin by slow intravenous injection, followed in severe cases by intravenous infusion of oxytocin at a rate that controls uterine atony or
- ergometrine by intramuscular injection or
ergometrine by slow intravenous injection (use with caution—risk of hypertension) or
- ergometrine with oxytocin (Syntometrine®) by intramuscular injection

Carboprost p. 706 has an important role in severe postpartum haemorrhage unresponsive to ergometrine maleate and oxytocin.

Misoprostol p. 709 [unlicensed] can be used in postpartum haemorrhage when oxytocin, ergometrine maleate, and carboprost are not available or are inappropriate.

**Mifepristone**

For termination of pregnancy, a single dose of mifepristone p. 708 is followed by administration of a prostaglandin (gemeprost p. 709 or misoprostol p. 709 [unlicensed]).

Guidelines of the Royal College of Obstetricians and Gynaecologists (November 2011) include [unlicensed] regimens for inducing medical abortion.

**Myometrial relaxants**

Tocolytic drugs postpone premature labour and they are used with the aim of reducing harm to the child. However, there is no satisfactory evidence that the use of these drugs reduces mortality. The greatest benefit is gained by using the delay to administer corticosteroid therapy or to implement other measures which improve perinatal health (including transfer to a unit with neonatal intensive care facility).

The oxytocin receptor antagonist, atosiban p. 708, is licensed for the inhibition of uncomplicated premature labour between 24 and 33 weeks of gestation. Atosiban may be preferable to a beta, agonist because it has fewer side effects. The dihydropyridine calcium-channel blocker nifedipine p. 154 also has fewer side-effects than a beta, agonist.

The beta, agonists salbutamol p. 222 and terbutaline sulfate p. 225 are licensed for inhibiting uncomplicated premature labour between 22 and 37 weeks of gestation to permit a delay in delivery of up to 48 hours. Use of high-dose short acting beta, agonists in obstetric indications has been associated with serious, sometimes fatal cardiovascular events in the mother and fetus, particularly when used for a prolonged period of time. Oral therapy is no longer recommended and parenteral therapy should be restricted to a maximum duration of 48 hours, given under the supervision of a specialist, and with close monitoring.

Indometacin p. 929, a cyclo-oxygenase inhibitor, also inhibits labour [unlicensed indication] and it can be useful in situations where a beta, agonist is not appropriate; however, there are concerns about neonatal complications such as transient impairment of renal function and premature closure of ductus arteriosus.

### Induction of labour

**PROSTAGLANDINS AND OXYTOCICS**

**Oxytocin**

**INDICATIONS AND DOSE**

Induction of labour for medical reasons | Stimulation of labour in hypotonic uterine inertia

**BY INTRAVENOUS INFUSION**

- Adult: Initially 0.001–0.004 units/minute, not to be started for at least 6 hours after administration of vaginal prostaglandin, dose increased at intervals of at least 30 minutes until a maximum of 3–4 contractions occur every 10 minutes (0.01 units/minute is often adequate) up to max. 0.02 units/minute, if regular contractions not established after a total of 5 units, stop induction attempt (may be repeated next day starting again at 0.001–0.004 units/minute)

**Caesarean section**

**BY SLOW INTRAVENOUS INJECTION**

- Adult: 5 units immediately after delivery

**Prevention of postpartum haemorrhage after delivery of placenta**

**BY INTRAVENOUS INFUSION**

- Adult: 5 units, if infusion previously used for induction or enhancement of labour, increase rate during third stage and for next few hours

**BY INTRAMUSCULAR INJECTION**

- Adult: 10 units, can be used instead of oxytocin with ergometrine (Syntometrine®)

**Treatment of postpartum haemorrhage**

**BY SLOW INTRAVENOUS INJECTION**

- Adult: 5 units, repeated if necessary

**Treatment of severe cases of postpartum haemorrhage (following intravenous injection)**

**BY INTRAVENOUS INFUSION**

- Adult: 40 units in 500 mL infusion fluid given at a rate sufficient to control uterine atony

**Incomplete, inevitable, or missed miscarriage**

**INITIALLY BY SLOW INTRAVENOUS INJECTION**

- Adult: 5 units, followed by (by intravenous infusion) 0.02–0.04 units/minute if required, the rate of infusion can be faster if necessary

**Important safety information**

Prolonged intravenous administration at high doses with large volume of fluid (which is possible in inevitable or missed miscarriage or postpartum haemorrhage) may cause water intoxication with hyponatraemia. To avoid: use electrolyte-containing diluent (i.e. not glucose), increase oxytocin concentration to reduce fluid, restrict fluid intake by mouth; monitor fluid and electrolytes.

**CONTRA-INDICATIONS** Any condition where spontaneous labour inadvisable - any condition where vaginal delivery inadvisable - avoid intravenous injection during labour - avoid prolonged administration in oxytocin-resistant uterine inertia - avoid rapid intravenous injection (may transiently reduce blood pressure) - fetal distress (discontinue immediately if this occurs) - hypertonic uterine contractions (discontinue immediately if this occurs) - severe cardiovascular disease - severe pre-eclamptic toxaemia

**CAUTIONS** Avoid large infusion volumes and restrict fluid intake by mouth (risk of hyponatraemia and water-intoxication) - enhancement of labour—presence of borderline cephalopelvic disproportion (avoid if significant) - history of lower-uterine segment caesarean section - induction of labour—presence of borderline cephalopelvic disproportion (avoid if significant) - mild pregnancy-induced cardiac disease - mild pregnancy-induced hypertension - moderate pregnancy-induced cardiac disease - moderate pregnancy-induced hypertension - risk factors for disseminated intravascular coagulation - secondary uterine inertia - women over 35 years

**INTERACTIONS** → Appendix 1 (oxytocin).

Effects enhanced by concomitant prostaglandins (very careful monitoring of uterine activity). Caudal block anaesthesia (may enhance hypertensive effects of sympathomimetic vasopressors).
706 Obstetrics

Genito-urinary system

- **SIDE-EFFECTS**
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** Manufacturer advises avoid.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- Pain (Ferring Pharmaceuticals Ltd)
  - Carbetocin 100 microgram per 1 ml Pain 100micrograms/ml solution for injection ampoules | 5 ampoule [Pain] £88.20 (Hospital only)

Carboprost

**INDICATIONS AND DOSE**
Postpartum haemorrhage due to uterine atony in patients unresponsive to ergometrine and oxytocin

- By deep intramuscular injection
  - Adult: 250 micrograms at least every 15 minutes, repeated if necessary, total dose should not exceed 2 mg (8 doses)

- **CONTRA-INDICATIONS** Cardiac disease - pulmonary disease - untreated pelvic infection
- **CAUTIONS** Excessive dosage may cause uterine rupture - history of anaemia - history of asthma - history of diabetes - history of epilepsy - history of glaucoma - history of hypertension - history of hypotension - history of jaundice - history of raised intra-ocular pressure - uterine scars

- **INTERACTIONS** Appendix 1 (prostaglandins)
- **SIDE-EFFECTS** Bronchospasm - cardiovascular collapse - chills - diaphoresis - diarrhoea - dizziness - dyspnoea - erythema at injection site - flushing - headache - hyperthermia - nausea - pain at injection site - pulmonary oedema - raised blood pressure - vomiting
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** Manufacturer advises avoid.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- Pain (Pfizer Ltd)
  - Carboprost (as Carboprost trometamol) 250 microgram per 1 ml Pain 250micrograms/ml solution for injection ampoules | 10 ampoule [Pain] £182.01 (Hospital only)

Dinoprostone

**INDICATIONS AND DOSE**
Prostaglandins and oxytocics

**Carbetocin**

**INDICATIONS AND DOSE**
Prevention of uterine atony after caesarean section

- By slow intravenous injection
  - Adult: 100 micrograms for 1 dose, to be given over 1 minute, administer as soon as possible after delivery, preferably before removal of placenta

- **CONTRA-INDICATIONS** Eclampsia - epilepsy - pre-eclampsia
- **CAUTIONS** Asthma - cardiovascular disease (avoid if severe) - hyponatraemia - migraine

5.2 Postpartum haemorrhage

- **SIDE-EFFECTS**
  - Common or very common Arrhythmia - headache - nausea - vomiting
  - Rare Anaphylactoid reactions (with dyspnoea, hypotension, or shock) - disseminated intravascular coagulation - hyponatraemia associated with high doses with large infusion volumes of electrolyte-free fluid - rash - uterine hyperstimulation (usually with excessive doses—may cause fetal distress, asphyxia, and death, or may lead to hypertonicity, tetanic contractions, soft-tissue damage or uterine rupture) - uterine spasm (may occur at low doses) - water intoxication associated with high doses with large infusion volumes of electrolyte-free fluid

- **MEDICATIONS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- Pain (Hospital)
  - Carbetocin 100 microgram per 1 ml Pain 100micrograms/ml solution for injection ampoules | 5 ampoule [Pain] £88.20 (Hospital only)
PROSTIN E2® VAGINAL TABLETS
Induction of labour
BY VAGINA
- Adult: 3 mg, inserted high into the posterior fornix, followed by 3 mg after 6–8 hours (max. per dose 6 mg), to be given if labour not established

Dose equivalence and conversion
Prostin E2 Vaginal tablets and Vaginal Gel are not bioequivalent.

PROPESES®
Cervical ripening and induction of labour at term
BY VAGINA
- Adult: 1 pessary, insert pessary (in retrieval device) high into posterior fornix and remove when cervical ripening adequate; if oxytocin necessary, remove 30 minutes before oxytocin infusion; remove if cervical ripening inadequate after 24 hours (dose not to be repeated).

- CONTRA-INDICATIONS Active cardiac disease • active pulmonary disease • avoid extra-amniotic route in cervicitis or vaginitis • fetal distress • fetal malpresentation • grand multiparas • history of caesarean section • history of difficult or traumatic delivery • history of major uterine surgery • major cephalopelvic disproportion • multiple pregnancy • placenta praevia or unexplained vaginal bleeding during pregnancy • ruptured membranes • untreated pelvic infection

- CAUTIONS Effect of oxytocin enhanced • history of asthma • history of epilepsy • history of glaucoma and raised intraocular pressure • hypertension • risk factors for disseminated intravascular coagulation • uterine rupture • uterine scarring

- INTERACTIONS → Appendix 1 (prostaglandins).

- SIDE-EFFECTS Abruptio placenta • amniotic fluid embolism • backache • bronchospasm • cardiac arrest • diarrhoea • disseminated intravascular coagulation • fetal distress • fever • low Apgar scores • maternal hypertension • nausea • pulmonary embolism • rapid cervical dilation • severe uterine contractions • stillbirth or neonatal death • uterine hypercontractility with or without fetal bradycardia • uterine hypertonus • uterine rupture • vaginal symptoms (warmth, irritation, pain) • vomiting

- HEPATIC IMPAIRMENT Manufacturers advise avoid.

- RENAL IMPAIRMENT Manufacturers advise avoid.

- MONITORING REQUIREMENTS
  - Monitor for disseminated intravascular coagulation after parturition.
  - Monitor uterine activity and fetal status (particular care if history of uterine hypertony)
  - Care needed in monitoring uterine activity when used in sequence following oxytocin.

- DIRECTIONS FOR ADMINISTRATION For intravenous infusion (Prostin E2®) give continuously or intermittently in Glucose 5% or Sodium Chloride 0.9%.

- PRESCRIBING AND DISPENSING INFORMATION
  Important: Do not confuse dose of Prostin E2® vaginal gel with that of Prostin E2® vaginal tablets—not bioequivalent.

- LESS SUITABLE FOR PRESCRIBING
  Intravenous solution rarely used and is considered less suitable for prescribing. Extra-amniotic solution less commonly used and is considered less suitable for prescribing.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

- Solution for infusion
  → Prostin E2 (Pfizer Ltd)
  Dinoprostone 1 mg per 1 ml Prostin E2 750micrograms/0.75ml solution for infusion ampoules | 1 ampoule £8.52 (Hospital only)

- Liquid
  → Prostin E2 (Pfizer Ltd)
  Dinoprostone 10 mg per 1 ml Prostin E2 5mg/0.5ml extraamniotic solution ampoules | 1 ampoule £18.40 (Hospital only)

Ergometrine maleate

INDICATIONS AND DOSE
Postpartum haemorrhage caused by uterine atony
BY INTRAMUSCULAR INJECTION OR BY SLOW INTRAVENOUS INJECTION
- Adult: 250–500 micrograms

- CONTRA-INDICATIONS Eclampsia • first stage of labour • induction of labour • second stage of labour • sepsis • severe cardiac disease • severe hypertension • vascular disease

- CAUTIONS Acute porphyrias p. 864 • cardiac disease • hypertension • multiple pregnancy • risk of hypertension associated with intravenous administration

- INTERACTIONS → Appendix 1 (ergot alkaloids).

- SIDE-EFFECTS
  - Common or very common Abdominal pain • arrhythmias • bradycardia • chest pain • dizziness • dyspnoea • headache • hypertension • nausea • palpitation • pulmonary oedema • rash • tinnitus • vasoconstriction • vomiting
  - Very rare Myocardial infarction

- HEPATIC IMPAIRMENT Manufacturer advises caution in mild or moderate impairment. Manufacturer advises avoid in severe impairment.

- RENAL IMPAIRMENT Manufacturer advises caution in mild or moderate impairment. Manufacturer advises avoid in severe impairment.

- MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

- Solution for injection
  → ERGOMETRINE MALEATE (Non-proprietary)
  Ergometrine maleate 500 microgram per 1 ml Ergometrine 500micrograms/2ml solution for injection ampoules | 10 ampoule £15.00

- Intravenous solution rarely used and is considered less suitable for prescribing.
Ergometrine with oxytocin

The properties listed below are those particular to the combination only. For the properties of the components please consider, ergometrine maleate p. 707, oxytocin p. 705.

**INDICATIONS AND DOSE**

Active management of the third stage of labour | Postpartum haemorrhage caused by uterine atony

**BY INTRAVENOUS INJECTION**

- Adult: 1 ml for one dose.

**BY INTRAMUSCULAR INJECTION**

- Adult: No longer recommended.

**BLEEDING DUE TO INCOMPLETE MISCARRIAGE OR ABORTION**

**BY INTRAMUSCULAR INJECTION**

- Adult: Adjusted according to response to, the patient’s condition and blood loss.

**SIDE-EFFECTS**

- **Common or very common** Dizziness · headache · hot flushes · hyperglycaemia · hypotension · injection-site reaction · nausea · tachycardia · vomiting

- **Uncommon** Fever · insomnia · pruritus · rash

- **HEPATIC IMPAIRMENT** No information available.

- **RENAL IMPAIRMENT** No information available.

- **MONITORING REQUIREMENTS** Monitor blood loss after delivery.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Tractocile® concentrate for intravenous infusion), give continuously in Glucose 5% or Sodium chloride 0.9%. Withdraw 10 ml infusion fluid from 100-ml bag and replace with 10 ml atosiban concentrate (7.5 mg/ml) to produce a final concentration of 750 micrograms/ml.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **ATOSIBAN (Non-proprietary)**

  Atosiban (as Atosiban acetate) 7.5 mg per 1 ml Atosiban 6.75mg/0.9ml solution for injection vials | 1 vial [POD] £18.41 (Hospital only)

  Tractocile (Ferring Pharmaceuticals Ltd)

  Atosiban (as Atosiban acetate) 7.5 mg per 1 ml Tractocile 6.75mg/0.9ml solution for injection vials | 1 vial [POD] £18.41 (Hospital only)

**Solution for infusion**

- **ATOSIBAN (Non-proprietary)**

  Atosiban (as Atosiban acetate) 7.5 mg per 1 ml Atosiban 37.5mg/ml concentrate for solution for infusion vials | 1 vial [POD] £52.82 (Hospital only)

  Tractocile (Ferring Pharmaceuticals Ltd)

  Atosiban (as Atosiban acetate) 7.5 mg per 1 ml Tractocile 37.5mg/ml solution for infusion vials | 1 vial [POD] £52.82 (Hospital only)

**5.4 Termination of pregnancy**

**PROGESTERONE RECEPTOR MODULATORS**

**Mifepristone**

- **DRUG ACTION** Mifepristone, an antiprogestogenic steroid, sensitises the myometrium to prostaglandin-induced contractions and ripens the cervix.

**INDICATIONS AND DOSE**

Cervical ripening before mechanical cervical dilatation for termination of pregnancy of up to 64 days gestation (under close medical supervision)

**BY MOUTH**

- Adult: 200 mg for 1 dose, to be taken 36-48 hours before procedure

Labour induction in fetal death in utero where prostaglandin or oxytocin inappropriate (under close medical supervision)

**BY MOUTH**

- Adult: 600 mg once daily for 2 days, if labour not started within 72 hours of first dose, another method should be used

Medical termination of intra-uterine pregnancy of up to 49 days gestation (under close medical supervision)

**BY MOUTH**

- Adult: 600 mg for 1 dose, dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina or misoprostol 400 micrograms by mouth, alternatively 200 mg for 1 dose, dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding

Medical termination of intra-uterine pregnancy of 50–63 days gestation (under close medical supervision)

**BY MOUTH**

- Adult: 600 mg for 1 dose, alternatively 200 mg for 1 dose, dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding
Termination of pregnancy of 13–24 weeks gestation (in combination with a prostaglandin) (under close medical supervision)

**BY MOUTH**

- **Adult:** 600 mg for 1 dose, alternatively 200 mg for 1 dose, dose followed 36–48 hours later by gemeprost 1 mg by vagina every 3 hours up to max. 5 mg or misoprostol; if abortion does not occur, 24 hours after start of treatment repeat course of gemeprost 1 mg by vagina up to max. 5 mg; follow-up visit after appropriate interval to assess vaginal bleeding recommended

- **SIDE-EFFECTS**
  - **Common or very common** Gastro-intestinal cramps - uterine contractions - vaginal bleeding (sometimes severe) may occur between administration of mifepristone and surgery (and rarely abortion may occur before surgery)
  - **Uncommon** Hypersensitivity reactions - rash - urticaria
  - **Rare** Chills - dizziness - fever - headache - hot flushes - hypotension - malaise
  - **Frequency not known** Infections - toxic shock syndrome

- **INTERACTIONS** → Appendix 1 (mifepristone).

- **CONTRA-INDICATIONS** Placenta praevia - unexplained vaginal bleeding - uterine scarring

- **CAUTIONS** Cardiovascular insufficiency - cervicitis - obstructive airways disease - raised intra-ocular pressure - vaginitis

**INDICATIONS AND DOSE**

- **BY VAGINA**
  - **Adult:** 1 mg every 3 hours for maximum 5 administrations, to be inserted into posterior fornix, second course may begin 24 hours after start of treatment (if treatment fails, pregnancy should be terminated by another method)

**Second trimester intra-uterine death**

- **BY VAGINA**
  - **Adult:** 1 mg every 3 hours for maximum 5 administrations only, to be inserted into posterior fornix

**Medical termination of intra-uterine pregnancy of up to 49 days gestation following mifepristone**

- **BY VAGINA**
  - **Adult:** 1 mg

**Termination of pregnancy of 13–24 weeks gestation (in combination with a prostaglandin) following mifepristone**

- **BY VAGINA**
  - **Adult:** 1 mg every 3 hours (max. per dose 5 mg), if abortion does not occur, 24 hours after start of treatment repeat course of gemeprost 1 mg by vagina up to max. 5 mg; follow-up visit after appropriate interval to assess vaginal bleeding recommended, careful monitoring of blood pressure and pulse essential for 3 hours after administration of gemeprost pessary (risk of profound hypotension)

**CONTRA-INDICATIONS** Acute porphyrias p. 864 - chronic adrenal failure - suspected ectopic pregnancy (use other specific means of termination) - uncontrolled severe asthma

**Vaginal and vulval conditions**

**Termination of pregnancy following mifepristone (gestation 50 to 63 days)**
- **INITIALLY BY VAGINA OR BY BUCAL ADMINISTRATION OR BY SUBLINGUAL ADMINISTRATION**
  - Adult: 800 micrograms for 1 dose, dose to be given 24–48 hours after mifepristone, if abortion has not occurred 4 hours after first misoprostol dose a further dose may be given, (by mouth or by vagina) 400 micrograms for 1 dose
- **Termination of pregnancy following mifepristone (gestation of 9 to 13 weeks)**
  - **INITIALLY BY VAGINA**
    - Adult: 800 micrograms for 1 dose, dose to be given 36–48 hours after mifepristone, followed by (by vagina or by mouth) 400 micrograms every 3 hours if required for a maximum of 4 doses
- **Termination of pregnancy following mifepristone (gestation of 13 to 24 weeks)**
  - **INITIALLY BY VAGINA**
    - Adult: 800 micrograms for 1 dose, dose to be given 36–48 hours after mifepristone, followed by (by vagina or by mouth) 400 micrograms every 3 hours if required for a maximum of 4 doses, if abortion has not occurred 3 hours after the last dose of misoprostol, a further dose of mifepristone may be given, and misoprostol may be recommenced 12 hours later

**Benign gastric ulceration | Benign duodenal ulceration | NSAID-associated ulceration**

**BY MOUTH**
- Adult: 800 micrograms daily in 2–4 divided doses continued for at least 4 weeks or may be continued for up to 8 weeks if required, dose to be taken with breakfast (or main meals) and at bedtime

**Prophylaxis of NSAID-induced gastric ulcer | Prophylaxis of duodenal ulcer**

**BY MOUTH**
- Adult: 200 micrograms 4 times a day, reduced if not tolerated to 200 micrograms 2–3 times a day, use lower dose is less effective

**UNLICENSED USE** Use of misoprostol for termination of pregnancy is an unlicensed use.

**CAUTIONS** Conditions where hypotension might precipitate severe complications (e.g. cerebrovascular disease, cardiovascular disease) - inflammatory bowel disease

**SIDE-EFFECTS**
- **Common or very common** Diarrhoea
- **Frequency not known** Abdominal pain - abnormal vaginal bleeding - dizziness - dyspepsia - flatulence - intermenstrual bleeding - menorrhagia - nausea - postmenopausal bleeding - rashes - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

**Diarrhoea** May occasionally be severe and require withdrawal, reduced by giving single doses not exceeding 200 micrograms and by avoiding magnesium-containing antacids.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises that misoprostol should not be used in women of childbearing age unless pregnancy has been excluded. In such patients it is advised that misoprostol should only be used if the patient takes effective contraceptive measures and has been advised of the risks of taking misoprostol if pregnant.

**PREGNANCY** Avoid—potent uterine stimulant (has been used to induce abortion). Teratogenic risk in first trimester.

**BREAST FEEDING** Present in milk, but amount probably too small to be harmful.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

---

**6 Vaginal and vulval conditions**

**Vaginal and vulval conditions**

Symptoms are often restricted to the vulva, but infections almost invariably involve the vagina which should also be treated. Applications to the vulva alone are likely to give only symptomatic relief without cure.

*Aqueous medicated douches* may disturb normal vaginal acidity and bacterial flora.

*Topical anaesthetic agents* give only symptomatic relief and may cause sensitivity reactions. They are indicated only in cases of pruritus where specific local causes have been excluded.

*Systemic drugs* are required in the treatment of infections such as gonorrhoea and syphilis.

**Preparations for vaginal and vulval changes**

A cream containing an oestrogen may be applied on a short-term basis to improve the vaginal epithelium in *menopausal atrophic vaginitis*. It is important to bear in mind that topical oestrogens should be used in the *smallest effective* amount to minimise systemic effects. Modified-release vaginal tablets and an impregnated vaginal ring are now also available.

The risk of endometrial hyperplasia and carcinoma is increased when *systemic* oestrogens are administered alone for prolonged periods. The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

Topical oestrogens are also used in postmenopausal women before vaginal surgery for prolapse when there is epithelial atrophy.

**Non-hormonal preparations for vaginal atrophy**

Several non-hormonal vaginal moisturisers are available and some are prescribable on the NHS (consult Drug Tariff).

**Vaginal and vulval infections**

Effective specific treatments are available for the common vaginal infections.

**Fungal infections**

*Candidal vulvitis* can be treated locally with cream, but is almost invariably associated with vaginal infection which should also be treated. *Vaginal candidiasis* is treated primarily with antifungal pessaries or cream inserted high into the vagina (including during menstruation). Single-
dose preparations offer an advantage when compliance is a problem. Local irritation may occur on application of vaginal antifungal products.

**Imidazole** drugs ( clotrimazole p. 712, econazole nitrate p. 712, fencosonate nitrate p. 713, and miconazole p. 713) are effective against candida in short courses of 1 to 14 days according to the preparation used; treatment can be repeated if initial course fails to control symptoms or if symptoms recur. Vaginal applications may be supplemented with antifungal cream for vulvitis and to treat other superficial sites of infection.

Oral treatment of vaginal infection with fluconazole p. 518 or itraconazole p. 519 is also effective.

**Vulvovaginal candidiasis in pregnancy**

Vulvovaginal candidiasis is common during pregnancy and can be treated with vaginal application of an imidazole (such as clotrimazole p. 712), and a topical imidazole cream for vulvitis. Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. Oral antifungal treatment should be avoided during pregnancy.

**Recurrent vulvovaginal candidiasis**

Recurrence of vulvovaginal candidiasis is particularly likely if there are predisposing factors, such as antibacterial therapy, pregnancy, diabetes mellitus, or possibly oral contraceptive use. Reservoirs of infection may also lead to recontamination and should be treated; these include other skin sites such as the digits, nail beds, and umbilicus as well as the gastro-intestinal tract and the bladder. The partner may also be the source of reinfection and, if symptomatic, should be treated with a topical imidazole cream at the same time.

Treatment against candida may need to be extended for 6 months in recurrent vulvovaginal candidiasis.

**Other infections**

*Trichomonal infections* commonly involve the lower urinary tract as well as the genital system and need systemic treatment with metronidazole p. 475 or tinidazole p. 476.

*Bacterial infections* with Gram-negative organisms are particularly common in association with gynaecological operations and trauma. Metronidazole is effective against certain Gram-negative organisms, especially *Bacteroides* spp. and can be used prophylactically in gynaecological surgery.

Clindamycin cream below and metronidazole gel are indicated for bacterial vaginosis.

Vaginal preparations intended to restore normal acidity may prevent recurrence of vaginal infections and permit the re-establishment of the normal vaginal flora.

The antiviral drugs aciclovir p. 552, famciclovir p. 552, and valaciclovir p. 552 can be used in the treatment of genital infection due to *herpes simplex virus*, the HSV type 2 being a major cause of genital ulceration; they have a beneficial effect on virus shedding and healing, generally giving relief from pain and other symptoms.
Metronidazole

- **Drug Action** Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa.

**Indications and Dose**

- Bacterial vaginosis
  - **by Vagina Using Vaginal Gel**
    - Adult: 1 applicatorful daily for 5 days, dose to be administered at night

- **Caution** Not recommended during menstruation - some systemic absorption may occur with vaginal gel

- **Side-Effects** Abnormal vaginal discharge - local irritation - pelvic discomfort - vaginal candidiasis

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug.

- **Vaginal Gel**
  - **Clotrimazole (Non-proprietary)**
    - Metronidazole 75 mg per 1 gram
    - Metronidazole 0.75% vaginal gel | 40 gram (£0.50) no price available
  - **Zidovar (Meda Pharmaceuticals Ltd)**
    - Metronidazole 75 mg per 1 gram | 40 gram (£0.80) £4.31

- **Cream**
  - **Canesten (clotrimazole)**
    - Metronidazole 20 mg per 1 gram
    - Metronidazole 100 mg pessaries | 1 pessary (£4.00 DT price = £3.47)
    - Canesten 100mg Soft Gel pessaries | 1 pessary (£6.23 DT price = £3.47)
  - **Canesten (clotrimazole)** (Bayer Plc)
    - Metronidazole 20 mg per 1 gram
    - Canesten 100 mg pessaries | 6 pessary (£3.50 DT price = £3.50)
    - Canesten 200 mg pessaries | 3 pessary (£3.10 DT price = £3.10)

- **Econazole Nitrate 150 mg**
  - **Gyno-Pevaryl**
    - Econazole nitrate 150 mg vaginal pessaries | 1 pessary (£6.23 DT price = £6.23)

**Side-effects**

- Abnormal vaginal discharge
- Local irritation
- Pelvic discomfort
- Vaginal candidiasis

6.2 Vaginal and vulval infections, fungal

**Imidazole Antifungals**

Clotrimazole

- **Indications and Dose**
  - **Superficial sites of infection in vaginal and vulval candidiasis (dose for 1% or 2% cream)**
    - **by Vagina Using Cream**
      - Adult: Apply 2–3 times a day, to be applied to anogenital area
  - **Vaginal candidiasis (dose for 10% intravaginal cream)**
    - **by Vagina Using Vaginal Cream**
      - Adult: 5 g for 1 dose, one applicatorful to be inserted into the vagina at night, dose can be repeated once if necessary
  - **Vaginal candidiasis**
    - **by Vagina Using Pessaries**
      - Adult: 200 mg for 3 nights, course can be repeated once if necessary, alternatively 100 mg for 6 nights, course can be repeated once if necessary, alternatively 500 mg for 1 night, dose can be repeated once if necessary
  - **Recurrent vulvovaginal candidiasis**
    - **by Vagina Using Pessaries**
      - Adult: 500 mg every 1 week for 6 months, dose to be administered following topical imidazole for 10–14 days

- **Unlicensed Use** Consult product literature for individual preparations.

- **Side-effects** Occasional local irritation

- **Conception and Contraception** Cream and pessaries may damage latex condoms and diaphragms.

- **Pregnancy** Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection.

**Econazole Nitrates**

- **Indications and Dose**
  - **Gyno-Pevaryl® Cream**
    - Vaginal and vulval candidiasis
    - **Initially by Vagina Using Vaginal Cream**
      - Adult: 1 applicatorful daily for at least 14 days, dose to be inserted vaginally at night and (to the skin) apply daily for at least 14 days, to be applied to vulva at night, course can be repeated once if necessary
  - **Gyno-Pevaryl® Once**
    - Vaginal and vulval candidiasis
    - **by Vagina**
      - Adult: 1 pessary for 1 dose, pessary to be inserted at night, dose to be repeated once if necessary

- **Pregnancy**
  - Econazole nitrate 150 mg | Gyno-Pevaryl Once 150mg vaginal pessary | 1 pessary (£3.69)
  - Econazole Nitrate 150 mg vaginal pessaries | 3 pessary (£4.17)

- **Exceptions to Legal Category** Brands for sale to the public include Canesten® Internal Cream.

- **Medicinal Forms**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Pessary**
    - **Clotrimazole (Non-proprietary)**
      - Clotrimazole 500 mg Clotrimazole 500mg pessaries | 1 pessary (£4.00 DT price = £3.47)
      - Canesten (clotrimazole) (Bayer Plc) Clotrimazole 100 mg Canesten 100mg pessaries | 6 pessary (£3.50 DT price = £3.50)
      - Clotrimazole 200 mg Canesten 200mg pessaries | 3 pessary (£3.10 DT price = £3.10)
      - Clotrimazole 500 mg Canesten 500mg Soft Gel pessaries | 1 pessary (£6.23 DT price = £3.47)
    - Canesten 500mg pessaries | 1 pessary (£0.50) £2.00 DT price = £1.47
    - Canesten Vaginal 500mg pessaries | 1 pessary (£0.50) £2.00 DT price = £1.47

- **Cream**
  - **Canesten (clotrimazole)** (Bayer Plc)
    - Clotrimazole 20 mg per 1 gram
    - Canesten 1% thrush cream | 10 gram (no price available) £4.46 DT price = £4.46
    - Clotrimazole 100 mg per 1 gram
      - Canesten Internal 10% cream | 5 gram (£6.23 DT price = £6.23)
      - Canesten 10% VC cream | 5 gram (£0.40) £4.50 DT price = £6.23
Fenticonazole nitrate

**INDICATIONS AND DOSE**

**Vaginal and vulval candidiasis**

- **Cream**
  - Adult: Apply 1–2 times a day, to be applied to the anogenital area

- **Cream**
  - Child: 1 capsule daily, ovule to be inserted at night as a single dose, dose can be repeated once if necessary

- **Side-effects**
  - Local irritation

- **Conception and contraception**
  - Effect on latex and vaginal capsules damage latex condoms and diaphragms.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Capsule**
  - **Excipients:** May contain Butylated hydroxyanisole, fragrances

- **Cream**
  - **Excipients:** May contain Butylated hydroxyanisole, fragrances

**6.3 Vaginal atrophy**

**OESTROGENS**

**Estriol**

**INDICATIONS AND DOSE**

**Gynest**

- Improve the vaginal epithelium in menopausal atrophic vaginitis
  - **by Vagina**
  - Adult: Apply 1 applicatorful daily until improvement occurs, dose to be applied preferably in the evening, reduced to 1 applicatorful twice weekly, attempts to discontinue should be made at 3–6 month intervals with re-examination

- **Ovestin**
  - Improve the vaginal epithelium in menopausal atrophic vaginitis
  - **by Vagina**
  - Adult: Apply 1 applicatorful daily for 2–3 weeks, then reduced to 1 applicatorful twice weekly, discontinued every 2–3 months for 4 weeks to assess need for further treatment

**Vaginal surgery for prolapse when there is epithelial atrophy in postmenopausal women (before surgery)**

- **by Vagina**
  - Adult: Apply 1 applicatorful daily for 2 weeks before surgery, resume 2 weeks after surgery

**Contra-indications**

- Active arterial thromboembolic disease (e.g. angina or myocardial infarction) - active thrombophlebitis - Dubin-Johnson syndrome (or monitor closely) - history of breast cancer - history of recurrent venous thromboembolism (unless already on anticoagulant treatment) - oestrogen-dependent cancer - recent arterial thromboembolic disease (e.g. angina or myocardial infarction).

**CAUTIONS**

**CAUTIONS, FURTHER INFORMATION**

### Risk of breast cancer

It is estimated that using all types of HRT increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping. Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use.

### Risk of endometrial cancer

The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT. In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

### Risk of ovarian cancer

Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.

### Risk of venous thromboembolism

Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use. Women who have predisposing factors (such as a personal or family history of deep-vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits. Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

### Risk of stroke

Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke.

### Risk of coronary heart disease

HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

### Other conditions

The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

### INTERACTIONS

- Appendix 1 (oestrogens).

### SIDE-EFFECTS

### SIDE-EFFECTS, FURTHER INFORMATION

**Leg Cramps** Venous thrombosis should be ruled out.

**Withdrawal Bleeding** Cyclic HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. The aim of continuous combined HRT (where a combination of oestrogen and progestogen is taken, usually in a single tablet, throughout each 28-day treatment cycle) is to avoid bleeding, but irregular bleeding may occur during the early treatment stages (if it continues endometrial abnormality should be excluded and consideration given to cyclical HRT instead).

### CONCEPTION AND CONTRACEPTION

Intravaginal cream may damage latex condoms and diaphragms.

**Gynest**

May damage latex condoms and diaphragms.

**Ovestin**

Effect on latex condoms and diaphragms not yet known.

### PREGNANCY

Not known to be harmful.

### BREAST FEDDING

Avoid; adverse effects on lactation.

### HEPATIC IMPAIRMENT

Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin–Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.

### RENAL IMPAIRMENT

Manufacturer advises caution in renal disease. Evidence for caution is unsatisfactory and many women with these conditions may stand to benefit from HRT.

### MONITORING REQUIREMENTS

- Closely monitor breast status if history of breast nodules or fibrocystic disease (risk of breast cancer).
- The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

**EXCIPIENTS:** May contain Arachis (peanut) oil, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates.

- **Estriol (Non-proprietary)**
  - Estranol 100 microgram per 1 gram Estranol 0.01% cream | 80 gram (PMD) no price available
  - **Ovestin** (Aspen Pharma Trading Ltd)
  - Ovestin 1mg per gram | 15 gram (PMD) £4.15
  - **Gynest** (Marlborough Pharmaceuticals Ltd)
  - Gynest 100 micrograms per 1 gram Gynest 0.01% cream | 80 gram (PMD) £4.15

2.9 Targeted therapy responsive malignancy 800

1 Immune system

1.1 Immune system disorders and transplantation

Immune response

Azathioprine p. 716, ciclosporin p. 717, mercaptopurine p. 762, and methotrexate p. 762 have a role in the treatment of inflammatory bowel disease.

Folic acid p. 836 should be given to reduce the possibility of methotrexate toxicity [unlicensed indication]. Folic acid is usually given weekly on a different day to the methotrexate; alternative regimens may be used in some settings.

Immunosuppressant therapy

Immunosuppressants are used to suppress rejection in organ transplant recipients and to treat a variety of chronic inflammatory and autoimmune diseases. Solid organ transplant patients are maintained on drug regimens, which may include antiproliferative drugs (azathioprine or mycophenolate mofetil p. 725), calcineurin inhibitors (ciclosporin p. 717 or tacrolimus p. 720), corticosteroids, or sirolimus p. 719. Choice is dependent on the type of organ, time after transplantation, and clinical condition of the patient. Specialist management is required and other immunomodulators may be used to initiate treatment or to treat rejection.

Impaired immune responsiveness

Modification of tissue reactions caused by corticosteroids and other immunosuppressants may result in the rapid spread of infection. Corticosteroids may suppress clinical signs of infection and allow diseases such as septicaemia or tuberculosis to reach an advanced stage before being recognised—important: normal immunoglobulin administration should be considered as soon as possible after measles exposure, and varicella–zoster immunoglobulin (VZIG) is recommended for individuals who have significant chickenpox (varicella) exposure. Specialist advice should be sought on the use of live vaccines for those being treated with immunosuppressive drugs.

Antiproliferative immunosuppressants

Azathioprine is widely used for transplant recipients and it is also used to treat a number of auto-immune conditions, usually when corticosteroid therapy alone provides inadequate control. It is metabolised to mercaptopurine, and doses should be reduced when allopurinol p. 909 is given concurrently.

Mycophenolate mofetil p. 725 is metabolised to mycophenolic acid which has a more selective mode of action than azathioprine.

There is evidence that compared with similar regimens incorporating azathioprine, mycophenolate mofetil reduces the risk of acute rejection episodes; the risk of opportunistic infections (particularly due to tissue-invasive cytomegalovirus) and the occurrence of blood disorders such as leucopenia may be higher. Cyclophosphamide p. 750 is less commonly prescribed as an immunosuppressant.

Corticosteroids and other immunosuppressants

Prednisolone p. 585 is widely used in oncology. It has a marked antitumour effect in acute lymphoblastic leukaemia, Hodgkin’s disease, and the non-Hodgkin lymphomas. It has a role in the palliation of symptomatic end-stage malignant disease when it may enhance appetite and produce a sense of well-being.

The corticosteroids are also powerful immunosuppressants. They are used to prevent organ transplant rejection, and in high dose to treat rejection episodes.

Ciclosporin p. 717 a calcineurin inhibitor, is a potent immunosuppressant which is virtually non-myelotoxic but markedly nephrotoxic. It has an important role in organ and tissue transplantation, for prevention of graft rejection following bone marrow, kidney, liver, pancreas, heart, lung, and heart-lung transplantation, and for prophylaxis and treatment of graft-versus-host disease.

Tacrolimus p. 720 is also a calcineurin inhibitor. Although not chemically related to ciclosporin it has a similar mode of action and side-effects, but the incidence of neurotoxicity appears to be greater; cardiomyopathy has also been reported. Disturbance of glucose metabolism also appears to be significant.

Sirolimus p. 719 is a non-calcineurin inhibiting immunosuppressant licensed for renal transplantation. Basiliximab p. 724 is used for prophylaxis of acute rejection in allogeneic renal transplantation. It is given with ciclosporin and corticosteroid immunosuppression regimes; its use should be confined to specialist centres.

Belatacept p. 726 is a fusion protein and co-stimulation blocker that prevents T-cell activation; it is licensed for prophylaxis of graft rejection in adults undergoing renal transplantation who are seropositive for the Epstein-Barr virus. It is used with interleukin-2 receptor antagonist...
Malignant disease

**INDICATIONS AND DOSE**

Severe acute Crohn's disease | Maintenance of remission of Crohn's disease | Maintenance of remission of acute ulcerative colitis

**BY MOUTH**
- Adult: 2–2.5 mg/kg daily, some patients may respond to lower doses

Rheumatoid arthritis that has not responded to other disease-modifying drugs | Severe systemic lupus erythematosus and other connective tissue disorders | Polymyositis in cases of corticosteroid resistance

**BY MOUTH**
- Adult: Initially up to 2.5 mg/kg daily in divided doses, adjusted according to response, rarely more than 3 mg/kg daily; maintenance 1–3 mg/kg daily, consider withdrawal if no improvement within 3 months

Autoimmune conditions

**BY MOUTH OR BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**
- Adult: 1–3 mg/kg daily, adjusted according to response, consider withdrawal if no improvement within 3 months, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) or by intravenous infusion

**Suppression of transplant rejection**

**BY MOUTH OR BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**
- Adult: 1–2.5 mg/kg daily, adjusted according to response, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) or by intravenous infusion

**Severe refractory eczema, normal or high TPMT activity**

**BY MOUTH**
- Adult: 1–3 mg/kg daily

**Severe refractory eczema, intermediate TPMT activity**

**BY MOUTH**
- Adult: 0.5–1.5 mg/kg daily

**Generalised myasthenia gravis**

**INITIALLY BY MOUTH OR BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**
- Adult: Initially 0.5–1 mg/kg daily, then increased to 2–2.5 mg/kg daily, dose is increased over 3–4 weeks, azathioprine is usually started at the same time as the corticosteroid and allows a lower maintenance dose of the corticosteroid to be used, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) or by intravenous infusion

**Unlicensed use**

Azathioprine doses given in BNF for suppression of transplant rejection and autoimmune conditions may differ from those in product literature. Use for severe refractory eczema is unlicensed.

**Contra-indications**

- When used for severe refractory eczema absent thiopurine methyltransferase (TPMT) activity · very low thiopurine methyltransferase (TPMT) activity

**Caution**

Reduce dose in elderly · reduced thiopurine methyltransferase activity

**Interactions** → Appendix 1 (azathioprine).

**Side-effects**

- Rare: Hepatic veno-occlusive disease · lymphoma · pancreatitis · pneumonia · red cell aplasia
- Frequency not known: Arthralgia · cholestatic jaundice · colitis in patients also receiving corticosteroids · diarrhoea · dizziness · dose-related bone marrow suppression · fever · hair loss · herpes zoster infection · hypersensitivity reactions · hypotension · increased susceptibility to
Infections in patients also receiving corticosteroids - interstitial nephritis - liver impairment - malaise - myalgia - nausea - neutropenia - rash - rigors - thrombocytopenia - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

**Red cell aplasia** Cases of pure red cell aplasia have been reported with azathioprine; dose reduction or discontinuation should be considered under specialist supervision.

**Neutropenia and thrombocytopenia** Usually resolved by reducing the dose.

**Nausea, vomiting and diarrhoea** Nausea, vomiting and diarrhoea may occur, usually starting early during the course of treatment, and in rheumatoid arthritis it may be appropriate to withdraw the drug.

**Hypersensitivity reactions** Hypersensitivity reactions (including malaise, dizziness, vomiting, diarrhoea, fever, rigors, myalgia, arthralgia, rash, hypotension and interstitial nephritis) call for immediate withdrawal.

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in hypersensitivity to mercaptopurine.

**Pregnancy** Transplant patients immunosuppressed with azathioprine should not discontinue it on becoming pregnant. However, there have been reports of premature birth and low birth-weight following exposure to azathioprine, particularly in combination with corticosteroids. Spontaneous abortion has been reported following maternal or paternal exposure. Azathioprine is teratogenic in animal studies. The use of azathioprine during pregnancy needs to be supervised in specialist units. Treatment should not generally be initiated during pregnancy.

**Breast feeding** Present in milk in low concentration. No evidence of harm in small studies — use if potential benefit outweighs risk.

**Hepatic impairment** Reduce dose. Monitor liver function.

**Renal impairment** Reduce dose.

**Pre-treatment screening** Thiopurine methyltransferase The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Consider measuring TPMT activity before starting azathioprine, mercaptopurine, or tioguanine therapy. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

**Monitoring requirements**

- Monitor for toxicity throughout treatment.
- Monitor full blood count weekly (more frequently with higher doses or if severe hepatic or renal impairment) for first 4 weeks (manufacturer advises weekly monitoring for 8 weeks but evidence of practical value unsatisfactory), thereafter reduce frequency of monitoring to at least every 3 months.
- Blood tests and monitoring for signs of myelosuppression are essential in long-term treatment.

**Directions for administration** For intravenous injection, give over at least 1 minute (followed by 50 mL sodium chloride intravenous infusion). For intravenous infusion (Imuran®), give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute 50 mg with 5–15 mL Water for Injections; dilute requisite dose to a volume of 20–200 mL with infusion fluid. Intravenous injection is alkaline and very irritant, intravenous route should therefore be used only if oral route not feasible.

**Patient and carer advice** Bone marrow suppression Patients and their carers should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. inexplicable bruising or bleeding, infection.

**Medicinal forms** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, capsule

### Table

**CAUTIONARY AND ADVISORY LABELS 21**

- **AZATHIOPRINE (Non-proprietary)**
  - Azathioprine 25 mg Azathioprine 25mg tablets | 28 tablet | £23.00
  - Azathioprine 50 mg Azathioprine 50mg tablets | 56 tablet | £15.85

- **Imuran (Aspen Pharma Trading Ltd)**
  - Azathioprine 25 mg Imuran 25mg tablets | 100 tablet | £8.00
  - Azathioprine 50 mg Imuran 50mg tablets | 100 tablet | £10.99
  - Brands may include Azaferon

**Powder for solution for injection**

- Imuran (Aspen Pharma Trading Ltd)
  - Azathioprine 50 mg Imuran 50mg powder for solution for injection vials | 1 vial | £15.38

### Calcineurin inhibitors and related drugs

**Ciclosporin**

**Drug action** Ciclosporin is a calcineurin inhibitor.

**indications and dose**

**Severe acute ulcerative colitis refractory to corticosteroid treatment**

- **By continuous intravenous infusion**
  - Adult: 2 mg/kg, to be given over 24 hours, dose adjusted according to blood-ciclosporin concentration and response

**Severe active rheumatoid arthritis where conventional second-line therapy inappropriate or ineffective (administered on expert advice)**

- **By mouth**
  - Adult: Initially 2.5 mg/kg daily in 2 divided doses, then increased if necessary up to 4 mg/kg after 6 weeks, dose increase, if required should be gradual, continue if response insufficient after 3 months, dose adjusted according to response for maintenance and treatment reviewed after 6 months (continue only if benefits outweigh risks)

**Short-term treatment of severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)**

- **By mouth**
  - Adult: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily) usually maximum 8 weeks but may be used for longer, if good initial response not achieved within 2 weeks, increase dose rapidly up to maximum

**Short-term treatment of very severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)**

- **By mouth**
  - Adult: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily), increased gradually to maximum if no improvement within 2 weeks but evidence of practical value unsatisfactory), thereafter reduce frequency of monitoring to at least every 3 months.

- Adult: Initially 2.5 mg/kg daily in 2 divided doses, then increased if necessary up to 4 mg/kg after 6 weeks, dose increase, if required should be gradual, continue if response insufficient after 3 months, dose adjusted according to response for maintenance and treatment reviewed after 6 months (continue only if benefits outweigh risks)

- Short-term treatment of severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)

- By mouth

  - Adult: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily) usually maximum 8 weeks but may be used for longer

- Severe psoriasis where conventional therapy ineffective or inappropriate (administered on expert advice)

  - By mouth

    - Adult: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily), increased gradually to maximum if no improvement within continued
1 month, initial dose of 2.5 mg/kg twice daily justified if condition requires rapid improvement; discontinue if inadequate response after 3 months at the optimum dose; max. duration of treatment usually 1 year unless other treatments cannot be used

Organ transplantation (used alone)

BY MOUTH
- Adult: 10–15 mg/kg, to be administered 4–12 hours before transplantation, followed by 10–15 mg/kg daily for 1–2 weeks postoperatively, then maintenance 2–6 mg/kg daily, reduce dose gradually to maintenance. Dose should be adjusted according to blood-ciclosporin concentration and renal function; dose is lower if given concomitantly with other immunosuppressants (e.g. corticosteroids); if necessary one-third corresponding oral dose can be given by intravenous infusion over 2–6 hours

Bone-marrow transplantation | Prevention and treatment of graft-versus-host disease

INITIALLY BY INTRAVENOUS INFUSION
- Adult: 5–10 mg/kg/day, to be administered over 2–6 hours from day before transplantation to 2 weeks postoperatively, alternatively (by mouth) 12.5–15 mg/kg daily, then (by mouth) 12.5 mg/kg daily for 3–6 months and then tailed off (may take up to a year after transplantation)

Nephrotic syndrome

BY MOUTH
- Adult: 5 mg/kg daily in 2 divided doses, for maintenance reduce to lowest effective dose according to proteinuria and serum creatinine measurements; discontinue after 3 months if no improvement in glomerulonephritis or glomerulosclerosis (after 6 months in membranous glomerulonephritis)

- UNLICENSED USE Not licensed for use in severe acute ulcerative colitis refractory to corticosteroid treatment

Important safety information

Patients should be stabilised on a particular brand of oral ciclosporin because switching between formulations without close monitoring may lead to clinically important changes in blood-ciclosporin concentration.

- CONTRA-INDICATIONS Abnormal renal function (in non-transplant indications) - malignancy (in non-transplant indications) - uncontrolled hypertension (in non-transplant indications) - uncontrolled infections (in non-transplant indications) - use with tacrolimus specifically contraindicated

- CAUTIONS Hyperuricaemia - in atopic dermatitis Staphylococcus aureus skin infections - not absolute contra-indication providing controlled (but avoid erythromycin unless no other alternative) - in atopic dermatitis allow herpes simplex infections to clear before starting (if they occur during treatment withdraw if severe) - in atopic dermatitis and psoriasis discontinue if lymphoproliferative disorder develops - in psoriasis treat patients with malignant or pre-malignant conditions of skin only after appropriate treatment (and if no other option)

- INTERACTIONS Appendix 1 (ciclosporin).

For patients other than transplant recipients, preferably avoid other immunosuppressants (increased risk of infection and malignancies, including lymphoma and skin cancer).

- SIDE-EFFECTS GENERAL SIDE-EFFECTS

- Common or very common Abdominal pain - anorexia - diarrhoea - fatigue - gingival hyperplasia - headache - hepatic dysfunction - hypercholesterolaemia - hyperkaeemia - hyperlipidaemia - hypertension - hypertrichosis - hyperuricaemia - hypomagnesaemia - muscle cramps - myalgia - myasthenia - paraesthesia - renal dysfunction (renal structural changes on long-term administration) - tremor - vomiting

- Uncommon Anaemia - oedema - signs of encephalopathy - thrombocytopenia - weight gain

- Rare Gynaecomastia - haemolytic uraemic syndrome - hyperglycaemia - menstrual disturbances - microangiopathic haemolytic anaemia - motor polyneuropathy - muscle weakness - myopathy - pancreatitis - visual disturbances secondary to benign intracranial hypertension

SPECIFIC SIDE-EFFECTS

- With intravenous use anaphylaxis

SIDE-EFFECTS, FURTHER INFORMATION

Visual disturbances Discontinue if visual disturbances secondary to benign intracranial hypertension occur.

- PREGNANCY Crosses placenta. There is less experience of ciclosporin in pregnancy but it does not appear to be any more harmful than azathioprine. The use of ciclosporin during pregnancy needs to be supervised in specialist units.

- BREAST FEEDING Present in milk - manufacturer advises avoid.

- HEPATIC IMPAIRMENT Dosage adjustment based on bilirubin and liver enzymes may be needed.

- RENAL IMPAIRMENT In patients with nephrotic syndrome and renal impairment initially 2.5 mg/kg daily. Reduce dose by 25–50% if serum creatinine more than 30% above baseline on more than one measurement. In rheumatoid arthritis, reduce dose if serum creatinine increases more than 30% above baseline in more than 1 measurement; if above 50%, reduce dose by 50% (even if within normal range) and discontinue if reduction not successful within 1 month.

In psoriasis and atopic dermatitis, reduce dose by 25–50% if serum creatinine increases more than 30% above baseline (even if within normal range) and discontinue if reduction not successful within 1 month.

- PRE-TREATMENT SCREENING In psoriasis, exclude malignancies (including those of skin and cervix) before starting (biopsy any lesions not typical of psoriasis).

- MONITORING REQUIREMENTS

Dermatological and physical examination, including blood pressure and renal function measurements required at least twice before starting treatment for psoriasis or atopic dermatitis.

Monitor liver function.

Monitor serum potassium especially in renal dysfunction (risk of hyperkalaemia).

Monitor serum magnesium.

Measure blood lipids before treatment and after the first month of treatment.

In psoriasis and atopic dermatitis monitor serum creatinine every 2 weeks for first 3 months then every month.

Investigate lymphadenopathy that persists despite improvement in atopic dermatitis.

Monitor kidney function - dose dependent increase in serum creatinine and urea during first few weeks may necessitate dose reduction in transplant patients (exclude rejection if kidney transplant) or discontinuation in non-transplant patients.

Monitor blood pressure - discontinue if hypertension develops that cannot be controlled by antihypertensives.

In long-term management of nephrotic syndrome, perform renal biopsies at yearly intervals.

In rheumatoid arthritis measure serum creatinine at least twice before treatment. During treatment, monitor serum
creatinine every 2 weeks for first 3 months, then every month for a further 3 months, then every 4–8 weeks depending on the stability of the disease, concomitant medication, and concomitant diseases (or more frequently if dose increased or concomitant NSAIDs introduced or increased).

- Monitor hepatic function if concomitant NSAIDs given.

**DIRECTIONS FOR ADMINISTRATION**

- With oral use Mix solution with orange juice (or squash) or apple juice (to improve taste) or with water immediately before taking (and rinse with more to ensure total dose). Do not mix with grapefruit juice. With capsules and oral solution, total daily dose should be taken in 2 divided doses.
- With intravenous use For intravenous infusion (Sandimmun®), give intermittently or continuously in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of 50 mg in 20–100 ml, give intermittent infusion over 2–6 hours; not to be used with PVC equipment. Observe patient for signs of anaphylaxis for at least 30 minutes after starting infusion and at frequent intervals thereafter.

**PRESCRIBING AND DISPENSING INFORMATION**

Brand name prescribing. Prescribing and dispensing of ciclosporin should be by brand name to avoid inadvertent switching. If it is necessary to switch a patient to a different ciclosporin, the patient should be monitored closely for changes in blood-ciclosporin concentration, serum creatinine, blood pressure, and transplant function. Sandimmun® capsules and oral solution are available direct from Novartis for patients who cannot be transferred to a different oral preparation.

**HANDLING AND STORAGE**

Keep medicine measure away from other liquids (including water).

**PATIENT AND CARER ADVICE**

Patients and carers should be counselled on the administration of ciclosporin capsules and oral solution. Avoid excessive exposure to UV light, including sunlight. In psoriasis and atopic dermatitis, avoid use of UVB or PUVA.

**MEDICINAL FORMS**

There can be variations in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, eye ointment.

- **Capsule**
  - Excipients: May contain Ethanol, ethyl lactate, propylene glycol
  - *Capsules (Non-proprietary)*
    - Ciclosporin 25 mg | 30 capsule [POD] no price available
    - Ciclosporin 50 mg | 30 capsule [POD] no price available
    - Ciclosporin 100 mg | 30 capsule [POD] no price available
  - *Capsules (Mylan Ltd)*
    - Ciclosporin 25 mg | 30 capsule [POD] £25.50
    - Ciclosporin 50 mg | 30 capsule [POD] £48.50
  - *Capsules (Morningside Healthcare Ltd)*
    - Ciclosporin 25 mg | 30 capsule [POD] £13.05
    - Ciclosporin 50 mg | 30 capsule [POD] £25.50
    - Ciclosporin 100 mg | 30 capsule [POD] £48.50
  - *Capsules (Dexcel-Pharma Ltd)*
    - Ciclosporin 25 mg | 30 capsule [POD] £13.06
    - Ciclosporin 50 mg | 30 capsule [POD] £25.60
    - Ciclosporin 100 mg | 30 capsule [POD] £48.90

- **Solution for infusion**
  - Excipients: May contain Ethanol, propylene glycol
  - *Sandimmun (Novartis Pharmaceuticals UK Ltd)*
    - Ciclosporin 100 mg per 1 ml | 30 capsule [POD] £59.16
  - *Sandimmun (Teva UK Ltd)*
    - Ciclosporin 50 mg per 1 ml | 30 capsule [POD] £25.59
    - Ciclosporin 100 mg per 1 ml | 30 capsule [POD] £48.89

**INTRA-VENOUS INJECTION**

- Solution for injection 500 mg/ml concentrate for infusion ampoules | 10 ampoule [POD] £9.71
  - Sandimmun 500 mg/ml concentrate for injection ampoules | 10 ampoule [POD] £19.36
- Solution for injection 250 mg/ml concentrate for infusion ampoules | 10 ampoule [POD] £19.36

- *Neoral (Novartis Pharmaceuticals UK Ltd)*
  - Ciclosporin 10 mg | 60 capsule [POD] £16.68
  - Ciclosporin 25 mg | 30 capsule [POD] £16.79
  - Ciclosporin 50 mg | 30 capsule [POD] £32.88
  - Ciclosporin 100 mg | 30 capsule [POD] £62.41
- *Sandimmun (Novartis Pharmaceuticals UK Ltd)*
  - Ciclosporin 25 mg | 30 capsule [POD] £24.65
  - Ciclosporin 50 mg | 30 capsule [POD] £48.27
  - Ciclosporin 100 mg | 30 capsule [POD] £91.61
  - *Vanquoral (Teva UK Ltd)*
  - Ciclosporin 25 mg | 30 capsule [POD] £13.05
  - Ciclosporin 50 mg | 30 capsule [POD] £25.59
  - Ciclosporin 100 mg | 30 capsule [POD] £48.89

**Capsules**

- *Capsules (Mylan Ltd)*
  - Ciclosporin 25 mg | 30 capsule [POD] £6.15
  - Ciclosporin 50 mg | 30 capsule [POD] £12.30
  - Ciclosporin 100 mg | 30 capsule [POD] £24.60

**Solution for Oral Suspension**

- Climipine (Mylan Ltd)
  - Ciclosporin 25 mg | 30 capsule [POD] £6.15
  - Ciclosporin 50 mg | 30 capsule [POD] £12.30
  - Ciclosporin 100 mg | 30 capsule [POD] £24.60

**Solution for Oral Suspension (sugar-free)**

- Climipine (Mylan Ltd)
  - Ciclosporin 25 mg | 30 capsule [POD] £6.15
  - Ciclosporin 50 mg | 30 capsule [POD] £12.30
  - Ciclosporin 100 mg | 30 capsule [POD] £24.60

**Sirolimus**

**DRUG ACTION**

Sirolimus is a non-calcineurin inhibiting immunosuppressant.

**INDICATIONS AND DOSE**

**Prophylaxis of organ rejection in kidney allograft recipients**

- **By mouth**
  - Adult: Initially 6 mg for 1 dose, to be given after surgery once wound has healed, then 2 mg once daily for 2–3 months (in combination with ciclosporin and corticosteroid); sirolimus dose should be given after ciclosporin), followed by maintenance 2 mg once daily, ciclosporin should then be withdrawn over 4–8 weeks (if not possible, sirolimus should be discontinued and an alternate immunosuppressive regimen used), dose to be adjusted according to whole blood-sirolimus trough concentration.

**Dose equivalence and conversion**

The 500 microgram tablet is not bioequivalent to the 1 mg and 2 mg tablets. Multiples of 500 microgram tablets should not be used as a substitute for other tablet strengths.

**CAUTIONS**

- Hyperlipidaemia - increased susceptibility to infection (especially urinary-tract infection) - increased susceptibility to lymphoma and other malignancies, particularly of the skin (limit exposure to UV light)

**INTERACTIONS**

- Appendix 1 (sirolimus).

**SIDE-EFFECTS**

- Common or very common Abdominal pain - acne - anaemia - arthralgia - ascites - constipation - diarrhoea - epistaxis - haemolytic uraemic syndrome - headache - hypercholesterolaemia - hyperglycaemia - hypertension - hypertriglyceridaemia - hypokalaemia - hypophosphataemia - impaired healing - leucopenia - lymphocele - nausea - neutropenia - oedema - osteonecrosis - pleural effusion - pneumonitis - proteinuria -
Malignant disease

- pyrexia · rash · stomatitis · tachycardia · thrombocytopenia · thrombotic thrombocytopenic purpura · venous thromboembolism
- Uncommon Nephrotic syndrome · pancreatitis · pancytopenia · pericardial effusion · pulmonary embolism · pulmonary haemorrhage
- Rare Alveolar proteinosis · anaphylactic reactions · angioedema · exfoliative dermatitis · hepatic necrosis · hypersensitivity reactions · hypersensitivity vasculitis · interstitial lung disease · lymphoedema
- Frequency not known Focal segmental glomerulosclerosis · reversible impairment of male fertility
- CONCEPTION AND CONTRACEPTION Effective contraception must be used during treatment and for 12 weeks after stopping.
- PREGNANCY Avoid unless essential—toxicity in animal studies.
- BREAST FEEDING Discontinue breast-feeding.
- HEPATIC IMPAIRMENT In severe impairment decrease dose by 50% and monitor whole blood-sirolimus trough concentration every 5–7 days until 3 consecutive measurements have shown stable blood-sirolimus concentration. Clearance reduced in mild to moderate impairment. Monitor whole blood-sirolimus level closely and consult local treatment protocol in hepatic impairment.
- MONITORING REQUIREMENTS
  - Monitor whole blood-sirolimus trough concentration (Afro-Caribbean patients may require higher doses).
  - Manufacturer advises pre-dose (‘trough’) whole blood-sirolimus concentration (using chromatographic assay) when used with ciclosporin should be 4–12 micrograms/litre (local treatment protocols may differ); after withdrawal of ciclosporin pre-dose whole blood-sirolimus concentration should be 12–20 micrograms/litre (local treatment protocols may differ).
  - Close monitoring of whole blood-sirolimus concentration required if concomitant treatment with potent inducers or inhibitors of metabolism and after discontinuing them, or if ciclosporin dose reduced significantly or stopped.
  - When changing between oral solution and tablets, measurement of whole blood ‘trough’ sirolimus concentration after 1–2 weeks is recommended.
  - Sirolimus whole-blood concentration is measured using either high performance liquid chromatography (HPLC) or immunoassay. Switching between different immunoassays or between an immunoassay and HPLC can lead to clinically significant differences in results and therefore incorrect dose adjustments. Adjustment to the target therapeutic dose range should be made with knowledge of the assay used and corresponding reference range.
  - Monitor kidney function when given with ciclosporin; monitor lipids; monitor urine proteins.
- DIRECTIONS FOR ADMINISTRATION Food may affect absorption (take at the same time with respect to food). Sirolimus oral solution should be mixed with at least 60 mL water or orange juice in a glass or plastic container immediately before taking; refill container with at least 120 mL of water or orange juice and drink immediately (to ensure total dose). Do not mix with any other liquids.
- PATIENT AND CARER ADVICE Patient or carers should be given advice on how to administer sirolimus. Patients should be advised to avoid excessive exposure to UV light.

● MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.
  - Tablet
    - Rapamune (Pfizer Ltd)
    - Sirolimus 1 mg Rapamune 1mg tablets | 30 tablet £86.49 DT price = £86.49
    - Sirolimus 2 mg Rapamune 2mg tablets | 30 tablet £172.98 DT price = £172.98
  - Oral solution
    - EXCIPIENTS: May contain Ethanol
    - Rapamune (Pfizer Ltd)
    - Sirolimus 1 mg per 1 ml Rapamune 1mg/ml oral solution (sugar-free) | 60 ml £162.41

Tacrolimus

- DRUG ACTION Tacrolimus is a calcineurin inhibitor.

INDICATIONS AND DOSE

ADOPORT®

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation
BY MOUTH
- Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation
BY MOUTH
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation
BY MOUTH
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation
BY MOUTH
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

Allograft rejection resistant to conventional immunosuppressive therapy
BY MOUTH
- Adult: Seek specialist advice

ADVAGRAF®

Prophylaxis of graft rejection following liver transplantation, starting 12–18 hours after transplantation
BY MOUTH
- Adult: 100–200 micrograms/kg once daily, to be taken in the morning

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation
BY MOUTH
- Adult: 200–300 micrograms/kg once daily, to be taken in the morning

Allograft rejection resistant to conventional immunosuppressive therapy
BY MOUTH
- Adult: Seek specialist advice

CAPEXION®

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation
BY MOUTH
- Adult: Initially 100–200 micrograms/kg daily in 2 divided doses
### Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

**BY MOUTH**
- Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

### Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

**BY MOUTH**
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

### Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

**BY MOUTH**
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

### Allograft rejection resistant to conventional immunosuppressive therapy

**BY MOUTH**
- Adult: Seek specialist advice

### ENvarsus®

**BY MOUTH**
- Adult: 110–130 micrograms/kg once daily, to be taken in the morning

### Rejection therapy

**BY MOUTH**
- Adult: Seek specialist advice

### Prograf® Capsules

**Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation**

**BY MOUTH**
- Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

**Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation**

**BY MOUTH**
- Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

**Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation**

**BY MOUTH**
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

**Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation**

**BY MOUTH**
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

### Allograft rejection resistant to conventional immunosuppressive therapy

**BY MOUTH**
- Adult: Seek specialist advice

### Prograf® Infusion

**Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation when oral route not appropriate**

**BY INTRAVENOUS INFUSION**
- Adult: Initially 10–50 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

**Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation when oral route not appropriate**

**BY INTRAVENOUS INFUSION**
- Adult: Initially 50–100 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

**Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation**

**BY INTRAVENOUS INFUSION**
- Adult: Initially 10–20 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

**Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation**

**BY INTRAVENOUS INFUSION**
- Adult: Initially 10–20 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

**Allograft rejection resistant to conventional immunosuppressive therapy**

**BY CONTINUOUS INTRAVENOUS INFUSION**
- Adult: Seek specialist advice (consult local protocol)

### Tacni®

**Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation**

**BY MOUTH**
- Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

### Seek specialist advice

- Initially divided doses
- Initially divided doses
- Initially divided doses
- Initial days (then transfer to oral therapy), dose to be continued
Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation
BY MOUTH
- Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation
BY MOUTH
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation, starting within 12 hours of transplantation
BY MOUTH
- Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation
BY MOUTH
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

Allograft rejection resistant to conventional immunosuppressive therapy
BY MOUTH
- Adult: Seek specialist advice

VIVAX®

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation
BY MOUTH
- Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation
BY MOUTH
- Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 12 hours of transplantation
BY MOUTH
- Adult: Initially 75 micrograms/kg daily in 2 divided doses

Allograft rejection resistant to conventional immunosuppressive therapy
BY MOUTH
- Adult: Seek specialist advice

Important safety information
MHRA/CHM advice: Oral tacrolimus products: prescribe and dispense by brand name only, to minimise the risk of inadvertent switching between products, which has been associated with reports of toxicity and graft rejection. To ensure maintenance of therapeutic response when a patient is stabilised on a particular brand, oral tacrolimus products should be prescribed and dispensed by brand name only.
- Advagraf® is a prolonged-release capsule that is taken once daily in the morning.
- Advagraf® is not interchangeable with other oral tacrolimus containing products; the MHRA has advised (June 2012) that oral tacrolimus products should be prescribed and dispensed by brand only.

CAUTIONS
- UV light (avoid excessive exposure to sunlight and sunlamps), increased risk of infections, lymphoproliferative disorders, malignancies, neurotoxicity, QT-interval prolongation

INTERACTIONS
- Appendix 1 (tacrolimus).

Contra-indication — avoid concurrent administration with ciclosporin (care if patient has previously received ciclosporin).

SIDE-EFFECTS
- Common or very common acne, alopecia, anaemia, anorexia, anxiety, arthralgia, ascites, bile-duct abnormalities, bloating, blood disorders, cholestasis, confusion, constipation, depression, diarrhoea, dizziness, dyspepsia, dyspnoea, electrolyte disturbances, flatulence, gastro-intestinal inflammation, gastrointestinal perforation, gastro-intestinal ulceration, haemorrhage, headache, hepatic dysfunction, hyperglycaemia, hyperkalaemia, hypertension, hyperuricaemia, hypokalaemia, impaired hearing, ischaemic events, jaundice, leukopenia, mood changes, muscle cramp, nausea, oedema, pancytopenia, paraesthesia, parenchymal lung disorders, peripheral neuropathy, photophobia, pleural effusion, psychosis, renal failure, renal impairment, renal tubular necrosis, seizures, sleep disturbances, sweating, tachycardia, thrombocytopenia, thromboembolic events, tinnitus, tremor, urinary abnormalities, visual disturbances, vomiting, weight changes
- Uncommon amnesia, arrhythmia, cardiac arrest, cardiomyopathy, cataract, cerebrovascular accident, coagulation disorders, coma, dermatitis, dysmennorrhoea, encephalopathy, gastro-intestinal reflux disease, heart failure, hypertonia, hypoglycaemia, influenza-like symptoms, palpitation, pancreatitis, paralysis, paralytic ileus, peritonitis, photosensitivity, respiratory failure, speech disorder
- Rare blindness, dehydrogenase, hirsutism, pericardial effusion, posterior reversible encephalopathy syndrome, respiratory distress syndrome, thrombotic thrombocytopenic purpura, toxic epidermal necrolysis
- Very rare haemorrhagic cystitis, myasthenia, Stevens-Johnson syndrome
- Frequency not known agranulocytosis, haemolytic anaemia, pure red cell aplasia

CARDIOMYOPATHY
Cardiomyopathy has been reported in children. Patients should be monitored by echocardiography for hypertrophic changes — consider dose reduction or discontinuation if these occur.

ALLERGY AND CROSS-SENSITIVITY
Contraindicated if history of hypersensitivity to macrolides.

CONCEPTION AND CONTRACEPTION
Exclude pregnancy before treatment.

PREGNANCY
Avoid unless potential benefit outweighs risk — crosses the placenta and risk of premature delivery, intra-uterine growth restriction, and hyperkalaemia.

BREAST FEEDING
Avoid — present in breast milk.

HEPATIC IMPAIRMENT
Dose reduction may be necessary in severe impairment.
**MEDICINAL FORMS**

**NATIONAL FUNDING/ACCESS DECISIONS**

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Prograf®), give continuously in Glucose 5% or Sodium Chloride 0.9%. Dilute concentrate in infusion fluid to a final concentration of 4–100 micrograms/mL; give over 24 hours. Tacrolimus is incompatible with PVC.

**PATIENT AND CARER ADVICE** May affect performance of skilled tasks (e.g. driving). Avoid excessive exposure to UV light including sunlight.

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (November 2010) that tacrolimus granules for oral suspension (Modigraf®) are accepted for restricted use within NHS Scotland in patients for whom tacrolimus is an appropriate choice of immunosuppressive therapy and where small changes (less than 500 micrograms) in dosing increments are required (such as, in paediatric patients) or in seriously ill patients who are unable to swallow tacrolimus capsules.

**IMMUNOGLOBULINS**

**Antithymocyte immunoglobulin (rabbit)**

**INDICATIONS AND DOSE**

Prophylaxis of organ rejection in heart allograft recipients

- **By intravenous infusion**
  - Adult: 1–2.5 mg/kg daily for 3–5 days, to be given over at least 6 hours

Prophylaxis of organ rejection in renal allograft recipients

- **By intravenous infusion**
  - Adult: 1–1.5 mg/kg daily for 3–9 days, to be given over at least 6 hours

Treatment of corticosteroid-resistant allograft rejection in renal transplantation

- **By intravenous infusion**
  - Adult: 1.5 mg/kg daily for 7–14 days, to be given over at least 6 hours

Doses at extremes of body-weight

To avoid excessive dosage in obese patients, calculate dose on the basis of ideal body weight.

**CONTRA-INDICATIONS** Infection

**SIDE-EFFECTS** Anaphylaxis - cytokine release syndrome - diarrhoea - dysphagia - fever - hypotension - increased susceptibility to infection - increased susceptibility to malignancy - infusion-related reactions - lymphopenia - myalgia - nausea - neutropenia - pruritus - rash - serum sickness - shivering - thrombocytopenia - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

Tolerability is increased by pretreatment with an intravenous corticosteroid and antithistamine; an antipyretic drug such as paracetamol may also be beneficial.

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk – no information available.

**BREAST FEEDING** Manufacturer advises avoid — no information available.

**MONITORING REQUIREMENTS** Monitor blood count.
Canakinumab

**Drug Action** Canakinumab is a recombinant human monoclonal antibody that selectively inhibits interleukin-1 receptor binding.

**Indications and Dose**

- **Acute gout** in patients whose condition has not responded adequately to treatment with NSAIDs or colchicine, or who are intolerant of them.
  - **By Subcutaneous Injection**
    - **Adult:** 150 mg for 1 dose, may be repeated at least 12 weeks after initial response if symptoms recur, patients who do not respond to initial dose should not be retreated.
  - Treatment of cryopyrin-associated periodic syndromes, including severe forms of familial cold auto-inflammatory syndrome (or familial cold urticaria), Muckle-Wells syndrome, and neonatal-onset multisystem inflammatory disease (also known as chronic infantile neurological cutaneous and articular syndrome).
  - **By Subcutaneous Injection**
    - **Adult:** (consult product literature)

**Contraindications**

- Active infection, leucopenia, neutropenia.

**Precautions, Further Information**

- **Vaccinations** Patients should receive all recommended vaccinations (including pneumococcal and inactivated influenza vaccine) before starting treatment; avoid live vaccines unless potential benefit outweighs risk—consult product literature for further information.

**Interactions**

- **Appendix 1** (canakinumab).
- Contra-indicated with concomitant use with tumour necrosis factor inhibitors (possible increased risk of infections).

**Side-effects**

- Common or very common: Back pain, increased susceptibility to infection (including serious infection), injection-site reactions, malaise, neutropenia, vertigo.
- Uncommon: Gastro-oesophageal reflux.
- Frequency not known: Malignancy, vomiting.

**Conception and Contraception**

- Effective contraception required during treatment and for up to 3 months after last dose.

**Pregnancy**

- Manufacturer advises avoid unless potential benefit outweighs risk.

**Breast feeding**

- Consider if benefit outweighs risk—not known if present in human milk.

**Hepatic Impairment** No information available.

**Renal Impairment** Limited information available but manufacturer advises no dose adjustment required.

**Pre-treatment Screening**

- Patients should be evaluated for latent and active tuberculosis before starting treatment.

**Monitoring Requirements**

- **Monitor full blood count including neutrophil count before starting treatment, 1–2 months after starting treatment, and periodically thereafter.**
- **Monitor for signs and symptoms of tuberculosis during and after treatment.**

**Medicinal Forms**

- There can be variation in the licensing of different medicines containing the same drug.

**Powder for Solution for Injection**

- **Ilaris** (Novartis Pharmaceuticals UK Ltd)

**Canakinumab 150 mg** Ilaris 150mg powder for solution for injection vials | 1 vial £9.927.80

**Monoclonal Antibodies (Anti-lymphocyte)**

Basiliximab

**Drug Action** Basiliximab is a monoclonal antibody that acts as an interleukin-2 receptor antagonist and prevents T-lymphocyte proliferation.

**Indications and Dose**

- **Prophylaxis of acute rejection in allogeneic renal transplantation used in combination with ciclosporin and corticosteroid-containing immunosuppression regimes (specialist use only)**

**By Intravenous Injection or By Intravenous Infusion**

- **Adult:** Initially 20 mg, administered within 2 days before transplant surgery, followed by 20 mg after 4 days, dose to be administered after surgery, withhold second dose if severe hypersensitivity or graft loss occurs.

**Caution**

- Off-label use in cardiac transplantation—increased risk of serious cardiac side-effects.

**Interactions**

- **Appendix 1** (basiliximab).

**Side-effects**

- Atrial flutter, cardiac arrest, cytokine release syndrome, palpitations, severe hypersensitivity reactions.

**Conception and Contraception**

- Adequate contraception must be used during treatment and for 16 weeks after last dose.

**Pregnancy**

- Manufacturer advises avoid—no information available.

**Breast feeding**

- Manufacturer advises avoid—no information available.

**Directions for Administration**

- **For intravenous infusion (Simulect®** give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute 10 mg with 2.5 mL water for injections then dilute to at least 25 mL with infusion fluid; reconstitute 20 mg with 5 mL water for injections then dilute to at least 50 mL with infusion fluid; give over 20–30 minutes.

**Medicinal Forms**

- There can be variation in the licensing of different medicines containing the same drug.

**Powder and Solvent for Solution for Injection**

- **Simulect** (Novartis Pharmaceuticals UK Ltd)

**Basiliximab 10 mg** Simulect 10mg powder and solvent for solution for injection vials | 1 vial £758.63 (Hospital only)

**Basiliximab 20 mg** Simulect 20mg powder and solvent for solution for injection vials | 1 vial £842.38 (Hospital only)
Belimumab

**INDICATIONS AND DOSE**

Adjunctive therapy in patients with active, autoantibody-positive systemic lupus erythematosus with a high degree of disease activity despite standard therapy

**BY INTRAVENOUS INFUSION**
- Adult: 10 mg/kg every 2 weeks for 3 doses, then 10 mg/kg every 4 weeks, review treatment if no response within 6 months

- **CAUTIONS** Do not initiate until active infections controlled - history or development of malignancy - predisposition to infection
- **INTERACTIONS** → Appendix 1 (belimumab).
- **SIDE-EFFECTS**
  - Common or very common Infusion-related reactions
  - Frequency not known Depression - diarrhoea - hypersensitivity reactions - infections - insomnia - myalgia - nausea - pain in extremities - pyrexia - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

Infusion-related side-effects are reported commonly, including severe or life-threatening hypersensitivity and infusion reactions. Premedication with an antihistamine, with or without an antipyretic may be considered.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment and for at least 4 months after last dose.
- **PREGNANCY** Avoid unless essential.
- **BREAST FEEDING** Avoid—present in milk in animal studies.
- **RENAL IMPAIRMENT** Caution in severe impairment—no information available.
- **MONITORING REQUIREMENTS** Delay in the onset of acute hypersensitivity reactions has been observed; patients should remain under clinical supervision for several hours following at least the first 2 infusions.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Benlysta®), give intermittently in Sodium chloride 0.9%; reconstitute with water for injections (420 mg in 1.5 mL, 400 mg in 4.8 mL) to produce a solution containing 80 mg/mL; gently swirl vial for 60 seconds, then allow to stand; swirl vial (without shaking) for 60 seconds every 5 minutes until dissolved; dilute requisite dose with infusion fluid to a final volume of 250 mL and give over 1 hour.

- **MEDIACION FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Powder for solution for infusion**
    - Benlysta® (GlaxoSmithKline UK Ltd.)
      - Belimumab 120 mg: Reconstitute with water for injection (1 vial) £121.50 (Hospital only)
      - Belimumab 400 mg: Reconstitute with water for injection (1 vial) £405.00 (Hospital only)

**PURINE SYNTHESIS INHIBITORS**

Mycophenolate mofetil

**INDICATIONS AND DOSE**

Prophylaxis of acute rejection in renal transplantation (in combination with a corticosteroid and ciclosporin) (under expert supervision)

**BY MOUTH**
- Adult: 1 g twice daily to be started within 72 hours of transplantation

- **CAUTIONS** Active serious gastro-intestinal disease (risk of haemorrhage, ulceration and perforation) - children (higher incidence of side-effects may call for temporary reduction of dose or interruption) - delayed graft function - elderly (increased risk of infection, gastro-intestinal haemorrhage and pulmonary oedema) - increased susceptibility to skin cancer (avoid exposure to strong sunlight) - risk of hypogammaglobulinaemia or bronchiectasis when used in combination with other immunosuppressants

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Hypogammaglobulinaemia or bronchiectasis Measure serum immunoglobulin levels if recurrent infections develop, and consider bronchiectasis or pulmonary fibrosis if persistent respiratory symptoms such as cough and dyspnoea develop.

- **INTERACTIONS** → Appendix 1 (mycophenolate).
- **Live vaccines** Specialist advice should be sought for those being treated with immunosuppressive drugs.

**SIDE-EFFECTS**
- Frequency not known Interstitial lung disease - intestinal villous atrophy - progressive multifocal leucoencephalopathy - pulmonary fibrosis

**SIDE-EFFECTS, FURTHER INFORMATION**

Cases of pure red cell aplasia has been reported with mycophenolate mofetil; dose reduction or
discontinuation should be considered under specialist supervision.

- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before starting treatment. Effective contraception required before treatment, during treatment, and for 6 weeks after discontinuation of treatment.

**MYFORTIC®** Manufacturer advises that men should use condoms during treatment and for 13 weeks after last dose.

- **PREGNANCY** Manufacturer advises avoid—congenital malformations reported.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **RENAL IMPAIRMENT** No data available in cardiac or hepatic transplant patients with renal impairment.

- **MONITORING REQUIREMENTS** Monitor full blood count every week for 4 weeks then twice a month for 2 months then every month in the first year (consider interrupting treatment if neutropenia develops).

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (CellCept®), give intermittently in Glucose 5%; reconstitute each 500–mg vial with 14 ml glucose 5% and dilute the contents of 2 vials in 140 ml infusion fluid; give over 2 hours.

- **PATIENT AND CARER ADVICE**
  - Bone marrow suppression Patients should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. infection or inexcusable bruising or bleeding.

**MEDICINAL FORMS**

**T-CELL ACTIVATION INHIBITORS**

**Belatacept**

**INDICATIONS AND DOSE**

Prophylaxis of graft rejection in adults undergoing renal transplantation who are seropositive for the Epstein-Barr virus

**BY INTRAVENOUS INFUSION**

- Adult: (consult product literature)

- **CAUTIONS** Increased risk of acute graft rejection—with tapering of corticosteroid, particularly in patients with high immunologic risk, increased risk of infection, latent and active tuberculosis, risk factors for post-transplant lymphoproliferative disorder

- **SIDE-EFFECTS**
  - Common or very common Anaemia, constipation, cough, dehydration, diarrhoea, headache, hypertension, hypophosphataemia, infection, leucopenia, malignancy, nausea, peripheral oedema, pyrexia, vomiting
  - Uncommon Infusion related reactions, progressive multifocal leucoencephalopathy

**ACETYLCHOLINE-RELEASE ENHANCERS**

**Fampridine**

**INDICATIONS AND DOSE**

Improvement of walking disability in multiple sclerosis (specialist use only)

**BY MOUTH**

- Adult. 10 mg every 12 hours, discontinue treatment if no improvement within 2 weeks

- **CONTRA-INDICATIONS** History of seizures (discontinue treatment if seizures occur)

- **CAUTIONS**
  - Atrioventricular conduction disorders - predisposition to seizures - sinoatrial conduction disorders - symptomatic cardiac rhythm disorders

- **INTERACTIONS**
  - Appendix 1 (fampridine). Caution in concomitant use of drugs that lower seizure threshold.
Multiple sclerosis 727

- **SIDE-EFFECTS**
  - Common or very common: Anxiety, back pain, constipation, dizziness, dyspepsia, dysphagia, headache, insomnia, malaise, nausea, paraesthesia, pharyngolaryngeal pain, tremor, urinary tract infection, vomiting
  - Uncommon: Seizures
  - **PREGNANCY** Avoid—toxicity in animal studies.
  - **BREAST FEEDING** Avoid—no information available.
  - **RENAL IMPAIRMENT** Avoid if eGFR less than 80 mL/minute/1.73 m².
  - **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (pack contains a desiccant) and discard any tablets remaining 7 days after opening.

- **MEDIcular FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule
  - **Modified-release tablet**
    - CAUTIONARY AND ADVISORY LABELS 23, 25
    - Fampyra (Biogen Idec Ltd) ▼
  - **FAMPRIDINE 10 mg** Fampyra 10mg modified-release tablets | 28 tablet | £181.00 | 56 tablet | £362.00

**FUMARIC ACIDS**

### Dimethyl fumarate

- **DRUG ACTION** Dimethyl fumarate has immunomodulatory and anti-inflammatory properties.

#### INDICATIONS AND DOSE

Treatment of adults with relapsing-remitting multiple sclerosis (initiated by a specialist) by mouth

- **Adult:** 120 mg twice daily for 7 days, then increased to 240 mg twice daily, for dose adjustment due to side effects—consult product literature

#### CAUTIONS

- Reduced lymphocyte count • risk of serious infections (do not start treatment until resolved and consider suspending treatment if infection develops during treatment) • severe active gastrointestinal disease

#### SIDE-EFFECTS

- Abdominal pain • burning sensation • diarrhoea • dyspepsia • erythema • flushing (may be severe and indicate hypersensitivity) • gastritis • gastroenteritis • leucopenia • lymphopenia • nausea • proteinuria • pruritus • rash • vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

Progressive multifocal leukoencephalopathy (PML) Severe prolonged lymphopenia reported, and patients are exposed to a potential risk of PML. Treatment should be stopped immediately if PML is suspected.

- **CONCEPTION AND CONTRACEPTION** Contraception required in women of child-bearing potential (consider non-hormonal methods).

- **PREGNANCY** Manufacturer advises avoid unless essential and potential benefit outweighs risk—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.

- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment.

- **MONITORING REQUIREMENTS**
  - Monitor full blood count (including lymphocytes) before treatment (within 6 months before initiation), then every 6 to 12 months thereafter, and as clinically indicated.
  - Monitor patient closely for features of progressive multifocal leukoencephalopathy (PML) (e.g. signs and symptoms of neurological dysfunction) and other opportunistic infections.
  - Monitor renal and hepatic function before treatment, after 3 and 6 months of treatment, then every 6 to 12 months thereafter, and as clinically indicated.

- **PATIENT AND CARER ADVICE** Patient information leaflet should be provided. Counselling is advised on progressive multifocal leukoencephalopathy.

- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - Dimethyl fumarate for treating relapsing-remitting multiple sclerosis (August 2014) NICE TA320
    - Dimethyl fumarate is recommended for the treatment of active relapsing-remitting multiple sclerosis, only if:
      - the patient does not have highly active or rapidly evolving severe relapsing-remitting multiple sclerosis and
      - the manufacturer provides dimethyl fumarate with the discount agreed in the patient access scheme
    - Patients currently receiving dimethyl fumarate whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA320

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Gastro-resistant capsule**
    - CAUTIONARY AND ADVISORY LABELS 21, 25
    - Tecfidera (Biogen Idec Ltd)
    - Dimethyl fumarate 120 mg Tecfidera 120mg gastro-resistant capsules | 14 capsule | £343.00
    - Dimethyl fumarate 240 mg Tecfidera 240mg gastro-resistant capsules | 56 capsule | £1,373.00

**IMMUNOMODULATING DRUGS**

### Fingolimid

- **DRUG ACTION** Fingolimid is an immunomodulating drug.

#### INDICATIONS AND DOSE

Treatment of highly active relapsing-remitting multiple sclerosis in patients who have high disease activity despite treatment with at least one disease modifying therapy or in those with rapidly evolving severe relapsing-remitting multiple sclerosis (initiated under specialist supervision)

- **BY MOUTH**
  - **Adult:** 500 micrograms once daily

**Important safety information**

MHRA/CHM ADVICE: FINGOLIMOD—NOT RECOMMENDED FOR PATIENTS AT KNOWN RISK OF CARDIOVASCULAR EVENTS. ADVICE FOR EXTENDED MONITORING FOR THOSE WITH SIGNIFICANT BRADYCARDIA OR HEART BLOCK AFTER THE FIRST DOSE AND FOLLOWING TREATMENT INTERRUPTION (JANUARY 2013)

Fingolimid is known to cause transient bradycardias and heart block after the first dose. Fingolimid is not recommended in the following patient groups who are at high risk of cardiovascular events unless the anticipated benefits outweigh the potential risks, and advice from a cardiologist is sought before initiation:

**Patients with the following medical conditions:**

- 2nd degree Mobitz Type II or higher degree atrioventricular block, sick sinus syndrome, or sinoatrial heart block
- Significant QT prolongation (QT-interval greater than 470 milliseconds in women, or greater than 450 milliseconds in men)
- History of symptomatic bradycardia or recurrent syncope, known ischaemic heart disease, cerebrovascular disease, history of myocardial
Malignant disease

CONCEPTION AND CONTRACEPTION

▶ Frequency not known

Uncommon

SIDE-EFFECTS

malignancies (except cutaneous basal cell carcinoma) • macular oedema • paraesthesia • influenza • depression • diarrhea • dizziness • dizziness • eosinophilia • eye pain • gastroenteritis • headache • herpes • hypertension • influenza • leucopoenia • lymphopenia • malaise • migraine • paraesthesia • pruritus • sinusitis • tinea • weight loss

▶ Uncommon Macular oedema • neutropenia • pneumonia

▶ Frequency not known Haemophagocytic syndrome • lymphoma

CONCEPTION AND CONTRACEPTION Exclude pregnancy before treatment. Ensure effective contraception during and for at least 2 months after treatment.

PREGNANCY Avoid (toxicity in animal studies).

BREAST FEEDING Avoid.

HEPATIC IMPAIRMENT Use with caution in mild to moderate impairment. Avoid in severe impairment.

MONITORING REQUIREMENTS

▶ Eye examination recommended 3–4 months after initiation of treatment (and before initiation of treatment in patients with diabetes or history of uveitis).

Monitor hepatic transaminases before treatment, then every 3 months for 1 year, then periodically thereafter.

Monitor full blood count before treatment, at 3 months, then at least yearly thereafter and if signs of infection—interrupt treatment if lymphocyte count reduced—consult product literature.

Monitor for signs and symptoms of haemophagocytic syndrome (including pyrexia, asthenia, hepatitis, splenomegaly and adenopathy)—may be associated with hepatic failure and respiratory distress; also progressive cytopenia, elevated serum-ferritin concentrations, hypertriglyceridaemia, hypofibrinogenaemia, coagulopathy, hepatic cytolysis, hyponatraemia)—initiate treatment immediately.

NATIONAL FUNDING/ACCESS DECISIONS

NIC technology appraisals (TAs)

Fingolimod for the treatment of highly active relapsing-remitting multiple sclerosis (April 2012) NICE TA254

Fingolimod is recommended as an option for the treatment of highly active relapsing-remitting multiple sclerosis in adults, only if:

▶ they have an unchanged or increased relapse rate or ongoing severe relapses compared with the previous year despite treatment with interferon beta, and

▶ the manufacturer provides fingolimod with the discount agreed as part of the patient access scheme

Patients currently receiving fingolimod whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA254

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (August 2012) that fingolimod (Gilenya®) is accepted for restricted use within NHS Scotland as single disease modifying therapy in highly active relapsing-remitting multiple sclerosis despite treatment with interferon beta, with an unchanged or increased relapse rate or ongoing severe relapses, as compared to the previous year.

CONTRA-INDICATIONS Active infection • active malignancies (except cutaneous basal cell carcinoma) • immunosuppression

CAUTIONS Check varicella zoster virus status—consult product literature for further information • chronic obstructive pulmonary disease • pulmonary fibrosis • risk of macular oedema • severe respiratory disease • susceptibility to QT-interval prolongation (including electrolyte disturbances)

INTERACTIONS → Appendix 1 (fingolimod).

Caution with concomitant use of drugs that prolong QT interval.

SIDE-EFFECTS

Common or very common Alopecia • AV block • back pain • blurred vision • bradycardia • bronchitis • cough • depression • diarrhea • dizziness • dyspnoea • eczema • eye pain • gastroenteritis • headache • herpes • hypertension • influenza • leucopoenia • lymphopenia • malaise • migraine • paraesthesia • pruritus • sinusitis • tinea • weight loss

Glatiramer acetate

DRUG ACTION Glatiramer is an immunomodulating drug comprising synthetic polypeptides.

INDICATIONS AND DOSE

Treatment of initial symptoms in patients at high risk of developing multiple sclerosis (initiated under specialist supervision) / Reducing frequency of relapses in ambulatory patients with relapsing-remitting multiple sclerosis who have had at least 2 clinical relapses in the past 2 years (initiated under specialist supervision) by subcutaneous injection

Adult: 20 mg daily
INTERFERONS

**Interferon beta**

### INDICATIONS AND DOSE

**REBIF® PRE-FILLED PEN AND SYRINGE**

For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

**BY SUBCUTANEOUS INJECTION**

- Adult: (consult product literature)

**EXTAVIA®**

For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided | For secondary progressive multiple sclerosis with active disease | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

**BY INTRAMUSCULAR INJECTION**

- Adult: (consult product literature)

**AVONEX® VIAL**

For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

**BY INTRAMUSCULAR INJECTION**

- Adult: (consult product literature)

### MEDICINAL FORMS

**Copaxone (Teva UK Ltd)**

- Glatiramer acetate 20 mg per 1 ml Copaxone 20mg/1ml solution for injection pre-filled syringes | 28 pre-filled disposable injection [REB] £21.95 (Hospital only)
- Glatiramer acetate 40 mg per 1 ml Copaxone 40mg/1ml solution for injection pre-filled syringes | 12 pre-filled disposable injection [REB] £31.95 (Hospital only)

**NHS restrictions**

- Provision of disease-modifying therapies for multiple sclerosis
  - The Department of Health, the National Assembly for Wales, the Scottish Executive, the Northern Ireland Department of Health, Social Services & Public Safety, and the manufacturers have reached agreement on a risk-sharing scheme for the NHS supply of interferon beta and glatiramer acetate for multiple sclerosis. Health Service Circular (HSC 2002/004) explains how patients can participate in the scheme. It is available on the Department of Health website (www.dh.gov.uk).

### CAUTIONS, FURTHER INFORMATION

- **CONTRA-INDICATIONS**
  - Decompensated liver disease - severe depressive illness

- **CAUTIONS**
  - History of cardiac disorders - history of depressive disorders (avoid in severe depression or in those with suicidal ideation) - history of seizures - history of severe myelosupression

Consult product literature for further information on contra-indications.
SID-EFFECTS Alopecia · anaphylaxis · blood disorders · chills · confusion · convulsions · fever · hepatitis · hypersensitivity reactions · influenza-like symptoms (decreasing over time) · irritation at injection site (including inflammation, hypersensitivity, necrosis) · malaise · menstrual disorders · mood and personality changes · myalgia · nausea · nephrotic syndrome · suicide attempts · thrombotic microangiopathy · thyroid dysfunction · urticaria · vomiting

SIDE-EFFECTS, FURTHER INFORMATION
Also consult product literature for all side effects.

CONCEPTION AND CONTRACEPTION Effective contraception required during treatment—consult product literature.

PREGNANCY Avoid unless potential benefit outweighs risk (toxicity in animal studies).

BREAST FEEDING Avoid—no information available.

HEPATIC IMPAIRMENT Caution in severe hepatic impairment.

RENAL IMPAIRMENT Caution in severe renal impairment.

MONITORING REQUIREMENTS
- Monitor for signs of hepatic injury—hepatic failure has been reported rarely.
- Patients should be monitored for clinical features of thrombotic microangiopathy (TMA), including thrombocytopenia, new onset hypertension, fever, central nervous system symptoms (e.g. confusion and paresis), and impaired renal function. Any signs of TMA should be investigated fully and, if diagnosed, interferon beta should be stopped immediately and treatment for TMA promptly initiated (consult product literature for details).
- Patients should also be monitored for signs and symptoms of nephrotic syndrome, including oedema, proteinuria, and impaired renal function—monitor renal function periodically. If nephrotic syndrome develops, treat promptly and consider stopping interferon beta treatment.

PRESCRIBING AND DISPENSING INFORMATION
BETAFERON® INJECTION
An auto-injector device is available from Bayer Schering.

EXTAVIA®
An auto-injector device (ExtaviPro® 30g) is supplied as part of the ExtaviPro® 30g kit.

REBIF®
Cartridges for use with RebiSmart® auto-injector device.

NATIONAL FUNDING/ACCESS DECISIONS
NICE technology appraisals (TAs)
Interferon beta and glatiramer acetate are not recommended for the treatment of multiple sclerosis in the NHS in England and Wales. Patients who are currently receiving interferon beta or glatiramer acetate for multiple sclerosis, whether as routine therapy or as part of a clinical trial, should have the option to continue treatment until they and their consultant consider it appropriate to stop, having regard to the established criteria for withdrawal from treatment. www.nice.org.uk/TA32

NHS restrictions
- Provision of disease-modifying therapies for multiple sclerosis
The Department of Health, the National Assembly for Wales, the Scottish Executive, the Northern Ireland Department of Health, Social Services & Public Safety, and the manufacturers have reached agreement on a risk-sharing scheme for the NHS supply of interferon beta and glatiramer acetate for multiple sclerosis. Health Service Circular (HSC 2002/004) explains how patients can participate in the scheme. It is available on the Department of Health website (www.dh.gov.uk).

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
EXCIPIENTS: May contain Benzyl alcohol
- Avonex (Biogen Idec Ltd)
  Interferon beta-1a 12 mega u per 1 ml Avonex 30micrograms/0.5ml (6millilions units) solution for injection pre-filled syringes | 4 pre-filled disposable injection £654.00 | 12 pre-filled disposable injection £1,962.00
  Avonex 30micrograms/0.5ml (6millilions units) solution for injection pre-filled pen | 4 pre-filled disposable injection £654.00 | 12 pre-filled disposable injection £1,962.00
- Rebif (Merck Serono Ltd)
  Interferon beta-1a 12 mega u per 1 ml Rebif 22micrograms/0.5ml (6millilions units) solution for injection 1.5ml cartridges | 4 cartridge £613.52
  Rebif 8.8micrograms/0.2ml (2.4millions units) solution for injection pre-filled syringes | 6 pre-filled disposable injection £no price available
  Rebif 8.8micrograms/0.2ml (2.4millions units) solution for injection pre-filled pen | 6 pre-filled disposable injection £no price available
  Rebif 22micrograms/0.5ml (6millilions units) solution for injection pre-filled pen | 6 pre-filled disposable injection £no price available
  Rebif 22micrograms/0.5ml (6millilions units) solution for injection pre-filled syringes | 6 pre-filled disposable injection £no price available
  Rebif 22micrograms/0.5ml (6millilions units) solution for injection pre-filled syringes | 12 pre-filled disposable injection £613.52
  Rebif 22micrograms/0.5ml (6millilions units) solution for injection pre-filled pen | 12 pre-filled disposable injection £613.52
  Rebif 44micrograms/0.5ml (12millilions units) solution for injection pre-filled pen | 12 pre-filled disposable injection £813.21
  Rebif 44micrograms/0.5ml (12millilions units) solution for injection pre-filled syringes | 12 pre-filled disposable injection £813.21
  Rebif 44micrograms/0.5ml (12millilions units) solution for injection pre-filled syringes | 12 pre-filled disposable injection £813.21

Powder and solvent for solution for injection
- Avonex (Biogen Idec Ltd)
  Interferon beta-1a 30 microgram Avonex 30microgram powder and solvent for solution for injection vials | 4 vial £654.00
- Betaseron (Bayer Plc)
  Interferon beta-1b 300 microgram Betaseron 300microgram powder and solvent for solution for injection vials | 15 vial £596.63
- Extavia (Novartis Pharmaceuticals UK Ltd)
  Interferon beta-1b 300 microgram Extavia 300microgram powder and solvent for solution for injection vials | 15 vial £596.63

Peginterferon beta-1a

DRUG ACTION Peginterferon beta-1a is a polyethylene glycol-conjugated (‘pegylated’) derivative of interferon beta; pegylation increases the persistence of interferon in the blood.

INDICATIONS AND DOSE
Treatment of relapsing, remitting multiple sclerosis
BY SUBCUTANEOUS INJECTION
- Adults: (consult product literature)

CONTRA-INDICATIONS
Severe depression · suicidal ideation

CAUTIONS
History of cardiac disorders · history of depressive disorders (avoid in severe depression or in those with suicidal ideation) · history of seizures · history of severe myelosuppression

CAUTIONS, FURTHER INFORMATION
Consult product literature for further information about cautions.

SIDE-EFFECTS
Consult product literature for information about side effects.
CONCEPTION AND CONTRACEPTION Effective contraception required during treatment—consult product literature.

PREGNANCY Do not initiate during pregnancy. Avoid unless potential benefit outweighs risk.

BREAST FEEDING Avoid—no information available.

HEPATIC IMPAIRMENT Caution in severe hepatic impairment.

RENAL IMPAIRMENT Caution in severe renal impairment.

MONITORING REQUIREMENTS
- Monitor for signs of hepatic injury—hepatic failure has been reported rarely.
- Thrombotic microangiopathy Patients should be monitored for clinical features of thrombotic microangiopathy (TMA), including thrombocytopenia, new onset hypertension, fever, central nervous system symptoms (e.g. confusion and paresis), and impaired renal function. Any signs of TMA should be investigated fully and, if diagnosed, interferon beta should be stopped immediately and treatment for TMA promptly initiated (consult product literature for details).
- Nephrotic syndrome Patients should also be monitored for signs and symptoms of nephrotic syndrome, including oedema, proteinuria, and impaired renal function—monitor renal function periodically. If nephrotic syndrome develops, treat promptly and consider stopping interferon beta treatment.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- Plegridy (Biogen Idec Ltd)
  - Peginterferon beta-1a 126 microgram per 1 ml Plegridy 63micrograms/0.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection £0.00
  - Peginterferon beta-1a 188 microgram per 1 ml Plegridy 94micrograms/0.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection £0.00
  - Peginterferon beta-1a 250 microgram per 1 ml Plegridy 125micrograms/0.5ml solution for injection pre-filled pen | 2 pre-filled disposable injection £0.00 | 6 pre-filled disposable injection £1,962.00

MONOCLONAL ANTIBODIES (ANTI-LYMPHOCYTE)

Anti-lymphocyte monoclonal antibodies

DRUG ACTION The anti-lymphocyte monoclonal antibodies cause lysis of B lymphocytes.

SIDE-EFFECTS
- Common or very common Allergic reactions - angioedema - bronchospasm - chills - cytokine release syndrome - dyspnoea - fever - flushing - nausea - pruritus - rash - tumour pain - vomiting
- Frequency not known Cardiac events

INFORMATION
- Infusion-related side-effects In rare cases infusion reactions may be fatal. Infusion-related side-effects occur predominantly during the first infusion. Patients should receive premedication before administration of anti-lymphocyte monoclonal antibodies to reduce these effects—consult product literature for details of individual regimens. The infusion may have to be stopped temporarily and the infusion-related effects treated—consult product literature for appropriate management. Evidence of pulmonary infiltration and features of tumour lysis syndrome should be sought if infusion-related effects occur.
- Cytokine release syndrome Fatalities following severe cytokine release syndrome (characterised by severe dyspnoea) and associated with features of tumour lysis syndrome have occurred after infusions of anti-lymphocyte monoclonal antibodies. Patients with a high tumour burden as well as those with pulmonary insufficiency or infiltration are at increased risk and should be monitored very closely (and a slower rate of infusion considered).

PRE-TREATMENT SCREENING All patients should be screened for hepatitis B before treatment.

MONITORING REQUIREMENTS Patients should also be monitored for cytopenias—consult product literature for specific recommendations.

Alemtuzumab

INDICATIONS AND DOSE
Treatment of adults with relapsing-remitting multiple sclerosis with active disease defined by clinical or imaging features

BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

UNLICENSED USE Although no longer licensed for oncological and transplant indications, alemtuzumab is also available through a patient access programme for these indications.

CONTRA-INDICATIONS Human immunodeficiency virus

CAUTIONS Hepatitis B carriers - hepatitis C carriers - in patients with active infection, a delay in initiation of alemtuzumab treatment should be considered until the infection is fully controlled - not recommended for inactive disease - not recommended for stable disease - patients should receive oral prophylaxis for herpes infection starting on the first day of treatment and continuing for at least a month following each treatment course - patients with previous autoimmune conditions other than multiple sclerosis - pretreatment before administration is required (consult product literature)

CAUTIONS, FURTHER INFORMATION
Autoimmune mediated conditions The risk of autoimmune mediated conditions may increase during treatment, including immune thrombocytopenic purpura, thyroid disorders, nephropathies, and cytopenias, and should be monitored for throughout the course of treatment (consult product literature).

For full details of cautions, consult product literature.

INTERACTIONS Appendix 1 (alemtuzumab).

SIDE-EFFECTS For full side effects details (including monitoring and management) consult product literature.

CONCEPTION AND CONTRACEPTION Women of childbearing potential should use effective contraception during and for 4 months after treatment.

PREGNANCY Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. Autoimmune thyroid disease during treatment may affect fetus (consult product literature).
Natalizumab

**DRUG ACTION** Natalizumab is a monoclonal antibody that inhibits the migration of leucocytes into the central nervous system, hence reducing inflammation and demyelination.

**INDICATIONS AND DOSE**

Highly active relapsing-remitting multiple sclerosis (initiated under specialist supervision).

**BY INTRAVENOUS INFUSION**

- Adult: 300 mg every 4 weeks, treatment should be discontinued if no response after 6 months

**CONTRA-INDICATIONS** Active infection • active malignancies (except cutaneous basal cell carcinoma) • immunosuppression • progressive multifocal leucoencephalopathy

**CAUTIONS, FURTHER INFORMATION**

Progressive Multifocal Leucoencephalopathy Natalizumab is associated with an increased risk of opportunistic infection and progressive multifocal leucoencephalopathy (PML) caused by JC virus. The risk of developing PML increases with the presence of anti-JCV antibodies, previous use of immunosuppressant therapy, and treatment duration (especially beyond 2 years of treatment); the risk beyond 4 years of treatment is not known. Patients with all three risk factors should only be treated with natalizumab if the benefits of treatment outweigh the risks. Treatment should be suspended until PML has been excluded. If a patient develops an opportunistic infection or PML, natalizumab should be permanently discontinued. For information on cautions consult product literature.

**INTERACTIONS** → Appendix 1 (natalizumab).

Concurrent use of interferon beta or glatiramer acetate contra-indicated.

**SIDE-EFFECTS**

- **Common or very common** Arthralgia • autoantibodies • nasopharyngitis • urinary-tract infection
- **Uncommon** Hypersensitivity reactions (discontinue permanently)
- **Frequency not known** Arthralgia (during infusion) • dizziness (during infusion) • fatigue (during infusion) • flushing (during infusion) • headache (during infusion) • increased risk of opportunistic infection • liver toxicity • nausea (during infusion) • pruritus (during infusion) • pyrexia (during infusion) • rigors (during infusion) • urticaria (during infusion) • vomiting (during infusion)

**SIDE-EFFECTS, FURTHER INFORMATION**

Progressive Multifocal Leucoencephalopathy If Progressive Multifocal Leucoencephalopathy (PML) is suspected, treatment should be suspended until PML has been excluded. If a patient develops an opportunistic infection or PML, natalizumab should be permanently discontinued.

Liver toxicity Discontinue treatment if significant liver injury occurs.

**PREGNANCY** Avoid unless essential—toxicity in animal studies.

**BREAST FEEDING** Present in milk in animal studies—avoid.

**PRE-TREATMENT SCREENING** Progressive Multifocal Leucoencephalopathy A magnetic resonance image (MRI) scan is recommended before starting treatment with natalizumab. Testing for serum anti-JCV antibodies before starting treatment or in those with unknown antibody status already receiving natalizumab is recommended and should be repeated every 6 months (consult product literature for full details).

**MONITORING REQUIREMENTS**

- Monitor liver function.
- Progressive Multifocal Leucoencephalopathy A magnetic resonance image (MRI) scan is recommended annually. Patients should be monitored for new or worsening neurological symptoms, and for cognitive and psychiatric signs of PML. All patients should continue to be monitored for signs and symptoms that may be suggestive of PML for approximately 6 months following discontinuation of treatment.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Tysabri®), give intermittently in Sodium chloride 0.9%; dilute 300 mg in 100 mL infusion fluid; gently invert to mix, do not shake. Use within 8 hours of dilution and give over 1 hour.

**PATIENT AND CARER ADVICE** A patient alert card should be provided.

Hypersensitivity reactions Patients should be told the importance of uninterrupted dosing, particularly in the early months of treatment (intermittent therapy may increase risk of sensitisation).

Progressive Multifocal Leucoencephalopathy Patients should be informed about the risks of PML before starting treatment with natalizumab and again after 2 years; they should be given an alert card which includes information about the symptoms of PML.

Liver toxicity Advise patients to seek immediate medical attention if symptoms such as jaundice or dark urine develop.
NATIONAL FUNDING/ACCESS DECISIONS

**NICE technology appraisals (TAs)**

- **Natalizumab for the treatment of adults with highly active relapsing-remitting multiple sclerosis (August 2007)**

  NICE TA127  
  Natalizumab is an option for the treatment only of rapidly evolving severe relapsing-remitting multiple sclerosis (RES). RES is defined by 2 or more disabling relapses in 1 year, and 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.  
  www.nice.org.uk/TA127

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (August 2007) that natalizumab is accepted for restricted use as single disease-modifying therapy in highly active relapsing-remitting multiple sclerosis only in patients with rapidly evolving severe relapsing-remitting multiple sclerosis defined by 2 or more disabling relapses in 1 year and with 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

  **Solution for infusion**
  
  **ELECTROLYTES:** May contain Sodium
  
  Tysabri (Biogen Idec Ltd) ▼
  
  Natalizumab 20 mg per 1 ml Tysabri 300mg/15ml concentrate for solution for infusion vials | 1 vial (£97) no price available (Hospital only)

PYRIMIDINE SYNTHESIS INHIBITORS

**Teriflunomide**

- **DRUG ACTION** Teriflunomide is a metabolite of leflunomide which has immunomodulating and anti-inflammatory properties.

INDICATIONS AND DOSE

Treatment of relapsing-remitting multiple sclerosis (initiated under specialist supervision)

BY MOUTH

- **DOSAGE**
  - **Adult:** 14 mg once daily

CONTRA-INDICATIONS

- Anaemia; leucopenia; neutropenia; serious infection; severe hypoproteinaemia; severe immunodeficiency; significantly impaired bone-marrow function; thrombocytopenia

CAUTIONS

- Adult over 65 years; anaemia; dyspnoea—assess for interstitial lung disease and consider suspending treatment; hypoproteinaemia (avoid if severe); impaired bone-marrow function (avoid if severe); latent tuberculosis; leucopenia; persistent cough—assess for interstitial lung disease and consider suspending treatment; severe infection—delay or suspend treatment until resolved; significant alcohol consumption—signs or symptoms of serious skin reactions (including ulcerative stomatitis, Stevens-Johnson syndrome, and toxic epidermal necrolysis)—discontinue treatment—switching between other immunomodulating drugs—thrombocytopenia

INTERACTIONS

- Appendix 1 (teriflunomide).

SIDE-EFFECTS

- Common or very common Acne; alopecia; anxiety; carpal tunnel syndrome; cystitis; diarrhoea; elevated liver enzymes; gastroenteritis; hyperaesthesia; hypertension; laryngitis; leucopenia; menorrhagia; musculoskeletal pain; myalgia; nausea; neuralgia; neutropenia; oral infection; paraesthesia; peripheral neuropathy; pollakiuria; rash; respiratory tract infection; sciatica; tinea pedis; urinary tract infection; vomiting; weight loss

Uncommon

- Anaemia; thrombocytopenia

Very rare

- Intestinal lung disease; pancreatitis

SIDE-EFFECTS, FURTHER INFORMATION

**Accelerated elimination procedure Important:** accelerated elimination procedure recommended following discontinuation due to serious adverse effects (consult product literature).

**Hepatic injury** Discontinue treatment if signs or symptoms of hepatic injury, or if liver enzymes exceed 3 times the upper limit of reference range.

CONCEPTION AND CONTRACEPTION

Effective contraception essential for women of child-bearing potential during treatment and for up to 2 years after treatment. In patients undergoing treatment with teriflunomide that are planning to conceive, the accelerated elimination procedure should be used prior to conception. Use of non-oral contraception is recommended during the accelerated elimination procedure—consult product literature.

PREGNANCY

- Avoid—toxicity in animal studies.

BREAST FEEDING

Present in milk in animal studies—manufacturer advises avoid.

HEPATIC IMPAIRMENT

- Avoid in severe impairment.

MONITORING REQUIREMENTS

- Monitor full blood count (including differential white cell count and platelet count) before treatment and as clinically indicated during treatment.

- Monitor blood pressure before treatment and periodically thereafter.

- Hepatic monitoring Monitor liver function before treatment and every 2 weeks for first 6 months then every 8 weeks thereafter or as clinically indicated (pre-existing liver disease may increase risk). Increase to weekly monitoring if alanine aminotransferase (ALT) is 2–3 times the upper limit of reference range: discontinue treatment if signs or symptoms of hepatic injury, or if liver enzymes exceed 3 times the upper limit of reference range.

TREATMENT CESSATION

Accelerated elimination procedures. To aid drug elimination in case of serious adverse effect or before conception, stop treatment and give either colestyramine p. 173 or charcoal, activated p. 1130. After the accelerated elimination procedure a plasma concentration of less than 20 micrograms/litre (measured on 2 occasions at least 14 days apart) and a waiting period of one and a half months are necessary before conception.

NATIONAL FUNDING/ACCESS DECISIONS

**NICE technology appraisals (TAs)**

- **Teriflunomide for treating relapsing-remitting multiple sclerosis (January 2014)**

  NICE TA303  
  Teriflunomide is recommended for the treatment of adults with active relapsing-remitting multiple sclerosis (normally defined as 2 clinically significant relapses in the previous 2 years), in adults who:
  - do not have highly active or rapidly evolving severe relapsing-remitting multiple sclerosis and
  - the manufacturer provides teriflunomide with the discount agreed in the patient access scheme.

  www.nice.org.uk/TA303

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (February 2014) that the use of teriflunomide (Aubagio)® in NHS Scotland is restricted to use in patients with relapsing-remitting multiple sclerosis who do not have highly active disease, and only as an alternative to treatment with interferon beta or glatiramer acetate.
2 Malignant disease

2.1 Antibody responsive malignancy

MONOClonAL Antibodies (anTI-LymphocyTE)

Rituximab

The properties listed below are those particular to the drug only. For properties common to the class, see Anti-lymphocyte monoclonal antibodies, p. 731.

INDICATIONS AND DOSE

Treatment of severe active rheumatoid arthritis in patients whose condition has not responded adequately to other disease-modifying antirheumatic drugs (including one or more tumour necrosis factor inhibitors) or who are intolerant of them (in combination with methotrexate)

BY INTRAVENOUS INFUSION

- Adult: 1 g, then 1 g after 2 weeks, patients should receive premedication before each infusion (consult product literature for details)
- Treatment of previously untreated stage III–IV follicular lymphoma (in combination with other chemotherapy) | Maintenance therapy in patients with follicular non-Hodgkin’s lymphoma that has responded to induction therapy (in combination with other chemotherapy)
- Treatment of diffuse large B-cell non-Hodgkin’s lymphoma (in combination with other chemotherapy)
- Treatment of chemotherapy-resistant or relapsed stage III–IV follicular non-Hodgkin’s lymphoma | Previously untreated or relapsed chronic lymphocytic leukaemia | Induction of remission in patients with severe, active granulomatosis with polyangiitis (Wegener’s) and microscopic polyangiitis (in combination with glucocorticoids)

BY INTRAVENOUS INFUSION

- Adult: Patients should receive premedication before each dose (consult product literature for details) (consult product literature or local protocols)

CONTRA-INDICATIONS

Severe heart failure (when used to treat granulomatosis with polyangiitis or microscopic polyangiitis) | Severe infection | Severe, uncontrolled heart disease (when used to treat granulomatosis with polyangiitis or microscopic polyangiitis)

CONTRA-INDICATIONS, FURTHER INFORMATION

For full details on contra-indications, consult product literature.

CAUTIONS

GENERAL CAUTIONS

History of cardiovascular disease; in adults exacerbation of angina, arrhythmia, and heart failure have been reported | patients receiving cardiotoxic chemotherapy; in adults exacerbation of angina, arrhythmia, and heart failure have been reported | transient hypotension occurs frequently during infusion (anti-hypertensives may need to be withheld for 12 hours before infusion)

SPECIFIC CAUTIONS

- When used for rheumatoid arthritis predisposition to infection

CAUTIONS, FURTHER INFORMATION

Hepatitis B infection and reactivation

Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking rituximab. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

For full details on cautions, consult product literature or local treatment protocol.

INTERACTIONS

- Appendix 1 (rituximab)

SIDE-EFFECTS

Abdominal pain | anaemia | antibody formation | aplastic anaemia | arthralgia | asthenia | blood disorders | depression | dyspepsia | headache | hypertension | hypotension | injection-site reactions | leucopenia | lupus erythematosus-like syndrome | migraine | muscle spasm | pancytopenia | paraesthesia | progressive multifocal leucoencephalopathy | pruritus | rhinitis | severe fatal skin reactions | severe skin reactions (permanently discontinue treatment if occurs) | sore throat | Stevens-Johnson syndrome (permanently discontinue treatment if occurs) | thrombocytopenia | toxic epidermal necrolysis (permanently discontinue treatment if occurs) | urticaria | worsening heart failure

SIDE-EFFECTS, FURTHER INFORMATION

Associated with infections, sometimes severe, including tuberculosis, sepsicaemia, and hepatitis B reactivation.

Progressive multifocal leucoencephalopathy

Progressive multifocal leucoencephalopathy (which is usually fatal or causes severe disability) has been reported in association with rituximab; patients should be monitored for cognitive, neurological, or psychiatric signs and symptoms. If progressive multifocal leucoencephalopathy is suspected, suspend treatment until it has been excluded.

For full details, including management of side-effects, consult product literature.

CONCEPTION AND CONTRACEPTION

Effective contraception (in both sexes) required during and for 12 months after treatment.

PREGNANCY

Avoid unless potential benefit to mother outweighs risk of B-lymphocyte depletion in fetus.

BREAST FEEDING

Avoid breast-feeding during and for 12 months after treatment.

MONITORING REQUIREMENTS

For full details on monitoring requirements consult product literature.

DIRECTIONS FOR ADMINISTRATION

For intravenous infusion (MabThera®), give intermittently in Glucose 5% or Sodium chloride 0.9%; dilute to 1-4 mg/mL and gently invert bag to avoid foaming.

PATIENT AND CARER ADVICE

Alert card | Patients treated for granulomatosis with polyangiitis and microscopic polyangiitis or rheumatoid arthritis should be provided with a patient alert card with each infusion.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- Rituximab for aggressive non-Hodgkin’s lymphoma

This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with cyclophosphamide, doxorubicin, vincristine, and prednisolone, is recommended for first-line treatment of...
Rituximab for the treatment of relapsed or refractory chronic lymphocytic leukaemia (July 2009) NICE TA174
This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with fludarabine and cyclophosphamide, is recommended as an option for the first-line treatment of chronic lymphocytic leukaemia. www.nice.org.uk/TA174

Rituximab for the treatment of relapsed or refractory chronic lymphocytic leukaemia (July 2010) NICE TA193
This NICE guidance was issued for rituximab by intravenous infusion. Rituximab in combination with fludarabine and cyclophosphamide is recommended as a treatment option for people with relapsed or refractory chronic lymphocytic leukaemia except when the condition:
• is refractory to fludarabine (that is, it has not responded to fludarabine, or has relapsed within 6 months of treatment), or
• has previously been treated with rituximab, unless it was in the context of a clinical trial, or a dose lower than the dose currently licensed for chronic lymphocytic leukaemia or with chemotherapy other than fludarabine and cyclophosphamide. Rituximab in combination with fludarabine and cyclophosphamide is recommended only in the context of research for patients with relapsed or refractory chronic lymphocytic leukaemia that has previously been treated with rituximab, unless rituximab has been given as specified above. www.nice.org.uk/TA193

Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010) NICE TA195
Rituximab, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or are intolerant of, other disease-modifying antirheumatic drugs (DMARDs), including at least 1 tumour necrosis factor (TNF) inhibitor. Repeat courses of rituximab should be given no more frequently than every 6 months, and should only be continued if an adequate response is achieved and maintained. www.nice.org.uk/TA195

Rituximab for the first-line maintenance treatment of follicular non-Hodgkin’s lymphoma (June 2011) NICE TA226
This NICE guidance was issued for rituximab by intravenous infusion. Rituximab maintenance therapy is recommended as an option for the treatment of people with follicular non-Hodgkin’s lymphoma that has responded to first-line induction therapy with rituximab in combination with chemotherapy. www.nice.org.uk/TA226

Rituximab for the first-line treatment of stage III-IV follicular lymphoma (January 2012) NICE TA243
This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with:
• cyclophosphamide, vincristine and prednisolone (CVP);
• cyclophosphamide, doxorubicin, vincristine and prednisolone (CHOP);
• mitoxantrone, chlorambucil and prednisolone (MCP);
• cyclophosphamide, doxorubicin, etoposide, prednisolone and interferon-alpha (CHVPi); or
• chlorambucil is recommended as an option for the treatment of symptomatic stage III and IV follicular lymphoma in previously untreated patients. www.nice.org.uk/TA243

Rituximab in combination with glucocorticoids for treating anti-neutrophil cytoplasmic antibody-associated vasculitis (March 2014) NICE TA308
This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with glucocorticoids, is recommended as an option for inducing remission in adults with anti-neutrophil cytoplasmic antibody (ANCA)-associated vasculitis (severely active granulomatosis with polyangiitis [Wegener’s] and microscopic polyangiitis), only if:
• further cyclophosphamide-based treatment would exceed the maximum cumulative cyclophosphamide dose, or
• cyclophosphamide is contraindicated or not tolerated, or
• the patient has not completed their family, and treatment with cyclophosphamide may materially affect their fertility, or
• the disease has remained active or progressed despite a course of cyclophosphamide lasting 3–6 months or
• the patient has had uroepithelial malignancy. www.nice.org.uk/TA308

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (August 2013) that Rituximab (MabThera®) is accepted for restricted use within NHS Scotland, in combination with glucocorticoids for the induction of remission in adult patients with severe, active granulomatosis with polyangiitis (Wegener’s) and microscopic polyangiitis. It is restricted to use in patients who have relapsed following treatment with cyclophosphamide or who are intolerant to or unable to receive cyclophosphamide.
The Scottish Medicines Consortium has advised (June 2014) that subcutaneous rituximab (MabThera®) is accepted for restricted use within NHS Scotland, in accordance with UK licensing, except in the maintenance setting, where use is restricted to patients who have responded to induction therapy with rituximab plus chemotherapy.

Medicinal forms
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
• MabThera (Roche Products Ltd)
Rituximab 119.66 mg per 1 ml MabThera 1400mg/11.7ml solution for injection vials | 1 vial (P) £1,344.65 (Hospital only)

Solution for infusion
• MabThera (Roche Products Ltd)
Rituximab 10 mg per 1 ml MabThera 100mg/10ml concentrate for solution for infusion vials | 2 vial (P) £340.25
MabThera 500mg/50ml concentrate for solution for infusion vials | 1 vial (P) £873.15
MONOCLONAL ANTIBODIES (ANTINEOPLASTIC)

Bevacizumab

**DRUG ACTION** Bevacizumab is a monoclonal antibody that inhibits vascular endothelial growth factor.

**INDICATIONS AND DOSE**
Treatment of metastatic colorectal cancer in combination with fluoropyrimidine-based chemotherapy / First-line treatment of metastatic breast cancer in combination with paclitaxel when treatment with other chemotherapy, including taxanes or anthracyclines is not appropriate | First-line treatment of metastatic breast cancer in combination with capcitabine when treatment with other chemotherapy, including taxanes or anthracyclines is not appropriate | Patients who have received adjuvant taxane or anthracycline-containing regimens in the previous 12 months should not be treated with bevacizumab in combination with capcitabine | Advanced or metastatic renal cell carcinoma in combination with interferon alfa-2a | First-line treatment of unresectable advanced, metastatic or recurrent non-small cell lung cancer other than predominantly squamous cell histology (in combination with platinum-based chemotherapy) | First-line treatment of advanced (FIGO stages IIIIB, IIC and IV) epithelial ovarian, fallopian tube, or primary peritoneal cancer (in combination with carboplatin and paclitaxel) | First recurrence of platinum-sensitive epithelial ovarian, fallopian tube, or primary peritoneal cancer in patients who have not been treated previously with bevacizumab or other drugs that target vascular endothelial growth factor (in combination with carboplatin and gemcitabine)

**ADMINISTRATION**
BY INTRAVENOUS INFUSION

**INDICATIONS**
- **Malignant disease**
  - First-line treatment of metastatic colorectal cancer (December 2010) NICE TA202
  - Bevacizumab in combination with fluorouracil plus folinic acid, with or without irinotecan, is not recommended for the first-line treatment of metastatic colorectal cancer
- **Advanced or metastatic renal cell carcinoma** (August 2009) NICE TA118
  - Bevacizumab (first-line), sorafenib (first-and second-line), and sunitinib are not recommended as second-line treatments for people with advanced or metastatic renal cell carcinoma. Sorafenib and sunitinib are not recommended as second-line treatments for people with advanced or metastatic renal cell carcinoma.
- **Breast cancer**
  - Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capcitabine for the treatment of metastatic colorectal cancer (December 2010) NICE TA212
  - Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capcitabine is not recommended for the treatment of metastatic colorectal cancer.
- **Non-small cell lung cancer**
  - Bevacizumab in combination with a taxane for the first-line treatment of metastatic breast cancer (February 2011) NICE TA214
  - Bevacizumab in combination with a taxane is not recommended for the first-line treatment of metastatic breast cancer.

**SIDE-EFFECTS**
- Abdominal pain • alopecia • anaemia • anorexia • arterial thromboembolism • asthma • bone marrow suppression • chest pain • congestive heart failure • constipation • dehydration • diarrhoea • drowsiness • dry skin • dysarthria • dyspnoea • exfoliative dermatitis • extravasation • eye disorders • fistulas • flushing • gall bladder perforation • gastro-intestinal perforation • haemorrhage • hand-foot syndrome • headache • hypersensitivity reactions • hypertension • hyperuricaemia • hypotension • hypoxia • impaired wound healing • infection • intestinal obstruction • lethargy • mucocutaneous bleeding • nausea • necrotising fasciitis (discontinue and initiate treatment promptly) • neutropenia • oral mucositis • osteonecrosis of the jaw • peripheral neuropathy • posterior reversible encephalopathy syndrome • proteinuria • pulmonary hypertension • pyrexia • rash • rhinitis • rashes • skin discoloration • supraventricular tachycardia • syncope • taste disturbances • thrombocytopenia • thromboembolism • tumour lysis syndrome • vomiting

**CONCEPTION AND CONTRACEPTION**
Effective contraception required during and for at least 6 months after treatment in women

**PREGNANCY**
Avoid toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING**
Manufacturer advises avoid breast-feeding during and for at least 6 months after treatment.

**MONITORING REQUIREMENTS**
- Monitor for necrotising fasciitis (usually secondary to wound healing complications, gastro-intestinal perforation or fistula formation) — discontinue and initiate treatment promptly.
- Monitor blood pressure.
- Monitor for congestive heart failure.
- Monitor for posterior reversible encephalopathy syndrome (presenting as seizures, headache, altered mental status, visual disturbance or cortical blindness, with or without hypertension).
- Consider dental check-up before initiating treatment (risk of osteonecrosis of the jaw).

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE TECHNOLOGY APPRAISALS (TAS)**
- Bevacizumab and cetuximab for the treatment of metastatic colorectal cancer (January 2007) NICE TA118
- Bevacizumab in combination with fluorouracil plus folinic acid, with or without irinotecan, is not recommended for the first-line treatment of metastatic colorectal cancer; see also NICE guidance Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy. www.nice.org.uk/TA118
- Bevacizumab (first-line), sorafenib (second-line), sunitinib (second-line), and temsirolimus (first-line) for the treatment of advanced or metastatic renal cell carcinoma (August 2009) NICE TA178
- Bevacizumab, sorafenib, and temsirolimus are not recommended as first-line treatments for people with advanced or metastatic renal cell carcinoma. Sorafenib and sunitinib are not recommended as second-line treatments for people with advanced or metastatic renal cell carcinoma.
- Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capcitabine for the treatment of metastatic colorectal cancer (December 2010) NICE TA212
- Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capcitabine is not recommended for the treatment of metastatic colorectal cancer.
- Bevacizumab in combination with a taxane for the first-line treatment of metastatic breast cancer (February 2011) NICE TA214
- Bevacizumab in combination with a taxane is not recommended for the first-line treatment of metastatic breast cancer.

**IMPORTANT SAFETY INFORMATION**
- Treatment with bevacizumab or sunitinib may be a risk factor for the development of osteonecrosis of the jaw. Patients treated with bevacizumab or sunitinib, who have previously received bisphosphonates, or are treated concurrently with bisphosphonates, may be particularly at risk.
- Dental examination and appropriate preventive dentistry should be considered before treatment with bevacizumab or sunitinib.
- If possible, invasive dental procedures should be avoided in patients treated with bevacizumab or sunitinib who have previously received, or who are currently receiving, intravenous bisphosphonates.

**CAUTIONS**
Elective surgery (withhold treatment and avoid for at least 28 days after major surgery or until wound fully healed) • history of arterial thromboembolism • history of cardiovascular disease (increased risk of cardiovascular events, especially in the elderly) • history of hypertension (increased risk of proteinuria—discontinue if nephrotic syndrome) • increased risk of fistulas (discontinue permanently if tracheo-oesophageal or grade 4 fistula develops) • increased risk of haemorrhage • increased risk of tumour-associated haemorrhage • intra-abdominal inflammation (risk of gastro-intestinal perforation and gall bladder perforation) • uncontrolled hypertension • untreated CNS metastases

**INTERACTIONS**
- Appendix 1 (bevacizumab).

**SIDE-EFFECTS**
- Abdominal pain • alopecia • anaemia • anorexia • arterial thromboembolism • asthma • bone marrow suppression • chest pain • congestive heart failure • constipation • dehydration • diarrhoea • drowsiness • dry skin • dysarthria • dyspnoea • exfoliative dermatitis • extravasation • eye disorders • fistulas • flushing • gall bladder perforation • gastro-intestinal perforation • haemorrhage • hand-foot syndrome • headache • hypersensitivity reactions • hypertension • hyperuricaemia • hypotension • hypoxia • impaired wound healing • infection • intestinal obstruction • lethargy • mucocutaneous bleeding • nausea • necrotising fasciitis (discontinue and initiate treatment promptly) • neutropenia • oral mucositis • osteonecrosis of the jaw • peripheral neuropathy • posterior reversible encephalopathy syndrome • proteinuria • pulmonary hypertension • pyrexia • rash • rhinitis • rashes • skin discoloration • supraventricular tachycardia • syncope • taste disturbances • thrombocytopenia • thromboembolism • tumour lysis syndrome • vomiting
**Brentuximab vedotin and panitumumab** for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012) NICE TA242

Brentuximab in combination with non-oxaliplatin (fluoropyrimidine-based) chemotherapy is not recommended for the treatment of patients with metastatic colorectal cancer that has progressed after first-line chemotherapy; see also NICE guidance on Bevacizumab and cetuximab for the treatment of metastatic colorectal cancer (January 2007). www.nice.org.uk/TA242

- **Bevacizumab in combination with capecitabine** for the first-line treatment of metastatic breast cancer (August 2012) NICE TA263

Bevacizumab in combinations with capecitabine is not recommended within its marketing authorisation for the first-line treatment of metastatic breast cancer, that is, when treatment with other chemotherapy options including taxanes or anthracyclines is not considered appropriate, or when taxanes or anthracyclines have been used as part of adjuvant treatment in the previous 12 months. www.nice.org.uk/TA263

- **Bevacizumab in combination with paclitaxel and carboplatin** for the first-line treatment of advanced ovarian cancer (May 2013) NICE TA284

Bevacizumab in combination with paclitaxel and carboplatin is not recommended for the first-line treatment of advanced ovarian cancer (including fallopian tube and primary peritoneal cancer). www.nice.org.uk/TA284

- **Bevacizumab in combination with gemcitabine and carboplatin** for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (May 2013) NICE TA285

Bevacizumab in combination with gemcitabine and carboplatin is not recommended within its marketing authorisation, that is, for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (including fallopian tube and primary peritoneal cancer) that has not been previously treated with bevacizumab or other vascular endothelial growth factor (VEGF) inhibitors or VEGF receptor-targeted agents. www.nice.org.uk/TA285

### Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (April 2012) that bevacizumab (Avastin®) is not recommended for use within NHS Scotland for the first line treatment of patients with metastatic breast cancer in whom treatment with other chemotherapy options including taxanes or anthracyclines is not considered appropriate.

## MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for infusion**

- **Avastin** (Roche Products Ltd)

  Bevacizumab 25 mg per 1 ml Avastin 400mg/16ml solution for infusion vials | 1 vial (P50) £324.40 (Hospital only)

  Avastin 100mg/4ml solution for infusion vials | 1 vial (P50) £242.66 (Hospital only)

- **Brentuximab vedotin**

**Medications related to Brentuximab vedotin**

- **Adcetris** (Takeda UK Ltd)

  Brentuximab vedotin 50 mg Adcetris 50mg powder for concentrate for solution for infusion vials | 1 vial (P50) £2,500.00

### Catumaxomab

**INDICATIONS AND DOSE**

Treatment of malignant ascites in patients with epithelial cell adhesion molecule (EpCAM) positive carcinomas, where standard therapy is not available or no longer feasible

**By intraperitoneal infusion**

- **Adult:** (consult product literature)

### CAUTIONS

- Elevated BMI—risk of hyperglycaemia · high tumour burden—risk of tumour lysis syndrome · rapidly proliferating tumours—risk of tumour lysis syndrome

### INTERACTIONS

- **Appendix 1** (brentuximab vedotin).

### SIDE-EFFECTS

- **Common or very common**
  - Anaphylaxis · arthralgia · back pain · constipation · cough · demyelinating polyneuropathy · diarrhoea · dizziness · dyspnoea · fatigue · hyperglycaemia · infusion-related reactions · myalgia · peripheral neuropathy · pruritus · rash

- **Uncommon**
  - Stevens-Johnson syndrome

- **Frequency not known**
  - Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · progressive multifocal leucoencephalopathy · thromboembolism · tumour lysis syndrome · vomiting

### CONCEPTION AND CONTRACEPTION

Effective contraception required during treatment and for 6 months after treatment in men and women.

**PREGNANCY**

Avoid unless potential benefit outweighs risk (toxicity in animal studies).

**BREAST FEEDING**

Avoid—no information available.

**MONITORING REQUIREMENTS**

- Monitor for symptoms of progressive multifocal leucoencephalopathy (presenting as new or worsening neurological, cognitive or behavioural signs or symptoms).
- Monitor for new or worsening abdominal pain—investigate and withhold treatment if acute pancreatitis suspected and discontinue if confirmed (fatal cases reported).
- Monitor for pulmonary toxicity—treat symptoms promptly.
- Routinely monitor hepatic function.
- Monitor for infusion-related (including anaphylactic) reactions.
- Monitor for signs of peripheral neuropathy—consult product literature for treatment adjustment.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

**ELECTROLYTES:** May contain Sodium

- **Adcetris** (Takeda UK Ltd)

  Brentuximab vedotin 50 mg Adcetris 50mg powder for concentrate for solution for infusion vials | 1 vial (P50) £2,500.00
Malignant disease

Uncommon

- Acute renal failure • gastro-intestinal haemorrhage • intestinal obstruction • seizures
- Frequency not known
  - Allopurinol • bone-marrow suppression • extravasation • hyperuricaemia • infusion related side-effects • nausea • oral mucositis • thromboembolism • tumour lysis syndrome • vomiting

<table>

Important safety information

MHRA/CHM advice: epidermal growth factor receptor (EGFR) inhibitors: serious cases of keratitis and ulcerative keratitis (May 2012)

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

Patients must receive an antihistamine and a corticosteroid at least one hour before infusion. Resuscitation facilities should be available and treatment should be initiated by a specialist.

- Contra-indications: RAS mutated colorectal tumours (or if RAS tumour status unknown) • combination of cetuximab with oxaliplatin-containing chemotherapy is contra-indicated in patients with metastatic colorectal cancer who have mutant or unknown RAS status
- Caution: Cardiopulmonary disease • cardiovascular disease • history of keratitis • pulmonary disease—discontinue if interstitial lung disease • risk factors for keratitis • severe dry eye • ulcerative keratitis (including contact lens use)
- Interactions: Appendix 1 (cetuximab).
- Side-effects:
  - Common or very common
    - Acne • aseptic meningitis • blepharitis • bronchospasm • chills • conjunctivitis • desquamation • diarrhoea • dizziness • dry skin • dyspnoea • fever • headache • hypertension • hypertrichosis • hypocalcaemia • hypomagnesaemia • hypotension • infusion-related reactions • keratitis • nail disorders • nausea • pruritus • rash • severe (sometimes fatal) hypersensitivity reactions (possibly delayed onset) • shock • skin reactions • urticaria • vomiting
  - Very rare
    - Stevens-Johnson syndrome • toxic epidermal necrolysis
- Pregnancy: Use only if potential benefit outweighs risk—no information available. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- Breast feeding: Avoid breast-feeding during and for 2 months after treatment—no information available.
- Pre-treatment screening:
  - Evidence of non-mutated (wild-type) RAS status (at exons 2, 3 and 4 of KRAS and NRAS) is required before cetuximab is initiated for the treatment of metastatic colorectal cancer, and should be determined by an experienced laboratory using a validated test method.
- Directions for administration: Resuscitation facilities should be available.

National funding/access decisions

NICE technology appraisals (TAs)

- Cetuximab for the treatment of locally advanced squamous cell cancer of the head and neck (June 2008) NICE TA145
- Cetuximab in combination with radiotherapy is an option for the treatment of locally advanced squamous cell cancer of the head and neck in patients who have a Karnofsky performance status of 90% or greater and when all forms of platinum-based chemoradiotherapy treatment are contra-indicated. www.nice.org.uk/TA145
- Cetuximab for the treatment of recurrent or metastatic squamous cell cancer of the head and neck (June 2009) NICE TA172
- Cetuximab in combination with platinum-based chemotherapy is not recommended for the treatment of recurrent or metastatic squamous cell cancer of the head and neck. www.nice.org.uk/TA172
- Cetuximab for the first-line treatment of metastatic colorectal cancer (August 2009) NICE TA176
- Cetuximab in combination with fluorouracil, folinic acid and oxaliplatin is an option for the first-line treatment of metastatic colorectal cancer under the following circumstances:
  - the primary tumour has been resected or is potentially operable;
  - the metastatic disease is confined to the liver and is unresectable; and
  - the patient is fit to undergo surgery to resect the primary colorectal tumour and to undergo liver surgery if the metastases become resectable after treatment with cetuximab.
- In patients unable to tolerate oxaliplatin, or in whom oxaliplatin is contra-indicated, cetuximab in combination with fluorouracil, folinic acid and irinotecan can be used as an alternative.
- In addition, the manufacturer is required to rebate 16% of the amount of cetuximab used per patient when used in combination with fluorouracil, folinic acid, and oxaliplatin.
- Patients who meet the above criteria should receive cetuximab for no more than 16 weeks. At 16 weeks, cetuximab should be stopped and the patient should be...
assessed for resection of liver metastases. www.nice.org.uk/TA176

- Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012) NICE TA242

Cetuximab monotherapy or combination chemotherapy is not recommended for the treatment of patients with metastatic colorectal cancer that has progressed after first-line chemotherapy. www.nice.org.uk/TA242

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (December 2014) that cetuximab (Erbitux®) is accepted for restricted use within NHS Scotland, in combination with irinotecan or oxaliplatin-based chemotherapy, for the treatment of RAS wild-type metastatic colorectal cancer in patients who have not previously received chemotherapy for their metastatic disease (first-line treatment).

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- Erbitux (Merck Serono Ltd)

Cetuximab 5 mg per 1 ml Erbitux 100mg/20ml solution for infusion vials | 1 vial £178.10 (Hospital only)

Erbitux 500mg/100ml solution for infusion vials | 1 vial £880.50 (Hospital only)

Solution for infusion

- Yervoy (Bristol-Myers Squibb Pharmaceuticals Ltd)

Ipilimumab 5 mg per 1 ml Yervoy 50mg/10ml concentrate for solution for infusion vials | 1 vial £3,750.00 (Hospital only)

Yervoy 200mg/40ml concentrate for solution for infusion vials | 1 vial £15,000.00 (Hospital only)

Ipilimumab

- DRUG ACTION

Ipilimumab causes T-cell activation.

INDICATIONS AND DOSE

Treatment of unresectable or metastatic advanced melanoma

BY INTRAVENOUS INFUSION

- Adult: (consult product literature)

- CAUTIONS

For full details consult product literature.

- INTERACTIONS

Appendix 1 (ipilimumab).

SIDE-EFFECTS, FURTHER INFORMATION

Immune-related reactions A corticosteroid can be used after starting ipilimumab, to treat immune-related reactions.

For further information on side-effects, (including monitoring and management of side effects) consult product literature.

- CONCEPTION AND CONTRACEPTION

Use effective contraception.

- PREGNANCY

Avoid unless potential benefit outweighs risk (toxicity in animal studies).

- BREAST FEEDING

Discontinue breast-feeding—no information available.

- HEPATIC IMPAIRMENT

Use with caution if plasma-bilirubin concentration greater than 3 times upper limit of normal range or if plasma-transaminase concentration 5 times or greater than the upper limit of normal range.

- MONITORING REQUIREMENTS

For information on monitoring of side effects, consult product literature.

- PRESCRIBING AND DISPENSING INFORMATION

Infusion-related side-effects have been reported; premedication with paracetamol and an antihistamine is recommended.

- NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- Ipilimumab for previously treated advanced (unresectable or metastatic) melanoma (December 2012) NICE TA268

Ipilimumab is recommended as an option for the treatment of advanced (unresectable or metastatic) melanoma in patients who have received prior therapy, only if the manufacturer provides ipilimumab with the discount agreed in the patient access scheme. www.nice.org.uk/TA268

- Ipilimumab for previously untreated advanced (unresectable or metastatic) melanoma (July 2014) NICE TA319

Ipilimumab is recommended, within its marketing authorisation, as an option for treating adults with previously untreated advanced (unresectable or metastatic) melanoma, only if the manufacturer provides ipilimumab with the discount agreed in the patient access scheme. www.nice.org.uk/TA319

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (March 2013) that ipilimumab (Yervoy®) is accepted for restricted use within NHS Scotland for the treatment of advanced (unresectable or metastatic) melanoma in adults who have received prior therapy, only whilst ipilimumab is available at the price agreed in the patient access scheme.

Obinutuzumab

The properties listed below are those particular to the drug only. For properties common to the class, see Anti-lymphocyte monoclonal antibodies, p. 731.

INDICATIONS AND DOSE

Treatment of previously untreated chronic lymphocytic leukaemia in patients for whom full-dose fludarabine-based therapy is unsuitable due to co-morbidities

BY INTRAVENOUS INFUSION

- Adult: (consult product literature or local protocols)

CONTRA-INDICATIONS

For obinutuzumab contraindications, consult product literature.

CAUTIONS

CAUTIONS, FURTHER INFORMATION

Hepatitis B infection and reactivation

Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking obinutuzumab. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

For full details on the cautions of obinutuzumab, consult product literature.

- INTERACTIONS

Appendix 1 (obinutuzumab).

SIDE-EFFECTS

For full side effect details for obinutuzumab (including monitoring and management), consult product literature.

CONCEPTION AND CONTRACEPTION

Use effective contraception during and for 18 months after treatment.

PREGNANCY

Avoid unless potential benefit outweighs risk of B-lymphocyte depletion in fetus.
**Malignant disease**

- **BREAST FEEDING** Avoid breast-feeding during and for 18 months after treatment—present in milk in animal studies.
- **MONITORING REQUIREMENTS** Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - Ofatumumab in combination with chlorambucil for untreated chronic lymphocytic leukaemia (June 2015) NICE TA343
    - Gazyvaro in combination with chlorambucil (Hospital only)
    - Ofatumumab 25 mg per 1 ml Gazyvaro 1000mg/40ml concentrate for solution for infusion vials | 1 vial (Ex) £3,312.00 (Hospital only)

**Ofatumumab**

The properties listed below are those particular to the drug only. For properties common to the class, see Anti-lymphocyte monoclonal antibodies, p. 731.

**INDICATIONS AND DOSE**

**Treatment of chronic lymphocytic leukaemia (CLL) in patients refractory to fludarabine and alemtuzumab**

**Treatment of CLL in patients who have not received prior therapy and who are not eligible for fludarabine based therapy (in combination with chlorambucil or bendamustine)**

**BY INTRAVENOUS INFUSION**

- **Adult:** Premedication must be given 30 minutes to 2 hours before each dose—consult product literature for details (consult local protocol)

**CONTRA-INDICATIONS** For full details on the contra-indications for ofatumumab, consult product literature.

**CAUTIONS** History of cardiac disease—monitor closely and discontinue treatment if cardiac arrhythmias occur

**CAUTIONS, FURTHER INFORMATION**

**Hepatitis B infection and reactivation** Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking ofatumumab. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature). For full details about the cautions for ofatumumab, consult product literature

**INTERACTIONS** → Appendix 1 (ofatumumab).

**SIDE-EFFECTS**

**SIDE-EFFECTS, FURTHER INFORMATION**

Infusion-related side-effects (including cytokine release syndrome) have been reported with ofatumumab; premedication with paracetamol, an antihistamine, and a corticosteroid must be given—consult product literature. For full details (including monitoring and management of side-effects) consult product literature.

**CONCEPTION AND CONTRACEPTION** Use effective contraception during and for 12 months after treatment.

**PREGNANCY** Avoid unless potential benefit outweighs risk.

**BREAST FEEDING** Discontinue breast-feeding during and for 12 months after treatment—no information available.

**RENAL IMPAIRMENT** No information available for creatinine clearance less than 30 mL/minute.

**MONITORING REQUIREMENTS**

- Monitor electrolytes (including potassium and magnesium) before and during administration and correct if abnormal.
- Patients must be monitored closely during each infusion for the onset of infusion reactions.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Ofatumumab for the treatment of chronic lymphocytic leukaemia refractory to fludarabine and alemtuzumab (October 2010) NICE TA202
  - Ofatumumab is not recommended for the treatment of chronic lymphocytic leukaemia that is refractory to fludarabine and alemtuzumab.
  - Patients currently receiving ofatumumab for this condition should have the option to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA202
  - Ofatumumab in combination with chlorambucil or bendamustine for untreated chronic lymphocytic leukaemia (June 2015) NICE TA344
  - Ofatumumab in combination with chlorambucil is an option for untreated chronic lymphocytic leukaemia only if: the person is ineligible for fludarabine-based therapy and the manufacturer provides ofatumumab with the discount agreed in the patient access scheme. Patients currently receiving ofatumumab that is not and the person is ineligible for fludarabine-based therapy and the manufacturer provides ofatumumab with the discount agreed in the patient access scheme. Patients currently receiving ofatumumab that is not

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- Gazyvaro (Roche Products Ltd) ▼
  - Obinutuzumab 25 mg per 1 ml Gazyvaro 1000mg/40ml concentrate for solution for infusion vials | 1 vial (Ex) £3,312.00 (Hospital only)

- **Solution for infusion**
  - Ofatumumab 20 mg per 1 ml Arzerra 100mg/5ml concentrate for solution for infusion vials | 3 vial (Ex) no price available (Hospital only)
  - Arzerra 1000mg/50ml concentrate for solution for infusion vials | 1 vial (Ex) £1,820.00 (Hospital only)
Panitumumab

**DRUG ACTION** Panitumumab is a monoclonal antibody that binds to the epidermal growth factor receptor (EGFR).

**INDICATIONS AND DOSE**
Treatment of non-mutated RAS metastatic colorectal cancer (combination therapy) / Treatment of non-mutated RAS metastatic colorectal cancer (monotherapy after failure of fluoropyrimidine, oxaliplatin, and irinotecan-containing chemotherapy regimens) BY INTRAVENOUS INFUSION

‡ Adult: (consult product literature)

**INTERACTIONS**

**CONTRA-INDICATIONS** Intestinal pulmonary disease - the combination of panitumumab with oxaliplatin-containing chemotherapy is contra-indicated in patients with mutant RAS metastatic colorectal cancer or for whom RAS status is unknown

**CAUTIONS** History of keratitis - history of severe dry eye - history of ulcerative keratitis - pulmonary disease—discontinue if interstitial lung disease develops - risk factors for keratitis - risk factors for severe dry eye - risk factors for ulcerative keratitis (including contact lens use)

**INTERACTIONS** → Appendix 1 (panitumumab).

**SIDE-EFFECTS**

‡ Uncommon Bronchospasm - cyanosis - hirsutism - infusion-related reactions - nasal dryness

‡ Rare Keratitis - skin necrosis - Stevens-Johnson syndrome - toxic epidermal necrolysis

‡ CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during and for at least 6 months after treatment in women

‡ PREGNANCY Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

‡ BREAST FEEDING Manufacturer advises avoid breastfeeding during and for 2 months after treatment.

‡ PRE-TREATMENT SCREENING Evidence of non-mutated RAS status (at exons 2, 3 and 4 of KRAS and NRAS) is required before panitumumab treatment is initiated, and should be determined by an experienced laboratory using a validated test method.

‡ MONITORING REQUIREMENTS

‡ ‡ Monitor for hypomagnesaemia.

‡ Monitor for hypocalcaemia.

‡ Monitor for dermatological reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis (consult product literature).

‡ NATIONAL FUNDING/ACCESS DECISIONS

‡ NICE technology appraisals (TAs)

‡ Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012) NICE TA242

‡ Panitumumab monotherapy is not recommended for the treatment of patients with metastatic colorectal cancer that has progressed after first-line chemotherapy. www.nice.org.uk/TA242

‡ MEDICINAL FORMS

‡ There can be variation in the licensing of different medicines containing the same drug.

‡ Solution for infusion

‡ ELECTROLYTES: May contain Sodium

‡ Vectorix (Amgen Ltd)

‡ Panitumumab 20 mg per 1 ml Vectorix 400mg/20ml concentrate for solution for infusion vials [1 vial (P2D) £1.517.16 (Hospital only) Vectorix 100mg/5ml concentrate for solution for infusion vials [1 vial (P2D) £379.29 (Hospital only)]

Pertuzumab

**DRUG ACTION** Pertuzumab is a recombinant humanised monoclonal antibody, and acts by inhibiting human epidermal growth factor receptor 2 protein (HER2) dimerisation.

**INDICATIONS AND DOSE**

‡ Treatment of HER2-positive metastatic or locally recurrent unresectable breast cancer in combination with trastuzumab and docetaxel, in patients who have not received previous anti-HER2 therapy or chemotherapy (initiated by a specialist)

‡ BY INTRAVENOUS INFUSION

‡ Adult: (consult product literature)

‡ CAUTIONS

‡ Conditions that could impair left ventricular function - history of congestive heart failure - impaired left ventricular function - prior anthracycline exposure - radiotherapy to the chest area - recent myocardial infarction - serious cardiac arrhythmia - uncontrolled hypertension

‡ INTERACTIONS → Appendix 1 (pertuzumab).
SIDE-EFFECTS
- Common or very common When used in combination with trastuzumab and docetaxel: anaemia, arthralgia, chills, constipation, cough, decreased appetite, diarrhoea, dizziness, dry skin, dyspepsia, dysphoeca, febrile neutropenia, headache, increased lacrimation, infusion-related reactions, insomnia, left ventricular dysfunction, leucopenia, malaise, myalgia, nail disorder, nasopharyngitis, neutropenia, oedema, pain, paronychia, peripheral neuropathy, pleural effusion, pruritis, pyrexia, rash, severe hypersensitivity reactions, taste disturbance, upper respiratory tract infection
- Uncommon Interstitial lung disease (when used in combination with trastuzumab and docetaxel)
- Frequency not known Alopecia, bone-marrow suppression, extravasation, hyperuricaemia, nausea, oral mucositis, thromboembolism, tumour lysis syndrome, vomiting

CONCEPTION AND CONTRACEPTION
Ensure effective contraception during and for at least six months after treatment in women of childbearing potential

PREGNANCY
Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

BREAST FEEDING
Avoid—no information available.

HEPATIC IMPAIRMENT
Caution—no information available.

RENAL IMPAIRMENT
Caution in severe impairment—no information available.

MONITORING REQUIREMENTS
- Assess for signs and symptoms of congestive heart failure (including left ventricular ejection fraction) before and during treatment—consult product literature, and withhold treatment if necessary.
- Monitor for febrile neutropenia.

DIRECTIONS FOR ADMINISTRATION
Resuscitation facilities should be available.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion
- Perjeta (Roche Products Ltd) ▼
  Pertuzumab 30 mg per 1 ml Perjeta 420mg/14ml concentrate for solution for infusion vials | 1 vial (P) £2,395.00 (Hospital only)

Siltuximab

DRUG ACTION
Siltuximab is a monoclonal antibody that inhibits interleukin-6 receptor binding.

INDICATIONS AND DOSE
Treatment of multicentric Castleman’s disease (MCD) in patients who are human immunodeficiency virus (HIV) negative and human herpesvirus-8 (HHV-8) negative
- By intravenous infusion
  • Adult: 11 mg/kg every 3 weeks

CAUTIONS
Patients at increased risk of gastrointestinal perforation—promptly investigate those presenting with symptoms suggestive of gastrointestinal perforation—severe infection— withhold treatment until resolved-treat infection prior to treatment

CAUTIONS, FURTHER INFORMATION
Hypersensitivity reactions Infusion-related side-effects are reported commonly with siltuximab; resuscitation facilities should be available during treatment. Consult product literature for further information about siltuximab cautions.

INTERACTIONS
- Appendix 1 (siltuximab).
  Live vaccines should not be given concurrently or within 4 weeks before starting siltuximab treatment.

SIDE-EFFECTS, FURTHER INFORMATION
Infusion-related side effects Siltuximab therapy should be discontinued permanently in the event of a severe infusion-related reaction, anaphylaxis, a severe allergic reaction, or the occurrence of cytokine-release syndrome. Mild to moderate infusion-related reactions may improve by temporarily reducing the rate or stopping the infusion. When restarting treatment, a reduced infusion rate and the administration of antihistamines, paracetamol, and corticosteroids should be considered. Consider discontinuation of siltuximab if more than 2 doses are delayed due to treatment-related toxicities during the first 48 weeks—for full details consult product literature.

CONCEPTION AND CONTRACEPTION
Women of childbearing potential should use effective contraception during and for 3 months after treatment.

PREGNANCY
Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT
Use with caution in hepatic impairment.

MONITORING REQUIREMENTS
- Monitor neutrophil and platelet count, and haemoglobin levels prior to each dose of siltuximab treatment for the first 12 months and thereafter prior to every third dosing cycle. Consider delaying treatment if required neutrophil, platelet, and haemoglobin levels not achieved—consult product literature for details.
- Monitor for infection during treatment.

DIRECTIONS FOR ADMINISTRATION
For intravenous infusion (Sylvant®), give intermittently in Glucose 5%. Allow vials to reach room temperature over approximately 30 minutes, then reconstitute each 100 mg vial with 5.2 mL of water for injection, and each 400 mg vial with 20 mL of water for injection, to produce a 20 mg/mL solution. Gently swirl without shaking to dissolve. Further dilute to 250 mL with glucose 5% and gently mix. Use within 6 hours of dilution and give over 60 minutes using an administration set lined with polyvinyl chloride or polyurethane, through a low-protein binding in-line 0.2 micron filter.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion
- Sylvant (Janssen-Cilag Ltd) ▼
  Siltuximab 100 mg Sylvant 100mg powder for concentrate for solution for infusion vials | 1 vial (P) £415.00 (Hospital only)
  Siltuximab 400 mg Sylvant 400mg powder for concentrate for solution for infusion vials | 1 vial (P) £1,661.00 (Hospital only)
Trastuzumab

INDICATIONS AND DOSE
Treatment of early breast cancer which overexpresses human epidermal growth factor receptor-2 (HER2) (initiated by a specialist)

Treatment of metastatic breast cancer in patients with HER2-positive tumours who have not received chemotherapy for metastatic breast cancer and in whom anthracycline treatment is inappropriate (in combination with paclitaxel or docetaxel) (initiated by a specialist)

Treatment of metastatic gastric cancer in patients with tumours that overexpress HER2 who have received at least 2 chemotherapy regimens including, where appropriate, an anthracycline and a taxane (initiated by a specialist)

BY INTRAVENOUS INFUSION OR BY SUBCUTANEOUS INJECTION

Adult: (consult product literature or local protocols)

Monotherapy for metastatic breast cancer in postmenopausal patients with hormone-receptor positive HER2-positive tumours not previously treated with trastuzumab (in combination with an aromatase inhibitor) (initiated by a specialist)

BY INTRAVENOUS INFUSION OR BY SUBCUTANEOUS INJECTION

Adult: Women with oestrogen-receptor-positive breast cancer should also have received hormonal therapy (consult product literature or local protocols)

Treatment of metastatic gastric cancer in patients with HER2-positive tumours who have not received treatment for metastatic gastric cancer (in combination with capecitabine or fluorouracil and cisplatin) (initiated by a specialist)

BY INTRAVENOUS INFUSION

Adult: (consult product literature or local protocols)

复习

CONTRA-INDICATIONS
Severe dyspnoea at rest

CAUTIONS
Coronary artery disease • history of hypertension • symptomatic heart failure • uncontrolled arrhythmias

INTERACTIONS
Use with anthracyclines

Concomitant use of trastuzumab with anthracyclines is associated with cardiotoxicity. The use of anthracyclines even after stopping trastuzumab can increase the risk of cardiotoxicity and if possible should be avoided for up to 24 weeks. If an anthracycline needs to be used, cardiac function should be monitored closely.

SIDE-EFFECTS
Acne • alopecia • alopecia • anaphylaxis • angioedema • anxiety • arthralgia • arthritis • asthenia • bone pain • bone-marrow suppression • cardiotoxicity • chest pain • chills • depression • dizziness • drowsiness • dry eye • dry skin • ecchymosis • extravasation • fever • gastro-intestinal symptoms • headache • hepatitis • hypersensitivity reactions • hypertension • hypertonia • hyperuricaemia • hypotension • increased lacrimation • infection • infusion-related side-effects (possibly delayed onset) • insomnia • leg cramps • malaise • mastitis • myalgia • nail disorders • nausea • oedema • oral mucositis • paraesthesia • paresis • peripheral neuropathy • pruritus • pulmonary events (possibly delayed onset) • rash • sweating • taste disturbance • thrombocytopenia • tremor • tumour lysis syndrome • urticaria • vomiting • weight loss

PREGNANCY
Manufacturer advises avoid—oligohydramnios reported. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

BREAST FEEDING
Avoid breast-feeding during treatment and for 7 months afterwards.

MONITORING REQUIREMENTS
Cardiotoxicity Monitor cardiac function before and during treatment—for details of monitoring and managing cardiotoxicity, consult product literature.

DIRECTIONS FOR ADMINISTRATION
Resuscitation facilities should be available during administration of trastuzumab.

PRESCRIBING AND DISPENSING INFORMATION
When prescribing, dispensing or administering, check that this is the correct preparation—trastuzumab is not interchangeable with trastuzumab emtansine.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

Guidance on the use of trastuzumab for the treatment of advanced breast cancer (March 2002) NICE TA34

Trastuzumab in combination with paclitaxel is recommended as an option for patients with tumours expressing human epidermal growth factor receptor 2 (HER2) scored at levels of 3+ who have not received chemotherapy for metastatic breast cancer, and in whom anthracycline treatment is inappropriate.

Trastuzumab monotherapy is recommended as an option for patients with tumours expressing HER2 scored at levels of 3+ who have received at least two chemotherapy regimens for metastatic breast cancer. Prior chemotherapy must have included at least an anthracycline and a taxane where these treatments are appropriate. It should also have included hormonal therapy in suitable oestrogen-receptor-positive patients. www.nice.org.uk/TA34

Trastuzumab for the adjuvant treatment of early-stage HER2-positive breast cancer (August 2006) NICE TA107

Trastuzumab, given at 3-week intervals for 1 year or until disease recurrence (whichever is the shorter period), is recommended as an option for women with early-stage HER2-positive breast cancer following surgery, chemotherapy (neoadjuvant or adjuvant) and radiotherapy (if applicable). www.nice.org.uk/TA107

Trastuzumab for the treatment of HER2-positive metastatic gastric cancer (November 2010) NICE TA208

Trastuzumab in combination with cisplatin and capecitabine or fluorouracil is recommended for human epidermal growth factor receptor-2-positive metastatic adenocarcinoma of the stomach or gastro-oesophageal junction in patients who:

• have not received treatment for metastatic disease and
• have tumours expressing high levels of HER2 as defined by a positive immunohistochemistry score of 3.

www.nice.org.uk/TA208

Lapatinib or trastuzumab in combination with an aromatase inhibitor for the first-line treatment of metastatic hormone-receptor-positive breast cancer that overexpresses HER2 (June 2012) NICE TA257

Lapatinib or trastuzumab in combination with an aromatase inhibitor is not recommended for first-line treatment in postmenopausal women of metastatic hormone-receptor-positive breast cancer that overexpresses human epidermal growth factor receptor 2 (HER2).

Postmenopausal women currently receiving lapatinib or trastuzumab in combination with an aromatase inhibitor for this indication should have the option to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA257

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (December 2013) that subcutaneous trastuzumab injection (Herceptin®) is accepted for restricted use within NHS Scotland for the treatment of adults with HER2 positive metastatic breast cancer and early breast cancer, when used within licensed indications excluding use in combination with an aromatase inhibitor for the treatment of postmenopausal patients with hormone-receptor positive metastatic breast cancer, not previously treated with trastuzumab.
Trastuzumab emtansine

**DRUG ACTION** Trastuzumab emtansine is an antibody-conjugate that contains trastuzumab covalently linked to DM1, a cytotoxic microtubule inhibitor.

**INDICATIONS AND DOSE**
Monotherapy for the treatment of HER2-positive, unresectable, locally advanced or metastatic breast cancer, in adult patients who have previously received trastuzumab and a taxane separately or in combination (initiated by a specialist) / Monotherapy for the treatment of HER2-positive, unresectable, locally advanced or metastatic breast cancer, in adult patients who have developed disease recurrence during or within 6 months of completing adjuvant therapy (initiated by a specialist) by intravenous infusion

Adult: (consult product literature or local protocols)

**CAUTIONS**
Dyspnoea at rest—increased risk of pulmonary events / history of congestive heart failure / patients over 75 years / peripheral neuropathy (temporarily discontinue treatment—consult product literature) / recent history of myocardial infarction / recent history of unstable angina / risk of left ventricular dysfunction—consult product literature for specific risks with trastuzumab treatment—serious arrhythmias

**INTERACTIONS** → Appendix 1 (trastuzumab). Caution with concomitant anticoagulant medication—increased risk of thrombocytopenia with haemorrhagic events.

**SIDE-EFFECTS**
Common or very common / Abdominal pain / arthralgia / blurred vision / chills / conjunctivitis / constipation / cough / diarrhea / dizziness / dry eye / dry mouth / dysgeusia / dyspepsia / dysphonia / epistaxis / gingival bleeding / haemorrhage / hand-foot syndrome / headache / hypertension / hypokalaemia / increased lactation / infusion-related reactions / insomina / left ventricular dysfunction / malaise / memory impairment / myalgia / nail disorder / periphereral neuropathy / peripheral oedema / pruritus / pyrexia / rash / thrombocytopenia / urinary tract infection / urticaria

Uncommon / Hepatic failure / hepatic toxicity / interstitial lung disease / nodular regenerative hyperplasia / pneumonitis / portal hypertension

Frequency not known / Alopecia / bone-marrow suppression / extravasation / hyperuricaemia / nausea / oral mucositis / thromboembolism / tumour lysis syndrome / vomiting

**CONCEPTION AND CONTRACEPTION**
Effective contraception must be used during and for 6 months after stopping treatment in women and men.

**PREGNANCY**
Manufacturer advises avoid—oligohydramnios reported with trastuzumab. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING**
Manufacturer advises avoid breast-feeding during and for 6 months after treatment.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Herceptin (Roche Products Ltd)**
  - Trastuzumab 120 mg per 1 ml
  - Herceptin 600mg/5ml solution for injection vials | 1 vial (£222.20, Hospital only)

**Powder for solution for infusion**
- **Herceptin (Roche Products Ltd)**
  - Trastuzumab 150 mg
  - Herceptin 150mg powder for solution for infusion vials | 1 vial (£407.40)

**Trastuzumab emtansine**

**HEPATIC IMPAIRMENT** Consult product literature for dose modification in cases of abnormal liver function tests. Consult product literature for initiating treatment and discontinuation in cases of abnormal liver function tests.

**RENAL IMPAIRMENT** No information available—manufacturer advises caution in severe impairment.

**MONITORING REQUIREMENTS**
- Monitor hepatic function before each dose.
- Monitor for signs and symptoms of neurotoxicity.
- Monitor closely for infusion-related and hypersensitivity reactions.
- Monitor platelet count before each dose and as clinically indicated (consult product literature for treatment modification in thrombocytopenia).
- Test cardiac function before treatment and regularly during treatment—delay or discontinue treatment in cases of left ventricular dysfunction.
- Monitor for dyspnoea, cough, fatigue and pulmonary infiltrates—discontinue if interstitial lung disease or pneumonitis confirmed (fatal cases reported).

**DIRECTIONS FOR ADMINISTRATION**
Resuscitation facilities should be available during administration of trastuzumab emtansine.

**PRESCRIBING AND DISPENSING INFORMATION**
When prescribing, dispensing or administering, check that this is the correct preparation—trastuzumab emtansine and trastuzumab are not interchangeable.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**
- **Kadcyla (Roche Products Ltd)**
  - Trastuzumab emtansine 100 mg
  - Kadcyla 100mg powder for concentrate for solution for infusion vials | 1 vial (£641.01)
  - Trastuzumab emtansine 160 mg
  - Kadcyla 160mg powder for concentrate for solution for infusion vials | 1 vial (£2,625.62)

2.2 Cytotoxic responsive malignancy

**Cytotoxic drugs**
The chemotherapy of cancer is complex and should be confined to specialists in oncology. Cytotoxic drugs have both anti-cancer activity and the potential to damage normal tissue; most cytotoxic drugs are teratogenic. Chemotherapy may be given with a curative intent or it may aim to prolong life or to palliate symptoms. In an increasing number of cases chemotherapy may be combined with radiotherapy or surgery or both as either neoadjuvant treatment (initial chemotherapy aimed at shrinking the primary tumour, thereby rendering local therapy less destructive or more effective) or as adjuvant treatment (which follows definitive treatment of the primary disease, when the risk of subclinical metastatic disease is known to be high). All cytotoxic drugs cause side-effects and a balance has to be struck between likely benefit and acceptable toxicity.

Combinations of cytotoxic drugs, as continuous or pulsed cycles of treatment, are frequently more toxic than single drugs but have the advantage in certain tumours of enhanced response, reduced development of drug resistance and increased survival. However for some tumours, single-agent chemotherapy remains the treatment of choice. Cytotoxic drugs fall into a number of classes, each with characteristic antitumour activity, sites of action, and toxicity. A knowledge of sites of metabolism and excretion...
is important because impaired drug handling as a result of disease is not uncommon and may result in enhanced toxicity.

**Guidelines for handling cytotoxic drugs**
- Trained personnel should reconstitute cytotoxics
- Reconstitution should be carried out in designated pharmacy areas
- Protective clothing (including gloves, gowns, and masks) should be worn
- The eyes should be protected and means of first aid should be specified
- Pregnant staff should avoid exposure to cytotoxic drugs (all females of child-bearing age should be informed of the reproductive hazard)
- Use local procedures for dealing with spillages and safe disposal of waste material, including syringes, containers, and absorbent material
- Staff exposure to cytotoxic drugs should be monitored

**Intrathecal chemotherapy**
A Health Service Circular (HSC 2008/001) provides guidance on the introduction of safe practice in NHS Trusts where intrathecal chemotherapy is administered; written local guidance covering all aspects of national guidance should be available. Support for training programmes is also available.

Copies, and further information may be obtained from: Department of Health
PO Box 777
London
SE1 6XH
Fax: 01623 724524
It is also available from the Department of Health website (www.dh.gov.uk).

**Safe systems for cytotoxic medicines**
NHS cancer networks have been established across the UK to bring together all stakeholders in all sectors of care, to work collaboratively to plan and deliver high quality cancer services for a given population. NHS cancer networks have websites containing information on local chemotherapy services and treatment (see www.cancer.nhs.uk/networks.htm).

Safe system requirements:
- cytotoxic drugs for the treatment of cancer should be given as part of a wider pathway of care coordinated by a multidisciplinary team
- cytotoxic drugs should be prescribed, dispensed, and administered only in the context of a written protocol or treatment plan
- injectable cytotoxic drugs should only be dispensed if they are prepared for administration
- oral cytotoxic medicines should be dispensed with clear directions for use

**Important safety information**
**Risks of incorrect dosing of oral anti-cancer medicines**
The National Patient Safety Agency has advised (January 2008) that the prescribing and use of oral cytotoxic medicines should be carried out to the same standard as parenteral cytotoxic therapy.

Standards to be followed to achieve this include:
- non-specialists who prescribe or administer on-going oral cytotoxic medication should have access to written protocols and treatment plans, including guidance on the monitoring and treatment of toxicity;
- staff dispensing oral cytotoxic medicines should confirm that the prescribed dose is appropriate for the patient. Patients should have written information that includes details of the intended oral anti-cancer regimen, the treatment plan, and arrangements for monitoring, taken from the original protocol from the initiating hospital. Staff dispensing oral cytotoxic medicines should also have access to this information, and to advice from an experienced cancer pharmacist in the initiating hospital.

**Doses**
Doses of cytotoxic drugs are determined using a variety of different methods including body-surface area or body-weight. Alternatively, doses may be fixed. Doses may be further adjusted following consideration of a patient’s neutrophil count, renal and hepatic function, and history of previous adverse effects to the cytotoxic drug. Doses may also differ depending on whether a drug is used alone or in combination.

Because of the complexity of dosage regimens in the treatment of malignant disease, dose statements have been omitted from some of the drug entries in this chapter. However, even where dose statements have been provided, detailed specialist literature, individual hospital chemotherapy protocols, or local cancer networks (www.cancer.nhs.uk/networks.htm) should be consulted before prescribing, dispensing, or administering cytotoxic drugs.

Prescriptions should not be repeated except on the instructions of a specialist.

**Side-effects of cytotoxic drugs**
Side-effects common to most cytotoxic drugs are discussed below whilst side-effects characteristic of a particular drug or class of drugs (e.g. neurotoxicity with vinca alkaloids) are mentioned in the appropriate sections. Manufacturers’ product literature, hospital-trust protocols, and cancer-network protocols should be consulted for full details of side-effects associated with individual drugs and specific chemotherapy regimes.

Many side-effects of cytotoxic drugs often do not occur at the time of administration, but days or weeks later. It is therefore important that patients and healthcare professionals can identify symptoms that cause concern and can contact an expert for advice. Toxicities should be accurately recorded using a recognised scoring system such as the Common Toxicity Criteria for Adverse Events (CTCAE) developed by the National Cancer Institute.

**Extravasation of intravenous drugs**
A number of cytotoxic drugs will cause severe local tissue necrosis if leakage into the extravascular compartment occurs. To reduce the risk of extravasation injury it is recommended that cytotoxic drugs are administered by appropriately trained staff. See information on the prevention and management of extravasation injury.

**Oral mucositis**
A sore mouth is a common complication of cancer chemotherapy; it is most often associated with fluorouracil p. 761, methotrexate p. 762, and the anthracyclines. It is best to prevent the complication. Good oral hygiene (rinsing the mouth frequently and effective brushing of the teeth with a soft brush 2–3 times daily) is probably beneficial. For fluorouracil, sucking ice chips during short infusions of the drug is also helpful.

Once a sore mouth has developed, treatment is much less effective. Saline mouthwashes should be used but there is no good evidence to support the use of antiseptic or anti-inflammatory mouthwashes. In general, mucositis is self-limiting but with poor oral hygiene it can be a focus for bone-borne infection.

**Tumour lysis syndrome**
Tumour lysis syndrome occurs secondary to spontaneous or treatment-related rapid destruction of malignant cells. Patients at risk of tumour lysis syndrome include those with non-Hodgkin’s lymphoma (especially if high grade and
bulky disease), Burkitt’s lymphoma, acute lymphoblastic leukaemia and acute myeloid leukaemia (particularly if high white blood cell counts or bulky disease), and occasionally those with solid tumours. Pre-existing hyperuricaemia, dehydration, and renal impairment are also predisposing factors. Features include hyperkalaemia, hyperuricaemia (see below), and hyperphosphataemia with hypocalcaemia; renal damage and arrhythmias can follow. Early identification of patients at risk, and initiation of prophylaxis or therapy for tumour lysis syndrome, is essential.

Hyperuricaemia
Hyperuricaemia, which may be present in high-grade lymphoma and leukaemia, can be markedly worsened by chemotherapy and is associated with acute renal failure. Allopurinol p. 909 should be started 24 hours before treating such tumours and patients should be adequately hydrated. The dose of mercaptopurine p. 762 or azathioprine p. 716 should be reduced if allopurinol needs to be given concomitantly.

Rasburicase p. 784, a recombinant urate oxidase, is licensed for hyperuricaemia in patients with haematological malignancy. It rapidly reduces plasma-urate acid concentration and may be of particular value in preventing complications following treatment of leukaemias or bulky lymphomas.

Bone-marrow suppression
All cytotoxic drugs except vincristine sulfate p. 773 and bleomycin p. 756 cause bone-marrow suppression. This commonly occurs 7 to 10 days after administration, but is delayed for certain drugs, such as Carmustine p. 749, lomustine p. 752, and melphalan p. 752. Peripheral blood counts must be checked before each treatment, and doses should be reduced or therapy delayed if bone-marrow has not recovered.

Cytotoxic drugs may be contra-indicated in patients with acute infection; any infection should be treated before, or when starting, cytotoxic drugs.

Fever in a neutropenic patient (neutrophil count less than 1.0 x 10^9/litre) requires immediate broad-spectrum antibacterial therapy. Appropriate bacteriological investigations should be conducted as soon as possible.

Patients taking cytotoxic drugs who have signs or symptoms of infection should be advised to seek prompt medical attention. All patients should initially be investigated and treated under the supervision of the appropriate oncology or haematology specialist.

In selected patients, the duration and the severity of neutropenia can be reduced by the use of recombinant human granulocyte-colony stimulating factors.

Symptomatic anaemia is usually treated with red blood cell transfusions. For guidance on the use of erythropoietins in patients with cancer, see MHRA/CHM advice and NICE guidance.

See advice on the use of live vaccines in individuals with impaired immune response.

Alopecia
Reversible hair loss is a common complication, although it varies in degree between drugs and individual patients. No pharmacological methods of preventing this are available.

Thromboembolism
Venous thromboembolism can be a complication of cancer itself, but chemotherapy increases the risk.

Pregnancy and reproductive function
Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

Exclude pregnancy before treatment with cytotoxic drugs. Contraceptive advice should be given before cytotoxic therapy begins—women of childbearing age should use effective contraception during and after treatment. Regimens that do not contain an alkylating drug or procarbazine may have less effect on fertility, but those with an alkylating drug or procarbazine carry the risk of causing permanent male sterility (there is no effect on potency). Pretreatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy.

Alkylation drugs often severely affect gametogenesis and carry the risk of causing permanent male sterility (there is no effect on potency). Pretreatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy.

Nausea and vomiting
Nausea and vomiting cause considerable distress to many patients who receive chemotherapy and to a lesser extent abdominal radiotherapy, and may lead to refusal of further treatment; prophylaxis of nausea and vomiting is therefore extremely important. Symptoms may be acute (occurring within 24 hours of treatment), delayed (first occurring more than 24 hours after treatment), or anticipatory (occurring prior to subsequent doses). Delayed and anticipatory symptoms are more difficult to control than acute symptoms and require different management.

Patients vary in their susceptibility to drug-induced nausea and vomiting; those affected more often include women, patients under 50 years of age, anxious patients, and those who experience motion sickness. Susceptibility also increases with repeated exposure to the cytotoxic drug.

Drugs may be divided according to their emetogenic potential and some examples are given below, but the symptoms vary according to the dose, to other drugs administered and to the individual’s susceptibility to emetogenic stimuli.

Mildly emetogenic treatment—fluorouracil, etoposide, methotrexate (less than 100 mg/m², low dose in children), the vinca alkaloids, and abdominal radiotherapy.

Moderately emetogenic treatment—the taxanes, doxorubicin hydrochloride, intermediate and low doses of cyclophosphamide, mitoxantrone, and high doses of methotrexate (0.1–1.2 g/m²).

Highly emetogenic treatment—cisplatin p. 768, dacarbazine p. 751, and high doses of cyclophosphamide.

Prevention of acute symptoms
For patients at low risk of emesis, pretreatment with dexamethasone p. 581 or lorazepam p. 412 may be used.

For patients at high risk of emesis, a 5HT3-receptor antagonist, usually given by mouth in combination with dexamethasone p. 581 and the neurokinin receptor antagonist aprepitant p. 351 is effective.

Prevention of delayed symptoms
For delayed symptoms associated with moderately emetogenic chemotherapy, a combination of dexamethasone and 5HT3-receptor antagonist is effective; for highly emetogenic chemotherapy, a combination of dexamethasone and aprepitant is effective. Metoclopramide hydrochloride p. 347 is also licensed for delayed chemotherapy-induced nausea and vomiting.
Prevention of anticipatory symptoms
---
Good symptom control is the best way to prevent anticipatory symptoms. Lorazepam can be helpful for its amnesic, sedative, and anxiolytic effects.

Treatment for cytotoxic-induced side effects
---

**Anthracycline side-effects**

Anthracycline-induced cardiotoxicity

The anthracycline cytotoxic drugs are associated with dose-related, cumulative, and potentially life-threatening cardiotoxic side-effects.

**Anthracycline extravasation**

Local guidelines for the management of extravasation should be followed or specialist advice sought.

See further information on the prevention and management of extravasation injury.

Chemotherapy-induced mucositis and myelosuppression

Folinic acid p. 781 (given as calcium folinate) is used to counteract the folate-antagonist action of methotrexate p. 762 and thus speed recovery from methotrexate-induced mucositis or myelosuppression (‘folinic acid rescue’).

Folinic acid is also used in the management of methotrexate overdose, together with other measures to maintain fluid and electrolyte balance, and to manage possible renal failure.

Folinic acid does not counteract the antibacterial activity of folate antagonists such as trimethoprim p. 462. When folinic acid and fluorouracil p. 761 are used together in metastatic colorectal cancer the response-rate improves compared to that with fluorouracil alone.

The calcium salt of levofolinic acid p. 782, a single isomer of folinic acid, is also used for rescue therapy following methotrexate administration, for cases of methotrexate overdose, and for use with fluorouracil for colorectal cancer.

The dose of calcium levofolinate is generally half that of calcium folinate.

The disodium salts of folinic acid and levofolic acid are also used for rescue therapy following methotrexate therapy, and for use with fluorouracil for colorectal cancer.

**Urothelial toxicity**

Haemorrhagic cystitis is a common manifestation of urothelial toxicity which occurs with the oxazaphosphorines, cyclophosphamide p. 750 and ifosfamide p. 751; it is caused by the metabolite acrolein. Mesna p. 783 reacts specifically with this metabolite in the urinary tract, preventing toxicity. Mesna is used routinely (preferably by mouth) in patients receiving ifosfamide, and in patients receiving cyclophosphamide p. 750 by the intravenous route at a high dose (e.g. more than 2 g) or in those who experienced urothelial toxicity when given cyclophosphamide previously.

**Anthracyclines and other cytotoxic antibiotics**

Drugs in this group are widely used. Many cytotoxic antibiotics act as radiomimetics and simultaneous use of radiotherapy should be avoided because it may markedly increase toxicity. Daunorubicin p. 754, doxorubicin hydrochloride p. 754, epirubicin hydrochloride p. 756 and idarubicin hydrochloride p. 756 are anthracycline antibiotics. Mitoxantrone p. 778 is an anthracycline derivative.

Doxorubicin hydrochloride is available as both conventional and liposomal formulations. The different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable. Conventional doxorubicin hydrochloride is used to treat the acute leukaemias, Hodgkin’s and non-Hodgkin’s lymphomas, paediatric malignancies, and some solid tumours including breast cancer.

Epirubicin hydrochloride is structurally related to doxorubicin hydrochloride and clinical trials suggest that it is as effective in the treatment of breast cancer. Idarubicin hydrochloride has general properties similar to those of doxorubicin hydrochloride; it is mostly used in the treatment of haematological malignancies.

Daunorubicin also has general properties similar to those of doxorubicin hydrochloride.

Mitoxantrone is structurally related to doxorubicin hydrochloride.

Pixantrone p. 779 is licensed as monotherapy for the treatment of refractory or multiply relapsed aggressive non-Hodgkin B-cell lymphomas, although the benefits of using it as a fifth-line or greater chemotherapy in refractory patients has not been established.

Bleomycin p. 766 is given intravenously or intramuscularly to treat metastatic germ cell cancer and, in some regimens, non-Hodgkin’s lymphoma.

Dactinomycin is principally used to treat paediatric cancers. Its side-effects are similar to those of doxorubicin, except that cardiac toxicity is not a problem.

Mitomycin p. 767 is given intravenously to treat upper gastrointestinal and breast cancers and by bladder instillation for superficial bladder tumours. It causes delayed bone marrow toxicity and therefore it is usually administered at 6-weekly intervals.

**Vincal alkaloids**

The vincal alkaloids, vinblastine sulfate p. 773, vincristine sulfate p. 773, and vindesine sulfate p. 774, are used to treat a variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer). Vinorelbine p. 775 is a semi-synthetic vincal alkaloid. See also, role of vinorelbine in the treatment of breast cancer.

**Antimetabolites**

Antimetabolites are incorporated into new nuclear material or combine irreversibly with cellular enzymes, preventing normal cellular division.

**Alkylation drugs**

Extensive experience is available with these drugs, which are among the most widely used in cancer chemotherapy. They act by damaging DNA, thus interfering with cell replication.

Cyclophosphamide p. 750 is used mainly in combination with other agents for treating a wide range of malignancies, including some leukaemias, lymphomas, and solid tumours. It is given by mouth or intravenously; it is inactive until metabolised by the liver.

Ifosfamide p. 751 is related to cyclophosphamide and is given intravenously.

Melphalan p. 752 is licensed for the treatment of multiple myeloma, polycythaemia vera, childhood neuroblastoma, advanced ovarian adenocarcinoma, and advanced breast cancer. However, in practice, melphalan is rarely used for ovarian adenocarcinoma; it is no longer used for advanced breast cancer. Melphalan is also licensed for regional arterial perfusion in localised malignant melanoma of the extremities and localised soft-tissue sarcoma of the extremities.

Lomustine p. 752 is a lipid-soluble nitrosourea and the drug is given at intervals of 4 to 6 weeks.

Carmustine p. 749 has similar activity to lomustine; it is given to patients with multiple myeloma, non-Hodgkin’s lymphomas, and brain tumours. Carmustine implants are licensed for intracranial use in adults for the treatment of recurrent glioblastoma multiforme as an adjunct to surgery. Carmustine implants are also licensed for high-grade malignant glioma as adjunctive treatment to surgery and radiotherapy.
Bendamustine for the first-line treatment of chronic lymphocytic leukaemia; it is available on a named-patient basis from specialist importing companies.

ALKYLATING AGENTS

Bendamustine hydrochloride

INDICATIONS AND DOSE
Treatment of chronic lymphocytic leukaemia | Treatment of non-Hodgkin’s lymphoma | Treatment of multiple myeloma
BY INTRAVENOUS INFUSION
Adult: (consult local protocol)

CONTRA-INDICATIONS
Jaundice · low leucocyte count · low platelet count · major surgery less than 30 days before start of treatment · severe bone marrow suppression

CAUTIONS
Avoid in Acute porphyrias p. 864 · cardiac disorders—monitor serum potassium and ECG

INTERACTIONS
→ Appendix 1 (bendamustine).

SIDE-EFFECTS
▶ Common or very common Amenorrhoea · angina · anorexia · arthralgias · chill· constipation · dehydration · diarrhoea · electrolyte disturbances · haemorrhage · hypertension · hypokalaemia · hypotension · infection · insomnia · malaise · pain · palpitation · pyrexia · respiratory dysfunction
▶ Uncommon Pericardial effusion
▶ Rare Acute circulatory failure · drowsiness · sweating · voice changes
▶ Very rare Anticholinergic syndrome · ataxia · cardiac failure · encephalitis · haemolysis · multiple organ failure · myocardial infarction · neurological disorders · paraesthesia · peripheral neuropathy · phlebitis · pulmonary fibrosis · tachycardia · taste disturbance
▶ Frequency not known Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · male sterility · nausea · oral mucositis · premature menopause · secondary malignancy · Stevens-Johnson syndrome · thromboembolism · toxic epidermal necrolysis · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION
Secondary malignancy Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

CONCEPTION AND CONTRACEPTION
Effective contraception is required during treatment in men or women, and for 6 months after treatment in men.

PREGNANCY
Avoid (teratogenic and mutagenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

BREAST FEEDING
Discontinue breast-feeding.

HEPATIC IMPAIRMENT
Consider a 30% dose reduction in moderate impairment. Avoid in severe impairment.

RENAL IMPAIRMENT
No information available on use in patients with creatinine clearance less than 10 ml/minute.

NATIONAL FUNDING/ACCESS DECISIONS
NICE technology appraisals (TAs)
Bendamustine for the first-line treatment of chronic lymphocytic leukaemia (February 2011) NICE TA216
Bendamustine is recommended as an option for the treatment of chronic lymphocytic leukaemia in patients for whom fludarabine combination chemotherapy is not appropriate. www.nice.org.uk/TA216

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (March 2011) that bendamustine (Levact®) is accepted for restricted use within NHS Scotland for the treatment of chronic lymphocytic leukaemia in patients for whom fludarabine combination chemotherapy is not appropriate.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion
▶ Levact (Napp Pharmaceuticals Ltd)
Bendamustine hydrochloride 25 mg Levact 25mg powder for concentrate for solution for infusion vials | 5 vial £347.26 (Hospital only)
Bendamustine hydrochloride 100 mg Levact 100mg powder for concentrate for solution for infusion vials | 5 vial £1,379.04 (Hospital only)

Busulfan
(Busulphan)

INDICATIONS AND DOSE
Chronic myeloid leukaemia, induction of remission
BY MOUTH
Adult: 60 micrograms/kg daily (max. per dose 4 mg); maintenance 0.5–2 mg daily
Conditioning treatment before haematopoietic stem-cell transplantation
BY MOUTH OR BY INTRAVENOUS INFUSION
Adult: (consult local protocol)
Doses at extremes of body-weight
Dose may need to be calculated based on body surface area or adjusted ideal body weight in obese patients—consult product literature.

Caution
Avoid in Acute porphyrias p. 864 · high dose (antiepileptic prophylaxis required) · history of seizures (antiepileptic prophylaxis required) · ineffective once in blast crisis phase · previous progenitor cell transplant (increased risk of hepatic veno-occlusive disease) · previous radiation therapy (increased risk of hepatic veno-occlusive disease) · risk of second malignancy · three or more cycles of chemotherapy (increased risk of hepatic veno-occlusive disease)

INTERACTIONS
→ Appendix 1 (busulfan).

SIDE-EFFECTS
GENERAL SIDE-EFFECTS
▶ Common or very common Cardiac tamponade in thalassaemia · hepatic fibrosis · hepatic veno-occlusive disease · hepatotoxicity · hyperbilirubininaemia · jaundice · pneumonia · skin hyperpigmentation
▶ Rare Aplastic anaemia · seizures · visual disturbances
▶ Very rare Gyanaeomastia · myasthenia gravis
▶ Frequency not known Alopecia · bone-marrow suppression · hyperuricaemia · irreversible bone-marrow aplasia · lung toxicity · male sterility · nausea · oral mucositis · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting

SPECIFIC SIDE-EFFECTS
▶ With intravenous use extravasation

SIDE-EFFECTS, FURTHER INFORMATION
Lung toxicity Discontinue if lung toxicity develops.
Carmustine

**INDICATIONS AND DOSE**

**Multiple myeloma** | **Non-Hodgkin’s lymphomas** | **Brain tumours**
---|---|---
**BY INTRAVENOUS INFUSION**
- Adult: (consult product literature)
- Recurrent glioblastoma multiforme as an adjunct to surgery | High-grade malignant glioma as adjunctive treatment to surgery and radiotherapy
- BY INTRALESIONAL IMPLANTATION
- Adult: (consult product literature)

**CAUTIONS** Avoid in Acute porphyrias p. 864
**INTERACTIONS** → Appendix 1 (carmustine).

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
- Alopecia - bone-marrow suppression (delayed) - hyperuricaemia - irritant to tissues - male sterility - nausea - oral mucositis - premature menopause - secondary malignancy - thromboembolism - tumour lysis syndrome - vomiting

**SPECIFIC SIDE-EFFECTS**
- With intravenous use pulmonary fibrosis (delayed) - renal damage (cumulative)

**SIDE-EFFECTS, FURTHER INFORMATION**

Secondary malignancy Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment in men or women.

**PREGNANCY** Avoid (teratogenic in animals). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING** Discontinue breast-feeding.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**
- Carmustine implants and temozolomide for the treatment of newly diagnosed high-grade glioma (June 2007) NICE TA121
- Carmustine implants are an option for the treatment of newly diagnosed high-grade (Grade 3 or 4) glioma for patients in whom at least 90% of the tumour has been resected. Carmustine implants should only be used within specialist centres. www.nice.org.uk/TA121

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Implant**
- Gliadel (Eisai Ltd)
  - Carmustine 7.7 mg Gliadel 7.7 mg implant | 8 device (£5,203.00 (Hospital only))

Chlorambucil

**INDICATIONS AND DOSE**

Some lymphomas and chronic leukaemias (used either alone or in combination therapy)

**BY MOUTH**
- Adult: (consult local protocol)

**CAUTIONS** Avoid in Acute porphyrias p. 864 · children with nephrotic syndrome (increased seizure risk) · history of epilepsy (increased seizure risk)

**SIDE-EFFECTS**

- Uncommon Skin rash
- Very rare Male sterility (in prepubertal and pubertal males)
- Frequency not known Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · premature menopause · secondary malignancy · Stevens-Johnson syndrome · thromboembolism · toxic epidermal necrolysis · tumour lysis syndrome · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

Secondary malignancy Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia. Skin reactions If a rash occurs further chlorambucil is contra-indicated and cyclophosphamide is substituted.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment in men or women.

**PREGNANCY** Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Manufacturer advises consider dose reduction in severe impairment—limited information available.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**
- Obinutuzumab in combination with chlorambucil for untreated chronic lymphocytic leukaemia (June 2015) NICE TA343
- Obinutuzumab, in combination with chlorambucil, is an option for untreated chronic lymphocytic leukaemia in
patients who have comorbidities that make full-dose fludarabine-based therapy unsuitable for them, only if:
- bendamustine-based therapy is not suitable and
- the manufacturer provides obinutuzumab with the discount agreed in the patient access scheme.
Patients currently receiving obinutuzumab that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA344

Ofatumumab in combination with chlorambucil or bendamustine for untreated chronic lymphocytic leukaemia (June 2015) NICE TA344
Ofatumumab in combination with chlorambucil is an option for untreated chronic lymphocytic leukaemia only if:
- the person is ineligible for fludarabine-based therapy and
- bendamustine is not suitable and
- the manufacturer provides ofatumumab with the discount agreed in the patient access scheme.
Patients currently receiving ofatumumab that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop. www.nice.org.uk/TA344

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- CHLORAMBUCIL (Non-proprietary) Chlorambucil 2 mg Chlorambucil 2mg tablets | 25 tablet [PMR] £40.51 DT price = £40.51

**Cyclophosphamide**

**INDICATIONS AND DOSE**
Rheumatoid arthritis with severe systemic manifestations

**BY MOUTH**
- Adult: 1–1.5 mg/kg daily

Severe systemic rheumatoid arthritis | Other connective tissue diseases (especially with active vasculitis)

**BY INTRAVENOUS INJECTION**
- Adult: 0.5–1 g every 2 weeks, then reduced to 0.5–1 g every 1 month, frequency adjusted according to clinical response and haematological monitoring. To be given with prophyactic mesna

Used, mainly in combination with other agents for treating a wide range of malignancies, including some leukaemias, lymphomas, and solid tumours

**BY MOUTH OR BY INTRAVENOUS INFUSION**
- Adult: (consult local protocol)

**UNLICENSED USE**
Not licensed for rheumatoid arthritis with severe systemic manifestations.

**Important safety information**
RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

**CONTRA-INDICATIONS**
Haemorrhagic cystitis

**CAUTIONS**
Avoid in Acute porphyrias p. 864 · diabetes mellitus · previous or concurrent mediastinal irradiation—risk of cardiotoxicity

**INTERACTIONS**
Appendix 1 (cyclophosphamide).

**SIDE-EFFECTS**
- **GENERAL SIDE-EFFECTS**
  - Common or very common Anorexia · cardiotoxicity at high doses · disturbances of carbohydrate metabolism · inappropriate secretion of anti-diuretic hormone · interstitial pulmonary fibrosis · pancreatitis · pigmentation of nails · pigmentation of palms · pigmentation of soles · urothelial toxicity
  - Rare Hepatotoxicity · renal dysfunction
  - Frequency not known Alopecia · bone-marrow suppression · haemorrhagic cystitis · hyperuricaemia · male sterility · nausea · oral mucositis · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting

**SPECIFIC SIDE-EFFECTS**
- With intravenous use extravasation

SIDE-EFFECTS, FURTHER INFORMATION
Haemorrhagic cystitis A urinary metabolite of cyclophosphamide, acrolein, can cause haemorrhagic cystitis; this is a rare but serious complication; increased fluid intake for 24–48 hours after intravenous injection, can prevent this complication. When high-dose therapy (e.g. more than 2 g intravenously) is used or when the patient is considered to be at high risk of cystitis (e.g. because of pelvic irradiation), mesna (given initially intravenously then by mouth) can also help prevent cystitis.

Secondary malignancy Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 3 months after treatment in men or women.

**PREGNANCY**
Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING**
Discontinue breast-feeding during and for 36 hours after stopping treatment.

**HEPATIC IMPAIRMENT**
Reduce dose—consult local treatment protocol for details.

**RENAL IMPAIRMENT**
Reduce dose if serum creatinine concentration greater than 120 micromol/litre.

**DIRECTIONS FOR ADMINISTRATION**
For intravenous infusion (cyclophosphamide injection; Baxter) give via drip tubing in Glucose 5% or Sodium chloride 0.9%; reconstitute 500 mg with 25 mL sodium chloride 0.9%; reconstitute 1 g with 50 mL sodium chloride 0.9%.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, solution for injection, oral suspension, solution for infusion, oral solution

**Tablet**
CAUTIONARY AND ADVISORY LABELS 25, 27
- CYCLOPHOSPHAMIDE (Non-proprietary) Cyclophosphamide (as Cyclophosphamide monohydrate) 50 mg Cyclophosphamide 50mg tablets | 100 tablet [POM] £139.00 DT price = £139.00

**Powder for solution for injection**
- CYCLOPHOSPHAMIDE (Non-proprietary) Cyclophosphamide (as Cyclophosphamide monohydrate) 500 mg Cyclophosphamide 500mg powder for solution for injection vials | 1 vial [POM] £9.66–£9.95
  - Cyclophosphamide (as Cyclophosphamide monohydrate) 1 gram Cyclophosphamide 1g powder for solution for injection vials | 1 vial [POM] £10.66–£11.47

**Powder for solution for injection**
- Cyclophosphamide (as Cyclophosphamide monohydrate) 2 gram Cyclophosphamide 2g powder for solution for injection vials | 1 vial [POM] no price available
Cytotoxic responsive malignancy 751

Dacarbazine

**INDICATIONS AND DOSE**
Metastatic melanoma | Soft tissue sarcomas (combination therapy) | Hodgkin’s disease (combination therapy)

**BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION**

- **Adult:** (consult local protocol)

- **CAUTIONS**
  - Caution in handling—irritant to tissues
  - Interactions → Appendix 1 (dacarbazine).

- **SIDE-EFFECTS**
  - **Rare** Irritant to skin · irritant to tissues · liver necrosis due to hepatic vein thrombosis
  - **Frequency not known** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · myelosuppression · oral mucositis · severe nausea · severe vomiting · tumour lysis syndrome · vomiting

- **CONCEPTION AND CONTRACEPTION**
  - Ensure effective contraception during and for at least 6 months after treatment in men or women.

- **PREGNANCY**
  - Avoid (carcinogenic and teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

- **BREAST FEEDING**
  - Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT**
  - Dose reduction may be required in combined renal and hepatic impairment. Avoid in severe impairment.

- **RENAL IMPAIRMENT**
  - Dose reduction may be required in combined renal and hepatic impairment. Avoid in severe impairment.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Dacarbazine is a component of a commonly used combination for Hodgkin’s disease (ABVD—doxorubicin [previously Adriamycin®], bleomycin, vinblastine, and dacarbazine).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Powder for solution for injection**
  - **Dacarbazine (as Dacarbazine citrate) 100 mg** Dacarbazine 100mg powder for solution for injection vials | 10 vial [PSI] £30.00
  - **Dacarbazine (as Dacarbazine citrate) 200 mg** Dacarbazine 200mg powder for solution for injection vials | 10 vial [PSI] £160.00

- **Powder for solution for infusion**
  - **Dacarbazine (as Dacarbazine citrate) 500 mg** Dacarbazine 500mg powder for solution for infusion vials | 1 vial [PSI] £37.50
  - **Dacarbazine (as Dacarbazine citrate) 1 gram** Dacarbazine 1g powder for solution for infusion vials | 1 vial [PSI] £70.00

Ifosfamide

**INDICATIONS AND DOSE**
Malignant disease

**BY INTRAVENOUS INFUSION**

- **Adult:** (consult local protocol)

- **CONTRA-INDICATIONS**
  - Acute infection · urinary-tract infection · urinary-tract obstruction · urothelial damage

- **CAUTIONS**
  - Avoid in Acute porphyrias p. 864 · diabetes mellitus

- **INTERACTIONS** → Appendix 1 (ifosfamide).

- **SIDE-EFFECTS**
  - **Common or very common** Confusion · disorientation · drowsiness · psychosis · renal toxicity (may lead to tubular dysfunction, Fanconi’s syndrome, or diabetes insipidus) · restlessness · uraemia
  - **Uncommon** Severe encephalopathy
  - **Rare** Anorexia · constipation · convulsions · diarrhoea
  - **Very rare** Jaundice · syndrome of inappropriate antidiuretic hormone secretion · thrombophlebitis · arrhythmias · bone-marrow suppression · extravasation · heart failure · hyperuricaemia · male sterility · nausea · oral mucositis · premature menopause · secondary malignancy · thrombopoemobolism · tumour lysis syndrome · vomiting

Estramustine phosphate

**INDICATIONS AND DOSE**
Prostate cancer

**BY MOUTH**

- **Adult:** Initially 560–840 mg daily in divided doses; maintenance 140–1400 mg daily in divided doses

- **CONTRA-INDICATIONS**
  - Peptic ulceration · severe cardiovascular disease · thromboembolic disorders

- **CAUTIONS**
  - Avoid in Acute porphyrias p. 864 · cardiovascular disease · cerebrovascular disease · conditions which might be aggravated by fluid retention (such as epilepsy or migraine) · congestive heart failure · diabetes · hypercalcaemia · hypertension

- **INTERACTIONS** → Appendix 1 (estramustine).

- **SIDE-EFFECTS**
  - **Rare** Angioedema
  - **Frequency not known** Alopecia · altered endocrine function · altered liver function · bone-marrow suppression · congestive heart failure · diarrhoea · gynaecomastia · hyperuricaemia · impotence · ischaemic heart disease · male sterility · myocardial infarction · nausea · oedema · oral mucositis · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**
Secondary malignancy
  - Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

- **CONCEPTION AND CONTRACEPTION**
  - Men should use effective contraceptive methods during treatment.

- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution.

- **RENAL IMPAIRMENT**
  - Manufacturer advises caution.

- **DIRECTIONS FOR ADMINISTRATION**
  - Each dose should be taken no less than 1 hour before or 2 hours after meals and should not be taken with products containing calcium, magnesium or aluminium, including dairy products and antacid medication.

- **PATIENT AND CARER ADVICE**
  - Patients should be given advice on how to administer estramustine capsules.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Capsule**
  - **CAUTIONARY AND ADVISORY LABELS 5, 23**
  - Estracyt (Pfizer Ltd)

  Estramustine phosphate (as Estramustine sodium phosphate) 140 mg Estracyt 140mg capsules | 100 capsule [PSI] £171.28
Malignant disease

SIDE-EFFECTS, FURTHER INFORMATION

**Urethral toxicity** Mesna is routinely given with ifosfamide to reduce urethral toxicity.

**Secondary malignancy** Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during and for at least 6 months after treatment in men or women.

**PREGNANCY** Avoid (teratogenic and carcinogenic in animals). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Avoid.

**RENAL IMPAIRMENT** Avoid if serum creatinine concentration greater than 120 micromol/litre.

**MONITORING REQUIREMENTS** Ensure satisfactory electrolyte balance and renal function before each course (risk of tubular dysfunction, Fanconi’s syndrome or diabetes insipidus if renal toxicity not treated promptly).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- **Ifosfamide (Non-proprietary)**
  - Ifosfamide 1 gram Ifosfamide 1g powder for concentrate for solution for injection vials | 1 vial £59.52
  - Ifosfamide 2 gram Ifosfamide 2g powder for concentrate for solution for injection vials | 1 vial £174.32

**Melphanal**

**INDICATIONS AND DOSE**
Multiple myeloma

**BY MOUTH**
- Adult: 150 micrograms/kg daily for 4 days, dose to be repeated every 5 weeks, dose may vary according to regimen

**BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**
- Adult: (consult product literature)

**Polycythaemia vera**

**BY MOUTH**
- Adult: Initially 6–10 mg daily for 5–7 days, then reduced to 2–4 mg daily until satisfactory response, then reduced to 2–6 mg once weekly

Localised malignant melanoma of the extremities and localised soft tissue sarcoma of the extremities

**BY REGIONAL ARTERIAL PERFUSION**
- Adult: (consult local protocol)

**Important safety information**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745**

**CAUTIONS** Avoid in Acute porphyrias p. 864

**INTERACTIONS** → Appendix 1 (melphanal).

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Rare Interstitial pneumonitis, life threatening pulmonary fibrosis

- Frequency not known Alopecia, bone-marrow suppression (delayed), hyperuricaemia, male sterility, nausea, oral mucositis, permanent bone marrow damage (with prolonged use), premature menopause, secondary malignancy, thromboembolism, tumour lysis syndrome, vomiting

**SPECIFIC SIDE-EFFECTS**

- With intravenous use extravasation

**SIDE-EFFECTS, FURTHER INFORMATION**
Secondary malignancy Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment in men or women.

**PREGNANCY** Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING** Discontinue breast-feeding.

**RENAL IMPAIRMENT** Reduce dose initially (consult product literature).

**MONITORING REQUIREMENTS** Monitor full blood count before and throughout treatment.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**SIDE-EFFECTS, FURTHER INFORMATION**

**MEDICINES, see p. 745**

**Important safety information**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745**

**CAUTIONS** Avoid in Acute porphyrias p. 864

**INTERACTIONS** → Appendix 1 (melphanal).

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Rare Interstitial pneumonitis, life threatening pulmonary fibrosis

- Frequency not known Alopecia, bone-marrow suppression (delayed), hyperuricaemia, male sterility, nausea, oral mucositis, permanent bone marrow damage (with prolonged use), premature menopause, secondary malignancy, thromboembolism, tumour lysis syndrome, vomiting

**SPECIFIC SIDE-EFFECTS**

- With intravenous use extravasation

**SIDE-EFFECTS, FURTHER INFORMATION**
Secondary malignancy Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment in men or women.

**PREGNANCY** Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING** Discontinue breast-feeding.

**Treosulfan**

**INDICATIONS AND DOSE**

- **Ovarian cancer**
  - **BY MOUTH OR BY INTRAVENOUS INJECTION OR BY INTRAPERITONEAL INSTILLATION**
  - **Adult:** (consult product literature)

**Important safety information**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**, see p. 745

- **CAUTIONS** Avoid in Acute porphyrias, p. 864
- **SIDE-EFFECTS**
  - **Common or very common** Skin pigmentation
  - **Rare** Allergic alveolitis, haemorrhagic cystitis, pulmonary fibrosis
  - **Frequency not known** Alopecia, bone-marrow suppression, extravasation of intravenous drugs, hyperuricaemia, nausea, oral mucositis, pulmonary fibrosis, Premature menopause, secondary malignancy, thromboembolism, tumour lysis syndrome, vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- Secondary malignancy: Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukemia.
- **PREGNANCY** Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

*CAUTIONARY AND ADVISORY LABELS 25*

- **TREOSULFAN (Non-proprietary)**
  - **Treosulfan 250 mg** Treosulfan 250mg capsules | 100 capsule $P39 £622.10

**Powder for solution for injection**

  - **Treosulfan 5 gram** Treosulfan 5g powder for solution for injection vials | 5 vial $P39 £990.64

**ANTHRACYCLINES**

**Daunorubicin**

**INDICATIONS AND DOSE**

- **Acute myelogenous leukaemia** | **Acute lymphocytic leukaemia**
  - **BY INTRAVENOUS INFUSION**
    - **Adult:** (consult local protocol)
    - **Advanced AIDS-related Kaposi’s sarcoma (liposomal formulation only)**
     - **BY INTRAVENOUS INFUSION**
     - **Adult:** (consult product literature)

- **CONTRA-INDICATIONS** Myocardial insufficiency, previous treatment with maximum cumulative doses of daunorubicin or other anthracycline, recent myocardial infarction, severe arrhythmia

- **CAUTIONS** Caution in handling—irritant to tissues
- **INTERACTIONS** Caution is necessary with concomitant use of cardiotoxic drugs, or drugs that reduce cardiac contractility. Concomitant use with trastuzumab is associated with cardiotoxicity. The use of anthracyclines even after stopping trastuzumab can increase the risk of cardiotoxicity and if possible should be avoided for up to 24 weeks. If trastuzumab needs to be used, cardiac function should be monitored closely.
- **SIDE-EFFECTS** Alopecia, bone-marrow suppression, extravasation, hyperuricaemia, nausea, oral mucositis, thromboembolism, tumour lysis syndrome, vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Cardiotoxicity** All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible
- **PREGNANCY** Avoid (teratogenic and carcinogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Reduce dose according to serum bilirubin concentration—consult local protocol for details.
- **Avoid in severe impairment.
- **RENAL IMPAIRMENT** Reduce dose by 25% if serum creatinine 105–265 micromol/litre. Reduce dose by 50% if serum creatinine greater than 265 micromol/litre. Avoid in severe impairment.
- **MONITORING REQUIREMENTS** Cardiac monitoring essential.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

- **DAUNORUBICIN (Non-proprietary)**
  - Daunorubicin (as Daunorubicin hydrochloride) 20 mg Daunorubicin 20mg powder for solution for infusion vials | 10 vial $P39 £550.00 (Hospital only)

  - Daunorubicin (as Daunorubicin hydrochloride citrate) 50 mg DaunoXome 50mg emulsion for infusion vials | 1 vial $P39 £131.75

**Doxorubicin hydrochloride**

**INDICATIONS AND DOSE**

- **Acute leukaemias** | **Hodgkin’s lymphoma** | **Non-Hodgkin’s lymphoma** | **Some solid tumours including breast cancer**

- **BY INTRAVENOUS INJECTION**
  - Adult: (consult product literature)
  - Some papillary bladder tumours (bladder instillation)
  - Recurrent superficial bladder tumours (bladder instillation)
  - Transitional cell carcinoma (bladder instillation)
  - Carcinoma in situ (bladder instillation)

- **BY INTRAVESICAL INSTILLATION**
  - Adult: (consult product literature)
Caelyx®
For AIDS-related Kaposis’s sarcoma in patients with low CD4 count and extensive mucocutaneous or visceral disease | Advanced ovarian cancer when platinum-based chemotherapy has failed | Progressive multiple myeloma (in combination with bortezomib) in patients who have received at least one prior therapy and who have undergone or are unsuitable for bone-marrow transplantation | Monotherapy for metastatic breast cancer in patients with increased cardiac risk

By intravenous infusion
- Adult: (consult product literature)

MYOCET®
For use with cyclophosphamide for metastatic breast cancer
- Adult: (consult product literature)

- CONTRA-INDICATIONS Consult product literature
- CAUTIONS Cardiac disease · caution in handling—irritant to tissues · consult product literature · elderly · hypotension · previous myocardial infarction
- INTERACTIONS → Appendix 1 (doxorubicin).
  Caution is necessary with concomitant use of cardiotonic drugs, or drugs that reduce cardiac contractility. Concomitant use with trastuzumab is associated with cardiotoxicity. The use of anthracyclines even after stopping trastuzumab can increase the risk of cardiotoxicity and if possible should be avoided for up to 24 weeks. If trastuzumab needs to be used, cardiac function should be monitored closely.

- SIDE-EFFECTS
  - Common or very common Dehydration · diarrhoea · red colouration of the urine
  - Uncommon Supraventricular tachycardia (related to drug administration)
  - Frequency not known Alopecia · bone-marrow suppression · cardiomyopathy (with higher cumulative doses) · consult product literature · extravasation · heart failure (potentially fatal) · hyperuricaemia · nausea · oral mucositis · renal damage · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION
Extravasation Extravasation can cause severe tissue necrosis.
Cardiomyopathy Higher cumulative doses are associated with cardiomyopathy and it is usual to limit total cumulative doses to 450 mg/m² because symptomatic and potentially fatal heart failure is common above this dose.
Cardiotoxic Some evidence suggests that weekly low-dose administration may be less cardiotoxic.

Liposomal formulations Liposomal formulations of doxorubicin may reduce the incidence of cardiotoxicity and lower the potential for local necrosis, but infusion reactions, sometimes severe, may occur. Hand-foot syndrome (painful, macular reddening skin eruptions) occurs commonly with liposomal doxorubicin and may be dose limiting. It can occur after 2–3 treatment cycles and may be prevented by cooling hands and feet and avoiding socks, gloves, or tight-fitting footwear for 4–7 days after treatment.

Elevated bilirubin concentration Doxorubicin is largely excreted in the bile and an elevated bilirubin concentration is an indication for reducing the dose.

- CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.

- PREGNANCY Avoid (teratogenic and toxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

- BREAST FEEDING Discontinue breast-feeding.

- HEPATIC IMPAIRMENT Reduce dose according to bilirubin concentration—consult product literature or local treatment protocol for details. Avoid in severe impairment.

- RENAL IMPAIRMENT Consult product literature in severe impairment.

- MONITORING REQUIREMENTS Patients should be assessed before treatment, by echocardiography. Cardiac monitoring during treatment may assist in determining safe dosage.

- DIRECTIONS FOR ADMINISTRATION Conventional doxorubicin is given by injection into a fast-running infusion, commonly at 21-day intervals.

- PRESCRIBING AND DISPENSING INFORMATION Doxorubicin is available as both conventional and liposomal formulations. The different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable.

- NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
- Paclitaxel, pegylated liposomal doxorubicin, and topotecan for second-line or subsequent treatment of advanced ovarian cancer (May 2005) NICE TA91
  Paclitaxel, combined with a platinum compound (carboplatin or cisplatin), is an option for advanced cancer that relapses 6 months or more after completing initial platinum-based chemotherapy. Paclitaxel alone is an option for advanced ovarian cancer that does not respond to, or relapses within 6 months of completing initial platinum-based chemotherapy.

Pegylated liposomal doxorubicin is an option for advanced ovarian cancer that does not respond to, or relapses within 12 months of completing initial platinum-based chemotherapy. Pegylated liposomal doxorubicin are options for advanced ovarian cancer in patients who are allergic to platinum compounds. Topotecan alone is an option only for advanced ovarian cancer that does not respond to, or relapses within 6 months of completing initial platinum-based chemotherapy or in those allergic to platinum compounds and for whom paclitaxel alone or pegylated liposomal doxorubicin are inappropriate.

Epirubicin hydrochloride

INDICATIONS AND DOSE
Treatment of breast cancer | Treatment and prophylaxis of certain forms of superficial bladder cancer
BY INTRAVENOUS INFUSION OR BY INTRAVESICAL INSTILLATION
→ Adult: (consult product literature or local protocols)

• CONTRA-INDICATIONS Bladder inflammation or contraction (when used as a bladder instillation) - catheterisation difficulties (when used as a bladder instillation) - haematuria (when used as a bladder instillation) - invasive tumours penetrating the bladder (when used as a bladder instillation) - myocardialopathy - previous treatment with maximum cumulative doses of epirubicin or other anthracycline - recent myocardial infarction - severe arrhythmia - severe myocardial insufficiency - unstable angina - urinary tract infections (when used as a bladder instillation)

• CAUTIONS Caution in handling—irritant to tissues

• INTERACTIONS → Appendix 1 (epirubicin). Caution is necessary with concomitant use of cardio toxic drugs, or drugs that reduce cardiac contractility. Concomitant use with trastuzumab is associated with cardiotoxicity. The use of anthracyclines even after stopping trastuzumab can increase the risk of cardiotoxicity and if possible should be avoided for up to 24 weeks. If trastuzumab needs to be used, cardiac function should be monitored closely.

• SIDE-EFFECTS Alopecia - bone-marrow suppression - cardiotoxicity - extravasation - hyperpigmentation of nails - hyperpigmentation of oral mucosa - hyperpigmentation of skin - hyperuricaemia - nausea - oral mucositis - red colouration of the urine - thromboembolism - tumour lysis syndrome - vomiting

SIDE-EFFECTS, FURTHER INFORMATION
Cardiotoxicity A maximum cumulative dose of 0.9–1 g/m² is recommended to help avoid cardiotoxicity.

• PREGNANCY Avoid (carcinogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

• BREAST FEEDING Discontinue breast-feeding.

• HEPATIC IMPAIRMENT Reduce dose according to bilirubin concentration—consult local treatment protocol for details. Avoid in severe impairment.

• RENAL IMPAIRMENT Dose reduction may be necessary in severe impairment.

• MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

INDICATIONS AND DOSE
Acute non-lymphocytic leukaemias monotherapy
BY MOUTH
→ Adult: 30 mg/m² daily for 3 days; maximum 400 mg/m² per course

Acute non-lymphocytic leukaemia in combination therapy
BY MOUTH
→ Adult: 15–30 mg/m² daily for 3 days; maximum 400 mg/m² per course

Advanced breast cancer after failure of first-line chemotherapy (not including anthracyclines)–monotherapy
BY MOUTH
→ Adult: 45 mg/m² for 1 dose, repeat treatment every 3–4 weeks, alternatively 15 mg/m² daily for 3 consecutive days, repeat treatment every 3–4 weeks; maximum 400 mg/m² per course

Acute leukaemias | Advanced breast cancer after failure of first-line chemotherapy (not including anthracyclines)
BY INTRAVENOUS INJECTION
→ Adult: (consult product literature)

Important safety information
RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

• CONTRA-INDICATIONS Previous treatment with maximum cumulative dose of idarubicin or other anthracycline - recent myocardial infarction - severe arrhythmias - severe myocardial insufficiency

• CAUTIONS Caution in handling—irritant to tissues

• INTERACTIONS → Appendix 1 (idarubicin). Concomitant use with trastuzumab is associated with cardiotoxicity. The use of anthracyclines even after stopping trastuzumab can increase the risk of cardiotoxicity and if possible should be avoided for up to 24 weeks. If trastuzumab needs to be used, cardiac function should be monitored closely.

• SIDE-EFFECTS

GENERAL SIDE-EFFECTS
→ Common or very common Abdominal pain - cardiac disorders - diarrhoea - haemorrhage - rash - red pigmentation of the urine
→ Uncommon Nail hyperpigmentation - skin hyperpigmentation
Azacitidine

**DRUG ACTION** Azacitidine is a pyrimidine analogue.

**INDICATIONS AND DOSE**

Treatment of intermediate-2 and high-risk myelodysplastic syndromes, chronic myelomonocytic leukaemia, and acute myeloid leukaemia, in adults who are not eligible for haematoopoietic stem cell transplantation

**BY SUBCUTANEOUS INJECTION**

Adult: (consult local protocol)

**CONTRA-INDICATIONS** Advanced malignant hepatic tumour

**CAUTIONS** History of severe congestive heart failure - unstable cardiac disease (consider cardiopulmonary assessment before and during treatment) - unstable pulmonary disease (consider cardiopulmonary assessment before and during treatment)

**SIDE-EFFECTS**

- Uncommon Anaphylactic reactions - hypersensitivity reactions
- Frequency not known Alopecia - bone-marrow suppression - extravasation - hepatic coma - hepatic failure - hyperuricaemia - nausea - oral mucositis - renal failure - thromboembolism - tumour lysis syndrome - vomiting

**CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 3 months after treatment in men or women.

**PREGNANCY** Avoid (teratogenic and toxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746:

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Caution in severe impairment.

**RENAL IMPAIRMENT** Delay next treatment cycle if serum-creatinine or blood urea nitrogen greater than twice baseline value and above the upper level of normal until values return to normal or baseline, and then reduce dose by 50% on the next treatment cycle. Reduce dose by 50% on the next treatment cycle if serum-bicarbonate concentration less than 20 mmol/litre.

**MONITORING REQUIREMENTS**

- Monitor liver function tests, serum creatinine, and serum bicarbonate before initiation of treatment and before each treatment cycle.
- Monitor full blood count before initiation of treatment, before each treatment cycle, and as clinically indicated.
- Monitor for bleeding.

**NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

- Azacitidine for the treatment of myelodysplastic syndromes, chronic myelomonocytic leukaemia and acute myeloid leukaemia (March 2011) NICE TA218

Azacitidine is recommended in adults who are not eligible for haematoopoietic stem cell transplantation as an option for the treatment of intermediate-2 and high-risk myelodysplastic syndromes, chronic myelomonocytic leukaemia, or acute myeloid leukaemia. www.nice.org.uk/TA218

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

CAUTIONARY AND ADVISORY LABELS 25

- Zavedos (Pfizer Ltd)
  - Idarubicin hydrochloride 5 mg Zavedos 5mg capsules | 1 capsule £41.47
  - Idarubicin hydrochloride 10 mg Zavedos 10mg capsules | 1 capsule £66.12

**Solution for injection**

- IDARUBICIN HYDROCHLORIDE (Non-proprietary)
  - Idarubicin hydrochloride 1 mg per 1 ml Idarubicin 1mg/1ml solution for injection vials | 1 vial £165.98
  - Idarubicin 5mg/5ml solution for injection vials | 1 vial £82.99–£87.36

**Powder for solution for injection**

- Zavedos (Pfizer Ltd)
  - Idarubicin hydrochloride 5 mg Zavedos 5mg powder for solution for injection vials | 1 vial £174.72
  - Idarubicin hydrochloride 10 mg Zavedos 10mg powder for solution for injection vials | 1 vial £360.00

Capecitabine

**DRUG ACTION** Capecitabine is metabolised to fluorouracil.

**INDICATIONS AND DOSE**

Stage III colon cancer, adjuvant following surgery (monotherapy)

**BY MOUTH**

- Adult: 1.25 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, recommended duration of treatment is 6 months, adjust dose according to tolerability—consult product literature

Stage III colon cancer, adjuvant following surgery (combination therapy)

**BY MOUTH**

- Adult: 0.8–1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, recommended duration of treatment is 6 months, adjust dose according to tolerability—consult product literature

Metastatic colorectal cancer (monotherapy)

**BY MOUTH**

- Adult: 1.25 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, adjust dose according to tolerability—consult product literature
### Metastatic colorectal cancer (combination therapy)

**BY MOUTH**
- Adult: 0.8–1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, adjust dose according to tolerability—consult product literature

**Advanced gastric cancer (first-line treatment in combination with a platinum based regimen)**
- Adult: 0.8–1 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, alternatively 625 mg/m² twice daily given continuously, adjust dose according to tolerability—consult product literature

**Locally advanced or metastatic breast cancer (second-line treatment as monotherapy after failure of a taxane and anthracycline regimen or where further anthracycline treatment as monotherapy after failure of a taxane and anthracycline regimen is not indicated)** Locally advanced or metastatic breast cancer (second-line treatment, in combination with docetaxel, where previous therapy included an anthracycline)
- Adult: 1.25 g/m² twice daily for 14 days, subsequent courses repeated after a 7-day interval, adjust dose according to tolerability—consult product literature

#### CONTRA-INDICATIONS
Diaphyromyridine dehydrogenase deficiency

#### CAUTIONS
- Diabetes mellitus, diarrhoea or dehydration—consult product literature for guidance on dose modification and treatment interruption—electrolyte disturbances—history of angina pectoris—history of arrhythmias—history of significant cardiovascular disease—nervous system disease

#### INTERACTIONS
Appendix 1 (capecitabine).

#### SIDE-EFFECTS
- Alopecia—bone-marrow suppression—hyperuricaemia—nausea—oral mucositis—thrombocytopenia—tumour lysis syndrome—vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION
For further information on side-effects, consult product literature

#### PREGNANCY
Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

#### BREAST FEEDING
Discontinue breast-feeding.

#### HEPATIC IMPAIRMENT
Manufacturer advises monitor liver function in mild to moderate impairment—consult product literature for guidance on treatment interruption; avoid in severe impairment.

#### RENAL IMPAIRMENT
Reduce starting dose of 1.25 g/m² to 75% if creatinine clearance 30–50 mL/minute. Avoid if creatinine clearance less than 30 mL/minute.

#### MONITORING REQUIREMENTS
- Severe skin reactions Monitor for symptoms of severe skin reactions (including Stevens-Johnson syndrome and toxic epidermal necrolysis)—permanently discontinue treatment immediately if symptoms occur.
- Hand-foot syndrome Monitor for symptoms of hand-foot syndrome—interrupt treatment if significant syndrome occurs and refer to product literature.
- Monitor plasma–calcium concentration.
- Monitor for eye disorders (including keratitis and corneal disorders).

#### NATIONAL FUNDING/ACCESS DECISIONS
**NICE technology appraisals (TAs)**
- Capecitabine and tegafur for uracil for metastatic colorectal cancer (May 2003) NICE TA61
- Capecitabine or tegafur with uracil (now discontinued) in combination with folinic acid is an option for the first-line treatment of metastatic colorectal cancer. www.nice.org.uk/TA61

- Capecitabine and oxaliplatin in the adjuvant treatment of stage III (Dukes’ C) colon cancer (April 2006) NICE TA100
- Capecitabine alone or oxaliplatin combined with fluorouracil and folinic acid are options for adjuvant treatment following surgery for stage III (Dukes’ C) colon cancer. www.nice.org.uk/TA100

- Capecitabine for the treatment of advanced gastric cancer (July 2010) NICE TA191
- Capecitabine in combination with a platinum-based regimen is recommended for the first-line treatment of inoperable advanced gastric cancer. www.nice.org.uk/TA191

- Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine for the treatment of metastatic colorectal cancer (December 2010) NICE TA212
- Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine is not recommended for the treatment of metastatic colorectal cancer. www.nice.org.uk/TA212

- Bevacizumab in combination with capecitabine for the first-line treatment of metastatic breast cancer (August 2012) NICE TA263
- Bevacizumab in combinations with capecitabine is not recommended within its marketing authorisation for the first-line treatment of metastatic breast cancer, that is, when treatment with other chemotherapy options including taxanes or anthracyclines is not considered appropriate, or when taxanes or anthracyclines have been used as part of adjuvant treatment in the previous 12 months. www.nice.org.uk/TA263

#### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS**

- **CAPECITABINE (Non-proprietary)**
  - Capecitabine 150 mg | 60 tablet [PPh £46.02 (Hospital only)] | 60 tablet [PPh £39.99]
  - Capecitabine 300 mg | 300 tablet [PPh £39.99 | 60 tablet [PPh £54.00]
  - Capecitabine 500 mg | 500 tablet [PPh £265.55 (Hospital only)] | 120 tablet [PPh £265.00]

- **Xeloda (Roche Products Ltd)**
  - Capecitabine 150 mg | 150mg tablets | 60 tablet [PPh £40.02]
  - Capecitabine 500 mg | 500mg tablets | 120 tablet [PPh £265.55]

#### Cladribine

**INDICATIONS AND DOSE**

**LITAK®**

**Hairy cell leukaemia**

**BY SUBCUTANEOUS INJECTION**

- Adult: (consult product literature or local protocols)

**LEUSTAT®**

**B-cell chronic lymphocytic leukaemia in patients who have failed to respond to standard regimens containing an alkylating agent** Hairy cell leukaemia

**BY INTRAVENOUS INFUSION**

- Adult: (consult product literature or local protocols)

#### CAUTIONS
Use irradiated blood only

**CAUTIONS, FURTHER INFORMATION**

Immunosuppressive effect of cladribine Cladribine has a potent and prolonged immunosuppressive effect. Patients treated with cladribine are more prone to serious bacterial, opportunistic fungal, and viral infections, and prophylactic therapy is recommended in those at risk. To prevent potentially fatal transfusion-related graft-versus-host reaction, only irradiated blood products should be
administered. Prescribers should consult specialist literature when using highly immunosuppressive drugs.

- **INTERACTIONS** → Appendix 1 (cladribine).
- **SIDE-EFFECTS** Abdominal pain, acute renal failure (with high doses) - alopecia - anxiety - arthralgia - asthma - bone-marrow suppression - chills - constipation - cough - diarrhoea - dizziness - dyspnoea - extravasation - flatulence - haemolytic anaemia - headache - hyperuricaemia - insomnia - malaise - myalgia - nausea - oedema - oral mucositis - pruritus - purpura - rash - severe myelosuppression (with neutropenia, anaemia and thrombocytopenia) - severe neurotoxicity (with high doses) - sweating - tachycardia - thromboembolism - tumour lysis syndrome - vomiting

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises that men should not father children during and for 6 months after treatment.
- **PREGNANCY** Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Regular monitoring recommended in hepatic impairment.
- **RENAL IMPAIRMENT** Regular monitoring recommended in renal impairment.
- **DIRECTIONS FOR ADMINISTRATION** Litak® for subcutaneous use only — no dilution required.

### Cytarabine

#### INDICATIONS AND DOSE

**Induction of remission of acute myeloblastic leukaemia**

- **BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INJECTION OR BY SUBCUTANEOUS INJECTION**
  - Adult: (consult local protocol)
  - Lymphomatous meningitis
    - **BY INTRATHECAL INJECTION**
    - Adult: (consult local protocol)

#### Important safety information

Not all cytarabine preparations can be given by intrathecal injection — consult product literature.

#### INTERACTIONS → Appendix 1 (cytarabine).

#### SIDE-EFFECTS

- Alopecia - bone-marrow suppression - extravasation - hyperuricaemia - nausea - oral mucositis - thromboembolism - tumour lysis syndrome - vomiting
- **PREGNANCY** Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Reduce dose — consult product literature.
- **MONITORING REQUIREMENTS** Cytarabine is a potent myelosuppressant and requires careful haematological monitoring.

#### NATIONAL FUNDING/ACCESS DECISIONS

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (July 2007) that liposomal cytarabine suspension (DepoCyt®) is not recommended for use within NHS Scotland for the intrathecal treatment of lymphomatous meningitis.

### Clofarabine

#### INDICATIONS AND DOSE

**Relapsed or refractory acute lymphoblastic leukaemia in patients who have received at least two previous regimes by INTRAVENOUS INFUSION**

- Adult 18-20 years: (consult local protocol)

#### IMPORTANT SAFETY INFORMATION

- **CAUTIONS** Cardiac disease
- **PREGNANCY** Manufacturer advises avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- **ELECTROLYTES:** May contain Sodium
- **DepoCyt®**
  - Cytarabine 1 mg per 1 ml Evoltra 20mg/20ml concentrate for solution for infusion vials | 4 vial (£93) £3,304.72 (Hospital only)

**Solution for injection**

- **CYTARABINE (Non-proprietary)**
  - Cytarabine 200 mg per 1 ml Evoltra 500mg/25ml solution for injection vials | 1 vial (£39) £135.00
  - Cytarabine 100 mg per 1 ml Evoltra 250mg/12.5ml solution for injection vials | 5 vial (£32) £60.98–£30.00
  - Cytarabine 20 mg per 1 ml Evoltra 200mg/10ml solution for injection vials | 5 vial (£10) £78.00–£40.00
  - Cytarabine 10 mg per 1 ml Evoltra 100mg/5ml suspension for injection vials | 1 vial (£40) no price available (Hospital only)
Decitabine

- **DRUG ACTION** Decitabine is a pyrimidine analogue.

**INDICATIONS AND DOSE**

Treatment of newly diagnosed acute myeloid leukaemia in patients over 65 years of age who are not candidates for standard induction chemotherapy

- **BY INTRAVENOUS INFUSION**
  - Elderly: (consult local protocol)

- **CAUTIONS**
  - History of severe congestive heart failure
  - History of unstable cardiac disease

- **INTERACTIONS** → Appendix 1 (decitabine).

**SIDE-EFFECTS**

- Common or very common Diarrhoea · epistaxis · headache
- Uncommon Acute febrile neutrophilic dermatosis
- Frequency not known Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

**PREGNANCY** Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution—no information available.

**RENAL IMPAIRMENT**

Manufacturer advises caution if creatinine clearance less than 30 mL/minute—no information available.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Powder for solution for infusion**
  - **ELECTROLYTES:** May contain Potassium, sodium
  - **Dacogen** (Janssen-Cilag Ltd)
    - Decitabine 50 mg Dacogen 50mg powder for concentrate for solution for infusion vials (1 vial PIP 1970.86)

---

Fludarabine phosphate

**INDICATIONS AND DOSE**

Initial treatment of advanced B-cell chronic lymphocytic leukaemia (CLL) or after first line treatment in patients with sufficient bone marrow reserves

- **BY MOUTH**
  - Adult: 40 mg/m² for 5 days every 28 days, usually given for 6 cycles

- **BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION**
  - Adult: (consult product literature)

**SIDE-EFFECTS**

- Common or very common Acute myeloid leukaemia · anorexia · chills · cough · diarrhoea · fever · immunosupression · malaise · myelodysplastic syndrome · myelosuppression (may be cumulative) · oedema · peripheral neuropathy · pneumonia · rash · visual disturbances · weakness

- Uncommon Autoimmune disorder · confusion · fibrosis · haemorrhage · immune-mediated haemolytic anaemia · neutropenia · pneumonitis · pulmonary toxicity · thrombocytopenia

- Rare Agitation · arthralgia · blindness · coma · heart failure · optic neuropathy · seizures · skin cancer · Stevens–Johnson syndrome · toxic epidermal necrolysis

- Frequency not known Alopecia · bone-marrow suppression · extravasation · haemorrhagic cystitis · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

**CONCEPTION AND CONTRACEPTION**

Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.

**PREGNANCY**

Avoid (embryotoxic and teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING**

Discontinue breast-feeding.

**RENAL IMPAIRMENT**

Reduce dose by up to 50% if creatinine clearance 30–70 mL/minute. Avoid if creatinine clearance less than 30 mL/minute.

**MONITORING REQUIREMENTS**

- Monitor for signs of haemolysis.
- Monitor for neurological toxicity.
- Assess creatinine clearance in patients over 65 years before treatment initiation.

**DIRECTIONS FOR ADMINISTRATION** Concentrate for intravenous injection or infusion must be diluted before administration (consult product literature).

**NATIONAL FUNDING/ACCESS DECISIONS**

- **NICE technology appraisals (TAs)**
  - Fludarabine for the treatment of B-cell chronic lymphocytic leukaemia (September 2001) NICE TA29
    - Oral fludarabine is recommended for the second-line treatment of B-cell chronic lymphocytic leukaemia in patients who have either failed, or are intolerant of, first line chemotherapy, and who would otherwise have received combination chemotherapy of either:
      - cyclophosphamide, doxorubicin, vincristine and prednisolone (CHOP)
      - cyclophosphamide, doxorubicin and prednisolone (CAP)
    - In patients with advanced disease, Rai stages III/IV (Binet stage C), or Rai stages I/II (Binet stage A/B) when the patient has disease-related symptoms or evidence of progressive disease.

- Fludarabine monotherapy for the first-line treatment of chronic lymphocytic leukaemia (February 2007) NICE TA119
  - Fludarabine monotherapy is not recommended for the first-line treatment of chronic lymphocytic leukaemia.

- [Scottish Medicines Consortium (SMC) Decisions](www.nice.org.uk/TA29)

  - The Scottish Medicines Consortium has advised (October 2006) that fludarabine is accepted for restricted use for the treatment of B-cell chronic lymphocytic leukaemia (CLL) in patients with sufficient bone marrow reserves.
  - First-line treatment should only be initiated in patients with advanced disease, Rai stages III/IV (Binet stage C), or Rai stages I/II (Binet stage A/B) where the patient has disease-related symptoms or evidence of progressive disease.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.
### Florouracil

**INDICATIONS AND DOSE**

Treatment of some solid tumours including gastro-intestinal tract cancers and breast cancer in combination with folic acid in advanced colorectal cancer.

**BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION OR BY INTRA-ARTERIAL INFUSION**

- **Adult:** (consult product literature)
- **INTERACTIONS** → Appendix 1 (fluorouracil).
- **SIDE-EFFECTS**
  - **Rare** Cerebellar syndrome
  - **Frequency not known** Alopecia, bone-marrow suppression, desquamative hand-foot syndrome (on prolonged infusion), extravasation, hyperuricaemia, mucositis, myelosuppression, nausea, oral mucositis, thromboembolism, tumour lysis syndrome, vomiting
- **PREGNANCY**
  - Avoid (teratogenic). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **HANDLING AND STORAGE** Caution in handling—irritant to tissues.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **FLUOROURACIL (Non-proprietary)**
  - Fluorouracil (as Fluorouracil sodium) 25 mg per 1 ml
  - Fluorouracil 500mg/20ml solution for injection vials | 1 vial (£3) £64.00
  - Fluorouracil 25mg/2ml solution for injection vials | 1 vial (£3) £110.42
  - Fluorouracil 50mg/2ml concentrate for solution for injection vials | 1 vial (£3) £156.00

**Solution for infusion**

- **FLUOROURACIL (Non-proprietary)**
  - Fluorouracil (as Fluorouracil sodium) 25 mg per 1 ml
  - Fluorouracil 5g/100ml solution for infusion vials | 1 vial (£3) £64.00
  - Fluorouracil (as Fluorouracil sodium) 50 mg per 1 ml
  - Fluorouracil 2.5g/50ml solution for infusion vials | 1 vial (£3) £32.00

---

### Gemcitabine

**INDICATIONS AND DOSE**

First-line treatment for locally advanced or metastatic non-small cell lung cancer (as monotherapy in elderly patients and in palliative treatment; otherwise in combination with cisplatin). Treatment of locally advanced or metastatic pancreatic cancer. Treatment of advanced or metastatic bladder cancer (in combination with cisplatin).

**Treatment of locally advanced or metastatic epithelial ovarian cancer** which has relapsed after a recurrence-free interval of at least 6 months following previous platinum-based therapy (in combination with carboplatin).

**Treatment of metastatic breast cancer** which has relapsed after previous chemotherapy including an anthracycline (in combination with paclitaxel).

**BY INTRAVENOUS INFUSION**

- **Adult:** (consult local protocol)

- **INTERACTIONS** → Appendix 1 (gemcitabine).
- **SIDE-EFFECTS**
  - **Rare** Haemolytic uraemic syndrome
  - **Frequency not known** Alopecia, bone-marrow suppression, extravasation, hyperuricaemia, influenza-like symptoms, microangiopathic haemolytic anaemia, mild gastrointestinal side-effects, musculoskeletal pain, nausea, oral mucositis, pulmonary toxicity, rash, renal impairment, thromboembolism, tumour lysis syndrome, vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

Microangiopathic haemolytic anaemia. Gemcitabine should be discontinued if signs of microangiopathic haemolytic anaemia occur.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment. Men must avoid fathering a child during and for 6 months after treatment.

**PREGNANCY** Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Manufacturer advises caution.

**RENAL IMPAIRMENT** Manufacturer advises caution.

**NATIONAL FUNDING/ACCESS DECISIONS**

- **NICE technology appraisals (TAs)**
  - Gemcitabine is an option for first-line chemotherapy for patients with advanced or metastatic adenocarcinoma of the pancreas and a Karnofsky score of at least 50 [Karnofsky score is a measure of the ability to perform ordinary tasks].
  - Gemcitabine is not recommended for patients who can have potentially curative surgery. There is insufficient evidence about its use for second-line treatment of pancreatic adenocarcinoma. www.nice.org.uk/TA25

- **Gemcitabine for the treatment of metastatic breast cancer (January 2007) NICE TA116**
  - Gemcitabine, in combination with paclitaxel, is an option for the treatment of metastatic breast cancer only when docetaxel monotherapy or docetaxel plus capcitabine are also considered appropriate. www.nice.org.uk/TA116

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (November 2006) that gemcitabine is accepted for restricted use for the treatment of metastatic breast cancer, which has relapsed following previous chemotherapy including an anthracycline (unless contra-indicated).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.
Solution for infusion

▶ GEMCITABINE (Non-proprietary)
Gemcitabine (as Gemcitabine hydrochloride)
200 mg Gemcitabine 200mg/5.3ml concentrate for solution for infusion vials | 1 vial £32.00
Gemcitabine 200mg/2ml concentrate for solution for infusion vials | 1 vial £32.00
Gemcitabine (as Gemcitabine hydrochloride) 1 gram Gemcitabine 1g/26.3ml concentrate for solution for infusion vials | 1 vial £162.00

Powder for solution for infusion

▶ GEMCITABINE (Non-proprietary)
Gemcitabine (as Gemcitabine hydrochloride)
200 mg Gemcitabine 200mg powder for solution for infusion vials | 1 vial £32.00
Gemcitabine (as Gemcitabine hydrochloride) 1 gram Gemcitabine 1g powder for solution for infusion vials | 1 vial £162.00
Gemcitabine (as Gemcitabine hydrochloride) 1.5 gram Gemcitabine 1.5g powder for solution for infusion vials | 1 vial £233.93
Gemcitabine (as Gemcitabine hydrochloride) 2 gram Gemcitabine 2g powder for solution for infusion vials | 1 vial £324.00
Gemzar (Eli Lilly and Company Ltd)
Gemcitabine (as Gemcitabine hydrochloride) 200 mg Gemzar 200mg powder for solution for infusion vials | 1 vial £32.55
Gemcitabine (as Gemcitabine hydrochloride) 1 gram Gemzar 1g powder for solution for infusion vials | 1 vial £162.76

Mercaptopurine

(6-Mercaptopurine)

INDICATIONS AND DOSE
Severe acute Crohn’s disease | Maintenance of remission of Crohn’s disease | Ulcerative colitis
BY MOUTH
> Adult: 1–1.5 mg/kg daily, some patients may respond to lower doses
Acute leukaemias | Chronic myeloid leukaemia
BY MOUTH USING TABLETS
> Adult: Initially 2.5 mg/kg daily, adjusted according to response, alternatively initially 50–75 mg/m² daily, adjusted according to response
> BY MOUTH USING ORAL SUSPENSION
> Adult: Initially 25–75 mg/m² daily, adjusted according to response

Dose equivalence and conversion
Mercaptopurine tablets and Xaluprine® oral suspension are not bioequivalent, haematological monitoring is advised when switching formulations.

UNLICENSED USE
Not licensed for use in severe ulcerative colitis and Crohn’s disease.

Important safety information
RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

CONTRA-INDICATIONS
Absence thiopurine methyltransferase activity

CAUTIONS
Reduced thiopurine methyltransferase activity

Thiopurine methyltransferase
The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

INTERACTIONS
> Appendix 1 (mercaptopurine).

SIDE-EFFECTS
> Rare Pancreatitis · transient oligospermia
> Very rare Intestinal ulceration · lymphoma
> Frequency not known Alopecia · anorexia · bone-marrow suppression · hepatotoxicity · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION
Gastro-intestinal side-effects
Tgiouanine has a lower incidence of gastrointestinal side-effects than mercaptopurine.

PREGNANCY
Avoid (teratogenic). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

BREAST FEEDING
Discontinue breast-feeding.

HEPATIC IMPAIRMENT
May need dose reduction.

RENAL IMPAIRMENT
Reduce dose.

PRE-TREATMENT SCREENING
Consider measuring thiopurine methyltransferase (TPMT) activity before starting mercaptopurine therapy.

MONITORING REQUIREMENTS
Monitor liver function.

PRESCRIBING AND DISPENSING INFORMATION
Flavours of oral liquid formulations may include raspberry.

METHOTREXATE

DRUG ACTION
Methotrexate inhibits the enzyme dihydrofolate reductase, essential for the synthesis of purines and pyrimidines.

INDICATIONS AND DOSE
Severe Crohn’s disease
BY INTRAMUSCULAR INJECTION
> Adult: Initially 25 mg once weekly until remission induced; maintenance 15 mg once weekly
Maintenance of remission of severe Crohn’s disease
BY MOUTH
> Adult: 10–25 mg once weekly
Moderate to severe active rheumatoid arthritis
BY MOUTH
> Adult: 7.5 mg once weekly, adjusted according to response; maximum 20 mg per week
Severe active rheumatoid arthritis
BY INTRAVENOUS INJECTION OR BY INTRAMUSCULAR INJECTION OR BY SUBCUTANEOUS INJECTION
▶ Adult: Initially 7.5 mg once weekly, then increased in steps of 2.5 mg once weekly, adjusted according to response; maximum 25 mg per week

Neoplastic diseases
BY INTRAVENOUS INJECTION OR BY INTRATHecal INJECTION OR BY INTRA-ARTERIAL INFUSION OR BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INFUSION OR BY MOUTH
▶ Adult: (consult product literature)
Severe psoriasis unresponsive to conventional therapy (specialist use only)
BY MOUTH OR BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION OR BY SUBCUTANEOUS INJECTION
▶ Adult: Initially 2.5–10 mg depending on response, then increased in steps of 2.5–5 mg, adjusted according to response, dose to be adjusted at intervals of at least 1 week; usual dose 7.5–15 mg once weekly, stop treatment if inadequate response after 3 months at the optimum dose; maximum 30 mg per week

UNLICENSED USE Not licensed for use in severe Crohn’s disease.

Gastro-intestinal toxicity Withdraw treatment if stomatitis develops—may be first sign of gastro-intestinal toxicity.

INTERACTIONS ⇒ Appendix L (methotrexate).
If aspirin or other NSAIDs are given concurrently the dose of methotrexate should be carefully monitored.

SIDE-EFFECTS
▶ Rare Pneumonitis
▶ Frequency not known Abdominal discomfort • acne • alopecia • anaphylactic reactions • anorexia • arthralgia • blood disorders • changes in nail pigmentation • changes in skin pigmentation • chills • chronic pulmonary fibrosis • confusion • conjunctivitis • cystitis • diarrhoea • dizziness • drowsiness • dyspepsia • dysuria • ecchymosis • fever • furunculosis • gastro-intestinal bleeding • gastro-intestinal ulceration • haematuria • headache • hepatotoxicity • hypotension • impotence • injection-site reactions • insomnia • interstitial pneumonitis • malaise • menstrual disturbances • mood changes • mucositis • myalgia • myelosuppression • nausea • neurotoxicity • osteoporosis • paraesthesia • pericardial tamponade • pericarditis • photosensitivity • pleuritic pain • precipitation of diabetes • pruritus • pulmonary fibrosis • pulmonary oedema • rash • reduced libido • renal failure • Stevens-Johnson syndrome • telangiectasia • thrombosis • toxic epidermal necrolysis • toxic megacolon • urticaria • vaginitis • vasculitis • visual disturbance • vomiting

SIDE-EFFECTS, FURTHER INFORMATION
In patients taking methotrexate for non-malignant conditions who experience side-effects, folic acid given on a different day from the methotrexate, may help to reduce the frequency of such side-effects. Withdraw treatment if stomatitis develops—may be first sign of gastro-intestinal toxicity. Treatment with folic acid (as calcium folinate) may be required in acute toxicity.

CONCEPTION AND CONTRACEPTION Effective contraception required during and for at least 3 months after treatment in men or women.

PREGNANCY Avoid (teratogenic; fertility may be reduced during therapy but this may be reversible).

BREAST FEEDING Discontinue breast-feeding—present in milk.

HEPATIC IMPAIRMENT When used for malignancy, avoid in severe hepatic impairment—consult local treatment protocol for details. Avoid with hepatic impairment in non-malignant conditions—dose-related toxicity.

RENAL IMPAIRMENT Reduce dose. Risk of nephrotoxicity at high doses. Avoid in severe impairment.

PRE-TREATMENT SCREENING Exclude pregnancy before treatment. Patients should have full blood count and renal and liver function tests before starting treatment.

MONITORING REQUIREMENTS
▶ In view of reports of blood dyscrasias (including fatalities) and liver cirrhosis with low-dose methotrexate patients should:
• have full blood count and renal and liver function tests repeated every 1–2 weeks until therapy stabilised, thereafter patients should be monitored every 2–3 months
• be advised to report all symptoms and signs suggestive of infection, especially sore throat
▶ Local protocols for frequency of monitoring may vary.
▶ Treatment with folic acid (as calcium folinate) may be required in acute toxicity.

PRESCRIBING AND DISPENSING INFORMATION
Folic acid following methotrexate administration helps to prevent methotrexate-induced mucositis and myelosuppression.

PATIENT AND CARER ADVICE
Methotrexate treatment booklets Methotrexate treatment booklets should be issued where appropriate.
In England, Wales, and Northern Ireland, they are available for purchase from: 3M Security Print and Systems Limited Gorse Street, Chadderton Oldham OL9 9QH Tel: 0845 610 1112 GPs can obtain supplies through their Local Area Team stores. NHS Hospitals can order supplies from www.nhsforms.co.uk or by emailing nhsforms@mmm.com. In Scotland, treatment booklets can be obtained by emailing stockorders.dpps@theagroup.com or by fax on 0131 629 9967.

These booklets include advice for adults taking oral methotrexate for inflammatory conditions, and a section for recording results of blood tests and dosage information.

Patients should be advised to avoid self-medication with over-the-counter aspirin or ibuprofen. Patients should be counselled on the dose, treatment booklet, and the use of NSAIDs. Patients and their carers should be warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort and dark urine), and respiratory effects (e.g. shortness of breath).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, oral suspension, oral solution.

Tablet

- METHOTREXATE (Non-proprietary)
  - Methotrexate 2.5 mg: Methotrexate 2.5mg tablets | 24 tablet POM £3.75 | 28 tablet POM £3.82 DT price = £2.80 | 100 tablet POM £14.19
  - Methotrexate 10 mg: Methotrexate 10mg tablets | 100 tablet POM £57.21 DT price = £35.15
  - Mavtex (Pfizer Ltd)
    - Methotrexate 2.5 mg: Mavtex 2.5mg tablets | 24 tablet POM £2.29 | 100 tablet POM £9.96
    - Methotrexate 10 mg: Mavtex 10mg tablets | 100 tablet POM £45.16 DT price = £35.15

Solution for injection

- METHOTREXATE (Non-proprietary)
  - Methotrexate (as Methotrexate sodium) 2.5 mg per 1 ml
    - Methotrexate 5mg/2ml solution for injection vials | 5 vial POM £30.00-£36.00
  - Methotrexate (as Methotrexate sodium) 25 mg per 1 ml
    - Methotrexate 1g/40ml solution for injection vials | 1 vial POM £43.68 (Hospital only) | 1 vial POM £44.57-£67.50
    - Methotrexate 500mg/20ml solution for injection vials | 1 vial POM £6.89 can be variatio | 1 vial POM £25.07-£48.00
    - Methotrexate 50mg/2ml solution for injection vials | 1 vial POM £4.49 (Hospital only) | 1 vial POM £3.00 | 5 vial POM £35.00
    - Methotrexate 200mg/8ml solution for injection vials | 1 vial POM £10.02
  - Methotrexate (as Methotrexate sodium) 100 mg per 1 ml
    - Methotrexate 1g/10ml solution for injection vials | 1 vial POM £85.00
  - Metotrex PEN (medac UK)
    - Methotrexate 50 mg per 1 ml
      - Metotrex PEN 30mg/0.6ml solution for injection pre-filled pen | 1 pre-filled disposable injection POM £18.95 Metotrex PEN 22.5mg/0.45ml solution for injection pre-filled pen | 1 pre-filled disposable injection POM £18.45 Metotrex PEN 12.5mg/0.25ml solution for injection pre-filled pen | 1 pre-filled disposable injection POM £16.50 Metotrex PEN 20mg/0.4ml solution for injection pre-filled pen | 1 pre-filled disposable injection POM £17.84 Metotrex PEN 17.5mg/0.35ml solution for injection pre-filled pen | 1 pre-filled disposable injection POM £17.50 Metotrex PEN 7.5mg/0.15ml solution for injection pre-filled pen | 1 pre-filled disposable injection POM £14.85 Metotrex PEN 10mg/0.2ml solution for injection pre-filled pen | 1 pre-filled disposable injection POM £15.29 Metotrex PEN 7.5mg/0.15ml solution for injection pre-filled pen | 1 pre-filled disposable injection POM £14.85 Metotrex PEN 10mg/0.2ml solution for injection pre-filled pen | 1 pre-filled disposable injection POM £18.89 Metotrex PEN 25mg/0.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection POM £18.48 Metotrex PEN 15mg/0.3ml solution for injection pre-filled pen | 1 pre-filled disposable injection POM £16.57

Solution for infusion

- METHOTREXATE (Non-proprietary)
  - Methotrexate (as Methotrexate sodium) 25 mg per 1 ml
    - Methotrexate 5g/200ml solution for infusion vials | 1 vial POM £200.57
  - Methotrexate (as Methotrexate sodium) 100 mg per 1 ml
    - Methotrexate 5g/50ml solution for infusion vials | 1 vial POM £400.00

Nelarabine

INDICATIONS AND DOSE

T-cell acute lymphoblastic leukaemia and T-cell lymphoblastic lymphoma in patients who have relapsed or who are refractory after receiving at least two previous regimens

BY INTRAVENOUS INFUSION

- Adults: (consult local protocol)

- CAUTIONS
  - Previous or concurrent craniospinal irradiation (increased risk of neurotoxicity), previous or concurrent intrathecal chemotherapy (increased risk of neurotoxicity)

- SIDE-EFFECTS
  - Common or very common Neurotoxicity (discontinue)

- CONCEPTION AND CONCEPTION

- Manufacturer advises effective contraception during and for at least 3 months after treatment in men and women.

- PREGNANCY
  - Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

- BREAST FEEDING
  - Discontinue breast-feeding.

- MONITORING REQUIREMENTS
  - Neurotoxicity Close monitoring for neurological events is strongly recommended—discontinue if neurotoxicity occurs.

- PATIENT AND CARER ADVICE
  - Drowsiness may affect performance of skilled tasks (e.g. cycling or driving).

- NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (March 2008) that the use of nelarabine (Atriance®) within NHS Scotland is restricted to bridging treatment before stem cell transplantation.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

- Atriance (Novartis Pharmaceuticals UK Ltd) ▼

Nelarabine 5 mg per 1 ml

- Atriance 250mg/50ml solution for infusion vials | 6 vial POM £1,332.00
Pemetrexed

**DRUG ACTION** Pemetrexed inhibits thymidylate transferase and other folate-dependent enzymes.

**INDICATIONS AND DOSE**
Treatment of unresectable malignant pleural mesothelioma which has not previously been treated with chemotherapy (in combination with cisplatin) | First-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology (in combination with cisplatin) | Second-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology (monotherapy) | Maintenance treatment in locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology that has not progressed immediately following platinum-based chemotherapy (monotherapy)

**SIDE-EFFECTS**
Common or very common: Conjunctivitis, dehydration, gastro-intestinal disturbances, increased lacrimation, neuropathy, oedema, skin disorders
Uncommon: Arrhythmias, colitis, interstitial pneumonitis
Rare: Acute renal failure, hepatitis, peripheral ischaemia
Frequency not known: Alopecia, bone marrow suppression, extravasation, hyperuricaemia, nausea, oral mucositis, Stevens–Johnson syndrome, thromboembolism, toxic epidermal necrolysis, tumour lysis syndrome, vomiting

**CAUTIONS**
- Diabetes - history of cardiovascular disease - prophylactic folic acid supplementation required (consult product literature)
- Cautions with concomitant nephrotoxic drugs including non-steroidal anti-inflammatory drugs (consult product literature)

**INTERACTIONS**
- Appendix 1 (pemetrexed). Caution with concomitant nephrotoxic drugs including non-steroidal anti-inflammatory drugs (consult product literature).

**CONCEPTION AND CONTRACEPTION**
Manufacturer advises effective contraception during treatment. Men must avoid fathering a child during and for 6 months after treatment.

**PREGNANCY**
Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING**
Discontinue breast-feeding.

**RENAL IMPAIRMENT**
Manufacturer advises avoid if creatinine clearance less than 45 mL/minute—no information available.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**
- Pemetrexed for the treatment of non-small cell lung cancer (August 2007) NICE TA124
  Pemetrexed is not recommended for the treatment of locally advanced or metastatic non-small cell lung cancer which has previously been treated with chemotherapy. www.nice.org.uk/TA124
- Pemetrexed for the treatment of malignant pleural mesothelioma (January 2008) NICE TA135
  Pemetrexed is an option for the treatment of malignant pleural mesothelioma only in patients who have a WHO performance status of 0 or 1 [WHO performance status is a measure of the ability to perform ordinary tasks], who are considered to have advanced disease and for whom surgical resection is considered inappropriate. www.nice.org.uk/TA135
- Pemetrexed for the first-line treatment of non-small cell lung cancer (September 2009) NICE TA181
  Pemetrexed, in combination with cisplatin, is an option for the first-line treatment of locally advanced or metastatic non-small cell lung cancer only if the histology of the tumour has been confirmed as adenocarcinoma or large-cell carcinoma. www.nice.org.uk/TA181

- Pemetrexed for the treatment of non-small cell lung cancer (June 2010) NICE TA190
  Pemetrexed is an option for the maintenance treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology that has not progressed immediately following combination therapy of a platinum compound with either gemcitabine, paclitaxel, or docetaxel. www.nice.org.uk/TA190

- Pemetrexed maintenance treatment following induction therapy with pemetrexed and cisplatin for non-squamous non-small-cell lung cancer (April 2014) NICE TA309
  Pemetrexed is not recommended for the maintenance treatment of locally advanced or metastatic non-squamous non-small-cell lung cancer in patients whose disease has not progressed immediately following induction therapy with pemetrexed and cisplatin. www.nice.org.uk/TA309

**Scottish Medicines Consortium (SMC) Decisions**
The Scottish Medicines Consortium has advised (August 2008) that pemetrexed (Alimta®) is accepted for restricted use within NHS Scotland as monotherapy for the second-line treatment of locally advanced or metastatic non-small cell lung cancer without predominantly squamous cell histology; it is restricted for use in patients with good performance status who would otherwise be eligible for docetaxel treatment.

The Scottish Medicines Consortium has advised (January 2010) that pemetrexed (Alimta®) is accepted for restricted use within NHS Scotland in combination with cisplatin for the first-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology; it is restricted to patients in whom the histology of the tumour has been confirmed as adenocarcinoma or large cell carcinoma.

The Scottish Medicines Consortium has advised (July 2005) that pemetrexed (Alimta®) in combination with cisplatin is accepted for restricted use within NHS Scotland for previously untreated patients with stage III/IV unresectable malignant pleural mesothelioma.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

**Tegafur with gimeracil and oteracil**

**DRUG ACTION** Tegafur is a prodrug of fluorouracil. Gimeracil inhibits the degradation of fluorouracil and oteracil decreases the activity of fluorouracil in normal gastrointestinal mucosa.
Indications and Dose
Tretment of advanced gastric cancer when used in combination with cisplatin

By Mouth
- Adult: (consult local protocol)

Important Safety Information
Risks of incorrect dosing of oral anti-cancer medicines, see p. 745

- Contra-Indications
  Dihydropyrimidine dehydrogenase deficiency

- Interactions
  → Appendix 1 (tegafur).

- Side-Effects
  Alopecia - bone-marrow suppression - hyperuricaemia - nausea - neuropathy - ocular toxicity - oral mucositis - thrombocytopenia - tumour lysis syndrome - vomiting

- Conception and Contraception
  Manufacturer advises effective contraception during and for up to 6 months after treatment.

- Pregnancy
  Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

- Breast Feeding
  Discontinue breast-feeding.

- Renal Impairment
  Reduce dose if creatinine clearance 30–50 mL/minute—consult product literature. Manufacturer advises avoid if creatinine clearance less than 30 mL/minute.

- National Funding/Access Decisions
  Scottish Medicines Consortium (SMC) Decisions
  The Scottish Medicines Consortium has advised (August 2012) that tegafur with gimeracil and oteracil (Teysuno®) is accepted for restricted use within NHS Scotland for the treatment of advanced gastric cancer, when given in combination with cisplatin, in patients who are unsuitable for an anthracycline, fluorouracil and platinum triplet first-line regimen.

Medical Forms
There can be variation in the licensing of different medicines containing the same drug.

Capsule
  Cautionary and Advisory Labels 23
- Teysuno (Nordic Pharma Ltd)
  Gimeracil 4.35 mg, Oteracil (as Oteracil potassium) 11.8 mg,
  Tegafur 15 mg
  126 capsule (£38) £279.72
  Gimeracil 5.8 mg, Oteracil (as Oteracil potassium) 15.8 mg,
  Tegafur 20 mg
  84 capsule (£38) £248.40

Tioguanine
(Thioguanine)

Indications and Dose
Acute leukaemia | Chronic myeloid leukaemia

By Mouth
- Adult: 100–200 mg/m² daily, can be given at various stages of treatment in short-term cycles

Important Safety Information
Risks of incorrect dosing of oral anti-cancer medicines, see p. 745

- Contra-Indications
  Absent thiopurine methyltransferase activity

- Caution
  Thiopurine methyltransferase status

Cautions, Further Information
Thiopurine methyltransferase
  The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

Long-Term Therapy
  Long-term therapy is no longer recommended because of the high risk of liver toxicity.

- Interactions
  → Appendix 1 (tioguanine).

- Side-Effects
  Rare Intestinal necrosis - intestinal perforation
  Frequency not known Alopecia - bone-marrow suppression - hepatotoxicity (discontinue) - hyperuricaemia - nausea - oral mucositis - stomatitis - thrombocytopenia - tumour lysis syndrome - vomiting - vomiting

Side-Effects, Further Information
Gastro-intestinal side-effects
  Tioguanine has a lower incidence of gastrointestinal side-effects than mercaptopurine.

- Conception and Contraception
  Ensure effective contraception during treatment in men or women.

- Pregnancy
  Avoid (teratogenicity reported when men receiving tioguanine have fathered children). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

- Breast Feeding
  Discontinue breast-feeding.

- Hepatic Impairment
  Reduce dose.

- Renal Impairment
  Reduce dose.

- Pre-Treatment Screening
  Consider measuring thiopurine methyltransferase (TPMT) activity before starting tioguanine therapy.

- Monitoring Requirements
  Monitor liver function weekly—discontinue if liver toxicity develops.

Medical Forms
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

Tablet
- Tioguanine (Non-proprietary)
  Tioguanine 40 mg
  Tioguanine 40 mg tablets | 25 tablet (£38)
  £103.54

Antineoplastic Antibiotics

Bleomycin

Indications and Dose
Squamous cell carcinoma | Metastatic germ cell cancer | Non-Hodgkin’s lymphoma

By Intravenous injection or by local infiltration or by intra-arterial infusion or by intramuscular injection or by intravenous infusion
- Adult: (consult product literature or local protocols)

- Caution
  Caution in handling—irritant to tissues

- Interactions
  → Appendix 1 (bleomycin).

- Side-Effects
  Common or Very Common Dermatological toxicity - mucositis
  Frequency not known Alopecia - chills (after drug administration) - extravasation - fever (after drug administration) - hypersensitivity reactions - hyperuricaemia - increased pigmentation particularly affecting the flexures and subcutaneous sclerotic plaques - less bone marrow suppression - nausea - oral mucositis - progressive pulmonary fibrosis (dose-related) - pulmonary
toxicity - Raynaud’s phenomenon - thromboembolism - tumour lysis syndrome - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

**Hypersensitivity reactions** Hypersensitivity reactions manifest by chills and fever commonly occur a few hours after drug administration and may be prevented by simultaneous administration of a corticosteroid, for example hydrocortisone intravenously.

**Progressive pulmonary fibrosis** This is dose-related, occurring more commonly at cumulative doses greater than 300 000 units and in the elderly. Basal lung crepitations or suspicious chest X-ray changes are an indication to stop therapy with this drug.

**Respiratory failure** Patients who have received extensive treatment with bleomycin (e.g. cumulative dose more than 100 000 units) may be at risk of developing respiratory failure if a general anaesthetic is given with high inspired oxygen concentrations. Anaesthetists should be warned of this.

**Pregnancy** Avoid (teratogenic and carcinogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**Breast feeding** Discontinue breast-feeding.

**Renal impairment** Reduce dose by half if serum creatinine 177–354 μmol/litre; reduce dose further if serum-creatinine greater than 354 μmol/litre.

**Prescribing and dispensing information** To conform to the European Pharmacopoeia vials previously labelled as containing ‘15 units’ of bleomycin are now labelled as containing 15 000 units. The amount of bleomycin in the vial has not changed.

**Medicinal forms** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- **Bleo-Kyowa** (ProStrakan Ltd)
  - Bleomycin (as Bleomycin sulfate) 15000 unit Bleo-Kyowa 15,000unit powder for solution for injection vials | 10 vial £10.00

**Mitomycin**

**Indications and dose**

Recurrent superficial bladder tumours (bladder instillation)

**By intravesical instillation**

- Adult: (consult product literature or local protocols)

Upper gastro-intestinal cancers | Breast cancers

**By intravenous injection**

- Adult: (consult product literature or local protocols)

**Cautions** Caution in handling—irritant to tissues

**Side-effects**

**General Side-effects**

Alopecia - bone marrow damage - bone-marrow suppression - hyperuricaemia - lung fibrosis - nausea - oral mucositis - renal damage - thromboembolism - tumour lysis syndrome - vomiting

**Specific Side-effects**

- With intravenous use extravasation

**Side-effects, further information**

Bone-marrow toxicity Mitomycin is usually administered at 6-weekly intervals because it causes delayed bone-marrow toxicity. Prolonged use may result in a permanent effect.

**Pregnancy** Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**Breast-feeding** Discontinue breast-feeding.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- **Mitomycin (non-proprietary)**
  - Mitomycin 2 mg Mitomycin-C Kyowa 2mg powder for solution for injection vials | 10 vial £58.83

  - Mitomycin 10 mg Mitomycin-C Kyowa 10mg powder for solution for injection vials | 1 vial £21.37

  - Mitomycin 20 mg Mitomycin-C Kyowa 20mg powder for solution for injection vials | 1 vial £39.94

  - Mitomycin 40 mg Mitomycin-C Kyowa 40mg powder for solution for injection vials | 1 vial £78.88

**Platinum compounds**

**Carboplatin**

**Indications and dose**

Treatment of advanced ovarian cancer and lung cancer (particularly the small cell type)

**By intravenous infusion**

- Adult: The dose of carboplatin is determined according to renal function rather than body surface area (consult product literature)

**Interactions** → Appendix 1 (platinum compounds).

**Side-effects**

Alopecia - bone-marrow suppression - extravasation - hyperuricaemia - myelosuppression - nausea - nausée - nephrotoxicity - neurotoxicity - oral mucositis - ototoxicity - thromboembolism - tumour lysis syndrome - vomiting - vomiting

**Side-effects, further information**

Carboplatin is better tolerated than cisplatin; nausea and vomiting are reduced in severity and nephrotoxicity, neurotoxicity, and ototoxicity are much less of a problem than with cisplatin. It is, however, more myelosuppressive than cisplatin.

**Pregnancy** Avoid (teratogenic and embryotoxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**Breast-feeding** Discontinue breast-feeding.

**Renal impairment** Reduce dose. Avoid if creatinine clearance less than 20 ml/minute. Monitor haematomatological parameters in renal impairment. Monitor renal function in renal impairment.

**Prescribing and dispensing information**

Carboplatin can be given in an outpatient setting.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- **Carboplatin (non-proprietary)**
  - Carboplatin 10 mg per 1 ml Carboplatin 50mg/5ml concentrate for solution for infusion vials | 1 vial £22.04 (Hospital only) | 1 vial £20.00 Carboplatin 150mg/15ml concentrate for solution for infusion vials | 1 vial £56.92 (Hospital only) | 1 vial £50.00 Carboplatin 600mg/60ml concentrate for solution for infusion vials | 1 vial £126.00 Carboplatin 600mg/60ml solution for infusion vials | 1 vial £120.00 Carboplatin 450mg/45ml concentrate for solution for infusion vials | 1 vial £116.85 (Hospital only) | 1 vial £150.00 Carboplatin 450mg/45ml solution for infusion vials | 1 vial £117.48 Carboplatin 150mg/15ml solution for infusion vials | 1 vial £85.83 Carboplatin 50mg/5ml solution for infusion vials | 1 vial £22.86
Cisplatin

INDICATIONS AND DOSE
Treatment of testicular, lung, cervical, bladder, head and neck, and ovarian cancer (alone or in combination)
BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

- CAUTIONS
CAUTIONS, FURTHER INFORMATION
Hydration Cisplatin requires intensive intravenous hydration and treatment may be complicated by severe nausea and vomiting.

- INTERACTIONS → Appendix 1 (platinum compounds).

- SIDE-EFFECTS
Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · hypomagnesaemia · myelosuppression · nephrotoxicity · oral mucositis · ototoxicity · peripheral neuropathy · severe nausea · severe vomiting · thromboembolism · tumour lysis syndrome

- CONTRA-INDICATIONS
Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.

- PREGNANCY
Avoid (teratogenic and toxic in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

- BREAST FEEDING
Discontinue breast-feeding.

- NICE technology appraisals (TAs)
- irinotecan, oxaliplatin, and raltitrexed for advanced colorectal cancer (August 2005) NICE TA93
A combination of fluorouracil and folinic acid with either irinotecan or oxaliplatin are options for first-line treatment for advanced colorectal cancer. Irinotecan alone or fluorouracil and folinic acid with oxaliplatin are options for patients who require further treatment subsequently. www.nice.org.uk/TA93

- Capetibamine and oxaliplatin in the adjuvant treatment of stage III (Dukes’ C) colon cancer (April 2006) NICE TA100
Capetibamine alone or oxaliplatin combined with fluorouracil and folinic acid are options for adjuvant treatment following surgery for stage III (Dukes’ C) colon cancer. www.nice.org.uk/TA100

- MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion
- Cisplatin 1 mg per 1 ml
- Cisplatin 50mg/50ml concentrate for solution for infusion vials | 1 vial | price not available
- Cisplatin 100mg/100ml solution for infusion vials | 1 vial | price not available

- Oxaliplatin 100 mg | 1 vial | price not available
- Oxaliplatin 200 mg | 1 vial | price not available
- Oxaliplatin 500 mg | 1 vial | price not available
- Oxaliplatin 1000 mg | 1 vial | price not available

- OXALIPLATIN (Proprietary)
- Oxaliplatin 150 mg | 1 vial | price not available
- Oxaliplatin 100 mg | 1 vial | price not available

Oxaliplatin

INDICATIONS AND DOSE
Treatment of metastatic colorectal cancer (in combination with fluorouracil and folinic acid) | Treatment of colon cancer after resection of the primary tumour (adjuvant treatment)
BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

- CONTRA-INDICATIONS
Peripheral neuropathy with functional impairment

- INTERACTIONS → Appendix 1 (platinum compounds).

- SIDE-EFFECTS
Alopecia · bone-marrow suppression · extravasation · gastro-intestinal disturbances · hyperuricaemia · myelosuppression · nausea · neurotoxicity (dose limiting) · ototoxicity · posterior reversible encephalopathy syndrome (associated with oxaliplatin combination chemotherapy) · sensory peripheral neuropathy (dose limiting) · thromboembolism · transient vision loss (reversible on discontinuation) · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION
Respiratory symptoms If unexplained respiratory symptoms occur, oxaliplatin should be discontinued until investigations exclude interstitial lung disease and pulmonary fibrosis.

- CONCEPTION AND CONTRACEPTION
Effective contraception required during and for 4 months after treatment in women and 6 months after treatment in men.

- PREGNANCY
Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

- BREAST FEEDING
Discontinue breast-feeding.

- NICE technology appraisals (TAs)
- Oxaliplatin, irinotecan, and capecitabine for advanced colorectal cancer (August 2005) NICE TA100
A combination of fluorouracil and folinic acid with either irinotecan or oxaliplatin are options for first-line treatment for advanced colorectal cancer. Irinotecan alone or fluorouracil and folinic acid with oxaliplatin are options for patients who require further treatment subsequently. www.nice.org.uk/TA100

- Capetibamine and oxaliplatin in the adjuvant treatment of stage III (Dukes’ C) colon cancer (April 2006) NICE TA100
Capetibamine alone or oxaliplatin combined with fluorouracil and folinic acid are options for adjuvant treatment following surgery for stage III (Dukes’ C) colon cancer. www.nice.org.uk/TA100

- MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion
- Oxaliplatin 100 mg | 1 vial | price not available
- Oxaliplatin 200 mg | 1 vial | price not available
- Oxaliplatin 500 mg | 1 vial | price not available
- Oxaliplatin 1000 mg | 1 vial | price not available

- OXALIPLATIN (Non-proprietary)
- Oxaliplatin 100 mg | 1 vial | price not available
- Oxaliplatin 200 mg | 1 vial | price not available
- Oxaliplatin 500 mg | 1 vial | price not available
- Oxaliplatin 1000 mg | 1 vial | price not available

- OXALIPLATIN (Proprietary)
- Oxaliplatin 150 mg | 1 vial | price not available
- Oxaliplatin 100 mg | 1 vial | price not available

RETINOIDS AND RELATED DRUGS

Bexarotene

- DRUG ACTION
Bexarotene is an agonist at the retinoid X receptor, which is involved in the regulation of cell differentiation and proliferation. Bexarotene can cause regression of cutaneous T-cell lymphoma.
Tretinoin

**INDICATIONS AND DOSE**
Induction of remission in acute promyelocytic leukaemia (used in previously untreated patients as well as in those who have relapsed after standard chemotherapy or who are refractory to it)

**BY MOUTH**
- Adult: 45 mg/m² daily in 2 divided doses maximum duration of treatment is 90 days, consult product literature for details of concomitant chemotherapy

**CAUTIONS**
Increased risk of thromboembolism during first month of treatment

**INTERACTIONS**
- Appendix 1 (retinoids).

**SIDE-EFFECTS**

**SIDE-EFFECTS, FURTHER INFORMATION**

**Retinoic acid syndrome**
Fever, dyspnoea, acute respiratory distress, pulmonary infiltrates, pleural effusion, hyperleucocytosis, hypotension, oedema, weight gain, hepatic, renal and multi-organ failure requires immediate treatment—consult product literature.

**CONCEPTION AND CONTRACEPTION**
Exclude pregnancy before starting treatment. Effective contraception must be used for at least 1 month before oral treatment, during treatment and for at least 1 month after stopping (oral progesterone-only contraceptives not considered effective).

**PREGNANCY**
Teratogenic. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING**
Avoid (discontinue breast-feeding).

**HEPATIC IMPAIRMENT**
Reduce dose to 25 mg/m².

**RENAL IMPAIRMENT**
Reduce dose to 25 mg/m².

**MONITORING REQUIREMENTS**
Monitor haematological and coagulation profile, liver function, serum calcium and plasma lipids before and during treatment.

**PRESCRIBING AND DISPENSING INFORMATION**
Tretinoin is the acid form of vitamin A.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

**TAXANES**
Cabazitaxel

**INDICATIONS AND DOSE**
Treatment of hormone refractory metastatic prostate cancer in patients who have previously been treated with a docetaxel-containing regimen (in combination with prednisone or prednisolone)

**BY INTRAVENOUS INFUSION**
- Adult: (consult product literature or local protocols)

**CAUTIONS**
Avoid in Acute porphyrias p. 864

**INTERACTIONS**
- Appendix 1 (cabazitaxel).

**SIDE-EFFECTS**
- Common or very common
  - Hypersensitivity reactions
  - Frequency not known

**SIDE-EFFECTS, FURTHER INFORMATION**

**Hypersensitivity reactions**
Routine premedication with a corticosteroid, an antihistamine, and a histamine H₂-receptor antagonist is recommended to prevent severe hypersensitivity reactions.
Docetaxel

INDICATIONS AND DOSE
Adjuvant treatment of operable node-positive and operable node-negative breast cancer (in combination with doxorubicin and cyclophosphamide) | Initial chemotherapy of locally advanced or metastatic breast cancer (with doxorubicin) | Locally advanced or metastatic breast cancer where cytotoxic chemotherapy with an anthracycline or an alkylating drug has failed (monotherapy) | Locally advanced or metastatic breast cancer where cytotoxic chemotherapy with an anthracycline has failed (with capcitabine) | Initial chemotherapy of metastatic breast cancer which overexpresses human epidermal growth factor-2 (with trastuzumab) | Locally advanced or metastatic non-small-cell lung cancer (with cisplatin) | Hormone-resistant metastatic prostate cancer (in combination with prednisone or prednisolone) | Initial treatment of metastatic gastric adenocarcinoma, including adenocarcinoma of the gastro-oesophageal junction (with cisplatin and fluorouracil) | Induction treatment of locally advanced squamous cell carcinoma of the head and neck (with cisplatin and fluorouracil) | BY INTRAVENOUS INFUSION | Adult: (consult product literature or local protocols)
Paclitaxel

- **DRUG ACTION** Paclitaxel is a member of the taxane group of drugs.

**INDICATIONS AND DOSE**

Treatment of ovarian cancer (advanced or residual disease following laparotomy) in combination with cisplatin (conventional paclitaxel only) / Treatment of metastatic ovarian cancer where platinum-containing therapy has failed (conventional paclitaxel only) / Treatment of locally advanced or metastatic breast cancer (in combination with other cytotoxics or alone if other cytotoxics have failed or are inappropriate) (conventional paclitaxel only) / Adjuvant treatment of node-positive breast cancer following treatment with anthracycline and cyclophosphamide (conventional paclitaxel only) / Treatment of non-small cell lung cancer (in combination with cisplatin) when surgery or radiotherapy not appropriate (conventional paclitaxel only) / Treatment of advanced AIDS-related Kaposi's sarcoma where liposomal anthracycline therapy has failed (conventional paclitaxel only) / First-line treatment of metastatic adenocarcinoma of the pancreas (in combination with gemcitabine) (conventional paclitaxel only) / Monotherapy of metastatic breast cancer when first-line treatment has failed and standard, anthracycline-containing therapy is not indicated (albumin-bound paclitaxel only) / In combination with gemcitabine for the first-line treatment of metastatic adenocarcinoma of the pancreas (albumin-bound paclitaxel only)

- **BY INTRAVENOUS INFUSION**

- **ADULTS** (consult product literature or local protocols)

- **CAUTIONS** Avoid in Acute porphyrias p. 864 - consult product literature - patients aged over 75 years with metastatic adenocarcinoma of the pancreas

- **INTERACTIONS** Appendix 1 (paclitaxel).

- **SIDE-EFFECTS**

  - Common or very common Arrhythmia - arthralgia - febrile neutropenia - gastro-intestinal disorders - myalgia - peripheral neuropathy - sensory neuropathy - tachycardia

  - Rare Bradycardia - cardiac arrest - congestive heart failure - left ventricular dysfunction

  - Frequency not known Alopecia - arrhythmias (nearly always asymptomatic) - asymptomatic hypotension - bone-marrow suppression - bradycardia - cardiac conduction defects - extravasation - hypersensitivity reactions - hyperuricaemia - muscle pain - myelosuppression - nausea - neutropenia - oral mucositis - pneumonitis - Stevens-Johnson syndrome - thromboembolism - toxic epidermal necrolysis - tumour lysis syndrome - vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**

  - Hypersensitivity reactions Routine premedication with a corticosteroid, an antihistamine and a histamine H$_2$-receptor antagonist is recommended to prevent severe hypersensitivity reactions; hypersensitivity reactions may occur rarely despite premedication.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least 6 months after treatment in men or women.

- **PREGNANCY** Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment.

- **MONITORING REQUIREMENTS**

  - Cardiac monitoring should be undertaken, particularly if patients have underlying cardiac disease or previous exposure to anthracyclines.

  - Patients should be monitored for signs and symptoms of pneumonitis and sepsis.

- **PRESCRIBING AND DISPENSING INFORMATION** Paclitaxel is available as both conventional and albumin-bound formulations. The different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable. Prescribers should specify the brand to be dispensed.

- **NATIONAL FUNDING/ACCESS DECISIONS**

  - **NICE technology appraisals (TAs)** Paclitaxel for ovarian cancer (January 2003) NICE TA05

    - Either paclitaxel in combination with a platinum compound (cisplatin or carboplatin) or a platinum compound alone are alternatives for the first-line treatment of ovarian cancer (usually following surgery).

    - www.nice.org.uk/TA05

  - Paclitaxel, pegylated liposomal doxorubicin, and topotecan for second-line or subsequent treatment of advanced ovarian cancer (May 2005) NICE TA91

    - Paclitaxel, combined with a platinum compound (carboplatin or cisplatin), is an option for advanced cancer that relapses 6 months or more after completing initial platinum-based chemotherapy. Paclitaxel alone is an option for advanced ovarian cancer that does not respond to, or relapses within 6 months of completing initial platinum-based chemotherapy.

    - Paclitaxel alone is an option for advanced ovarian cancer in patients who are allergic to platinum compounds. www.nice.org.uk/TA91

    - Paclitaxel for the adjuvant treatment of early node-positive breast cancer (September 2006) NICE TA108

    - Paclitaxel, within its licensed indication, is not recommended for the adjuvant treatment of women with early node-positive breast cancer. www.nice.org.uk/TA108

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  - **Solution for infusion**

    - EXCIPIENTS: May contain Polyoxyl castor oils

    - **PACLITAXEL (Non-proprietary)** Paclitaxel 6 mg per 1 ml Paclitaxel 150mg/25ml concentrate for solution for infusion vials | 1 vial (PPh) £300.52 - £561.00 (Hospital only) | 1 vial (PPh) £300.52 Paclitaxel 30mg/5ml concentrate for solution for infusion vials | 1 vial (PPh) £91.45 - £116.05 (Hospital only) | 1 vial (PPh) £105.84

    - Paclitaxel 100mg/16.7ml concentrate for solution for infusion vials | 1 vial (PPh) £303.65 - £374.00 (Hospital only) | 1 vial (PPh) £317.21

    - Paclitaxel 300mg/50ml concentrate for solution for infusion vials | 1 vial (PPh) £861.52 - £1.122.00 (Hospital only) | 1 vial (PPh) £951.63

- **Powder for suspension for infusion**

  - ELECTROLYTES: May contain Sodium

    - **Abrasaxe** (Celgene Ltd)

    - Paclitaxel albumin 100 mg Abraxane 100mg powder for suspension for infusion vials | 1 vial (PPh) £246.00 (Hospital only)
TOPOISOMERASE I INHIBITORS

Irinotecan hydrochloride

**DRUG ACTION** Irinotecan inhibits topoisomerase I, an enzyme involved in DNA replication.

**INDICATIONS AND DOSE**
Metastatic colorectal cancer in combination with fluorouracil and folinic acid or as monotherapy when treatment containing fluorouracil has failed: First-line treatment of metastatic colorectal carcinoma of the colon or rectum (in combination with fluorouracil, folinic acid and bevacizumab) in metastatic colorectal cancer (incombination with capecitabine with or without bevacizumab).

**CONTRA-INDICATIONS** Bowel obstruction · chronic inflammatory bowel disease

**CAUTIONS** Raised plasma-bilirubin concentration · risk factors for cardiac disease

**INTERACTIONS** → Appendix 1 (irinotecan).

**SIDE-EFFECTS**
- Uncommon Interstitial pulmonary disease
- Frequency not known Acute cholinergic syndrome (with early diarrhoea) and delayed diarrhoea (consult product literature) · alopecia · anorexia · asthenia · bone-marrow suppression · extravasation · gastrointestinal effects (delayed diarrhoea requiring prompt treatment may follow irinotecan treatment) · hyperuricaemia · myelosuppression (dose limiting) · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

**CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for up to 3 months after treatment in men.

**PREGNANCY** Avoid (teratogenic and toxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Avoid if plasma-bilirubin concentration greater than 3 times upper limit of normal range. Monitor closely for neutropenia if plasma-bilirubin concentration 1.5–3 times upper limit of normal range (consult product literature).

**RENAL IMPAIRMENT** Manufacturer advises avoid—no information available.

**MONITORING REQUIREMENTS** Monitor respiratory function.

**NATIONAL FUNDING/ACCESS DECISIONS**

**BNF**

**Topotecan**

**DRUG ACTION** Topotecan inhibits topoisomerase I, an enzyme involved in DNA replication.

**INDICATIONS AND DOSE**
Metastatic ovarian cancer when first-line or subsequent treatment has failed: Treatment of recurrent carcinoma of the cervix, after radiotherapy, and for patients with stage IVB cervical cancer (October 2005) NICE TA183.

**CONTRA-INDICATIONS** Bowel obstruction · chronic inflammatory bowel disease

**CAUTIONS** Raised plasma-bilirubin concentration · risk factors for cardiac disease

**INTERACTIONS** → Appendix 1 (topotecan).

**SIDE-EFFECTS**
- Alopecia · anorexia · asthenia · bone-marrow suppression · extravasation · gastrointestinal effects · hyperuricaemia · myelosuppression (dose limiting) · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

**PREGNANCY** Avoid (teratogenicity and fetal loss in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Avoid in severe impairment.

**RENAI IMPAIRMENT** Reduce dose. Avoid infusion if creatinine clearance less than 20 mL/minute. Avoid oral route if creatinine clearance less than 60 mL/minute.

**NATIONAL FUNDING/ACCESS DECISIONS**

**BNF**

**Paclitaxel, pegylated liposomal doxorubicin, and topotecan for second-line or subsequent treatment of advanced ovarian cancer (May 2005) NICE TA91**

Topotecan alone is an option only for advanced ovarian cancer that does not respond to, or relapses within 6 months of completing platinum-based chemotherapy or in those allergic to platinum compounds and for whom paclitaxel alone or pegylated liposomal doxorubicin are inappropriate. www.nice.org.uk/TA91

**Topotecan for the treatment of recurrent and stage IVB cervical cancer (October 2009) NICE TA183**

Topotecan in combination with cisplatin is recommended as a treatment option for recurrent or stage IVB cervical cancer in patients who have not previously received cisplatin. www.nice.org.uk/TA183

Solution for infusion

Solution for infusion

Powder for solution for infusion

Powder for solution for infusion

Topotecan (as Topotecan hydrochloride) 1 mg

Vincristine injections are for intravenous administration only. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

CONTRA-INDICATIONS

CONTRA-INDICATIONS, FURTHER INFORMATION

Intrathecal injection contra-indicated.

CAUTIONS

Caution in handling—irritant to tissues

INTERACTIONS

Appendix 1 (vinblastine).

SIDE-EFFECTS, FURTHER INFORMATION

Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids; it occurs less often with vinblastine than with vincristine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced. Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.

PREGNANCY

Avoid (limited experience suggests fetal harm; teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

BREAST FEEDING

Discontinue breast-feeding.

HEPATIC IMPAIRMENT

Dose reduction may be necessary—consult local treatment protocol for details.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS

5

Hycamtin (Novartis Pharmaceuticals UK Ltd)

Topotecan (as Topotecan hydrochloride) 1 mg
Topotecan (as Topotecan hydrochloride) 4 mg

Solution for infusion

Topotecan (as Topotecan hydrochloride) 4 mg

Vinblastine sulfate

INDICATIONS AND DOSE

Variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer)

Adult: (consult product literature)

Important safety information

Vinblastine is for intravenous administration only. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

CONTRA-INDICATIONS

CONTRA-INDICATIONS, FURTHER INFORMATION

Intrathecal injection contra-indicated.

CAUTIONS

Caution in handling—irritant to tissues

neuromuscular disease

Appendix 1 (vincristine).
**SIDE-EFFECTS**

- **Rare** Diarrhoea - inappropriate secretion of antidiuretic hormone - intestinal necrosis - paralytic ileus - seizures - urinary retention
- **Frequency not known** Abdominal pain - alopecia - autonomic neuropathy - constipation - extravasation - eye disorders - hyperuricaemia - loss of deep tendon reflexes - motor weakness - muscle wasting - myelosuppression (negligible) - nausea - neurotoxicity - oral mucositis - otorrhexis - peripheral neuropathy - peripheral paraesthesia - severe bronchospasm following administration (more commonly when used in combination with mitomycin-C) - severe local irritation (care must be taken to avoid extravasation) - thromboembolism - tumour lysis syndrome - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Neurotoxicity**
  - Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids and is a limiting side-effect of vincristine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced. Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.

- **PREGNANCY**
  - Avoid (teratogenicity and fetal loss in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

- **BREAST FEEDING**
  - Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT**
  - Dose reduction may be necessary—consult local treatment protocol for details.

**MEDICINAL FORMS**

- **Vincristine Sulfate (Non-proprietary)**
  - Vincristine sulfate 1 mg per 1 ml
    - Vincristine 1mg/1ml solution for injection vials | 1 vial £11.47 | 5 vial £58.75
    - Vincristine 2mg/2ml solution for injection vials | 1 vial £30.07 | 5 vial £157.37
  - Vincristine 5mg/5ml solution for injection vials | 5 vial £133.30

**Vinflunine**

**INDICATIONS AND DOSE**

Treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract after failure of a platinum-containing regimen (monotherapy)

- **Adult:** (consult local protocol)

**Vinflunine sulfate**

**INDICATIONS AND DOSE**

Variety of cancers including leukemias, lymphomas, and some solid tumours (e.g. breast and lung cancer)

- **Adult:** (consult product literature)

**Important safety information**

Vinflunine injections are for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

**SIDE-EFFECTS**

- Alopecia - autonomic neuropathy - bone-marrow suppression - extravasation - hyperuricaemia - irritant to tissues - myelosuppression (dose-limiting) - nausea - neurotoxicity - oral mucositis - peripheral neuropathy - severe bronchospasm following administration (more commonly when used in combination with mitomycin-C) - severe local irritation (if extravasated) - thromboembolism - tumour lysis syndrome - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Neurotoxicity**
  - Neurotoxicity, usually as peripheral or autonomic neuropathy; it occurs less often with vindesine than with vincristine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced. Motor weakness can also occur, and increasing motor weakness calls for dose reduction or discontinuation. Recovery from neurotoxic effects is usually slow but complete.

- **PREGNANCY**
  - Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

- **BREAST FEEDING**
  - Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT**
  - Dose reduction may be necessary.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- Eldisine (Genus Pharmaceuticals Ltd)
  - Vindesine sulfate 5 mg. Eldisine 5mg powder for solution for injection vials | 1 vial £78.30 (Hospital only)
**INDICATIONS AND DOSE**

**Advanced breast cancer** | **Advanced non-small cell lung cancer**
---|---
**BREAST FEEDING** | **HEPATIC IMPAIRMENT**
Reduce dose unless essential (teratogenicity, and fetal loss in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746. | Reduce dose if creatinine clearance is less than 50 mL/min—consult product literature.

**SIDE-EFFECTS, FURTHER INFORMATION**

**Neurotoxicity**

Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids and is a limiting side-effect of vincristine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; otoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced. Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.

**CONCEPTION AND CONTRACEPTION**

Manufacturer advises effective contraception during and for up to 3 months after treatment.

**PREGNANCY**

Avoid unless essential—teratogenicity and embryotoxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING**

Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**

Reduce dose—consult product literature.

**OTHER CYTOTOXIC DRUGS**

**Arsenic trioxide**

**INDICATIONS AND DOSE**
Acute promyelocytic leukaemia in patients who have relapsed or failed to respond to previous treatment with a retinoid and chemotherapy

**BY INTRAVENOUS INFUSION**
- Adult: (consult local protocol)

- **CAUTIONS** Hypokalaemia (correct before treatment) - hypomagnesaemia (correct before treatment) - previous treatment with anthracyclines (increased risk of QT interval prolongation)

- **INTERACTIONS** → Appendix 1 (arsenic trioxide).
  Avoid concomitant administration with drugs causing QT interval prolongation.

- **SIDE-EFFECTS**
  - **Common or very common** Atrial fibrillation - atrial flutter - diarrhoea - fatigue - haemorrhage - hyperglycaemia - hypokalaemia - leucocyte activation syndrome - musculoskeletal pain - paraesthesia - pleuritic pain - QT interval prolongation
  - **Uncommon** Abdominal pain - blurred vision - hypotension - oedema - pneumonitis - rash - renal failure - seizures - tachycardia - vasculitis
  - **Frequency not known** Alopecia - bone-marrow suppression - extravasation - hyperuricaemia - nausea - oral mucositis - thromboembolism - tumour lysis syndrome - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**
Leucocyte activation syndrome: Signs and symptoms of leucocyte activation syndrome include unexplained fever, dysphagia, weight gain, pulmonary infiltrates, pleural or pericardial effusions, with or without leucocytosis—treat with high dose corticosteroids, consult product literature.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment in men and women.

- **PREGNANCY** Avoid (teratogenic and embryotoxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution—limited information available.

- **RENAL IMPAIRMENT** Manufacturer advises caution—limited information available.

- **MONITORING REQUIREMENTS** ECG required before and during treatment—consult product literature.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**
- Trisenox (Teva UK Ltd)
  - Arsenic trioxide 1 mg per 1 ml Trisenox 10mg/10ml concentrate for solution for infusion ampoules | 1 ampoule (P) £2,920.00 (Hospital only)

**Crisantaspase**

- **DRUG ACTION** Crisantaspase is the enzyme asparaginase produced by Erwinia chrysanthemi.

**INDICATIONS AND DOSE**
Acute lymphoblastic leukaemia

BY INTRAMUSCULAR INJECTION OR BY SUBCUTANEOUS INJECTION OR BY INTRAVENOUS INJECTION
- Adult: (consult product literature)

- **CONTRA-INDICATIONS** History of pancreatitis related to asparaginase therapy

- **SIDE-EFFECTS**
  - **Common or very common** Coagulation disorders - confusion - convulsions - diarrhoea - dizziness - drowsiness - headache - lethargy - liver dysfunction - neurotoxicity - pancreatitis
  - **Uncommon** Anaphylaxis - changes in blood lipids - hyperglycaemia
  - **Rare** CNS depression
  - **Very rare** Abdominal pain - hypertension - myalgia
  - **Frequency not known** Alopecia - bone-marrow suppression - extravasation - hyperuricaemia - nausea - oral mucositis - thromboembolism - tumour lysis syndrome - vomiting

- **PREGNANCY** Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

- **BREAST FEEDING** Discontinue breast-feeding.

- **DIRECTIONS FOR ADMINISTRATION** Facilities for the management of anaphylaxis should be available.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**
- Erwinase (EUSA Pharma Ltd)
  - Crisantaspase 10000 unit Erwinase 10,000unit powder for solution for injection vials | 5 vial (P) £3,065.00

**Eribulin**

**INDICATIONS AND DOSE**
Treatment of locally advanced or metastatic breast cancer when the disease has progressed after treatment with at least 1 chemotherapy regimen for advanced disease

**BY INTRAVENOUS INJECTION**
- Adult: Give on day 1 and day 8 of a 21-day cycle, previous therapy should have included an anthracycline and a taxane in either the adjuvant or previous therapy should have included an anthracycline and a taxane in either the adjuvant or metastatic setting unless the patient is unsuitable for these treatments (consult local protocol)

- **CONTRA-INDICATIONS** Congenital long QT syndrome

- **CAUTIONS** Bradycardia - bradycardia - increased susceptibility to QT-interval prolongation - congestive heart failure (increased susceptibility to QT-interval prolongation) - electrolyte disturbances (increased susceptibility to QT-interval prolongation) - susceptibility to QT-interval prolongation

- **INTERACTIONS** → Appendix 1 (eribulin).
  Caution with concomitant use of drugs that prolong QT-interval.

- **SIDE-EFFECTS** Alopecia - bone-marrow suppression - extravasation - hyperuricaemia - myelosuppression -
Etoposide

**INDICATIONS AND DOSE**

Small cell carcinoma of the bronchus, the lymphomas and testicular cancer

**BY MOUTH**

- Adult: 120–240 mg/m² daily for 5 days

**BY INTRAVENOUS INFUSION**

- Adult: (consult product literature)

**SIDE-EFFECTS**

- Alopecia
- Bone-marrow suppression
- Hyperuricaemia
- Irritant to tissues
- Nausea
- Oral mucositis
- Peripheral neuropathy
- QT-interval prolongation
- Thromboembolism
- Tumour lysis syndrome
- Vomiting

**PREGNANCY**

- Avoid (teratogenic in animal studies)
- See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

**BREAST FEEDING**

- Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**

- Avoid in severe impairment.

**MEDICAL FORMS**

- Etoposide (as Etoposide phosphate) 100 mg capsules (Bristol-Myers Squibb Pharmaceuticals Ltd)
- Etoposide 50 mg capsules (Bristol-Myers Squibb Pharmaceuticals Ltd)

**DIRECTIONS FOR ADMINISTRATION**

- Etoposide may be given orally or by slow intravenous infusion, the oral dose being double the intravenous dose. A preparation containing etoposide phosphate can be given by intravenous injection or infusion. Etoposide is usually given daily for 3–5 days and courses should not be repeated more frequently than at intervals of 21 days.

**REMEDIAL/SOURCES OF FURTHER INFORMATION**

- Etoposide (as Etoposide phosphate) "Etopophos" (Hospital only)
- Etoposide 50 mg capsules (Hospital only)
- Etoposide 100 mg capsules (Hospital only)

**SIDE-EFFECTS**

- Bone-marrow suppression
- Dizziness
- Drowsiness
- Hypomagnesaemia
- Hypotension
- Nausea and vomiting
- Peripheral neuropathy
- QT-interval prolongation
- Thromboembolism
- Tumour lysis syndrome
- Vomiting

**CAUTIONS**

- Leg ulcers (review treatment if cutaneous vasculitic ulcerations develop)

**INTERACTIONS**

- Appendix 1 (hydroxyurea)

**SIDE-EFFECTS**

- Alopecia
- Bleeding (in sickle-cell disease)
- Bone-marrow suppression
- Dizziness
- Hyperuricaemia
- Hypomagnesaemia
- Nausea
- Oral mucositis
- Rash
- Reduced sperm count
- Skin cancers
- Thromboembolism
- Tumour lysis syndrome
- Vomiting

**CONCEPTION AND CONTRACEPTION**

- Manufacturer advises effective contraception before and during treatment.

**Hydroxyurea**

**INDICATIONS AND DOSE**

- Treatment of chronic myeloid leukaemia
- Treatment of cancer of the cervix in conjunction with radiotherapy
- Polycythaemia

**BY MOUTH**

- Adult: 20–30 mg/kg daily, alternatively 80 mg/kg every 3 days

**SICKLE-CELL DISEASE**

- Consult with a specialist centre

**BY MOUTH**

- Adult: Initially 15 mg/kg daily, increased in steps of 2.5–5 mg/kg daily every 12 weeks according to response; usual dose 15–30 mg/kg daily; maximum 35 mg/kg per day
Malignant disease

8

Mitotane

Mitotane selectively inhibits the activity of the adrenal cortex, necessitating corticosteroid replacement therapy.

INDICATIONS AND DOSE
Symptomatic treatment of advanced or inoperable adrenocortical carcinoma

BY MOUTH
- Adult: Initially 2–3 g daily in 2–3 divided doses adjusted according to plasma-concentration monitoring. In severe illness initial dose can be increased up to 6 g daily, reduce dose or interrupt treatment if signs of toxicity, discontinue if inadequate response after 3 months

Important safety information
RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

CAUTIONS
- Avoid in Acute porphyrias p. 864 • risk of accumulation in overweight patients

INTERACTIONS
- Appendix 1 (mitotane).

SIDE-EFFECTS
- Common or very common Anaemia • anorexia • asthenia • ataxia • cognitive impairment • confusion • diarrhoea • dizziness • drowsiness • endocrine side effects • epigastric discomfort • gastro-intestinal disturbances • gynaecomastia • headache • hypercholesterolaemia • hypertiglyceridaemia • hypogonadism • leucopenia • liver disorders • movement disorder • myasthenia • nausea • neuropathy • neurotoxicity • paraesthesia • prolonged bleeding time • rash • thrombocytopenia • thyroid disorders • vomiting
- Rare Flushing • haematuria • haemorrhagic cystitis • hypersalivation • hypertension • hypouricaemia • ocular disorders • postural hypotension • proteinuria • pyrexia • visual disturbances
- Frequency not known Alopecia • bone-marrow suppression • hyperuricaemia • nausea • oral mucositis • thromboembolism • tumour lysis syndrome • vomiting

PREGNANCY
- Manufacturer advises avoid. See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

BREAST FEEDING
- Discontinue breast-feeding.

HEPATIC IMPAIRMENT
- Manufacturer advises caution in mild to moderate hepatic impairment. Avoid in severe impairment. In mild to moderate hepatic impairment, monitoring of plasma-mitotane concentration is recommended.

RENAL IMPAIRMENT
- Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment. In mild to moderate renal impairment, monitoring of plasma-mitotane concentration is recommended.

MONITORING REQUIREMENTS
- Plasma-mitotane concentration for optimum response

MEDICATIONS
- Monitor plasma-mitotane concentration—consult product literature.

PRESCRIBING AND DISPENSING INFORMATION
- Corticosteroid replacement therapy Corticosteroid replacement therapy is necessary with treatment with mitotane. The dose of glucocorticoid should be increased in case of shock, trauma, or infection.

PATIENT AND CARER ADVICE
- Central nervous system toxicity may affect performance of skilled tasks (e.g. driving). Patients should be warned to contact doctor immediately if injury, infection, or illness occurs (because of risk of acute adrenal insufficiency).

MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, oral suspension, capsule Table
- Siklos (Nordic Pharma Ltd)
  - Hydroxycarbamide 100 mg Siklos 100mg tablets | 60 tablet £100.00
  - Hydroxycarbamide 1 gram Siklos 1000mg tablets | 30 tablet £50.00

- Hydroxycarbamide (Non-proprietary)
  - Hydroxycarbamide 500 mg Hydroxycarbamide 500mg capsules | 100 capsule £86.00 DT price = £11.25
  - Hydrea (Bristol-Myers Squibb Pharmaceuticals Ltd)
  - Hydroxycarbamide 500 mg Hydroxycarbamide 500mg capsules | 100 capsule £10.47 DT price = £11.25

Mitoxantrone

Mitoxantrone (Mitoxantrone)

INDICATIONS AND DOSE
Metastatic breast cancer | Non-Hodgkin’s lymphoma | Adult acute non-lymphocytic leukaemia | Non-resectable primary hepatocellular carcinoma
- Intravenous infusion
  - Adult: (consult local protocol)

CAUTIONS
- Intrathecal administration not recommended

INTERACTIONS
- Appendix 1 (mitoxantrone).

Caution is necessary with concomitant use of cardiotoxic drugs, or drugs that reduce cardiac contractility. Concomitant use with trastuzumab is associated with cardiotoxicity. The use of anthracyclines even after stopping trastuzumab can increase the risk of cardiotoxicity and if possible should be avoided for up to
MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- Nipent ( Hospira UK Ltd)
  Pentostatin 10 mg Nipent 10mg powder for solution for injection vials | 1 vial (PZN) 8663.78 (Hospital only)

Pixintrone

INDICATIONS AND DOSE

Treatment of refractory or multiply relapsed aggressive non-Hodgkin B-cell lymphomas (monotherapy)

BY INTRAVENOUS INFUSION

- Adult: (consult product literature)

CONTRA-INDICATIONS

Active severe infection • risk factors for severe infection

CAUTIONS

Active cardiovascular disease • cardiac risk factors • caution in handling—irritant to tissues • concurrent radiotherapy to the mediastinal area • previous radiotherapy to the mediastinal area • previous therapy with anthracyclines • previous therapy with anthracenidines • non-Hodgkin B-cell lymphomas (monotherapy) • cardiac risk factors • increased risk of cardiac toxicity • Contra-indicated with concurrent immunisation with live virus vaccines.

SIDE-EFFECTS

- Common or very common Abdominal pain • abnormal liver function tests • biochemical disturbances • bone pain • cardiac disorders • cardiac toxicity (during or following treatment) • chromaturia • conjunctivitis • constipation • cough • diarrhoea • drowsiness • dry mouth • dyspepsia • dyspnoea • electrolyte disturbances • haematuria • headache • hypotension • infection • loss of appetite • malaise • nail disorder • oedema • pallor • paraesthesia • pruritus • pyrexia • severe myelosuppression • skin discolouration • tachycardia • taste disturbances • vein discolouration • weight loss
  - Uncommon Anxiety • arrhythmia • arthralgia • arthritis • dizziness • dry eye • keratitis • musculoskeletal pain • musculoskeletal weakness • night sweats • oesophagitis • oliguria • petechiae • pleural effusion • pneumonitis • rash • rectal haemorrhage • rhinorrhea • skin ulcer • sleep disorder • spontaneous erection • tumour progression • vein disorder • vertigo
  - Frequency not known Alopecia • bone-marrow suppression • extravasation • hyperuricaemia • nausea • oral mucositis • photosensitivity • thromboembolism • tumour lysis syndrome • vomiting

CONCEPTION AND CONTRACEPTION

Ensure effective contraception during and for at least 6 months after treatment in men or women.

PREGNANCY

Manufacturer advises avoid—tumour lysis syndrome • vomiting

BREAST FEEDING

Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT

No information available—manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

RENA L IMPAIRMENT

No information available—manufacturer advises caution.

MONITORING REQUIREMENTS

Baseline investigations should include a full blood count, assessment of cardiac function measured by left ventricular ejection fraction, and measurement of serum concentrations of total bilirubin and total creatinine.

Pentostatin

INDICATIONS AND DOSE

Hairy cell leukaemia (initiated in specialist centres)

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- Adult: To be given on alternate weeks (consult product literature)

INTERACTIONS

- Appendix 1 (pentostatin).

SIDE-EFFECTS

- Alopecia • bone-marrow suppression • extravasation • hyperuricaemia • immunosuppression • myelosuppression • nausea • neurotoxicity (withhold or discontinue) • oral mucositis • severe rash (withhold treatment) • thromboembolism • tumour lysis syndrome • vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Pentostatin can cause myelosuppression, immunosuppression, and a number of other side effects that may be severe. Treatment should be withheld in patients who develop a severe rash, and withheld or discontinued in patients showing signs of neurotoxicity.

CONCEPTION AND CONTRACEPTION

Manufacturer advises that men should not father children during and for 6 months after treatment.

PREGNANCY

Avoid (teratogenic in animal studies).

See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

BREAST FEEDING

Discontinue breast-feeding.

HEPATIC IMPAIRMENT

Manufacturer advises caution—limited information available.

RENA L IMPAIRMENT

Avoid if creatinine clearance less than 60 ml/minute.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- Nipent ( Hospira UK Ltd)
  Pentostatin 10 mg Nipent 10mg powder for solution for injection vials | 1 vial (PZN) 8663.78 (Hospital only)

INFORMATION AND DOSE

Treatment of refractory or multiply relapsed aggressive non-Hodgkin B-cell lymphomas (monotherapy)

BY INTRAVENOUS INFUSION

- Adult: (consult product literature)
Pixantrone monotherapy for treating multiply relapsed or refractory aggressive non-Hodgkin’s B-cell lymphoma (February 2014) NICE TA306
Pixantrone monotherapy is recommended as an option for treating adults with multiply relapsed or refractory aggressive non-Hodgkin’s B-cell lymphoma in patients:
- who have previously been treated with rituximab and
d who are receiving third- or fourth-line treatment and
- if the manufacturer provides pixantrone with the discount agreed in the patient access scheme. www.nice.org.uk/TA306

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**
ELECTROLYTES: May contain Sodium
- Pixuvri (CTI Life Sciences Ltd) ▼
- Pixantrone (as Pixantrone dimaleate) 29 mg Pixuvri 29mg powder for concentrate for solution for infusion vials | 1 vial £295 no price available

**Procarbazine**
- **DRUG ACTION** Procarbazine is a mild monoamine-oxidase inhibitor.

**INDICATIONS AND DOSE**
Hodgkin’s lymphoma
- **Adult:** (consult local protocol)

**Important safety information**
RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES, see p. 745

**CONTRA-INDICATIONS**
Pre-existing severe leucopenia - pre-existing severe thrombocytopenia

**CAUTIONS**
Cardiovascular disease - cerebrovascular disease - epilepsy - phaeochromocytoma - procarbazine is a mild monoamineoxidase inhibitor (dietary restriction is rarely considered necessary)

**INTERACTIONS** ▶ Appendix 1 (procarbazine).
Alcohol ingestion may cause a disulfiram-like reaction.

**SIDE-EFFECTS**
- Common or very common Loss of appetite
- Frequency not known Alopecia - bone-marrow suppression - hypersensitivity rash (discontinue treatment) - hyperuricaemia - jaundice - myelosuppression - nausea - oral mucositis - thromboembolism - tumour lysis syndrome - vomiting
- **PREGNANCY** Avoid (teratogenic in animal studies and isolated reports in humans). See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.

**Raltitrexed**
- **DRUG ACTION** Raltitrexed is a thymidylate synthase inhibitor.

**INDICATIONS AND DOSE**
 Palliation of advanced colorectal cancer when fluorouracil and folinic acid cannot be used
BY INTRAVENOUS INFUSION
 ▶ Adult: (consult local protocol)

**INTERACTIONS** ▶ Appendix 1 (raltitrexed).
- **SIDE-EFFECTS** Alopecia - bone-marrow suppression - extravasation - gastro-intestinal effects - hyperuricaemia - myelosuppression - nausea - oral mucositis - thromboembolism - tumour lysis syndrome - vomiting
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY** See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Reduce dose and increase dosing interval if creatinine clearance less than 65 mL/minute (consult product literature). Avoid if creatinine clearance less than 25 mL/minute.

**NATIONAL FUNDING/ACCESS DECISIONS**
NICE technology appraisals (TAs)
- Irinotecan, oxaliplatin, and raltitrexed for advanced colorectal cancer (August 2005) NICE TA93
Raltitrexed is **not** recommended for the treatment of advanced colorectal cancer. Its use should be confined to clinical studies. www.nice.org.uk/TA93

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**
- Tomudex (Hospira UK Ltd) Raltitrexed 2 mg Tomudex 2mg powder for solution for infusion vials | 1 vial £175.00

**Trabectedin**
- **INDICATIONS AND DOSE**
  Treatment of advanced soft tissue sarcoma when treatment with anthracyclines and ifosfamide has failed or is contra-indicated | Treatment of relapsed platinum-sensitive ovarian cancer (in combination with pegylated liposomal doxorubicin)
  BY INTRAVENOUS INFUSION
  ▶ Adult: (consult product literature or local protocols)

**CONTRA-INDICATIONS**
Elevated creatine phosphokinase (consult product literature).

**INTERACTIONS** Caution in concomitant use with hepatotoxic drugs (avoid alcohol).
2.3 Cytotoxic drug-induced side effects

FOLATES

Folinic acid

**INDICATIONS AND DOSE**

Prevention of methotrexate-induced adverse effects

BY INTRAMUSCULAR INJECTION OR BY INTRAVENOUS INJECTION

- Adult: 15 mg every 6 hours for 24 hours, to be started usually 12–24 hours after start of methotrexate infusion, dose may be continued by mouth, consult local treatment protocol for further information

Suspected methotrexate overdosage

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- Adult: Initial dose equal to or exceeding dose of methotrexate, to be given at a maximum rate of 160 mg/minute, consult poisons information centres for advice on continuing management

Adjunct to fluorouracil in colorectal cancer

BY SLOW INTRAVENOUS INJECTION

- Adult: (consult product literature)

**SODIOFOLIN®**

As an antidote to methotrexate

BY INTRAVENOUS INFUSION OR BY INTRAVENOUS INFUSION

- Adult: (consult product literature)

Adjunct to fluorouracil in colorectal cancer

BY INTRAVENOUS INJECTION OR BY INTRAVENOUS INFUSION

- Adult: (consult product literature)

**CONTRA-INDICATIONS**

Intrathecal injection

**CAUTIONS**

Not indicated for pernicious anaemia or other megaloblastic anaemias caused by vitamin B12 deficiency • avoid simultaneous administration of methotrexate

**INTERACTIONS**

→ Appendix 1 (folicates).

**SIDE-EFFECTS**

- Rare • Agitation (after high doses) • depression (after high doses) • insomnia (after high doses) • pyrexia (after parenteral use)

**PREGNANCY**

Not known to be harmful; benefit outweighs risk.

**BREAST FEEDING**

Presence in milk unknown but benefit outweighs risk.

**NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

- Trabectedin for the treatment of advanced soft tissue sarcoma (February 2010) NICE TA185
- Trabectedin for the treatment of relapsed ovarian cancer (April 2011) NICE TA222

Trabectedin in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine for the treatment of metastatic colorectal cancer (December 2010) NICE TA212

Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine is not recommended for the treatment of metastatic colorectal cancer. www.nice.org.uk/TA212

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- FOLINIC ACID (Non-proprietary)
  
  Folinic acid (as Calcium folinate) 3 mg per 1 ml Calcium folinate 3mg/1ml solution for injection ampoules | 5 ampoule [PSt] £30.00–£36.00
  
  Folinic acid (as Calcium folinate) 7.5 mg per 1 ml Calcium folinate 15mg/2ml solution for injection ampoules | 5 ampoule [PSt] £38.99–£39.00
  
  Folinic acid (as Calcium folinate) 10 mg per 1 ml Calcium folinate 50mg/5ml solution for injection ampoules | 1 vial [PSt] £18.44 (Hospital
Levofolic acid

**DRUG ACTION** Levofolic acid is an isomer of folinic acid.

**INDICATIONS AND DOSE**

**Prevention of methotrexate-induced adverse effects**
- **BY INTRAMUSCULAR INJECTION** OR **BY INTRAVENOUS INJECTION**
  - Adult: Usual dose 7.5 mg every 6 hours for 10 doses, usually started 12–24 hours after beginning of methotrexate infusion

**Suspected methotrexate overdosage**
- **BY INTRAVENOUS INFUSION** OR **BY INTRAVENOUS INJECTION**
  - Adult: Initial dose at least 50% of the dose of methotrexate, intravenous infusion to be administered at a maximum rate of 150 mg/minute, consult poisons information centres for advice on continuing management

**Adjunct to fluorouracil in colorectal cancer**
- **BY SLOW INTRAVENOUS INJECTION**
  - Adult: (consult product literature)

**CONTRA-INDICATIONS** Intrathecal injection

**CAUTIONS** Not indicated for pernicious anaemia or other megaloblastic anaemias caused by vitamin B<sub>12</sub> deficiency; avoid simultaneous administration of methotrexate

**INTERACTIONS** → Appendix 1 (folates).

**SIDE-EFFECTS**
- Rare Agitation (after high doses) - depression (after high doses) - insomnia (after high doses) - pyrexia (after parenteral use)
- PREGNANCY Not known to be harmful; benefit outweighs risk.
- BREAST FEEDING Presence in milk unknown but benefit outweighs risk.

**Iron Chelators**

**Dexrazoxane**

**INDICATIONS AND DOSE**

**CARDIOXANE®**

Prevention of chronic cumulative cardiotoxicity caused by doxorubicin or epirubicin treatment in advanced or metastatic breast cancer patients who have received a prior cumulative dose of 300 mg/m<sup>2</sup> of doxorubicin or a prior cumulative dose of 540 mg/m<sup>2</sup> of epirubicin when further anthracycline treatment is required

**BY INTRAVENOUS INFUSION**
- Adult: Administer 10 times the doxorubicin-equivalent dose or 10 times the epirubicin-equivalent dose, dose to be given 30 minutes before anthracycline administration

**SAVENE®**

Anthracycline extravasation

**BY INTRAVENOUS INFUSION**
- Adult: Initially 1 g/m<sup>2</sup>; daily (max. per dose 2 g) for 2 days, then 500 mg/m<sup>2</sup> for 1 day, first dose to be given as soon as possible and within 6 hours after injury

**CONTRA-INDICATIONS** Children

**CAUTIONS** Myelosuppression (effects may be additive to those of chemotherapy)

**CARDIOXANE®**

Manufacturer advises caution in patients with heart failure—no information available • manufacturer advises caution in patients with myocardial infarction in previous 12 months—no information available • manufacturer advises caution in patients with symptomatic valvular heart disease—no information available • manufacturer advises caution in patients with uncontrolled angina—no information available

**INTERACTIONS** → Appendix 1 (dexrazoxane).

**SIDE-EFFECTS**

**CARDIOXANE®**
- Common or very common Anorexia - asthenia - diarrhoea - dizziness - dry mouth - dyspnoea - erythema - infection - malaise - nausea - oedema - paraesthesia - peripheral neuropathy - stomatitis - syncope - vomiting
- Uncommon Abdominal pain - acute myeloid leukaemia - constipation - cough - dyspepsia - headache - lymphoedema - nail disorder - reduced ejection fraction - tachycardia - thromboembolism (when given with cytotoxic drugs)

**Frequency not known** Alopecia - anaemia - blood disorders - fatigue - injection-site reactions - leucopenia - phlebitis - pruritis - pyrexia - thrombocytopenia

**SAVENE®**
- Uncommon Drowsiness - myalgia - thromboembolism (when given with cytotoxic drugs) - weight loss

**CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least 3 months after treatment in men and women.

**PREGNANCY** Avoid unless essential (toxicity in animal studies).

**BREAST FEEDING** Discontinue breast-feeding.
PREGNANCY

Manufacturer advises that if anthracycline dose is reduced, reduce the Cardioxane® dose by a similar ratio.

SAVENE®

Manufacturer advises avoid—no information available.

RENEWAL IMPAIRMENT

Cardioxane®

Manufacturer advises reduce dose by 50% if creatinine clearance less than 40 mL/minute.

SAVENE®

Manufacturer advises avoid—risk of accumulation.

MONITORING REQUIREMENTS

◆ Monitor full blood count.
◆ Monitor serum creatinine levels.
◆ Monitor for cardiac toxicity.
◆ Monitor liver function.

DIRECTIONS FOR ADMINISTRATION

Local coolants such as ice packs should be removed at least 15 minutes before administration.

Cardioxane®

For intravenous infusion, give intermittently in compound sodium lactate; reconstitute each vial with 25 mL water for injections and dilute each vial with 25–100 mL infusion fluid; give requisite dose over 15 minutes.

SAVENE®

For intravenous infusion, reconstitute each 500–mg vial with 25 mL of diluent; dilute requisite dose further in remaining diluent and give over 1–2 hours into a large vein in an area other than the one affected.

MEDITICL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

◆ Cardioxane (Clinigen Healthcare Ltd)
  Dextrazoxane 500 mg Cardioxane 500 mg powder for solution for infusion vials | 1 vial [POD] £156.57

Powder and solvent for solution for infusion

Electrolytes: May contain potassium, sodium

Dextrazoxane 500 mg Saven 1000 mg powder for concentrate and solvent for solution for infusion vials | 10 vial [POD] no price available

RECOMBINANT HUMAN KERATINOCYTE GROWTH FACTORS

Palifermin

◆ Drug Action Palifermin is a human keratinocyte growth factor.

INDICATIONS AND DOSE

Management of oral mucositis in patients with haematological malignancies receiving myeloblastic radiochemotherapy with autologous haematopoietic stem-cell support

By intravenous injection

◆ Adult: 60 micrograms/kg once daily for 3 doses (third dose given 24–48 hours before myeloblastic therapy) then 3 further doses at least 24 hours after myeloblastic therapy, and more than 4 days after most recent palifermin injection, starting on the same day as (but after) stem-cell infusion

SIDE-EFFECTS

◆ Arthralgia - discoloration of the tongue - erythema - fever - oedema - oral paraesthesia - pruritus - rash - skin hyperpigmentation - taste disturbance - thickening of the tongue

PREGNANCY

Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

◆ Kepivance (Swedish Orphan Biovitrum Ltd)
  Palifermin 6.25 mg Kepivance 6.25 mg powder for solution for injection vials | 6 vial [POD] £265.44

UROPROTECTIVE DRUGS

Mesna

INDICATIONS AND DOSE

Cytotoxic induced urothelial toxicity

BY MOUTH OR BY INTRAVENOUS INJECTION

◆ Adult: Dose to be calculated according to oxazaphosphorine (cyclophosphamide or ifosfamide) treatment (consult product literature)

SIDE-EFFECTS

◆ Common or very common: Colic - depression - diarrhoea - fatigue - headache - hypotension - irritability - joint pains - limb pains - nausea - rash - tachycardia - vomiting

◆ Rare: Hypersensitivity reactions (more common in patients with auto-immune disorders)

ALLERGY AND CROSS-SENSITIVITY

Contraindicated if history of hypersensitivity to thiol-containing compounds.

PREGNANCY

Not known to be harmful.

See also Pregnancy and reproductive function in Cytotoxic drugs, p. 746.

EFFECT ON LABORATORY TESTS

False positive urinary ketones. False positive or false negative urinary erythrocytes.

DIRECTIONS FOR ADMINISTRATION

For oral administration of the injection, contents of ampoule are taken in a flavoured drink such as orange juice or cola which may be stored in a refrigerator for up to 24 hours in a sealed container.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Tablet

◆ Mesna (Non-proprietary)
  Mesna 400 mg Mesna 400 mg tablets | 10 tablet [POD] £134.30-£134.40
  Mesna 600 mg Mesna 600 mg tablets | 10 tablet [POD] £190.60

Solution for injection

◆ Mesna (Non-proprietary)
  Mesna 100 mg per 1 ml Mesna 1g/10ml solution for injection ampoules | 15 ampoule [POD] £64.1 15 Mesna 400mg/4ml solution for injection ampoules | 15 ampoule [POD] £201.15

2.4 Hyperuricaemia associated with cytotoxic drugs

Drugs used for Hyperuricaemia associated with cytotoxic drugs not listed below; Allopurinol, p. 905
Malignant disease

URATE OXIDASES

**Rasburicase**

**INDICATIONS AND DOSE**

Prophylaxis and treatment of acute hyperuricaemia, before and during initiation of chemotherapy, in patients with haematological malignancy and high tumour burden at risk of rapid lysis

**BY INTRAVENOUS INFUSION**

- Adult: 200 micrograms/kg once daily for up to 7 days according to plasma-urate concentration

- Precautions: Monitor closely for reactions.

**SIDE-EFFECTS**

- Fever
- Headache
- Rash
- Vomiting

**CONTRA-INDICATIONS**

- G6PD deficiency

**CAUTIONS**

- Atopic allergies

**MEDICINAL FORMS**

- Powder and solvent for solution for infusion

**Powder and solvent for solution for infusion**

- Rasburicase 1.5 mg (Fasturtec 1.5mg powder and solvent for solution for infusion vials $1 3 3$ 2 0 8 $1 3$ Hospital only)

- Rasburicase 7.5 mg (Fasturtec 7.5mg powder and solvent for solution for infusion vials $1 1 2 8 9 4 4$ Hospital only)

- Medicinal forms

- There can be variation in the licensing of different medicines containing the same drug.

**Hormones, malignant disease**

Hormonal manipulation has an important role in the treatment of breast, prostate, and endometrial cancer, and a more marginal role in the treatment of hypernephroma. These treatments are not curative, but may provide excellent palliation of symptoms in selected patients, sometimes for a period of years. Tumour response, and treatment toxicity should be carefully monitored and treatment changed if progression occurs or side-effects exceed benefit.

**Oestrogens**

Diethylstilbestrol p. 788 is sometimes used to treat prostate cancer, but it is not usually used first-line because of its side-effects. It is occasionally used in postmenopausal women with breast cancer. Ethinylestradiol p. 655 is the most potent oestrogen available; unlike other oestrogens it is only slowly metabolised in the liver.

**Progestogens**

Progestogens have a role in the treatment of endometrial cancer; their use in breast cancer and renal cell cancer has declined. Progestogens are now rarely used to treat prostate cancer. Medroxyprogesterone acetate p. 695 or megestrol acetate p. 788 are usually chosen and can be given orally; high-dose or parenteral treatment cannot be recommended.

**Androgens**

Testosterone esters have largely been superseded by other drugs for breast cancer.

**Hormone Antagonists**

**Breast Cancer**

The management of patients with breast cancer involves surgery, radiotherapy, drug therapy, or a combination of these. For operable breast cancer, treatment before surgery (neoadjuvant therapy) reduces the size of the tumour and facilitates breast-conserving surgery; hormone antagonist therapy (e.g. letrozole) is chosen for steroid hormone-receptor-positive breast cancer and chemotherapy for steroid hormone-receptor-negative tumours or for younger women.

**Early breast cancer**

All women should be considered for adjuvant therapy following surgical removal of the tumour. Adjuvant therapy is used to eradicate the micrometastases that cause relapses. Choice of adjuvant treatment is determined by the risk of recurrence, steroid hormone-receptor status of the primary tumour, and menopausal status.

Adjuvant therapy comprises cytotoxic chemotherapy and hormone-antagonist therapy. Women with steroid hormone-receptor-positive breast cancer are considered for hormone-antagonist therapy (preceded by cytotoxic chemotherapy if necessary) whilst women with steroid hormone-receptor-negative breast cancer should be considered for cytotoxic chemotherapy.

Aromatase inhibitors act predominantly by blocking the conversion of androgens to oestrogens in the peripheral tissues. They do not inhibit ovarian oestrogen synthesis and should not be used in premenopausal women. Anastrozole p. 792 and letrozole p. 793 are non-steroidal aromatase inhibitors; exemestane p. 792 is a steroidal aromatase inhibitor. Aromatase inhibitors are usually prescribed as initial adjuvant therapy in postmenopausal women with oestrogen-receptor-positive tumours; tamoxifen p. 791, an oestrogen-receptor antagonist, is used if an aromatase inhibitor is not appropriate. Adjuvant hormone antagonist therapy should generally be continued for 5 years following removal of the tumour. In postmenopausal women considered for extended adjuvant therapy, 5 years of tamoxifen is followed by letrozole for a further 2–3 years.

**Advanced breast cancer**

Treatment of advanced breast cancer depends on the patient’s drug history and an assessment of disease severity. Aromatase inhibitors, such as anastrozole or letrozole, are the preferred treatment in postmenopausal women with oestrogen-receptor-positive advanced breast cancer, a long disease-free interval following treatment for early breast cancer, and disease limited to bone or soft tissues; tamoxifen can be used if aromatase inhibitors are not suitable. Progestogens, such as medroxyprogesterone acetate p. 695, may be used after aromatase inhibitors and tamoxifen in postmenopausal women.
Widespread, with strontium ranelate p.

Bone disease can often be palliated with irradiation or, if to other hormone manipulation e.g. with an anti-androgen.

Occasional patients respond disease progression despite this treatment (hormone-refractory prostate cancer), but occasional patients respond to other hormone manipulation e.g. with an anti-androgen.

Cytotoxic chemotherapy is indicated for advanced steroid hormone-receptor-negative tumours and for aggressive disease, particularly when metastases involve visceral sites (e.g. the liver) or if the disease-free interval following treatment for early breast cancer is short.

Cytotoxic drugs used in breast cancer

An anthracycline combined with fluorouracil p. 761 and cyclophosphamide p. 750, and sometimes also with methotrexate p. 762 is effective. Cyclophosphamide, methotrexate, and fluorouracil can be useful if an anthracycline is inappropriate (e.g. in cardiac disease).

Metastatic disease

The choice of chemotherapeutic regimen will be influenced by whether the patient has previously received adjuvant treatment and the presence of any co-morbidity.

For women who have not previously received chemotherapy, an anthracycline (such as doxorubicin hydrochloride p. 754 or epirubicin hydrochloride p. 756) alone or in combination with another cytotoxic drug is the standard initial therapy for metastatic breast disease.

Patients with anthracycline-refractory or resistant disease should be considered for treatment with a taxane either alone or in combination with trastuzumab p. 743 if they have tumours that overexpress HER2. Other cytotoxic drugs with activity against breast cancer include capcitabine p. 757, mitoxantrone p. 778, mitomycin p. 767, and vinorelbine p. 775. Trastuzumab p. 743 alone is an option for chemotherapy-resistant cancers that overexpress HER2.

Trastuzumab emtansine can be used as monotherapy in HER2-positive metastatic breast cancer previously treated with trastuzumab and a taxane, or when there is a disease recurrence during or following adjuvant therapy.

The use of bisphosphonates in patients with metastatic breast cancer may reduce pain and prevent skeletal complications of bone metastases.

Gonadorelin analogues and gonadotrophin-releasing hormone antagonists

Metastatic cancer of the prostate usually responds to hormonal treatment aimed at androgen depletion. Standard treatments include bilateral subcapsular orchidectomy or use of a gonadorelin analogue (buserelin p. 631, goserelin p. 632, leuprolrelate acetate p. 633, or triptorelin p. 635). The gonadotrophin-releasing hormone antagonist, degarelix p. 787, is also available. Response in most patients lasts for 12 to 18 months. No entirely satisfactory therapy exists for disease progression despite this treatment (hormone-refractory prostate cancer), but occasional patients respond to other hormone manipulation e.g. with an anti-androgen.

Bone disease can often be palliated with irradiation or, if widespread, with strontium ranelate p. 626 or prednisolone p. 585.

Gonadorelin analogues

Gonadorelin analogues are as effective as orchidectomy or diethylstilbestrol p. 788 but are expensive and require parenteral administration, at least initially. They cause initial stimulation then depression of luteinising hormone release by the pituitary.

Gonadorelin analogues are also used in women for breast cancer and other indications. The gonadorelin analogues cause side-effects similar to the menopause in women and orchidectomy in men.

Anti-androgens

Cyproterone acetate p. 662, flutamide p. 787 and bicalutamide p. 786 are anti-androgens that inhibit the tumour ‘flare’ which may occur after commencing gonadorelin analogue administration. Cyproterone acetate and flutamide are also licensed for use alone in patients with metastatic prostate cancer refractory to gonadorelin analogue therapy. Bicalutamide is used for prostate cancer either alone or as an adjunct to other therapy, according to the clinical circumstances.

Abiraterone acetate p. 786 (in combination with prednisone p. 586 or prednisolone p. 585) and enzalutamide p. 787 are licensed for metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after treatment with a docetaxel-containing chemotherapy regimen. Abiraterone acetate p. 786 and enzalutamide p. 787 are also licensed to treat metastatic castration-resistant prostate cancer in patients who are asymptomatic or mildly symptomatic after failure of androgen deprivation therapy in whom chemotherapy is not yet clinically indicated. Medical castration with a luteinising hormone-releasing hormone analogue should be continued during treatment in patients not surgically castrated.

Gonadotrophin-releasing hormone antagonists

Degarelix p. 787 is a gonadotrophin-releasing hormone antagonist used to treat advanced hormone-dependent prostate cancer. It does not induce a testosterone surge or tumour ‘flare’, therefore anti-androgen therapy is not required.

Somatostatin analogues

Lanreotide p. 789, octreotide p. 789 and pasireotide p. 790 are analogous of the hypothalamic release-inhibiting hormone somatostatin. Lanreotide and octreotide are indicated for the relief of symptoms associated with neuroendocrine (particularly carcinoid) tumours and acromegaly. Additionally, lanreotide is licensed for the treatment of thyroid tumours and octreotide is also licensed for the prevention of complications following pancreatic surgery. Lanreotide (Somatuline Autogel®) is also licensed for the treatment of unresectable locally advanced or metastatic gastroenteropancreatic neuroendocrine tumours of midgut, pancreatic or unknown origin where hindgut sites of origin have been excluded. Octreotide long-acting depot injection is licensed for treatment of advanced neuroendocrine tumours of the midgut, or treatment where primary origin is not known but non-midgut sites of origin have been excluded. Octreotide may also be valuable in reducing vomiting in palliative care and in stopping variceal bleeding [unlicensed indication]—see also vasopressin p. 576 and terlipressin acetate p. 77. Pasireotide is licensed for the treatment of Cushing’s disease when surgery has failed or is inappropriate.
Abiraterone acetate

**INDICATIONS AND DOSE**

Metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after treatment with a docetaxel-containing chemotherapy regimen (in combination with prednisone or prednisolone) | Metastatic castration-resistant prostate cancer in patients who are asymptomatic or mildly symptomatic after failure of androgen deprivation therapy in whom chemotherapy is not yet clinically indicated (in combination with prednisone or prednisolone)

**BY MOUTH**
- Adult: 1 g once daily, for dose of concurrent prednisone or prednisolone—consult product literature

**CAUTIONS**
- Diabetes (increased risk of hyperglycaemia—monitor blood sugar frequently) | history of cardiovascular disease
- Hypokalaemia before treatment (if significant risk of congestive heart failure, such as history of cardiac failure, uncontrolled hypertension or cardiac events, consult product literature for management and increased monitoring).

**INTERACTIONS** → Appendix 1 (abiraterone). Caution with concurrent chemotherapy—safety and efficacy not established. Caution with concomitant use of drugs known to be associated with myopathy or rhabdomyolysis.

**SIDE-EFFECTS**
- **Common or very common** Angina | arhythmia | atrial fibrillation | diarrhoea | dyspepsia | fractures | haematuria | heart failure | hepatotoxicity | hypertension | hypertriglyceridaemia | hypokalaemia | peripheral oedema | rash | sepsis | tachycardia | urinary tract infection

- **Uncommon** Adrenal insufficiency | myopathy | rhabdomyolysis

- **Rare** Allergic alveolitis

**CONCEPTION AND CONTRACEPTION**

Men should use condoms if their partner is pregnant, and use condoms in combination with another effective contraceptive method if their partner is of child-bearing potential—toxicity in animal studies.

**HEPATIC IMPAIRMENT**

Use with caution in moderate impairment and only if benefit clearly outweighs risk. Avoid in severe impairment.

**RENAL IMPAIRMENT**

Use with caution in severe impairment—no information available.

**MONITORING REQUIREMENTS**

- Monitor blood pressure, serum potassium concentration, and fluid balance before treatment, and at least monthly during treatment—consult product literature for management of hypertension, hypokalaemia and oedema.
- Monitor liver function before treatment, then every 2 weeks for the first 3 months of treatment, then monthly thereafter—interrupt treatment if serum alanine aminotransferase or aspartate aminotransferase greater than 5 times the upper limit (consult product literature for details of restarting treatment at a lower dose) and discontinue permanently if 20 times the upper limit.

**NATIONAL FUNDING/ACCESS DECISIONS**

- Abiraterone for castration-resistant metastatic prostate cancer previously treated with a docetaxel-containing regimen (June 2012) NICE TA259

Abiraterone in combination with prednisone or prednisolone is recommended as an option for the treatment of castration-resistant metastatic prostate cancer only if:
- their disease has progressed on or after one docetaxel-containing chemotherapy regimen, and
- the manufacturer provides abiraterone with the discount agreed in the patient access scheme. Patients currently receiving abiraterone in combination with prednisone or prednisolone whose disease does not meet the first criteria should be able to continue therapy until they and their clinician consider it appropriate to stop. [www.nice.org.uk/TA259](www.nice.org.uk/TA259)

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (July 2012) that abiraterone (Zytiga®), in combination with prednisone or prednisolone, is accepted for restricted use within NHS Scotland for the treatment of metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after treatment with docetaxel-containing chemotherapy regimen, and have received only one prior chemotherapy regimen.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS 23**
  - Zytiga (Janssen-Cilag Ltd)
    - Abiraterone acetate 250 mg Zytiga 250mg tablets | 120 tablet pack £2,930.00

**Bicalutamide**

**INDICATIONS AND DOSE**

Locally advanced prostate cancer at high risk of disease progression either alone or as adjuvant treatment to prostatectomy or radiotherapy | Locally advanced, non-metastatic prostate cancer when surgical castration or other medical intervention inappropriate

**BY MOUTH**
- Adult: 150 mg once daily

**Advanced prostate cancer, in combination with gonadorelin analogue or surgical castration**

**BY MOUTH**
- Adult: 50 mg once daily, to be started at the same time as surgical castration or at least 3 days before gonadorelin therapy

**CAUTIONS**

- Risk of photosensitivity—avoid excessive exposure to UV light and sunlight

**INTERACTIONS** → Appendix 1 (bicalutamide).

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain | alopecia | anaemia | arthralgia | asthenia | breast tenderness | chest pain | cholestasis | constipation | decreased appetite | decreased libido | depression | dizziness | dry skin | dyspepsia | fatigue | gynaecomastia | haematuria | hepatotoxicity | hirsutism | hot flushes | impotence | jaundice | nausea | oedema | pruritus | rash | somnolence | weight gain

- **Uncommon** Angioedema | hypersensitivity reactions | interstitial lung disease | urticaria

- **Rare** Hepatic failure | photosensitivity reactions

**HEPATIC IMPAIRMENT**

Increased accumulation possible in moderate to severe impairment—manufacturer advises caution.

**MONITORING REQUIREMENTS**

Consider periodic liver function tests.
Enzalutamide

INDICATIONS AND DOSE
Metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after docetaxel therapy

BY MOUTH
- Adult: 160 mg once daily, for dose adjustments due to side-effects, consult product literature

- CAUTIONS
  - Alcoholism - bradycardia - brain injury - brain metastases - brain tumours - history of QT-interval prolongation - history or risk of seizure - recent cardiovascular disease - risk factors for QT-interval prolongation - stroke - uncontrolled hypertension
  - INTERACTIONS → Appendix 1 (enzalutamide).
  - Caution with concurrent use of medication which may lower seizure threshold. Caution with concurrent chemotherapy—safety and efficacy not established. Caution with concomitant use of drugs that prolong QT interval.

- SIDE-EFFECTS
  - Common or very common Anxiety - cognitive disorder - dry skin - falls - fractures - headache - hot flush - hypertension - memory impairment - neutropenia - pruritus - visual hallucinations
  - Uncommon Leucopenia - seizure

- CONCEPTION AND CONTRACEPTION
  - Men should use condoms during treatment and for 3 months after stopping treatment if their partner is pregnant, and use condoms in combination with another effective contraceptive method if their partner is of child-bearing potential—toxicity in animal studies.

- HEPATIC IMPAIRMENT
  - Manufacturer advises caution in moderate impairment. Avoid in severe impairment.

- RENAL IMPAIRMENT
  - Caution in severe impairment—no information available.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

  **Capsule**
  - CAUTIONARY AND ADVISORY LABELS 25
  - Enzalutamide 40 mg
    - Xtandi (Astellas Pharma Ltd) ▼
    - Enzalutamide 40 mg capsules | 112 capsule £2,734.67

Flutamide

INDICATIONS AND DOSE
Advanced prostate cancer

BY MOUTH
- Adult: 250 mg 3 times a day

- CAUTIONS
  - Avoid excessive alcohol consumption - avoid in Acute porphyrias p. 864 - cardiac disease (oedema reported)

- INTERACTIONS → Appendix 1 (flutamide).

- SIDE-EFFECTS

- HEPATIC IMPAIRMENT
  - Use with caution (hepatotoxic).

- MONITORING REQUIREMENTS
  - Liver function tests, monthly for first 4 months, periodically thereafter and at the first sign or symptom of liver disorder (e.g. pruritus, dark urine, persistent anorexia, jaundice, abdominal pain, unexplained influenza-like symptoms).

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**
  - FLUTAMIDE (Non-proprietary)
    - Flutamide 250 mg
      - Flutamide 250mg tablets | 84 tablet £98.58 DT price = £74.84

Degarelix

INDICATIONS AND DOSE
Advanced hormone-dependent prostate cancer

BY SUBCUTANEOUS INJECTION
- Adult: Initially 240 mg, to be administered as 2 injections of 120 mg, then 80 mg every 28 days, dose to be administered into the abdominal region

- CAUTIONS
  - Diabetes - susceptibility to QT-interval prolongation

- INTERACTIONS
  - Avoid concomitant use of drugs that prolong QT interval.

- SIDE-EFFECTS
  - Common or very common
    - Asthenia - dizziness - drowsiness - headache - hot flushes - influenza-like symptoms - injection-site reactions - insomnia - nausea - night sweats - sweating - weight gain
  - Uncommon

- HEPATIC IMPAIRMENT
  - Manufacturer advises caution in severe impairment—no information available.

- RENAL IMPAIRMENT
  - Manufacturer advises caution in severe impairment—no information available.

- MONITORING REQUIREMENTS
  - Monitor bone density.
**OESTROGENS**

**Diethylstilbestrol**

*(Stilboestrol)*

**INDICATIONS AND DOSE**

- Breast cancer in postmenopausal women
  - By mouth
    - Adult: 10–20 mg daily
- Prostate cancer
  - By mouth
    - Adult: 1–3 mg daily

**CAUTIONS**

- Cardiovascular disease
- **SIDE-EFFECTS**
  - Arterial thrombosis
  - Bone pain
  - Bronchitis
  - Cataracts
  - Central nervous system changes
  - Coughing
  - Dizziness
  - Dryness
  - Fluid retention
  - Headache
  - Hirsutism
  - Indigestion
  - Insomnia
  - Jaundice
  - Loss of vision during treatment
  - Pancreatitis (shortly after administration)
  - Pancreatitis (after long-term treatment)
  - Pruritus
  - Rash
  - Skin reactions
  - Tumour flare
  - Urinary frequency
  - Urticaria
  - Vomiting
  - Weight change
  - Weight gain

**PREGNANCY**

Avoid. Reversible feminisation of male fetuses reported in animal studies. Risk of hypospadias in male fetuses and masculinisation of female fetuses.

**BREAST FEEDING**

Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**

Avoid. Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **DIETHYLSILBESTROL (Non-proprietary)**
  - Diethylstilbestrol 1 mg
    - Diethylstilbestrol 1mg tablets | 28 tablet [P] £120.00 DT price = £112.47
  - Diethylstilbestrol 5 mg
    - Diethylstilbestrol 5mg tablets | 28 tablet [P] £208.00 DT price = £208.00

**PROGESTOGENS**

**Megestrol acetate**

**INDICATIONS AND DOSE**

- Treatment of breast cancer
  - By mouth
    - Adult: 160 mg once daily

**CONTRA-INDICATIONS**

- Acute porphyrias p. 864
- Breast cancer (unless progestogens are being used in the management of this condition)
- Genital cancer (unless progestogens are being used in the management of this condition)
- History during pregnancy of idiopathic jaundice
- History during pregnancy of pheochromocytoma
- History during pregnancy of severe pruritus
- History of liver tumours
- Severe arterial disease
- Undiagnosed vaginal bleeding

**CAUTIONS**

- Asthma
- Cardiac dysfunction
- Conditions that may worsen with fluid retention
- Diabetes (progestogens can decrease glucose tolerance—monitor patient closely)
- Epilepsy
- History of depression
- Hypertension
- Migraine
- Susceptibility to thromboembolism (particular caution with high dose)

**INTERACTIONS**

- Appendix 1 (progestogens)

**SIDE-EFFECTS**

- Acne
- Adrenal insufficiency
- Alopexia
- Anaphylactoid reactions
- Asthenia
- Bloating
- Breast tenderness
- Cardial tunnel syndrome
- Change in libido
- Constipation
- Cushings syndrome
- Depression
- Diarrhoea
- Dizziness
- Drowsiness
- Fluid retention
- Headache
- Hirsutism
- Indigestion
- Insomnia
- Jaundice
- Loss of vision during treatment
- Pancreatitis (shortly after administration)
- Pancreatitis (after long-term treatment)
- Pruritus
- Rash
- Skin reactions
- Tumour flare
- Urinary frequency
- Urticaria
- Vomiting
- Weight change
- Weight gain

**PREGNANCY**

Avoid. Reversible feminisation of male fetuses reported in animal studies. Risk of hypospadias in male fetuses and masculinisation of female fetuses.

**BREAST FEEDING**

Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**

Avoid. Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Megace**
  - Megace (Bristol-Myers Squibb Pharmaceuticals Ltd)
    - Megace acetate 160 mg Megace 160mg tablets | 30 tablet [P] £19.52 DT price = £19.52

**SOMATOSTATIN ANALOGUES**

**Somatostatin analogues**

- **CAUTIONS**
  - Diabetes mellitus (antidiabetic requirements may be reduced)
  - Insulinoma (increased depth and duration of hypoglycaemia may occur—observe patients and monitor blood glucose levels when initiating treatment and changing doses)
  - May cause growth hormone-secreting pituitary tumour expansion during treatment (causing serious complications)

- **SIDE-EFFECTS**
  - Rare: Pancreatitis (shortly after administration)
  - Frequency not known: Abdominal pain, anorexia, bloating, diarrhoea, flatulence, gallstones (after long-term treatment), gastro-intestinal disturbances, hyperglycaemia (with chronic administration), hyperglycaemia (with chronic administration) - irritation at the injection site
  - Nausea
  - Pain at the injection site
  - Steatorrhoea
  - Vomiting

**MONITORING REQUIREMENTS**

- Monitor for signs of tumour expansion (e.g. visual field defects)
- Ultrasound examination of the gallbladder is recommended before treatment and at intervals of 6–12 months during treatment.

**DIRECTIONS FOR ADMINISTRATION**

- Injection sites should be rotated.
Lanreotide

**INDICATIONS AND DOSE**

**Somatuline Autogel**

- **Acromegaly (if somatostatin analogue not given previously)**
  - Adult: Initially 60 mg every 28 days, adjusted according to response, (consult product literature), for patients treated previously with somatostatin analogue, consult product literature for initial dose, dose to be given in the gluteal region

- **Neuroendocrine (particularly carcinoid) tumours**
  - Adult: Initially 60–120 mg every 28 days, adjusted according to response, dose to be given in the gluteal region

**NEED FEEDING**

- Rare
- Uncommon

**SIDE-EFFECTS**

- Monitor for hypothyroidism
- Manufacturer advises use only if potential benefit outweighs risk.

**INTERACTIONS**

- Adult: (consult product literature)

**CAUTIONS**

- Cardiac disorders (including bradycardia) - patients with carcinoid tumours—exclude the presence of an obstructive intestinal tumour before treatment

**SIDE-EFFECTS**

- Common or very common: Alopecia - biliary dilatation - bradycardia - constipation - dizziness - dyspepsia - headache - lethargy - malaise - muscularkeletal pain - myalgia - raised bilirubin
- Uncommon: Hot flushes - insomnia
- Rare: Hypothyroidism

**PREGNANCY**

- Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**

- Manufacturer advises caution—no information available.

**MONITORING REQUIREMENTS**

- Monitor for hypothyroidism when clinically indicated.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Somatuline Autogel (Ipsen Ltd)
  
  **Lanreotide** (as Lanreotide acetate) 120 mg per 1 ml Somatuline Autogel 60mg/0.5ml solution for injection pre-filled syringes with safety system | 1 pre-filled disposable injection (£31.50)

  **Lanreotide** (as Lanreotide acetate) 180 mg per 1 ml Somatuline Autogel 90mg/0.5ml solution for injection pre-filled syringes with safety system | 1 pre-filled disposable injection (£36.00)

- Somatuline Autogel (Ipsen Ltd)
  
  **Lanreotide** (as Lanreotide acetate) 240 mg per 1 ml Somatuline Autogel 120mg/0.5ml solution for injection pre-filled syringes with safety system | 1 pre-filled disposable injection (£37.00)

**Powder and solvent for suspension for injection**

- Somatuline LA (Ipsen Ltd)
  
  **Lanreotide** (as Lanreotide acetate) 30 mg Somatuline LA 30mg powder and solvent for suspension for injection vials | 1 vial (£3.23)

Octreotide

**INDICATIONS AND DOSE**

**Symptoms associated with carcinoid tumours with features of carcinoid syndrome, VIPomas, glucagonomas**

**BY SUBCUTANEOUS INJECTION**

- Adult: Initially 50 micrograms 1–2 times a day, adjusted according to response to 200 micrograms 3 times a day, higher doses may be required exceptionally; maintenance doses are variable; in carcinoid tumours, discontinue after 1 week if no effect; if rapid response required, initial dose may be given by intravenous injection (with ECG monitoring)

  **Acromegaly, short-term treatment before pituitary surgery or long-term treatment in those inadequately controlled by other treatment or until radiotherapy becomes fully effective**

**PREVENTION OF COMPLICATIONS FOLLOWING PANCREATIC SURGERY**

**BY SUBCUTANEOUS INJECTION**

- Adult: (consult product literature)

**Test dose before use of depot preparation**

**BY SUBCUTANEOUS INJECTION**

- Adult: Test dose 50–100 micrograms for 1 dose, test dose should be given if subcutaneous octreotide not previously given

**Acromegaly | Neuroendocrine (particularly carcinoid) tumour adequately controlled by subcutaneous octreotide**

**BY DEEP INTRAMUSCULAR INJECTION USING DEPOT INJECTION**

- Adult: Initially 20 mg every 4 weeks for 3 months then adjusted according to response, increased if necessary up to 30 mg every 4 weeks, to be administered into the gluteal muscle, for acromegaly, start depot 1 day after the last dose of subcutaneous octreotide, for neuroendocrine tumours, continue subcutaneous octreotide for 2 weeks after first dose of depot octreotide

**Advanced neuroendocrine tumours of the midgut, or tumours of unknown primary origin where non-midgut sites of origin have been excluded**

**BY DEEP INTRAMUSCULAR INJECTION USING DEPOT INJECTION**

- Adult: 30 mg every 4 weeks

**Reduce intestinal secretions in palliative care**

**BY CONTINUOUS SUBCUTANEOUS INFUSION**

- Adult: 0.25–0.5 mg/24 hours (max. per dose 0.75 mg/24 hours), occasionally doses higher than the maximum are sometimes required

**INTERACTIONS**

**SIDE-EFFECTS**

- Alopecia - arthralgias - biliary colic (associated with abrupt withdrawal of subcutaneous octreotide) - bradycardia - dehydration - dizziness - dyspepsia - headache - hepatotoxicity - pancreatitis (associated with abrupt withdrawal of subcutaneous octreotide) - rash

**SIDE-EFFECTS, FURTHER INFORMATION**

- Gastro-intestinal side-effects: Administering non-depot injections of octreotide between meals and at bedtime may reduce gastro-intestinal side-effects.

**CONCEPTION AND CONTRACEPTION**

- Effective contraception required during treatment.

**PREGNANCY**

- Possible effect on fetal growth; manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**

- Manufacturer advises avoid—present in milk in animal studies.
DIRECTIONS FOR ADMINISTRATION

Monitor liver function.

With intravenous use

MONITORING REQUIREMENTS

acting subcutaneous octreotide (associated with biliary colic and pancreatitis).

TREATMENT CESSATION

Avoid abrupt withdrawal of short-acting subcutaneous octreotide (associated with biliary colic and pancreatitis).

DIRECTIONS FOR ADMINISTRATION

For intravenous infusion, dilute with Sodium Chloride 0.9% to a concentration of 10–50%.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Octreotide (as Octreotide acetate) 50 microgram per 1 ml
Octreotide 50 micrograms/1ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (Pasireotide) £15.85
Octreotide 50 micrograms/1ml solution for injection ampoules | 5 ampoule (Pasireotide) £9.74–£18.60 Octreotide 50 micrograms/1ml solution for injection vials | 5 vial (Pasireotide) £14.87–£22.00
Octreotide (as Octreotide acetate) 100 microgram per 1 ml
Octreotide 100 micrograms/1ml solution for injection ampoules | 5 ampoule (Pasireotide) £18.61–£32.65 Octreotide 100 micrograms/1ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (Pasireotide) £28.90 Octreotide 100 micrograms/1ml solution for injection vials | 5 vial (Pasireotide) £27.97–£32.65
Octreotide (as Octreotide acetate) 200 microgram per 1 ml
Octreotide 1 mg/5ml solution for injection vials | 1 vial (Pasireotide) £65.00–£69.66
Octreotide (as Octreotide acetate) 500 microgram per 1 ml
Octreotide 500 micrograms/1ml solution for injection vials | 5 vial (Pasireotide) £115.47–£158.25 Octreotide 500 micrograms/1ml solution for injection ampoules | 5 ampoule (Pasireotide) £74.80–£169.35 DT price = £135.47 Octreotide 500 micrograms/1ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (Pasireotide) £135.47–£149.00
Sandostatin (Novartis Pharmaceuticals UK Ltd)

Octreotide (as Octreotide acetate) 50 microgram per 1 ml
Sandostatin 50 micrograms/1ml solution for injection ampoules | 5 ampoule (Pasireotide) £14.87
Octreotide (as Octreotide acetate) 100 microgram per 1 ml
Sandostatin 100 micrograms/1ml solution for injection ampoules | 5 ampoule (Pasireotide) £27.97
Octreotide (as Octreotide acetate) 200 microgram per 1 ml
Sandostatin 1 mg/5ml solution for injection vials | 1 vial (Pasireotide) £55.73
Octreotide (as Octreotide acetate) 500 microgram per 1 ml
Sandostatin 500 micrograms/1ml solution for injection ampoules | 5 ampoule (Pasireotide) £135.47–£149.00

Powder and solvent for suspension for injection

Sandostatin LAR (Novartis Pharmaceuticals UK Ltd)

Octreotide (as Octreotide acetate) 10 mg
Sandostatin LAR 10mg powder and solvent for suspension for injection vials | 1 vial (Pasireotide) £469.84
Octreotide (as Octreotide acetate) 20 mg
Sandostatin LAR 20mg powder and solvent for suspension for injection vials | 1 vial (Pasireotide) £717.05
Octreotide (as Octreotide acetate) 30 mg
Sandostatin LAR 30mg powder and solvent for suspension for injection vials | 1 vial (Pasireotide) £993.44

Pasireotide

INDICATIONS AND DOSE

Cushing’s disease when surgery has failed or is inappropriate

BY SUBCUTANEOUS INJECTION

Adult: Initially 600 micrograms twice daily for 2 months, then increased if necessary to 900 micrograms twice daily, consider discontinuation if no response within 2 months, for dose adjustment due to side effects—consult product literature

CAUTIONS

Cardiac disorders (including bradycardia) - susceptibility to QT-interval prolongation (including electrolyte disturbances)

INTERACTIONS

Appendix 1 (pasireotide).

Caution with concomitant use of drugs that prolong QT interval.

SIDE-EFFECTS

Adrenal insufficiency - alopecia - anaemia - arthralgia - bradyarrhythmia - decreased appetite - fatigue - headache - hyperglycaemia - hypotension - myalgia - pruritus - QT-interval prolongation

PREGNANCY

Avoid—toxicity in animal studies.

BREAST FEEDING

Avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT

Reduce initial dose to 300 micrograms twice daily (increased if necessary after 2 months to max. 600 micrograms twice daily) in moderate impairment. Avoid in severe impairment.

MONITORING REQUIREMENTS

Monitor liver function before treatment, weekly for the first 1–2 months of treatment, periodically thereafter, and 3 months after treatment is complete.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Pasireotide (as Pasireotide disaspartate) 300 microgram per 1 ml
Pasireotide 0.3mg/1ml solution for injection ampoules | 60 ampoule (Pasireotide) £2,800.00
Pasireotide (as Pasireotide disaspartate) 600 microgram per 1 ml
Pasireotide 0.6mg/1ml solution for injection ampoules | 60 ampoule (Pasireotide) £3,240.00
Pasireotide (as Pasireotide disaspartate) 900 microgram per 1 ml
Pasireotide 0.9mg/1ml solution for injection ampoules | 60 ampoule (Pasireotide) £3,240.00

2.6 Hormone responsive breast cancer

ANTI-OESTROGENS

Fulvestrant

INDICATIONS AND DOSE

Treatment of oestrogen-receptor-positive metastatic or locally advanced breast cancer in postmenopausal women in whom disease progresses or relapses while on, or after, other anti-oestrogen therapy

BY DEEP INTRAMUSCULAR INJECTION

Adult: 500 mg every 2 weeks for the first 3 doses, then 500 mg every 1 month, to be administered into the buttock

SIDE-EFFECTS

Common or very common Anorexia - asthenia - back pain - diarrhoea - headache - hot flushes - hypersensitivity reactions - injection-site reactions - nausea - rash - urinary tract infections - venous thromboembolism - vomiting
Tamoxifen

**DRUG ACTION** An anti-oestrogen which induces gonadotrophin release by occupying oestrogen receptors in the hypothalamus, thereby interfering with feedback mechanisms; chorionic gonadotrophin is sometimes used in the hypothalamus, thereby interfering with feedback mechanisms; chorionic gonadotrophin is sometimes used as an adjunct in the treatment of female infertility.

**INDICATIONS AND DOSE**

Pre- and perimenopausal women with oestrogen-receptor-positive breast cancer not previously treated with tamoxifen

**BY MOUTH**

- Adult: 20 mg daily

**Anovulatory infertility**

- Adult: Initially 20 mg daily on days 2, 3, 4 and 5 of cycle, if necessary the daily dose may be increased to 40 mg then 80 mg for subsequent courses; if cycles irregular, start initial course on any day, with subsequent course starting 45 days later or on day 2 of cycle if menstruation occurs

**CONTRA-INDICATIONS** Treatment of infertility contra-indicated if personal or family history of idiopathic venous thromboembolism or genetic predisposition to thromboembolism

**CAUTIONS** Porphyria

**INTERACTIONS** → Appendix 1 (tamoxifen).

**SIDE-EFFECTS**

- Rare Angioedema - bullous pemphigoid - cholestasis - fatty liver - hepatitis - hypersensitivity reactions - hypertriglyceridaemia - interstitial pneumonitis - neutropenia - Stevens-Johnson syndrome

- Frequency not known Alopecia - anemia - catacacts - corneal changes - decreased platelet counts - endometrial changes - gastrointestinal disturbances - headache - hot flushes - hypercalcaemia if bony metastases - increased risk of thromboembolic events, especially when used with cytotoxics - leucopenia - light-headedness - liver enzyme changes - occasional cystic ovarian swellings in premenopausal women - occasionally oedema - pancreatitis - pruritus vulvae - rashes - retinopathy - suppression of menstruation in some premenopausal women - thrombocytopenia - thromboembolic events - tumour flare - uterine fibroids - vaginal bleeding - vaginal discharge - visual disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**

**Endometrial changes** Increased endometrial changes, including hyperplasia, polyps, cancer, and uterine sarcoma reported; prompt investigation required if abnormal vaginal bleeding including menstrual irregularities, vaginal discharge, and pelvic pain or pressure in those receiving (or who have received) tamoxifen.

**Risk of thromboembolism** Tamoxifen can increase the risk of thromboembolism particularly during and immediately after major surgery or periods of immobility (consider interrupting treatment to initiate anticoagulant measures).

**CONCEPTION AND CONTRACEPTION** Unless being used in the treatment of female infertility, effective contraception must be used during treatment and for 2 months after stopping. Patients being treated for infertility should be warned that there is a risk of multiple pregnancy (rarely more than twins).

**PREGNANCY** Avoid—possible effects on fetal development.

**BREAST FEEDING** Suppresses lactation. Avoid unless potential benefit outweighs risk.

**PATIENT AND CARER ADVICE**

Endometrial changes Patients should be informed of the risk of endometrial cancer and told to report relevant symptoms promptly. Thromboembolism Patients should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness and any pain in the calf of one leg.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Fulvestrant (AstraZeneca UK Ltd)
  - Fulvestrant 50 mg per 1 ml
    - Fulvestrant 250mg/5ml solution for injection pre-filled syringes | 2 pre-filled disposable injection
    - Price available

**Tamoxifen**

- Adult: 20 mg daily
- Adult: 40 mg for subsequent courses
- Adult: 80 mg for subsequent courses
- Adult: 160 mg for subsequent courses

**INDICATIONS AND DOSE**

Hormone-dependent metastatic breast cancer in postmenopausal women

**BY MOUTH**

- Adult: 60 mg daily

**CONTRA-INDICATIONS** Bradycardia - electrolyte disturbances (particularly uncorrected hypokalaemia) - endometrial hyperplasia - heart failure with reduced left-ventricular ejection fraction - history of arrhythmias - QT prolongation

**CAUTIONS** Avoid in Acute porphyrias p. 864 - history of severe thromboembolic disease

**INTERACTIONS** → Appendix 1 (toremifene).
Avoid concomitant administration of drugs that prolong QT interval.

**SIDE-EFFECTS**
- **Common or very common** Depression • dizziness • fatigue • hot flushes • nausea • oedema • rash • sweating • vaginal bleeding • vaginal discharge • vomiting
- **Uncommon** Anorexia • constipation • dyspnoea • endometrial hypertrophy • headache • increased weight • insomnia • thromboembolic events
- **Very rare** Alopecia • jaundice • transient corneal opacity
- **Frequency not known** Hypercalcaemia (especially if bone metastases and usually at beginning of treatment)

**SIDE-EFFECTS, FURTHER INFORMATION**
- **Endometrial changes** Increased endometrial changes, including hyperplasia, polyps and cancer reported. Abnormal vaginal bleeding including menstrual irregularities, vaginal discharge and symptoms such as pelvic pain or pressure should be promptly investigated.

**PREGNANCY** Avoid.
**BREAST FEEDING** Avoid.
**HEPATIC IMPAIRMENT** Elimination decreased in hepatic impairment—avoid if severe.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **ANASTROZOLE (Non-proprietary)**
  - Anastrozole 1 mg [Fareston 1mg tablets | 30 tablet](®) £29.08
- **Arimidex** (AstraZeneca UK Ltd)
  - Anastrozole 1 mg [Arimidex 1mg tablets | 28 tablet](®) £68.56 DT price = £1.98

**Exemestane**

**INDICATIONS AND DOSE**
Adjuvant treatment of oestrogen-receptor-positive early breast cancer in postmenopausal women following 2–3 years of tamoxifen therapy

**Advanced breast cancer in postmenopausal women in whom anti-oestrogen therapy has failed**

**BY MOUTH**
- Adult: 25 mg daily

**CONTRA-INDICATIONS** Not indicated for premenopausal women
**INTERACTIONS** → Appendix 1 (exemestane).

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain • alopecia • anorexia • constipation • depression • dizziness • dyspepsia • fatigue • headache • hot flushes • insomnia • nausea • rash • sweating • vomiting
- **Uncommon** Asthenia • drowsiness • peripheral oedema
- **Rare** Leucopenia • thrombocytopenia
**PREGNANCY** Avoid.
**BREAST FEEDING** Avoid.
**HEPATIC IMPAIRMENT** Manufacturer advises caution.
**RENAL IMPAIRMENT** Manufacturer advises caution.

**NATIONAL FUNDING/ACCESS DECISIONS**
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (October 2005) that exemestane (Aromasin®) is accepted for restricted use within NHS Scotland as an adjuvant treatment in postmenopausal women with oestrogen-receptor-positive invasive early breast cancer, following 2–3 years of initial adjuvant tamoxifen therapy.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **CAUTIONARY AND ADVISORY LABELS** 21
  - **EXEMESTANE (Non-proprietary)**
    - Exemestane 25 mg [Exemestane 25mg tablets | 30 tablet](®) £88.80 DT price = £22.48
    - 90 tablet (®) no price available
  - **Aromasin** (Pfizer Ltd)
    - Exemestane 25 mg [Aromasin 25mg tablets | 30 tablet](®) £88.80 DT price = £22.48
Letrozole

**INDICATIONS AND DOSE**

First-line treatment in postmenopausal women with hormone-dependent advanced breast cancer. Adjunct treatment of oestrogen-receptor-positive invasive early breast cancer in postmenopausal women. Advanced breast cancer in postmenopausal women (naturally or artificially induced menopause) in whom other anti-oestrogen therapy has failed. Extended adjunct treatment of hormone-dependent invasive breast cancer in postmenopausal women who have received standard adjuvant tamoxifen therapy for 5 years. Neo-adjuvant treatment in postmenopausal women with localised hormone-receptor-positive, human epidermal growth factor-2 negative breast cancer where chemotherapy is not suitable and surgery not yet indicated.

**BY MOUTH**

- Adult: 2.5 mg daily

- **CONTRA-INDICATIONS**
  Not indicated for premenopausal women

- **CAUTIONS**
  Susceptibility to osteoporosis

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain - alopecia - anorexia - appetite increase - arthralgia - bone fracture - constipation - depression - diarrhoea - dizziness - dry skin - dyspepsia - fatigue - headache - hot flushes - hypercholesterolaemia - hypertension - increased sweating - musculoskeletal pain - nausea - osteoporosis - peripheral oedema - rash - vaginal bleeding - vomiting - weight changes
  - **Rare** Arterial thrombosis - pulmonary embolism
  - **Frequency not known** Hepatitis - toxic epidermal necrolysis

- **CONCEPTION AND CONTRACEPTION**
  Manufacturer advises effective contraception required until postmenopausal status fully established (return of ovarian function reported in postmenopausal women).

- **PREGNANCY**
  Avoid (isolated cases of birth defects reported).

- **BREAST FEEDING**
  Manufacturer advises avoid.

- **HEPATIC IMPAIRMENT**
  Manufacturer advises caution in severe impairment.

- **RENAL IMPAIRMENT**
  Manufacturer advises caution if creatinine clearance less than 10 mL/minute.

- **MONITORING REQUIREMENTS**
  Osteoporosis Assess bone mineral density before treatment and at regular intervals.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Letrozole (Non-proprietary)**
  Letrozole 2.5 mg tablets | 14 tablet (PO) £49.90
  DT price = £2.26 | 28 tablet (PO) £84.86
  Femara (Novartis Pharmaceuticals UK Ltd)

- **Letrozole 2.5 mg** Femara 2.5mg tablets | 30 tablet (PO) £90.92

2.7 Immunotherapy responsive malignancy

**IMMUNOMODULATING DRUGS**

**Mifamurtide**

**INDICATIONS AND DOSE**

Treatment of high-grade, resectable, non-metastatic osteosarcoma after complete surgical resection (in combination with chemotherapy).

**BY INTRAVENOUS INFUSION**

- Adult: Infusion to be given over 1 hour (consult product literature or local protocols)

- **UNLICENSED USE**
  Not licensed for use in patients over 30 years of age at initial diagnosis.

- **CAUTIONS**

- **INTERACTIONS**
  - Appendix 1 (mifamurtide).

- **SIDE-EFFECTS**

- **CONCEPTION AND CONTRACEPTION**
  Effective contraception required.

- **PREGNANCY**
  Avoid.

- **BREAST FEEDING**
  Avoid—no information available.

- **HEPATIC IMPAIRMENT**
  Use with caution—no information available.

- **RENAL IMPAIRMENT**
  Use with caution—no information available.

- **MONITORING REQUIREMENTS**
  - Monitor renal function, hepatic function and clotting parameters.
  - Monitor patients with history of venous thrombosis, vasculitis, or unstable cardiovascular disorders for persistent or worsening symptoms during administration—consult product literature.

- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Mifamurtide for the treatment of osteosarcoma (October 2011) NICE TA235

Mifamurtide in combination with postoperative multi-agent chemotherapy is recommended (within its licensed indication), as an option for the treatment of high-grade resectable non-metastatic osteosarcoma after macroscopically complete surgical resection in children, adolescents and young adults and when mifamurtide is made available at a reduced cost to the NHS under the patient access scheme. www.nice.org.uk/TA235

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.
IMMUNOSTIMULANTS

Histamine dihydrochloride

INDICATIONS AND DOSE
Maintenance therapy, in combination with aldesleukin, in patients with acute myeloid leukaemia in first remission
BY SUBCUTANEOUS INJECTION
Adult: (consult local protocol)

CONTRA-INDICATIONS Consult product literature for information about histamine dihydrochloride contra-indications.

CAUTIONS Consult product literature for information about histamine dihydrochloride cautions.

INTERACTIONS → Appendix 1 (histamine).

SIDE-EFFECTS Consult product literature for side effects.

CONCEPTION AND CONTRACEPTION Ensure effective contraception during treatment in men and women.

PREGNANCY Manufacturer advises avoid—no information available.

BREAST FEEDING Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT Increased risk of tachycardia and hypotension in moderate to severe impairment.

RENAL IMPAIRMENT Increased risk of hypotension in severe impairment.

NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (December 2010) that histamine dihydrochloride (Ceplene®) is not recommended for use within NHS Scotland.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
Ceplene (Meda Pharmaceuticals Ltd) ▼ Histamine dihydrochloride 1 mg per 1 ml Ceplene 0.5mg/0.5ml solution for injection vials | 14 vial £1,181.32

IMMUNOTHERAPIES

Bacillus calmette-guérin

DRUG ACTION Bacillus Calmette-Guérin is a live attenuated strain derived from Mycobacterium bovis.

INDICATIONS AND DOSE
Bladder instillation for the treatment of primary or recurrent bladder carcinoma and for the prevention of recurrence following transurethral resection
BY INTRAVESICAL INSTILLATION
Adult: (consult product literature)

CONTRA-INDICATIONS Fever of unknown origin · HIV infection · impaired immune response · severe haematoma · tuberculosis · urinary-tract infection

CAUTIONS Bladder injury (delay administration until mucosal damage healed) · traumatic catheterisation (delay administration until mucosal damage healed) · urethral injury (delay administration until mucosal damage healed)

SIDE-EFFECTS
Rare Arthralgia · bladder contracture · hypersensitivity reactions · orchitis · rash · renal abscess · transient urethral obstruction

Frequency not known Cystitis · dysuria · fever · haematuria · influenza-like syndrome · malaise · ocular symptoms · systemic BCG infection (with fatalities)—consult product literature · urinary frequency

PREGNANCY Avoid.

BREAST FEEDING Avoid.

PRE-TREATMENT SCREENING Screen for active tuberculosis (contra-indicated if tuberculosis confirmed).

MEDICINAL FORMS
Powder for reconstitution for installation
ImmuCyst (Alliance Pharmaceuticals Ltd) Connaught strain Bacillus of Calmette-Guerin 81 mg ImmuCyst 81mg powder for reconstitution for installation vials | 1 vial £79.23 (Hospital only)
Oncotec (Merck Sharp & Dohme Ltd) TICE strain Bacillus of Calmette-Guerin 12.5 mg Oncotec 12.5mg powder for reconstitution for installation vials | 1 vial £71.61 (Hospital only)

INTERFERONS

Interferon alfa

DRUG ACTION Interferon alfa has shown some antitumour effect in certain lymphomas and solid tumours.

INDICATIONS AND DOSE
INTRONA® PEN
Chronic myelogenous leukaemia (as monotherapy or in combination with cytarabine) | Hairy cell leukaemia | Follicular lymphoma | Lymph or liver metastases of carcinoid tumour | Chronic hepatitis B | Chronic hepatitis C | Adjunct to surgery in malignant melanoma | Maintenance of remission in multiple myeloma
BY SUBCUTANEOUS INJECTION
Adult: (consult local protocol)

INTRONA® VIALS
Chronic myelogenous leukaemia (as monotherapy or in combination with cytarabine) | Hairy cell leukaemia | Follicular lymphoma | Lymph or liver metastases of carcinoid tumour | Chronic hepatitis B | Chronic hepatitis C | Adjunct to surgery in malignant melanoma | Maintenance of remission in multiple myeloma
BY SUBCUTANEOUS INJECTION OR BY INTRAVENOUS INFUSION
Adult: (consult local protocol)

ROFERON-A®
Chronic myelogenous leukaemia | Hairy cell leukaemia | Chronic hepatitis B | Chronic hepatitis C | Adjunct to surgery in malignant melanoma | AIDS-related Kaposi’s sarcoma | Advanced renal cell carcinoma | Progressive cutaneous T-cell lymphoma | Follicular non-Hodgkin’s lymphoma
BY SUBCUTANEOUS INJECTION
Adult: (consult local protocol)

CONTRA-INDICATIONS Avoid injections containing benzyl alcohol in neonates

CONTRA-INDICATIONS, FURTHER INFORMATION
For contra-indications consult product literature and local treatment protocol.

CAUTIONS For cautions consult product literature and local treatment protocol.

INTERACTIONS → Appendix 1 (interferons).
### Interferon gamma-1b (Immune interferon)

#### INDICATIONS AND DOSE

**To reduce the frequency of serious infection in chronic granulomatous disease**

**BY SUBCUTANEOUS INJECTION**
- Adult: 50 micrograms/m² 3 times a week

**To reduce the frequency of serious infection in severe malignant osteoporosis**
- Adult: 50 micrograms/m² 3 times a week

#### CAUTIONS
- Arrhythmias, cardiac disease, congestive heart failure, ischaemia, seizure disorders (including seizures associated with fever)

#### INTERACTIONS
